Curriculum; Trend Analysis

ABSTRACT

This report summarizes the findings of the analyses of data on course offerings in the public secondary schools of the United States. The study on academic trends during the 1972-73 and 1981-82 school years focused on courses in computer application, foreign languages, mathematics, social sciences, visual and performing arts, and vocational education. Section 1 presents the rationale for the study. Section 2 describes the methodology of the analysis. In the third section, a summary highlights enrollments in each of academic years, the courses which were most frequently offered, and those with the highest enrollment. Section 4 contains a summary of the trends in subject area enrollments over the nine-year period from 1973 to 1982. Section 5 presents tables displaying the findings reported in the previous two sections. The report concludes with a technical appendix describing the survey sample designs of the 1972 and 1982 surveys. (JD)

1. INTRODUCTION

Over the past fifteen years, secondary schools have served both as a laboratory for new curricula and instructional ideas, and as a battleground for conflicts over the goals of secondary school education. Both histories are presently being chronicled for the public through a variety of commission and task force reports on the state of the American educational system.

To a great extent, the educational system is a reflection of the society in which it functions. Curriculum, and instructional philosophies are tied to public concerns and problems. For example, concern over technological superiority was expressed in the mathematics and science curricula of the late fifties and early sixtles, and concern for the education of the whole child was reflected in the popularity of special interest and personal development courses in the late sixtles and seventies. The back-to-basics movement of the seventies arose partly from a public perception that the level of mathematical and linguistic literacy of our youth was woefully inadquate.

All of these changes and innovations in curriculum are now being questioned by the public, and by educators. Arguments centering around the question of the basic goal of secondary education are found in the education literature. Those who feel the goal should be a general preparation for life and further study wish to see a core curriculum required for all students. Those who believe in specialized preparation in certain subject areas, such as mathematics or vocational preparation, are in favor of tracking students as to their interests and abilities. 2

In 1982, the National Center for Education Statistics(NCES) analyzed the high school transcripts of 12,000 seniors to determine how well they had met

^{2/} See A Nation at Risk

This position is taken by Mortimer Adler and the members of the Paidela Group and is discussed in <u>The Paidela Proposal</u>, New York: Macmillian Publishing Co., Inc., 1982. It is promoted to some extent by the National Commission on Excellence in Education, <u>A Nation at Risk</u>, Washington, D.C.: U.S. Government Printing Office, 1983.

the "New Basics" requirements recommended by the National Commission on Excellence in Education (NCEE). NCEE had recommended that all students be required to take 3 years of mathematics, 3 years of science, 4 years of English, 3 years of social studies, and one-half year of computer science. For the college-bound, the Commission also recommended that two years of foreign language study be required. Of the requirements recommended, few were met by all high school graduates. According to NCES, only 1.8 percent of the students met all of the requirements in the "Five New Basics."

English and social studies were the two areas where the requirements were most frequently satisfied. Over a student's high school career, the number of credits earned each year in English tended to remain stable, while there was a steady decline in credits earned in math and science. Social studies credits declined after the 11th grade, while computer science credits increased, primarily in the 12th grade. Very few students ever took advanced courses in math or science.

NCEE will be adopted by school districts, and whether if adopted there would be little or no time left in the school day for electives. It also remains to be seen whether the number of credits required in these areas will be increased. Meanwhile, new developments in curriculum and instruction continue in the schools. Some examples of these developments include:

e Computer Applications: While increased use of computers is evident in all areas, including music and art, about 40 percent of secondary school students attended schools that offered no instruction in the use of computers. There is much debate over software development and its applications in secondary schools.

^{3/ &}quot;How Well Do High School Graduates of Today Meet The Curriculum Standards of the National Commission on Excellence?" National Center for Education Statistics bulletin, NCES 83-233, September, 1983.

The NEA, Educational Products Information Exchange and others are endeavoring to stimulate the development of improved educational software and to encourage the sharing of successful practices and products.

- Foreign Languages: Tests for foreign language proficiency have recently been developed by the American Council for the Teaching of Foreign Languages, and by the Educational Testing Service. Trends in foreign language instruction include: teaching through immersion in the language and associated culture; giving more practice in thinking in the language; using less rote repetition; introducing students to the cultural aspects of the language.
- Mathematics: A mathematics curriculum with three or more tracks has been suggested as a way of reaching all students, and particularly as a way of helping those with special interests and abilities. With this system, there can be a greater and earlier emphasis on statistics, real world applications, and the development of problem-solving skills.
- Social Studies: There has been a trend towards a reduction in electives, replacing these with a core/curriculum consisting of:
 U.S. history, geography, economics, and government. Some social studies teachers have reported a decline in inquiry teaching which seemed to result from a back-to-basics perspective in their communities.
- budgets in school districts are affected by the economy. At the same time, people are recognizing the importance of the arts as a mechanism of concept development. Students are gaining some opportunities in the arts through independent art, music, and drama projects supported by their communities.
- Vocational Education: Two events, the development of more schoolindustry partner hips and an evolving re-structuring of the
 concept of the classroom as the sole source of academic credit,

\$ 30

group instruction is losing support, while integration of vocational and academic instruction is gaining in popularity.

These developments have had a significant impact upon the course offerings and course enrollments in our secondary schools over the past decade. New courses have emerged and other courses have become less important in the overall education of our young people. Enrollments have risen and declined as schools have adapted their curricula to social and economic influences.

While education professionals are well acquainted with the changes that have taken place in the education system in recent years, no attempt has been made to document the current status of the secondary school curricular nationwide. Moreover, no attempt has been made to assess present curricular in relation to those of a decade ago.

A.Trend Study of Course Offerings and Enrollments

Evaluation Technologies Incorporated (ETI) of Arlington, Virginia was contracted with to conduct a trend study of course offerings and enrollments. The study focused on the course offerings and enrollments in public secondary schools, during the 1972-73 and 1981-82 academic years. The analyses were directed toward the overall study goals of:

- Establishing the importance of specific courses in the 1981-82 secondary school curriculum, as reflected in the number and percentage of schools offering courses, the total enrollments of these schools, and course enrollments;
- identifying changes that have occurred in the emphasis placed on courses in the public secondary schools of today (i.e., the courses offered in the 1981-82 academic year) as compared with nine years ago; and
- Describing the relative importance of general subject areas in 1981-82 versus 1972-73.

Trend Data Sources

Data to investigate public secondary school course offerings and course enrollments were available through several surveys sponsored by the National Center for Education Statistics. Particularly useful were the data collected by:

- The 1973 Survey of Public Secondary School Offerings, Enrollments, and Curriculum Practices:
- The 1982 High School and Beyond Course Offerings and Course Enroll—
 ments Survey; and
- The 1982 High School and Beyond Transcripts Survey.

Data from the 1973 survey of public schools were used to produce 1972-73 national estimates of the number of courses offered in public secondary schools, the types of courses offered, and the student enrollment in these courses. Similar estimates were produced for the 1981-82 academic year from the two HS&B surveys conducted as part of the 1982 HS&B First Follow-up Study. Together, they provided the information needed to identify changes in course offerings and enrollments for specific courses (e.g., French 1, American history, and elementary algebra), and for general subject areas (e.g., foreign language arts, social studies, and mathematics) over the nine-year period.

