71. A Note on the Number of Generators of an Ideal

By Yasuo Kinugasa<br>Department of Mathematics, Aoyama Gakuin University

(Comm. by Kenjiro Shoda, m. J. A., March 12, 1971)

Through this note, we mean by a ring a commutative ring with identity 1. Let $R$ be a noetherian ring and $A$ be an ideal of R. O. Forster showed that, if $A R_{M}$ is generated by at most $r$ elements for any maximal ideal $M$ of $R$, then $A$ is generated by at most $r+$ Alt. $R$ elements, where Alt. $R$ is the Krull dimension of $R$ (cf. O. Forster [1]). In this note, we shall study the number of generators of an ideal and improve the above Forster's result, that is:

Theorem 1. Let $R$ be a ring and $A$ be a finitely generated ideal of $R$. Assume that: (1) there are only a finite number of maximal ideals of $R$ which contain $A$ and (2) $A R_{M}$ is generated by at most $r$ elements for any maximal ideal $M$ of $R$. Then $A$ is generated by at most $r+1$ elements.

Theorem 2. Let $R$ be a noetherian ring and $A$ be an ideal of $R$ such that Alt. $R / A<\infty$. Assume $A R_{M}$ is generated by at most $r$ elements for any maximal ideal $M$ of $R$. Then $A$ is generated by at most $r+$ Alt. $R / A+1$ elements.

To prove these theorems we need the following lemmas.
Lemma 1. Let $R$ be a ring. Assume $0=Q_{1} \cap \cdots \cap Q_{n}$ be an irredundant decomposition of zero ideal of $R$ (not necessarily primary decomposition). If $Q_{1}+Q_{j}=R(j=2, \cdots, n)$, then $Q_{1}$ is a principal ideal.

Proof. Since $Q_{1} \oplus Q_{2} Q_{3} \cdots Q_{n}=R$, we can take $x \in Q_{1}$ and $y \in Q_{2} \cdots Q_{n}$ such that $x+y=1$. For any element $z \in Q_{1}, z=z x+z y=z x$, so we have $Q_{1}=x R$.

Lemma 2. Let $R$ be a ring and $A$ be a finitely generated ideal which contains an ideal $B$. If $A R_{M}=B R_{M}$ for any maximal ideal $M$ which contains $A$, then $A=B$ or $A=x R+B$ for some element $x$ of $A$.

Proof. Since $A$ is finitely generated, $A R_{M}=B R_{M}$ implies $B: A \not \subset M$ for any maximal ideal $M$ which contains $A$. So we have $(A \cap(B: A)) R_{M}$ $=B R_{M}$ for any maximal ideal $M$ of $R$, hence $B=A \cap(B: A)$. If $B: A$ $=R$ then $B=A$. If $B: A \neq R$ then $A+(B: A)=R$ since $B: A \not \subset M$ for any maximal ideal $M$ which contains $A$. So Lemma 1 implies $A=B$ $+x R$ for some $x \in A$ by considering $R / B$ and $A / B$.

Lemma 3. Let $R$ be a ring and $A$ be an ideal of $R$. Assume that: (1) there are only a finite number of maximal ideals $M_{1}, \cdots, M_{n}$ which contain $A$ and (2) $A R_{M_{i}}$ is generated by at most $r$ elements for every $i$.

Then there are elements $x_{1}, \cdots, x_{r}$ of $A$ such that $\left(x_{1}, \cdots, x_{r}\right) R_{M_{i}}=A R_{M_{i}}$ ( $i=1, \cdots, n$ ).

Proof. Choose $x_{i j}$ of $A$ such that $\left(x_{i 1}, \cdots, x_{i r}\right) R_{M_{i}}=A R_{M_{i}}(i=1$, $\cdots, n)$ and take elements $\alpha_{1}, \cdots, \alpha_{n}$ of $R$ such that $\alpha_{i} \notin M_{i}$ and $\alpha_{i} \in$ $\bigcap_{j \neq i} M_{j}(i=1, \cdots, n ; j=1, \cdots, n)$. Put $x_{j}=\sum_{i=1}^{n} x_{i j} \alpha_{i}$ then $x_{j}=x_{i j} \alpha_{i}$ $\left(\bmod A M_{i}\right)(i=1, \cdots, n) . \quad$ So we have $\left(x_{1}, \cdots, x_{r}\right) R_{M_{i}}=\left(x_{i 1}, \cdots, x_{i r}\right) R_{M_{i}}$ $=A R_{M_{i}}(i=1, \cdots, n)$.

