E_n-homology

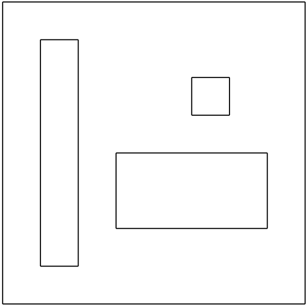
A resolution spectral sequence

A Blanc-Stover spectral sequence

Examples

Little n-cubes

Let C_n denote the operad of little n-cubes. $C_n(r)$, $r \geq 0$.
$n = 2, r = 3$:



C_n acts on and detects n-fold based loop spaces.

E_n-homology

$(C_* C_n(r))_r$, $r \geq 1$ is an operad in the category of chain complexes.
Let E_n be a cofibrant replacement of $C_* C_n$.
For an augmented E_n-algebra A_* let $\bar{A}_*$ denote the augmentation ideal.

The sth E_n-homology group of $\bar{A}_*$, $H_s^{E_n}(\bar{A}_*)$ is then the sth derived functor of indecomposables of $\bar{A}_*$.

Theorem [Fresse 2011]
There is an n-fold bar construction for E_n-algebras, B^n, such that

$$H_s^{E_n}(\bar{A}_*) \cong H_s(\Sigma^{-n} B^n(\bar{A}_*)).$$

I.e., E_n-homology is the homology of an n-fold algebraic delooping.

Some results

Cartan (50s): $H_*^{E_n}$ of polynomial algebras, exterior algebras and some more.
Fresse (2011): X a nice space: $B^n(C^*(X))$ determines the cohomology of $\Omega^n X$.
Livernet-Richter (2011): Functor homology interpretation for $H_*^{E_n}$ for augmented commutative algebras.
$H_*^{E_n}(\bar{A}_*) \cong HH_{*+n}^{[n]}(A_*)$, Hochschild homology of order n in the sense of Pirashvili.
What is $H_*^{E_n}(\bar{A}_*)$ in other interesting cases such as Hochschild cochains, $A_* = C^*(B, B)$, or $A_* = C_*(\Omega^n X)$?

Setting

In the following k is a field, most of the times $k = \mathbb{F}_2$ or $k = \mathbb{Q}$.
The underlying chain complex of A_* is non-negatively or non-positively graded.
Over $\mathbb{F}_2$: $n = 2$; for $\mathbb{Q}$: arbitrary n.

1-restricted Lie algebras

Definition

A 1-*restricted Lie algebra over* $\mathbb{F}_2$ is a non-negatively graded $\mathbb{F}_2$-vector space, $\mathfrak{g}_*$, together with two operations, a Lie bracket of degree one, $[-,-]$ and a restriction, ξ:

$$\begin{aligned} [-,-]\colon \quad & \mathfrak{g}_i \times \mathfrak{g}_j \to \mathfrak{g}_{i+j+1}, \quad & i, j \geq 0, \\ \xi\colon \quad & \mathfrak{g}_i \to \mathfrak{g}_{2i+1} & i \geq 0. \end{aligned}$$

These satisfy the relations

1. The bracket is bilinear, symmetric and satisfies the Jacobi relation

   $[a,[b,c]]+[b,[c,a]]+[c,[a,b]] = 0$ for all homogeneous $a, b, c \in \mathfrak{g}_*$.

2. The restriction interacts with the bracket as follows: $[\xi(a), b] = [a,[a,b]]$ and $\xi(a+b) = \xi(a) + \xi(b) + [a,b]$ for all homogeneous $a, b \in \mathfrak{g}_*$.

1-rL: The category of 1-restricted Lie algebras.

1-restricted Gerstenhaber algebras

Definition

A 1-*restricted Gerstenhaber algebra over* $\mathbb{F}_2$ is a 1-restricted Lie algebra G_* together with an augmented commutative $\mathbb{F}_2$-algebra structure on G_* such that the multiplication in G_* interacts with the restricted Lie-structure as follows:

- (Poisson relation)

$$[a, bc] = b[a, c] + [a, b]c, \text{ for all homogeneous } a, b, c \in G_*.$$

- (multiplicativity of the restriction)

$$\xi(ab) = a^2\xi(b)+\xi(a)b^2+ab[a, b] \text{ for all homogeneous } a, b \in G_*.$$

1-rG: the category of 1-restricted Gerstenhaber algebras.
In particular, the bracket and the restriction annihilate squares: $[a, b^2] = 2b[a, b] = 0$ and $\xi(a^2) = 2a^2\xi(a) + a^2[a, a] = 0$. Thus if 1 denotes the unit of the algebra structure in G_*, then $[a, 1] = 0$ for all a and $\xi(1) = 0$.