In evaluating any observed changes in enrollments for specific courses, the rader should keep in mind that between 1972 and 1982, there was an overall increase of about 14 percent in course-taking behavior -- resulting perhaps from a tendency of schools to offer more and shorter courses.

It also may be worthwhile to alert the reader to the fact that another, recently published, NCES report presents data which might, in superficial examination, appear to be inconsistent with some of the findings reported here.

This other report examines changes in student course-work between 1972 and 1980 but is not really comparible with the present analysis because: (1) it considers a different span of grades (10 - 12 vs. 9 - 12); (2) it considers only 5 subject areas vs. all; and (3) its 1980 enrollment data are based on student questionnaire responses (as contrasted with the transcripts used in the present study).

Report Organization

This report summarizes the findings of the analyses of NCES data on course offerings and enrollments in the public secondary schools of the United States. The remainder of the report is organized into four sections and a technical appendix.

Section 2 of the report describes the methodology of the analysis. It contains a description of the inconsistencies between the 19% survey and the 1982 survey. An overview of the adjustments made to compensate for these inconsistencies is presented along with discussion describing their impact on the study findings.

Section 3 summarizes the course offerings and course enrollments of U.S. public secondary schools during the two academic years for which survey data were analyzed. The summary highlights the courses which were most frequently offered and those with the highest enrollments in each of the academic years. The course offerings and enrollments in subjects of current concern to educators, decision makers, and the general public (e.g., mathematics, science, and foreign language courses) are also highlighted.

Section 4 contains a summary of the trends in subject area enrollments over the nine-year period from 1973 to 1982. The narrative focuses on subject areas that have experienced large increases or decreases in enrollments during this period. Findings relating to the emergence of new subject areas or course types are reported.

^{1/} High School Seniors: A Comparative Study of the Classes of 1972 and 1980, NCES 84-202, 1984.

Section 5 presents the tables on which the findings reported in the previous two sections are based. A description of table content and a guide to table use is given prior to the tables.

The report concludes with a technical appendix. The appendix describes the survey sample designs of the 1973 and 1982 surveys. Detailed descriptions of the adjustments made to compensate for the inconsistencies between the 1973 and 1982 surveys are provided. Procedures for calculating the standard errors of the estimates found in the report tables are discussed, and the standard errors of the estimates are presented in a series of tables.

. 2. OVERVIEW OF STUDY METHODOLOGY

As noted above, the data used for the analysis of secondary school course offerings and enrollments came from independent surveys. Consequently, the data were not directly comparable; certain adjustments were required prior to using the data in a comparative analysis.

The 1973 and 1982 course offerings and course enrollments surveys differed in two fundamental ways. First, the sampling frames of the two surveys reflected two different populations, resulting in different types of schools being selected for participation. In the 1973 survey, <u>public</u> schools with <u>grade 7 or above</u> were sampled. The 1982 survey was part of the larger HS&B First Follow-up study. The request for course offerings and course enrollments information was made of those schools whose students were selected for participation in the First Follow-up study. Consequently, the sample of the 1982 survey included <u>private as well as public</u> secondary schools. The school sample was restricted to those with a grade 12, i.e., schools that had no 1980 sophomore base year participants were excluded.

Secondly, certain key data items and coding structures were not consistent across the two surveys. In particular, the succt areas and course titles used in the 1973 survey, which appear in the succept statistical publications, differed scightly from those used in the 1982 study of offerings and enrollments. These variations reflected the changes in course offerings that have occurred over the past decade. Also, the 1973 survey collected total school membership by grade level and ascertained the upper and lower grade levels associated with placement in each course. The 1982 survey did not collect comparable data items, making it more difficult to estimate course enrollments for specific grade levels. The 1982 study collected data on total school membership and on school membership for the 10th and 12th grades, and included limited information on course grade levels.

^{5/} Grade level data are available for certain courses as part of the CSSC codes.

^{4/} See Osterndorf, Logan, <u>Summary of Offerings and Enrollments in Public Secondary Schools</u>, 1972-73, <u>Washington</u>, D. C.: U.S. <u>Government Printing Office</u>, 1975; and <u>A Classification of Secondary School Courses</u>, Evaluation Technologies Incorporated, 1982.

Data adjustments to compensate for the discrepancies dited above involved modifying the data used from one or both of the surveys. The type of adjustment depended on the source of the discrepancy and on the objective of the analysis for which the data were to be used. These adjustments are described below.

2.1. Adjustments for Sampling Inconsistencies

The differences between the sampling frames of the two offerings and enrollments surveys, and thus, the types of schools represented by the data, were
adjusted in two ways. First, only a public school subset of the data was
analyzed from the 1982 survey. Secondly, only data from schools in the 1973
survey with a grade 12 were included in the analyses. These adjus ments
reduce the chances of the analyses producing misleading results, as a
function of the differences between the samples.

The effects of these adjustments on the sample sizes of the two surveys are summarized in the Technical Appendix to this report. Selecting only those schools with a grade 12 in the 1973 survey to estimate 1972-73 course characteristics reduced the number of cases available for analysis from 7,852 to 5,379. Selecting public school only for the 1982 survey reduced the number of 1982 cases from 975 schools to 835 schools.

2.2. Adjustments for Course Title and Coding Inconsistencies

Differences in the course titles used in the two surveys were reconciled by using the 1972-73 course terminology. Thus, the 1982 course titles and course codes were redefined in terms of the earlier data.

It was not possible to redefine the 1982 data so that there was complete correspondence with the 1972-73 course titles and subject areas. Since the early 1970s, some courses are no longer taught in secondary schools, while other new courses have emerged. For example, a series of courses in the computer science field are now being offered in the secondary schools of the United States that were not previously available.

^{6/} More information on the procedure used to adjust for course title and coding inconsistencies and the difficulties inherent in this procedure is found in the Technical Appendix to this report.

2.3 Adjustments for Enrollment Data Inconsistencies

Estimates of the number and percentage of U.S. secondary school course and subject area offerings were based on school-reported data in 1972-73 and 1981-82. Moreover, estimates of the 9th through 12th grade student enroll-ments in these schools came from data reported by the schools themselves.

The analysis of course enrollments was intended to be based on school-reported enrollment data. The unacceptable rate of nonresponse to the 1982 HS&B Offerings and Enrollments Survey request for course enrollments, however, required that alternative data be used for this purpose. Whereas school-reported enrollment data were used to estimate course enrollments during the 1972-73 academic year, estimates of 1981-82 course enrollments were derived from the data collected by the 1982 HS&B Transcripts Survey.

The 1981-82 course enrollments presented in the tables of this report are not directly comparable to the 1972-73 course enrollments. The 1981-82 estimates were based on the high school course-taking histories of a single student cohort, while the 1972-73 estimates were derived from the reported course enrollments throughout each school for a single school year. Nevertheless, the two types of estimates provide an indicator of the relative gain or loss in course enrollments between 1972 and 1982.

The assumptions underlying the use of student transcript data to estimate 1981-82 course enrollments are described in Section 5.2. The specific methods used to estimate course enrollments from student transcript data and the circumstances that led to the decision to use these data are outlined in the Technical Appendix to this report.