Remark 1. By Lemma 3, when ( $R, M_{1}, \cdots, M_{n}$ ) is a quasi-semilocal ring and if $A R_{M_{i}}$ is generated by at most $r$ elements for every $i$, $A$ is generated by $r$ elements. So if $R_{M_{i}}$ is noetherian for every $i$, then $R$ is noetherian. This is (E1. 2) of Appendix in Nagata [3].

Proof of Theorem 1. Obvious by Lemma 3 and Lemma 2.
Corollary 1. Let $R$ be a ring (not necessarily noetherian) and $M$ be a maximal ideal which is finitely generated. If $M R_{M}$ is generated by $r$ elements, then $M$ is generated by at most $r+1$ elements.

Corollary 2. Let $R$ be a noetherian ring and $A$ be an ideal of $R$ such that Alt. $R / A=0$. If $A R_{M}$ is generated by at most $r$ elements for any maximal ideal $M$ of $R$ then $M$ is generated by at most $r+1$ elements.

From this corollary, we have the well known
Corollary 3. Let $R$ be a Dedekind ring then any ideal of $R$ is generated by at most two elements.

Let $R$ be a noetherian ring and $A$ be an ideal of $R$ such that Alt. $R / A<\infty$. We use the following notation:

Spec $R=\{$ the set of all prime ideals of $R\}$,

$$
\begin{aligned}
V(A) & =\{P \in \operatorname{Spec} R \mid P \supset A\}, \\
B(t) & =\sum_{a_{i} \in A}\left(\left(a_{1}, \cdots, a_{t-1}\right): A\right) .
\end{aligned}
$$

Lemma 4. Let $P$ be a prime ideal. Then $\mu\left(A R_{P}\right) \geqq t$ if and only if $P \supset B(t)$, where $\mu\left(A R_{P}\right)$ is the minimal number of generators of $A R_{P}$.

Proof. $P \supset B(t)$ implies $P \supset\left(a_{1}, \cdots, a_{t-1}\right): A$ for any $a_{1}, \cdots, a_{t-1}$ of A. This means that $A R_{P} \neq \sum_{i=1}^{t-1} a_{i} R_{P}$ for any elements $a_{1}, \cdots, a_{t-1}$ of $A$, thus we have $\mu\left(A R_{P}\right) \geqq t$. Conversely $\mu\left(A R_{P}\right) \geqq t$ means $A R_{P} \supseteq$ $\sum_{i=1}^{t-1} a_{i} R_{P}$ for any elements $a_{1}, \cdots, a_{t-1}$ of $A$ so we have $\sum_{i=1}^{t-1} a_{i} R_{p}: A R_{P}$ $\subseteq P R_{P}$ thus $P \supset \sum_{i=1}^{t-1} a_{i} R: A$ for any $a_{1}, \cdots, a_{t-1}$ of $A$, so $P \supset B(t)$. This completes the proof.

Let $R$ and $A$ be as above. For any $P \in \operatorname{Spec} R$, put

$$
\begin{aligned}
f_{P}(A) & = \begin{cases}\left(A R_{P}\right)+\text { Alt. } R / P & \text { if } A R_{P} \neq 0 \\
0 & \text { if } A R_{P}=0, \\
f(A) & =\operatorname{Sup}_{P \in V(A)} f_{P}(A) \quad \text { and } \quad g(A)=\operatorname{Sup}_{P \in \operatorname{Spec} R} f_{P}(A) .\end{cases}
\end{aligned}
$$

Lemma 5. Assume that $R$ is noetherian and that Alt. $R / A<\infty$. Put $S=\left\{P \in V(A) \mid f_{P}(A)=f(A)\right\}$ and $T=\left\{P \in \operatorname{Spec} R \mid f_{P}(A)=g(A)\right\}$. Then (1) $S$ is a finite set if $f(A)>0$, (2) $T$ is a finite set if $g(A)>0$ and Alt. $R<\infty$.

