

Appendix 1. Major elements compositions of dated samples

Major element contents of the dated samples are reported in Table S1. Their classification is based on the Total Alkali-Silica diagram of Figure S1.

Data have been obtained at the University of Napoli Federico II by means of an Axios X-Ray fluorescence (XRF) spectrometer, with techniques described in Melluso *et al.* (2011). Samples have been prepared as pressed powder pellets. Errors are estimated to be within 1%.

Loss on ignition (LOI) data have been determined at University of Padova by weighting about 1g of sample powder in a ceramic crucible and heating it into a furnace at 100°C overnight, and into a muffle at 1100°C for 4.30 hours, and weighting after each heating; values after 1100°C heating are reported in Table S1.

Appendix 2. Petrography of the dated samples

Gabbros from Phenai Mata are coarse grained rocks and differ in their modal and chemical composition. The alkali gabbro PL3 is very rich in diopsidic clinopyroxene (about 80 vol.%), while plagioclase (An₉₀; about 15 vol.%) and olivine (Fo₆₇₋₇₂; about 5 vol%) are rare. The tholeiitic gabbros PL9 and PL20 trend to anorthosites (60-75 vol.% plagioclase; An₇₃₋₈₀), while olivine (Fo₆₈) augitic clinopyroxene and orthopyroxene mantling olivine are present in similar amounts (10-15 vol.%).

The sample PL2 is a mafic nepheline syenite, mostly constituted by K-feldspar and Fe-pargasitic amphibole, with nepheline and pale green clinopyroxene as minor phases. Apatite and Fe-Ti oxides are early crystallized accessory phases, epidote and zeolites are secondary.

The basalt PL54 presents plagioclase (An₆₂₋₇₆) as main phenocryst phase. Clinopyroxene and olivine are found in the groundmass. The sample PL61 of Pavagadh Fo-rich olivine, Ca-clinopyroxene and An₆₇₋₆₈ plagioclase as phenocryst phases, set in a microcrystalline mesostasis with also Fe-Ti oxides and alkali feldspar.

PL63 is a glassy rhyolite samples at the top of the Pavagadh hill, and with phenocryst of plagioclase (An₄₀₋₅₃), and minor Fe-olivine, clinopyroxene, pigeonite and Fe-Ti oxides set in a rhyolitic glass.