All of the planned analyses of course enrollments were limited to student enrollments in grades 9 through 12. In order to limit the analysis in this manner certain adjustments to the survey data were made.

The analyses of the high school enrollments and course enrollments required an estimate of the total school 9th through 12th grade enrollment for each of the survey years. For the 1973 survey, this estimate was calculated by

taking the weighted sum of the school-reported enrollments for grades 9, 10, 11, and 12. No direct estimate was available for the 1982 survey, however, since similar school grade level enrollment data were not collected. Instead, an estimate of the total national enrollment in grades 9 through 12 was obtained by summing the weighted enrollments reported by all high schools in the HS&B sample.

The analyses of course enrollment data also required estimates of the number of 9th through 12th grade students enrolled in each individual course identified by the sampled school's. Since some of the schools in both the 1973 and 1982 samples had grades below grade 9 (e.g., 7th and 8th grades), steps were taken to reduce the chances of including students from lower grades in the estimates of 9th through 12th grade course enrollments.

First, courses with a grade designation below grade 9 were deleted from the analyses. Second, ETI's education specialists reviewed the courses listed by schools in the 1973 sample and dets fined the likelihood that they would include students below grade 9. Courses that were judged to have a high probability of including significant numbers of students from these lower grade levels were deleted from the analyses. If a course was deleted in 1973 it was also deleted from the 1982 data.

Restricting the analysis of course enrollments to the number of 9th through 12th grade students enrolled in the courses offered by the schools was less of a problem in 1982. As indicated previously, 1981-82 school year course enrollments were derived from student transcript data. Each transcript record contained information on the courses a student took when he or she was a freshman, sophomore, junior, and senior. Thus, course enrollments based on student transcript data translate directly to 9th through 12th grade enrollments.

The major concern associated with the use of school-reported total enrollments was whether they represented only grade 9 through 12 enrollment or included the enrollment for grade ranges other than 9 through 12 (e.g., 7-12 or 8-12). Subsequent analyses supported the use of total high school enrollment/as an estimate of grade 9 through 12 enrollment. These analyses and other information on the use of this variable are found in the Technical Appendix to this report.

3. A SUMMARY OF COURSE OFFERINGS AND COURSE ENROLLMENTS

Course offerings and course enrollments for the U.S. public secondary schools are presented for 1973 and 1982 in Tables 1 and 2, respectively. Each of these tables presents the following kinds of information with respect to over 400 aggregated course titles: (a) the number of (public) secondary schools offering that course, (b) that number expressed as a percentage of all public secondary schools, (c) the total enrollment among schools offering that course, (d) that enrollment expressed as a percentage of total enrollment throughout the nation (i.e., the percentage of students in the country who thematically could have taken the course), (e) total national enrollments in that course, (f) that value expressed as a percentage of all students in the nation, and (g) that value expressed as a percentage of all students attending school when the course was offered.

3.1. Most Frequent Offerings

Only two course titles were offered in 90 percent or more of the estimated 15,309 public high schools of the United States in 1972-73. The two course titles were English, grades 9-12 and first-year typing. In addition, over 80 percent of the schools offered general math for grades 9 through 12, geometry, chemistry I/II, and band. When courses offered by more than 70 percent of the public schools were included, the list of courses most frequently offered during the 1972-73 academic year expanded to include: first-year shorthand, elementary algebra, intermediate algebra, choir/chorus, biology I, physics I/II, U.S. history grades 9-12, western civilization and history, and driver's education (classroom portion). Courses offered by at least 60 percent of the public secondary schools further included:

- Art I
- Bookkeeping I
- Public speaking I and II
- First-year Spanish

a/ Enrollment figures and percentages may sometimes exceed 100 percent since a student who took more than one course in an area was counted once for each such course.

- Health and physical education, grade 9
- Health and physical education, grade 10
- First-year home economics
- Driver's education (practice/simulation)
- Second-year/third-year/fourth-year typing.

During 1981-82, English, grades 9-12 and first-year typing were joined by four feourse titles -- biology 1; general math, grades 9-12; elementary algebra; and geometry, plane and solid -- as the only courses offered by 90 percent or more of the nation's high schools. Intermediate algebra, along with band, chemistry-i/li, and grade 9 health and physical education were the only course titles from the most frequently offered courses in 1972-73 (i.e., those offered by at least 60 percent of the schools) that were offered by 80-89 percent of the schools during the later time period. Art 1, first-year shorthand, second-year through fourth-year typing, choir/chorus, and western civilization and history which were offered by 60 percent or more of the schools in 1972-73, were offered in 70-79 percent of the schools in 1981-82.

Sixteen course titles were much more widely offered in 1981-82 than in 1972-73. Each of the following was offered by at least 60 percent of the schools in 1981-82 but by much smaller percentages in 1972-73. These courses were:

- General busine s
- Accounting
- Journalism
- Communication theory/speech/diction⁸
- First-year French
- Second-year Spanish <
- Health, grades 9-12
- Carpentry/woodworking
- General science
- Chemistry and physics, college level
- American history
- American government
- Sociology/social organization
- Drafting/mechanical drawing
- Career education/occupational guidance
- Vocational group guidance.

^{8/} The difference between 1972-73 and 1981-82 course offerings is to a large extent a function of the classification schemes used. In 1972-73 many of the courses grouped to form this title are found under speech and public speaking ! and !!.

There were several course titles which were less widely offered in 1981-82 than in 1972-73. Physics I/II, which had been offered by 74 percent of the schools in 1972-73, was offered by 36 percent of the schools in 1981-82. U.S. history which had been offered by 75 percent of the 1972-73 schools was offered by only 46 percent of the schools in 1981-82. The other courses experiencing a similar decline were:

Bookkeepingsl

Public speaking I and II

· • Health and physical education, grade 10

Driver's education (practice/simulation).

. 3.2. Courses with the Highest Enrollments

During the 1972-73 academic year, 16 of the course titles had enrollments of one million or more students. These courses are listed below:

- English, grades 9-12
- First-year typing
- Health, grades 9-12
- Health and physical education, all grades
- General math, grades 9-12
- Elementary algebra
- Geometry, plane and solid
- Choir/chorus/glee club
- · Band
- Blology I
- Chemistry I/II
- U.S. history
- Western civilization and history
- American government
- Driver's education, classroom
- Driver's education, practice/simulation ~

With the exceptions of grade 12 health and physical education, chemistry 1/11, and driver's education (practice/simulation), all courses which had enrollments of one million or more in the 1972-73 school year held the same status in 1981-82. In the latter year, eight additional courses had one million students enrolled. These were:

- Art I
- Developmental reading
- Composition
- General science

• First-year and second-year physical science

• American history

- Sociology/social organization
- Career education and occupational guidance.

Another seven courses had enrollments of 750,000 or more in 1981-82. These included: American literature, health and physical education for grade 12, chemistry I/II, first-year Spanish, intermediate algebra, carpentry/wood-working, and vocational group guidance.

Courses with at least 750,000 students enrolled during the 1972-73 school year included: art i, developmental reading. American literature, intermediate algebra, and composition. All but American literature and intermediate algebra had an enrollment of one million or more in 1981-82.