Proof. $f(A)$ is finite since Alt. $R / A$ is finite and $g(A)$ is finite since Alt. $R$ is finite.
(1) For any $P \in S$, put $t=\mu\left(A R_{P}\right)$ then $P \supset A+B(t)$ by Lemma 4, so there exists a minimal prime ideal $P^{\prime}$ of $A+B(t)$ such that $P \supset P^{\prime}$. $t=\mu\left(A R_{P}\right) \geqq \mu\left(A R_{P}\right) \geqq t$ implies $\mu\left(A R_{P}\right)=\mu\left(A R_{P^{\prime}}\right)=t$. On the other hand, $\mu\left(A R_{P}\right)+$ Alt. $R / P \geqq \mu\left(A R_{P \prime}\right)+$ Alt. $R / P^{\prime}$ since $P \in S$, so we have Alt. $R / P=$ Alt. $R / P^{\prime}$, hence $P=P^{\prime}$. Thus $S$ is a finite set.
(2) For any $P \in T$, set $t=\mu\left(A R_{P}\right)$ then $P$ must be a minimal prime ideal of $B(t)$ in the same way as in (1), so $T$ is finite.

Lemma 6 (Forster's lemma). Let $P_{1}, \cdots, P_{n}$ be prime ideals and $A$ an ideal. If $A R_{P_{i}} \neq 0(i=1, \cdots, n)$ then there exists an element $x$ of $A$ such that $x R_{P_{i}} \not \subset A P_{i} R_{P_{i}}(i=1,2, \cdots n)$.

Proof. We may assume $P_{i} \not \subset P_{1}(j>i)$. We prove this lemma by induction on $n$. If $n=1$, it is obvious. If $n>1$, we can take an element $y$ of $A$ such that $y R_{P_{i}} \not \subset A P_{i} R_{P_{i}}(i=1, \cdots, n-1)$ by the hypothesis of induction. If $y R_{P_{n}} \not \subset A P_{n} R_{P_{n}}$, put $x=y$. If $y R_{P_{n}} \subset A P_{n} R_{P_{n}}$, take elements $a, z_{1}, \cdots, z_{n-1}$ of $R$ such that $a \in A, a R_{P_{n}} \not \subset A P_{n} R_{P_{n}}$ and $z_{i} \in P_{i}-P_{n}(i=1$, $\cdots, n-1)$. Put $z=\alpha z_{1} \cdots z_{n-1}$ and $x=y+z$, then $x R_{P_{i}} \not \subset A P_{i} R_{P_{i}}(i=1$, $\cdots, n)$.

Proof of Theorem 2. Let notations be as in Lemma 5. We shall show that $A$ is generated by at most $f(A)+1$ elements, by induction on $f(A)$. If $f(A)=0$, then $A R_{P}=0$ for any $P \in V(A)$ so $A R_{M}=0$ for any maximal ideal which contains $A$. Thus $A$ is principal by Lemma 2. If $f(A)>0$, then we can take an element $x$ of $A$ such that $\mu\left(A R_{P} / x R_{P}\right)$ $=\mu\left(A R_{P}\right)-1$ for any $P \in S$ by Lemma 5 and Lemma 6. Let $\bar{R}=R / x R$, $\bar{P}=P / x R(P \in V(A))$ and $\bar{A}=A / x R$. If $P \in S$ then $\mu\left(A R_{P} / x R_{P}\right)$ + Alt. $(\bar{R} / \bar{P})=\mu\left(A R_{P}\right)-1+$ Alt. $(R / P)=f(A)-1$. If $P \notin S$ then $\mu\left(A R_{P} / x R_{P}\right)+$ Alt. $(\bar{R} / \bar{P}) \leqq \mu\left(A R_{P}\right)+$ Alt. $(R / P)<f(A)$ so we have $f(\bar{A})$ $=f(A)-1$ since $\bar{A} \bar{R}_{\bar{P}}=A R_{P} / x R_{P}$. Thus $\bar{A}$ is generated by at most $f(\bar{A})+1=f(A)$ elements, so $A$ is generated by at most $f(A)+1$ elements. For any $P \in V(A)$ and for any maximal ideal $M$ of $R$, we have Alt. ( $R / P$ ) $\leqq$ Alt. $(R / A)$ and $\operatorname{Sup} \mu\left(A R_{P}\right) \leqq \operatorname{Sup} \mu\left(A R_{M}\right)$, so the proof is complete.