Free objects and indecomposables

For a graded vector space V_* let $1rL(V_*)$ be the free 1-restricted Lie algebra on V_*.
The free commutative algebra $S(1rL(V_*))$ has a well-defined 1-rG structure and is the free 1-restricted Gerstenhaber algebra generated by V_*:

$$1rG(V_*) = S(1rL(V_*)).$$

For $G_* \in 1rG$ let $Q_{1rG}(G_*)$ be the graded vector space of indecomposables.
Note: $Q_{1rG}(G_*) = Q_{1rL}(Q_a(G_*))$.

Homology of free objects

Lemma

$$H_*(E_2(\bar{A}_*)) \cong 1rG(H_*(\bar{A}_*)).$$

Proof: Let X be a space. F. Cohen desribes $H_*(C_2(X); \mathbb{F}_2)$.
Observation by Haynes Miller: $H_*(C_2(X); \mathbb{F}_2) \cong 1rG(\bar{H}_*(X; \mathbb{F}_2))$.
(Dyer-Lashof operations only give algebraic operations.)
Take X with $\bar{H}_*(X; \mathbb{F}_2) \cong H_*(\bar{A}_*)$, then
$H_*(E_2(\bar{A}_*)) \cong H_*(C_2(X); \mathbb{F}_2)$.

Resolution spectral sequence

Theorem

There is a spectral sequence

$$E^2_{p,q} \cong (\mathbb{L}_p Q_{1rG}(H_*(\bar{A}_*)))_q \Rightarrow H^{E_2}_{p+q}(\bar{A}_*)$$

.

Proof: Standard resolution $E_2^{\bullet+1}(\bar{A}_*)$.

$E^1_{p,q} : H^{E_2}_q(E_2^{p+1}(\bar{A}_*)) \cong H_q(E_2^p(\bar{A}_*))$

$$H_q(E_2^p(\bar{A}_*)) \cong 1rG^p(H_*\bar{A}_*)_q \cong Q_{1rG}(1rG^{p+1}(H_*\bar{A}_*))_q.$$

d^1 takes homology wrt resolution degree.

Example

For X connected:
$(\mathbb{L}_p Q_{1rG}(H_*(C_*(\Omega^2\Sigma^2 X;\mathbb{F}_2)))_* = (\mathbb{L}_p Q_{1rG}(1rG(\bar{H}_*(X;\mathbb{F}_2)))_*$.
This reduces to $\bar{H}_q(X;\mathbb{F}_2)$ in the $(p=0)$-line and

$$H_q^{E_2}(C_*(\Omega^2\Sigma^2 X;\mathbb{F}_2)) \cong \bar{H}_q(X;\mathbb{F}_2).$$

Rational case

The rational case is much easier:

$$H_*(E_{n+1}\bar{A}_*) \cong nG(H_*(\bar{A}_*)),$$

the free n-Gerstenhaber algebra generated by the homology of $\bar{A}_*$.
We get:

$$E^2_{p,q} \cong (\mathbb{L}_p Q_{nG}(H_*(\bar{A}_*)))_q \Rightarrow H^{E_{n+1}}_{p+q}(\bar{A}_*)$$

for every E_{n+1}-algebra $\bar{A}_*$ over the rationals.