3.3. Offerings and Enrollments In Courses of Special Concern

As described in the introductory section of this report (see Section 1), the status of secondary school instruction in mathematics, science, foneign languages, vocational education, the arts, and the humanities has been a key concern of professional educators and of the general public. Consequently, course offerings and course enrollments in each of these subject areas were examined separately.

3.3.1. Mathematics

Nearly 88 percent of the public schools in 1972-73 offered one or more courses in mathematics compared with over 99 percent of the schools in 1981-82. A majority of the public secondary schools in both years offered courses in general math for grades 9-12, elementary and intermediate algebra, and geometry (plane and solid). During 1972-73, a majority of the schools offered courses in algebra and trigonometry but in 1981-82 only a minority of schools did so. A slight majority of the schools offered a course in applied mathematics in 1981-82.

The total enrollment in mathematics courses in 1972-73 was 6,619,000, representing 55 percent of the total public secondary school enrollment for that year. This figure does not include the approximately 468,000 students

who were enrolled in special and experimental math programs such as SMSG and ULCSM. Since no such programs were coded in the 1981-82 survey, they were not included in the analysis.

In 1981-82, the total enrollment in mathematics courses was about 9,850,000 which represented approximately 78 percent of the total high school enrollment of 12,660,537 students.

The largest enrollments in mathematics during both school years were in general mathematics for grades 9-12, elementary algebra, and plane and solid geometry. The percentage of the total U.S. enrollment in general mathematics and elementary algebra increased from 1973 to 1982, while the percentage in geometry stayed approximately the same over that period.

3.3.2. Science

In 1972-73, 89 percent of the public high schools offered one or more science courses but in 1981-82 virtually all schools (99.7 percent) did so. The most common science course in the earlier year was chemistry, but in the later year was biology.

Enrollment in the sciences was 6,119,000 students during the 1972-73 school year, increasing to 8,278,000 students during the 1981-82 period. In the earlier year, enrollment in the sciences represented 51 percent of the total high school enrollment and the same percent of high school enrollment in schools offering one or more science courses. The comparable percentages for the 1981-82 school year were 65 and 66, respectively. Therefore, in 1981-82 as compared with 1972-73, the number of students who took science courses constituted a larger percentage of all students, and also a larger percentage of those students who had the opportunity to take such courses.

During both years, the science course with the largest enrollment was biology i. The second largest enrollment in 1972-73 was in chemistry I/II, while in 1981-82 it was in general science.

The percent of the total high school enrollment participating in general science increased over the period. During the 1972-73 school year enrollment in general science represented 5 percent of the total high school enrollment. By the 1981-82 school year, enrollment in this course represented 14 percent of the total high school student enrollment. Over the same period, the percentage of students enrolled in general science in those schools offering the course increased slightly from 17 to 20 percent.

3.3.3. Foreign Languages

The percentage of public high schools offering foreign language instruction stayed relatively stable between the 1972-73 and 1981-82 school years. Approximately 83 percent of the schools in the earlier year offered one or more courses in foreign language compared with 84 percent of the schools in the later year. The most frequently offered courses during both years were first-and second-year Spanish followed by first- and second-year French. These were the only foreign language courses to be offered by a majority of the schools during both years. Moreover, French and Spanish were the only foreign languages which the majority of students had the option of studying in 1982 for four full years.

Foreign language enrollment over the nine-year period dropped slightly. During 1972-73, an estimated 3,067,000 students (26 percent of total enrollment) were enrolled in foreign language courses. In 1981-82 this figure had dropped to 2,953,000 students, or 23 percent of the total high school enrollment.

The largest 1972-73 enrollments in foreign language courses were in first-and second-year Spanish (6 and 5 percent, respectively). First-and second-year French each had an enrollment equal to 3 percent of the total high school enrollment. The same pattern existed in 1981-82 with 7 percent of the total high school enrollment in first-year Spanish and 4 percent in second-year Spanish. The percentages for first- and second-year French were three percent and two percent, respectively. The language in which the largest percentage of students enrolled for a third year of instruction was Spanish (less than 2 percent).

3.3.4. <u>Vocational Education</u>

A comparison of vocational education in 1972-73 and 1981-82 was made by examining the course offerings and course enrollment data for four subject areas--agriculture, business, home economics, and trades and industry. The results of this analysis revealed that the percentage of U.S. public secondary schools offering vocational education courses had increased from 1972-73 to 1981-82.

The largest increase was in the percentage of schools offering trade and industry courses. In 1972-73 only 24 percent of the schools offered instruction in this area but by 1981-82 this percentage had grown to 94. Over the same period, the percentage of schools offering courses in agriculture increased from 30 to 48 and for home economics the increase was from 80 to 96 percent. The increase for business was much smaller, 95 to 99 percent.

The individual vocational education courses most frequently offered in 19811982 were first-year typing, second—through fourth-year typing, first-year
shorthand, general business, accounting, first-year home economics, and
first- and second-year drafting and mechanical drawing. With the exception
of accounting, these same courses were those most often offered in 1972-73.
In the earlier period, bookkeeping I was offered more frequently than
accounting.

While the number of schools offering courses in agriculture, business, home economics, and trade and industry has increased, the percentage of students enrolled in these courses has stayed about the same with the exception of trade and industry. Moreover, as the number of schools offering agricultural courses has increased, the percentage of the students taking these courses in schools where they were offered has declined. For example, enrollment in agriculture courses represented 12 percent of the high school

(2)

^{9/} Drafting/mechanical drawing was found primarily under industrial arts in 1972-73. /

enrollment in schools offering these courses in 1972-73. While the number of schools offering agricultural courses in 1981-82 had increased by approximately 60 percent, the course enrollment in schools offering these types of study had declined by about 50 percent.

3.3.5. Arts

The analysis of arts education focused on two subject areas in Tables 1 through 3. The two areas were arts and music. The percentage of U.S. secondary schools offering instruction in the arts increased from 74 percent in 1972-73 to 90 percent in 1981-82.

The only art course offered by a majority of the schools in both years was art i. This introductory art course was offered by 61 percent of the secondary schools during 1972-73 and by 77 percent of the schools in 1981-82. The other course title offered by more than half the schools in 1981-82 was commercial and industrial design. Nearly 55 percent of the schools offered instruction in these areas in 1981-82 as compared with 12 percent in 1972-73.

Enrollment in the arts, like offerings in the arts, rose over the period. In 1972-73, 2,143,000 students were enrolled in arts courses, representing 18 percent of the total U.S. high school student enrollment. By 1981-82 enrollment in arts courses had increased to 3,061,000 students or 24 percent of the total high school enrollment. The course enrollment in schools offering these courses also increased between 1972-73 and 1981-82, indicating increased demand for this type of study.

Music offerings increased over the period, but not to the same extent as other arts offerings. During the 1972-73 school year, music was offered by 88 percent of the schools, increasing to 93 percent by 1981-82. In both-years, the only courses offered by a majority of the schools were band and choir/chorus/glee club.

At the same time that the percentage of schools offering courses in music increased, the number and percentage of students enrolled in these courses declined. The total U.S. enrollment in music declined from 3,004,000 to

2,733,000 between 1973 and 1982. During the 1972-73 academic year, music enrollment represented 25 percent of the total U.S. secondary school enrollment. This percentage fell to 22 percent by 1981-82. A comparable decline occurred in the percentage of music enrollment based only on those enrollments in schools offering music courses.