The following proposition is an improvement of Corollary 1 and Satz 4 of [1], in a special case.

Proposition 1. Let $R$ be a noetherian ring, $M$ be a maximal ideal of $R$ and $Q$ be an $M$-primary ideal. Assume $\mu\left(Q R_{M}\right)>$ Alt. $R$. Then $Q$ is generated by $\mu\left(Q R_{M}\right)$ elements.

Proof. Put $\mu\left(Q R_{M}\right)=r$ and $\sqrt{0}=\bigcap_{i=1}^{n_{0}} P(0, i)$ where $P(0, i)$ is a minimal prime of zero. We may assume $P(0,1) \subset M$. By virtue of Proposition 2 of Chap. 2 of [2], we can take elements $x_{1}, \cdots, x_{r}$ of $A$ satisfying the following conditions:
(1) $\sqrt{\left(x_{1}, \cdots, x_{i}\right)}=\bigcap_{j=1}^{n_{i}} P(i, j)$ and $P(i, 1) \subset M(0 \leqq i \leqq r)$ where each
$P(i, j)$ is a minimal prime ideal of $\left(x_{1}, \cdots, x_{i}\right)$,
(2) $\quad x_{i+1} \notin\left(x_{1}, \cdots, x_{i}\right)+Q M,(0 \leqq i \leqq r)$,
(3) $\quad x_{i+1} \notin P(i, j),\left(j=2, \cdots, n_{i}\right)$ if $M=P(i, 1),(0 \leqq i \leqq r)$,
(3') $x_{i+1} \notin P(i, j),\left(j=1, \cdots, n_{i}\right)$ if $M \neq P(i, 1),(0 \leqq i \leqq r)$.
We can take these elements $x_{1}, \cdots, x_{r}$ of $Q$. For:
$Q \subset\left(x_{1}, \cdots, x_{s}\right)+Q M$ implies $Q R_{M}=\left(x_{1}, \cdots, x_{s}\right) R_{M}+Q M R_{M}$, hence $Q R_{M}=\left(x_{1}, \cdots, x_{s}\right) R_{M}$.
(2) implies $\left(x_{1}, \cdots, x_{r}\right) R_{M}=Q R_{M}$ since $\mu\left(Q R_{M}\right)=r$, so we have $P(r, 1)=M$. If there exists $P(r, j),(j \geqq 2)$ then we have a chain of prime ideals

$$
P(r, j) \supseteq P\left(r-1, j_{r-1}\right) \supseteq \cdots \supseteq P\left(1, j_{1}\right) \supseteq P\left(0, j_{0}\right)
$$

by (3) and ( $3^{\prime}$ ). So height $P(r, j) \geqq r$ for any $j,(j \geqq 2)$. This contradicts Alt. $R<r$. Hence $\sqrt{\left(x_{1}, \cdots, x_{r}\right)}=P(r, 1)=M$. So we have $Q=\left(x_{1}, \cdots, x_{r}\right)$ since $Q R_{M}=\left(x_{1}, \cdots, x_{r}\right) R_{M}$ and $\left(x_{1}, \cdots, x_{r}\right)$ is an $M$-primary ideal.

Remark 2. If $R$ is noetherian with Alt. $R<\infty$ and $A R_{M}$ is generated by at most $r$ elements for any maximal ideal $M$, then we may prove that $A$ is generated by at most $g(A)$ elements by using induction on $g(A)$. (cf. Forster, [1]). When Alt. $(R / A)=$ Alt. $R$, Forster's result (Satz 2 of [1]) is better than our Theorem 2.