General Blanc-Stover setting

Let $\mathcal{C}$ and $\mathcal{B}$ be some categories of graded algebras (*e.g.*, Lie, Com, n-Gerstenhaber etc.) and let $\mathcal{A}$ be a concrete category (such as graded vector spaces) and $T\colon \mathcal{C} \to \mathcal{B}$, $S\colon \mathcal{B} \to \mathcal{A}$.
If TF is is S-acyclic for every free F in $\mathcal{C}$, then there is a Grothendieck composite functor spectral sequence for all C in $\mathcal{C}$

$$E^2_{s,t} = (\mathbb{L}_s \bar{S}_t)(\mathbb{L}_* T)C \Rightarrow (\mathbb{L}_{s+t}(S \circ T))C.$$

- Note: T, S non-additive.
- $\bar{S}_t(\pi_* B) = \pi_t(SB)$ if B is free simplicial; otherwise it is defined as a coequaliser.
- $\bar{S}$ takes the homotopy operations on $\pi_* B$ into account (B a simplicial object in $\mathcal{B}$): $\pi_* B$ is a Π-$\mathcal{B}$-algebra.
- $\mathcal{B} = \mathit{Com}$: $\pi_*(B)$ has divided power operations. $\mathcal{B} = \mathit{rLie}$: $\pi_* B$ inherits a Lie bracket and has some extra operations.

In our case

Theorem

- $k = \mathbb{F}_2$: For any $C \in 1rG$:

$$E^2_{s,t} = \mathbb{L}_s((\bar{Q}_{1rL})_t)(AQ_*(C|\mathbb{F}_2, \mathbb{F}_2)) \Rightarrow \mathbb{L}_{s+t}(Q_{1rG}).$$

- For $k = \mathbb{Q}$ we get for all n-Gerstenhaber algebras C:

$$\mathbb{L}_s((\bar{Q}_{nL})_t)(AQ_*(C|\mathbb{Q}, \mathbb{Q})) \Rightarrow \mathbb{L}_{s+t}(Q_{nG}).$$

Hochschild cochains, rational case

Let V be a vector space. Then $C^*(TV, TV)$ is an E_2-algebra. How close is $H_*^{E_2}(\bar{C}^*(TV, TV)$ to V, *i.e.*, how free is $C^*(TV, TV)$ as an E_2-algebra?

Proposition

For $V = \mathbb{Q}$, *i.e.* $TV = \mathbb{Q}[x]$ the E_2-homology of the reduced Hochschild cochain complex is non-trivial in all degrees $r \geq -1$, more precisely

$$H_r^{E_2}(\bar{C}^*(\mathbb{Q}[x], \mathbb{Q}[x])) \cong \mathbb{Q}$$

for all $r \geq -1$.

Thus in this case E_2-homology of the Hochschild cochains on $T\mathbb{Q}$ is much larger than the vector space $\mathbb{Q}$ we started with.

The calculations uses the equivalence of categories of n-Lie algebras and graded Lie-algebras given by n-fold (de)suspension. Thus (up to suspension) we have to calculate ordinary Lie-homology of $AQ_*(HH^*(\mathbb{Q}[x],\mathbb{Q}[x]))$ and this is concentrated in homological degree zero and there it is $\mathbb{Q}\langle x_0, y_{-1}\rangle$ with trivial 1-Lie structure.

$\infty > dim(V) \geq 2$

In these cases we can determine the input for the Blanc-Stover spectral sequence:

$$AQ_*(HH^*(TV, TV)|\mathbb{Q}; \mathbb{Q}) \cong HH^{(1)}_{*+1}(\mathbb{Q} \rtimes M(-1); \mathbb{Q})$$

and the first Hodge summand $HH^{(1)}_*(\mathbb{Q} \rtimes M(-1); \mathbb{Q})$ is additively isomorphic to the free graded Lie-algebra generated by the graded vector space $M(-1)$.
However, $M(-1) = HH^1(TV, TV)$ is *not* free as a Lie-algebra.

Chains on iterated loop spaces

Let k be $\mathbb{Q}$ and let X be an $(n+1)$-connected nice topological space.
Then $H_*(\Omega^{n+1}X;\mathbb{Q}) \cong S(\Sigma^{-n}\pi_*(\Omega X)\otimes\mathbb{Q})$ as n-Gerstenhaber algebras.

Proposition

$$\mathbb{L}_s(Q_{nG})(H_*(\Omega^{n+1}X;\mathbb{Q}))_q \cong \mathrm{Tor}^{H_*(\Omega X;\mathbb{Q})}_{s+1,q+n}(\mathbb{Q},\mathbb{Q}).$$

Conjecture

This does not just look like a shifted version of the Rothenberg-Steenrod E^2-term, but there is an underlying isomorphism of spectral sequences. The RS-spsq converges to $H_*(X;\mathbb{Q})$.