3.3.6. Humanities

As was the case with the arts and vocational education, humanities offerings and enrollments data were not restricted to a single subject area in Tables 1 through 3. To analyze the humanities over the nine-year period, it was necessary to examine changes in the English language arts and the social sciences. Foreign languages, another humanities area, was discussed earlier. Course offerings and enrollment estimates for each of these areas are summarized below.

English language arts courses were offered by virtually every public school with a grade 12 (99.9 percent) in both years. The most frequently offered course in 1972-73 and 1981-82 was English for grades 9 through 12. In 1972-73 English for grades 9 through 12 was followed by speech and public speaking, and journalism and school publications as frequently offered high school English language arts courses. During the 1981-82 school year, journalism and school publications was the second most frequent offering followed by communication/speech/diction.

English enrollment increased from 15,605,000 students during 1972-73 to 17,716,000 students during 1981-82. During the earlier year, English enrollment represented 130 percent 11 of the total U.S. high school enrollment

^{10/} Not all of the courses listed under the social science are are typically defined as humanities offerings. Whether or not to are humanities courses depends on the content and orientation of the courses.

^{11/} Enrollment figures and percentages may sometimes exceed 100 percent since a student who took more than one course in an area was counted once for each such course.

of 11,974,683 students as compared with 140 percent of the 12,660,537 students in 1982. The predominant English course title in both years was English for grades 9 through 12.

The number and percentage of schools offering social science courses increased from 14,551 schools (95 percent) in 1972-73 to 15,646 schools (99.9 percent) in 1981-82. In 1972-73 only three social science titles were offered by a majority of the schools. These were: U.S. history, grades 9-12; western civilization and history, and American government. By 1981-82, western civilization and history and American government were joined by psychology, sociology and social organization, and career education and occupational guidance. The percentage of schools offering U.S. history, grades 9-12, declined to 46 percent of the schools; however, 64 percent of the schools offered American history and world background increasing from 23 percent.

Enrollment in the social sciences also increased over the nine-year period. The social science enrollment as a percentage of the U.S. total secondary school enrollment and as a percentage of the enrollment in those schools offering social science study stood at approximately 118 percent in 1981-82 as compared with/98 percent in 1972-73.

During the 1972-73 school year the three courses offered by the majority of the schools-U.S. history, grades 9-12, western civilization and history, and American government--each had an enrollment of over one million students.

U.S. history, grades 9-12, American government, American history and world backgrounds, western civilization and history and sociology and social organization, and career education and occupational guidance had the largest enrollments in 1981-82 with over one million students each.

4. A SUMMARY OF TRENDS IN SUBJECT AREA ENROLL'MENTS

Changes in subject area enrollments from 1973 to 1982 were examined by comparing the aggregated enrollments in the courses listed under each subject area during the two academic years (see Table 3). Since students were tabulated once for wach course they took within a given area, many students were counted more than once. Consequently, the number of students enrolled in each subject area and their percentage of the total high school enrollement in each subject area do not represent the number and percentage of unique students taking courses in these areas.

Seven subject areas with increased enrollments were English language arts, home economics, health and physical education, social sciences, mathematics, natural sciences, art, and vocational trade and industrial education. Among these, vocational trade and industrial education courses experienced the largest increase. Course enrollments in business were approximately the same in 1982 as they were in 1973. This was also true for industrial arts, agriculture, foreign languages, and R.O.T.C.

The only subject areas which experienced declining enrollments from 1973 to 1982 were safety and driver's education, and music. The decline in safety and driver's education was largely attributable to declines in practice driver's education.

4.1. New Subject Areas

New subject areas were added to Tables 2 and 3 reflecting areas of study in 1982 not found in 1973. The first of these, computer science, is a new area of study that has just begun to be incorporated into the high school curriculum. 12 In the 1981-82 school year, less than 50 percent of the schools offered instruction in this area. About 61 percent of all students attended schools with one or more offerings in computer science, but only 3

^{12/} The computer science subject area does not include computer courses offered under the business title computer operation/key punching/data processing. Another 88,656 students were enrolled in these courses. One or more of these courses were offered by 13 percent of the schools.

percent of the total student population took a computer science course. The 1982 enrollment in computer science courses was 344,000 students with the majority of this enrollment being about equally spread between computer programming and data processing courses. The enrollment in each of these two types of courses represented only 1 percent of the total U.S. secondary school enrollment. 13

The second subject area added to the tables was allied health. This area of vocational education is treated separately here to highlight its emergence since the 1972-73 survey. During the 1981-82 school year, courses in this area were offered by 21 percent of the schools and were available to about 30 percent of all high school students.

The 1982 enrollment in allied health courses stood at 80,000 students representing less than one percent of the U.S. total secondary school student population. Enrollments in these courses accounted for two percent of the enrollment of the schools offering allied health courses.

The third area added to Table 2 does not form, as such, a specific area of study. Instead, it contains a set of 1981-82 courses that had no comparable titles in the earlier survey. The courses included under this miscellaneous heading are architecture and environmental design, industrial and home management services, parks and recreation, museology, and engineering.

Together, the enrollment in these courses was 38,000 students or less than one percent of the 1981-82 total high school enrollment. The largest enrollment was in engineering with 20,000 students.

^{13/} These data describe the situation as of 1982. Undoubtedly, the incidence of studying computer science and allied health is much greater today (1985).

5. DESCRIPTION OF THE TABLES AND A GUIDE TO THEIR USE

Three tables are included in this report. Table 1 summarizes the estimates of course offerings and course enrollments based on the 1973 survey of public secondary schools in the United States. Table 2 summarizes the estimates of course offerings and course enrollments based on the 1982 survey of U.S. public secondary schools and secondary schools students. Table 3 presents the estimated total enrollment in 18 subject areas for the 1972-73 and 1981-82 academic years. Each of these tables and its use is described in more detail in the sections which follow.

5.1. <u>Table 1</u>

Table 1 summarizes the revised 1973 survey data on course offerings and course enrollments. Estimates or the number and percentage of schools offering courses across 15 subject areas and the number and percentage of students enrolled in these courses differ from those previously published by NCES for two reasons: (1) the data used to derive the estimates in the current study are from schools with a grade 12 whereas the earlier published estimates were based on data supplied by schools with a grade 7 or above; (2) the course titles listed in the tables sometimes differ from the course titles in the earlier publication due to changes in the secondary school curricula over the nine-year period covered by the two surveys and the effects of these changes on the different course coding schemes used by the two surveys. 14

All estimates of course offerings and course enrollments reported in the tables have been expanded to represent all public secondary schools with a grade 12 and all students enrolled in these schools. The number of schools with a grade 12 in 1973 was 15,306 and the estimated number of students enrolled in these schools was 11,974,683.

The estimates reported in the seven columns of Table 1 are based on different types of data supplied by the sampled schools and provide different

^{14/} These differences were discussed in Section 2.

types of information on public secondary school courses and course enrollments. Estimates of the number and percentage of schools offering individual course titles represent unique schools, i.e., schools offering more than one of the courses grouped to form a course title are counted only once. These estimates can be used to gauge the relative importance of individual courses and subject areas in the secondary school curriculum.

Estimates of the high school enrollments in schools offering individual course titles were computed by summing the school-reported enrollments in grade 9 through grade 12. The accompanying percentage relates these enrollment estimates to the total student enrollment in all public secondary schools. This percentage can be used as an indicator of the extent to which U.S. public secondary school students have the apportunity to study specific topics.

Estimates of individual course enrollments did not equate to the number of unique students enrolled in the courses. Since certain courses were grouped to identify the course titles listed in the table, some students were counted more than once. Thus, it was possible to have more students enrolled in a course or subject area than there were students in the population.

Two percentages were calculated for course enrollments. The first related course enrollment to the total public secondary school enrollment. The resulting value can be used to compare the relative overall participation of public secondary school students in a single course with participation in other courses. The second percentage related course enrollment to the high school enrollment of those schools actually offering a course. This estimate can be used to identify the relative demand for a course when the opportunity to take the course is available.

5.2. <u>Table 2</u>

Table 2 summarizes the 1982 course offerings and course enrollments data. It presents the same type of information as Table 1 and can be used to answer the same kinds of questions. As with Table 1, all estimates have

been expanded to represent all public secondary schools operating in 1982 with a grade 12 and all the stagents enrolled in these schools. The findings apply to 15,667 schools with a total grade 9 through grade 12 enrollment of 12,660,537° students.

Estimates of course offerings and the high school enrollment in schools offering courses were computed in the same way as they were in Table 1. Thus, the restrictions and applications of the Table 2 estimates are the same as for Table 1.

All estimates of course enrollments reported in Table 2 are based fotally or in part on student transcript data rather than on school-reported course enrollment figures. This was necessary because "the attempt to obtain enrollment figures from the HS&B sample schools met with an unacceptably high unit and item nonnesponse rate.

Estimates of the U.S. enrollment in each course was computed by counting and properly weighting the number of students that enrolled in the course during their school career. Since transcript data were available on a single student cohort-graduating class of 1982—the time frame for the estimates of course enrollment now covers the period 1978—82 rather than 1981—82.

Use of the transcript-based estimates rests on two assumptions. First, it assumes that the course-taking patterns of 1982 freshman, sophomores, and juniors were the same as those of 1982 seniors. Secondly, it assumes that the courses available to students during the 1981-82 school year were available to students during the period 1978-1980.

The accuracy of the course enrollment estimates is dependent upon the validity of these assumptions. The reader is therefore alerted to use care in interpreting these estimates and in assigning significance to the course enrollment patterns in the table. A more detailed description of these estimates is provided in the Technical Appendix to this report.

5.3. \Table 3

Table 3 compares the 1972-73 and 1981-82 school-year course enrollments in the subject areas listed in Tables 1 and 2. The procedures used to estimate

subject are enrollment figures were the same as those used for Tables 1 and 2. Percentages were based on the total U.S. public secondary school, enrollment during the appropriate survey year.

5.4. Comparisons of 1972-73 and 1981-82 Course Offerings and Course Enrollments

The estimates presented in Tables 1 through 3 were developed to provide a means of comparing the course and subject area offerings in public secondary schools during the two survey years and the enrollments in these courses or areas. Care was taken to make the 1972-73 and 1981-82 data as comparable as possible. Nevertheless, absolute comparisons are not possible. Changes in course titles and the changing structure of the secondary school curriculum over the nine-year period covered by the two surveys made it extremely difficult to equate course titles in the later years with those found in the earlier survey. Thus, before concluding that the offerings or enrollments in a specific course have increased or decreased, the list of courses found in Tables 1 and 2 and the courses that were grouped to form the course titles (see Technical Appendix) should be examined. In some instances, course offerings and enrollment variations between 1973 and 1982 may be a function of the way in which courses were defined and grouped in each year.

It should also be noted that students took more courses in the latter year. The average number of courses per stu ent ws 6.01 in 1972 and 7.47 in 1982. The two data sets supply no explanat in for this change. However, several educators have indicated that between 1972 and 1982 school periods increased in number and decreased in length.

The cautions concerning comparisons of 1972-73 and 1981-82 school year estimates of course offerings and course enrollments apply more to analyses of specific courses than they do to analyses of subject area offerings and enrollments. Discrepancies in the courses grouped to define course titles typically occur within a single subject area, i.e., a course is not usually moved from one subject area to another. Thus, subject area offerings and enrollments will not be sensitive to changes in the course titles subsumed

under them. All courses within a subject area and their accompanying enrollments will be captured in the aggregated values regardless of the placement or grouping of the courses. Nevertheless, the larger number of courses in 1981-82 should be considered when comparing enrollments across years.

^{2/} Estimates are based on student transcript data.

These numbers and percentages differ from those previously reported for this survey (Osterndorf, Logan. <u>Summary of Offerings and Enrollments in Public Secondary Schools</u>, 1972-73, NCES 76-150.) because the data have been reprocessed after modifying the sample to make it more similar to that used in the 1981-82 study (see appendix c).

TECHNICAL APPENDICES

A. SOURCES OF THE DATA

Data for the analysis of public secondary school course offerings and enrollments came from three sources. Course offerings and enrollments data for the 1972-73 school year were collected as part of the 1973 Survey of Public Secondary School Offerings, Enrollments, and Curriculum Practices sponsored by NCES. Two NCES surveys provided the data on 1981-82 course offerings and enrollments. Both surveys were part of the HS&B First Follow-Up Study. The 1982 HS&B Offerings and Enrollments Survey provided data on secondary school offerings, while the data collected by the 1982 HS&B Transcripts Survey were used to estimate course enrollments.

All three of the NCES surveys were constructed to provide national estimates. The sample designs of the three are described in the following sections. 1

A.1. 1973 Survey of Public Secondary Schools Sample Design

The sample design of the 1973 survey of public secondary schools was a onestage stratified simple random sample. Schools were atratified by state,

70

^{1/} More detailed information on the sample designs of the three surveys as well as information on their data collection procedures and other survey features is provided in:

Logan Osterndorf, <u>Summary of Offerings and Enrollments in Public Secondary Schools</u>, <u>1972-73</u>. Washington, D.C.: U.S. Government Printing Office (NCES 76-150), 1975.

C. Jones, S. Knight, H. McWilliams, M. Butz, I. Crawford, and B. Stephenson, <u>High School and Beyond Course Offerings and Course Enrollments Survey (1982): Data File User's Manual</u>. Chicago, Illinois: National Opinion Research Center, 1983.

C. Jones, S. Knight, M. Butz, I. Crawford, and B. Stephenson, <u>High School and Beyond Transcripts Survey (1982): Data File User's Manual.</u> Chicago, Illinois: National Opinion Research Center, 1983.

location (large-city schools versus schools located outside large cities), enrollment size (1,500 or greater, 1,000-1,499, 500-999, 300-499, 100-299, and under 100), and school grade (junior high, senior high, and combination schools with both junior and senior high school grades). Nationally, 8,193 schools were selected from a universe of 22,737 schools.

A.2 High School and Beyond Sample Designs

A.2.1 Base Year Survey Sample Design

Base year data for the HS&B study were collected in 1980. A highly stratified, two-stage probability sample was used to select more than 58,000 high school students (over 28,000 seniors and over 30,000 sophomores) from more than 1,000 public and private secondary schools. Schools were selected during the first stage of the design with a probability proportional to the estimated enrollment in their 10th and 12th grades. During the second stage of sampling, 36 seniors and 36 sophomores were selected in each school, except in those schools with fewer than 36 seniors or 36 sophomores. In the latter schools, all eligible students were drawn in the sample.

A.2.2 First Follow-Up Survey Sample Design

The HS&B First Follow-Up Survey sample retained the essential features of the 1980 sample design. That is, it was a multi-stage, stratified, probability sample with schools selected during the first stage of sampling and

71

This section criterion was not used uniformally across all the strata in the sample design. In certain special sample strata (e.g., schools with large minority enrollments), study requirements resulted in an oversampling of schools. For more information on the Base Year Survey sample design, see M. Frankel, L. Luane, D. Buonanno, and R. Tourangeau, Sample Design Report, Chicago, Illinois: National Opinion Research Center. 1981.

^{3/} See C. Jones, M. Clarke, G. Mooney, H. McWilliams, I. Crawford, B. Stephenson, and R. Tourangeau, <u>High School and Beyond 1980 Sophomore Cohort First Follow-Up (1982): Data File User's Manual</u>, Chicago, Illinois: National Opinion Research Center, 1983.

students selected during the second stage. Listed below are the important features of the 1982 First Follow-Up design:

- All schools selected as part of the Base Year Survey were contacted for participation in the First Follow-Up Survey unless they had no 1980 sophomores, had closed, or had merged with other schools in the Base Year sample.
- 1980 sophomores still enrolled in their 1980 schools were retained with certainty, resulting in the inclusion of approximately 30,000 1980 sophomores in the sample.
- 1980 sophomore cohort students who were no longer attending their Base Year schools (e.g., dropouts, early graduates, and those who had transferred as individuals to a new school) were subsampled.

A.2.3 Opurse Offerings and Course Enrollments Survey Sample Design

Secondary school course offerings and enrollment data were collected from those schools selected as the first-stage sampling units in the Base Year Survey in which 1980 sophomores were still enrolled during the 1981-82 academic year. Of the more than 1,000 schools included in the Base Year Survey, 975 schools had a 10th and/or 12th grade in 1980 and were in continuous existence through the 1981-82 academic year (i.e., they had not closed or merged with other schools since the 1980 survey). School administrators at the 975 schools were asked to provide information on the courses offered at their schools during the academic year and the enrollments in these courses.

A.2.4 Transcripts Survey Sample Design

The sample for the HS&B Transcripts Survey was selected from among the 1980 sophomores who were eligible for the First Follow-Up Survey. Prior to selecting the sample, 1980 sophomores were stratified according to a number of student and school level characteristics. The strata were partitioned into one of two major groups with different student selection probabilities:

one contained policy-relevant subgroups (e.g., students from private schools, base year nonrespondents, and high achievement blacks and high achievement Hispanics), and the other contained all remaining søphomore subgroupings (e.g., other blacks, other Hispanics, and all other students).

All students in the policy-relevant subgroups were selected with certainty, resulting in 12,987 students being included in the Transcripts Survey sample. An additional 5,440 sophomores were selected from the remaining subgroups, with a selection probability equal to approximately .32. A total of 18,427 members of the 1980 sophomore cohort were selected for participation in the Transcripts Survey.

B. SURVEY NONRESPONSE AND NONRESPONSE ADJUSTMENTS

Not all of the sampled schools in the 1973 survey responded to the request for information on course offerings and course enrollments. Approximately 96 percent of the 7,850 schools sampled responded to the request for this information. In order to account for nonresponding schools, the case weights of the responding schools were adjusted so that they summed to the original estimated population of 22,737 schools.

Lists of courses offered in the 1981-82 school year were supplied by 941 (97 percent) of the schools selected for participation. Data on course enrollments were received from only 762 (78 percent) of the eligible schools. In addition, 97 percent of the schools reported incomplete enrollment values for the courses they offered during the school year. Roughly one-third of the schools reported enrollment data for 80-90 percent of the courses they reported offering, and another one-third of the schools reported enrollment data for between 0 and 59 percent of their courses.

Only 63 (4 percent) of the 1,516 unique course titles that were reported as being offered by one or more schools had complete enrollment data. Approximately 72 percent of the courses identified by schools had between 40 and 100 percent missing enrollment data.

An adjustment for nonresponse to the request for course offerings data was incorporated into the 1981-82 estimates displayed in Tables 2 and 3. This

was accomplished by adjusting the case weights for the responding schools. Case weights were multiplied by the ratio of the sum of the weights for all sampled schools to the sum of the weights for the responding schools.

Because of the high nonresponse rate the school-reported enrollments data could not be used for estimating course enrollments. To do so would have led to seriously biased estimates. It was therefore decided to use student transcript data to estimate 1981-82 course enrollments. The procedures for doing so are elaborated on in Section E.3 of this appendix.

The response rate associated with the Transcripts Survey was satisfactory. Ninety-one percent of the schools responded to the request for student transcripts and provided 15,941 (88 percent) of the 18,152 transcripts requested.

The case weights for the transcripts data were adjusted to take into account differential rates of response for a number of school types and student statuses. The average nonresponse adjustment factor was 1.13.5

C. ADJUSTMENTS TO COMPENSATE FOR SCHOOL SAMPLE DESIGN INCONSISTENCIES

In order to compare the estimates of course offerings and course enrollments for the two school years, several adjustments had to be made to the 1973 and 1982 survey data. Since the 1973 survey selected only public schools, private schools selected for the 1982 survey were deleted from consideration. The 1973 survey data were also adjusted by deleting schools that did not have a grade 12. This adjustment resulted in a 1973 sample comparable to

A-5 7.1

^{4/} For the public school data used in the analysis, this adjustment was equal to 15,667/15,115. Thus all estimates of the number of schools offering courses were inflated by a factor of 1.0365.

^{5/} For more information on this adjustment see <u>High School and Beyond</u>
<u>Transcripts Survey (1982): Data File User's Manual</u>, pp. 12-17.

that of 1982. A summary of the effects of these changes on the sample sizes of the school surveys is presented in Table C.1.

Estimates of 1972-73 course offerings and course enrollments, after the above adjustments were made, were based on a sample of 5,379 schools. When private schools were removed from the 1981-82 survey, 862 of the sampled schools remained of which 835 reported course offerings data.

D. COURSE TITLE AND SUBJECT AREA INCONSISTENCIES

The number of course titles found in secondary schools has increased over the nine-year period, 1973-1982. Moreover, the structure of the secondary school curriculum has changed along with the content of the courses taught in public high schools. Since the two studies were designed to collect data for a particular time period, the course title and subject area coding structures used in the surveys differ somewhat from one another.

There is often variation in the numbers of courses listed under a particular subject area as well as differences in the way in which some subjects are organized. For example, the courses listed under English in 1972-73 are found in several different program areas in the classification system used in 1981-82. The courses listed under English in the 1972-73 data are listed under letters, basic skills, journalism, humanities, dramatic arts, and library in the 1981-82 data.

There was also a marked change in course content during the period covered by the surveys. In 1972, for example, English courses were most frequently year-long studies of literature, composition and speech. Courses were usually designated by grade levels. In the late sixties, flexibility in this arrangement began, culminating in the 1980s with the change to limited, specific titles for courses that might have greater appeal to students. Some of these later titles were "lifted" out of year-long courses, e.g., romanticism, realism, Victorian literature. Others reflected an expanded world view and greater awareness of heretofore ignored areas such as women in literature, protest literature, Mexican-American literature, and irish

^{1/} Figures in parentheses represent the proportion of the original sampled schools that remained after the adjustment was made.

literature. "Finally, some reflected new developments or a new emphasis in society, for example: rock poetry, literature of human values, interpersonal communication, and technical English.

Before any analysis of the courses offered in 1972-73 and 1981-82 could begin, it was necessary to develop a set of guidelines for reconciling these differences. It was decided that the course coding structure used in the 1973 survey would be the foundation for the analysis. Thus, the 1973 and 1982 course titles were reviewed by education curriculum specialists, and titles from the latter survey were identified that matched or approximated the course content of the 1973 titles.

It was not always possible to identify the 1982 course title that matched a course listed in the 1973 survey. Several approaches to this problem were adopted:

- (1) When a specific course offered in 1981-82 was identified as having originally been part of a more general 1972-73 offering, it was aggregated with the original title as it appeared in 1972-73. For example, English courses such as renaissance literature, romanticism, and realism were grouped with British literature.
- (2) Certain courses that had emerged since 1972-73 were either: (1) grouped to form their own subject area and listed separately, either because they did not fit into an existing 1972-73 subject area or because they were of special interest (e.g., computer science); or (2) were classified under the "not elsewhere classified" (N.E.C.) category of the appropriate subject area.
- (3) When a single course listed under a subject area in 1981-82 had been listed as multiple courses under more than one subject area in 1972-73, the integrety of the course structure of each school year was maintained and the discrepancy between the two noted in the tables. For example, crafts is listed under both the arts and industrial arts subject areas in 1972-73 and is listed only under art in 1981-82.

When there were no equivalent 1981-82 titles to those appearing in 1972-73 the titles were dropped from both years. For example, special mathematics programs (e.g., SMSG, IPI, GCMP, and IMP) listed in the 1972-73 data were not coded in 1981-82. Therefore, they were not included in the analysis.

Section G contains a copy of the course listing that was used for the 1972-73 table entries previously published by NCES. The 1981-82 courses that were grouped to form the table course titles and subject areas are summarized in Section H of this appendix. For the most part the courses listed under a course title are the same in both years. Differences in the courses grouped to form titles in 1972-73 as compared with 1981-82 are noted in Table 1.

E. ESTIMATION PROCEDURES

The goals of the analysis were to identify the courses and subject areas offered in U.S. public secondary schools, and to identify the enrollments in these courses and subject areas for two school years. These data were to be used to determine changes in the curricula of secondary schools and in student participation over the nine-year period covered by two NCES surveys.

Since the goals of the study were directed towards understanding course offerings and course enrollments in all U.S. public secondary schools, estimates were expanded to represent all or some portion of the national population of schools and students. The procedures used to produce the estimates found in the study tables are described below.

E.1 Number and Percentage of U.S. Public Secondary Schools Offering Courses

The total number of schools offering each of the course titles found in Tables 1 and 2 was computed by taking the weighted sum of the schools reporting that a course was offered to the students in their school during

^{6/} L. Osterndorf and P. Horn, <u>Course Offerings</u>, <u>Enrollments</u>, <u>and <u>Curriculum Practices in Public Secondary Schools</u>, <u>1972-73</u>. Washington, D.C.: National Center for Education Statistics, 1976.</u>

the school year that was covered by the survey. Since course titles frequently represent aggregations of individual courses, each school was counted only once for each course title listed in the tables. In other words, the total number of schools offering a course title actually translates to the total number of schools offering one or more of the courses represented by the course title.

| •

The 1972-73 estimates of the number of schools offering course titles were expanded to represent the population of 15,306 schools. Estimates of 1981-82 secondary schools offering the course titles were expanded to represent the population of 15,667 schools. To account for the absence of data from some of the public schools selected to participate in the 1982 survey, all estimates of the number of schools offering course titles were adjusted by a factor of 1.0365. This adjustment represented the ratio of the estimated total population of public schools to the estimate of this population using only responding schools.

The percentage of 1972-73 and 1981-82 schools offering each course title was based on weighted data using the estimate of the total number of schools offering the course and the total school population.

E.2 <u>High School Enrollment in Schools Offering Various Courses</u>

Since the study was only concerned with the courses schools offered their 9th through 12th grade students and the 9th through 12th grade enrollment in these courses, estimates of the high school enrollment were restricted to the grade 9 through grade 12 high school student memberships. In 1972-73, these enrollments were estimated by the weighted sum of the school-reported enrollments in grades 9, 10, 11, and 12.

The HS&B survey of U.S. secondary schools did not request grade-specific enrollments for the 9th and 11th grades. Instead, it asked for the total high school membership of the schools and their grade 10 and grade 12 student memberships.

in the absence of grade-specific enrollment data, schools' responses to the survey item concerning total high school membership were used to estimate the enrollments in those schools offering courses. The accuracy of these estimates rests in part on the assumption that schools defined high school in the same way, i.e., that high school referred only to grade 9 through grade 12. The wording of the questionnaire item and additional analyses comparing the results of this method with other estimation methods and alternative enrollment data suggested that the assumption was valid.

Total high school membership data were not provided by all of the 835 public secondary schools. High school membership values were imputed for 70 (8 percent) of the schools using a cell-average method. All responding schools were stratified by school type (e.g., public, alternative, and Cuban public), census region, and the degree of urbanization. The average high school membership value in each stratum was assigned to all nonresponding schools in the stratum (i.e., those failing to respond to the request for total high school membership data).

The 1981-82 estimates of high school enrollments in schools actually offering courses of study were further adjusted. All estimates were adjusted by a factor of 1.0365 to account for nonresponse to the request for offerings data.

The estimated percentage of the high school enrollment in schools offering a course was based on weighted data. The estimate was expanded to represent the percent of the U.S. students enrolled in schools actually offering the course.

E.3 Course Enrollment

Course enrollment data proved to be the most problematic in both survey years. As a result, various procedures were developed and implemented to offset the shortcomings of these data. The procedures used to restrict the estimates of course enrollments to grades 9 through grade 12 students were described in Section 2.1 of the report.

Each estimate of the 1972-73 enrollment in a secondary school course was calculated by taking the weighted sum of the school-reported course enrollments. The enrollment in a course was computed as a percent of the total high school population of U.S. secondary school students and as a percent of the high school enrollment in those schools where a course was offered. The first percentage was based on 11,974,683 students, while the base of the second varied for each course title.

As noted in Section B above, 1981-82 course enrollment data were missing for an unacceptably large percentage of the course titles reported by the sampled schools. Therefore, the decision was made to estimate course enrollments from data collected by the HS&B Transcripts Survey.

The only restriction on the use of transcript data to estimate course enrollments was that a student was attending or had attended one of the original 862 public schools sampled for the Course Offerings and Enrollments Survey. Thus, included in these estimates were the course histories of students who were still attending their original schools as well as the course histories of students who had transferred to another public school. A total of 12,695 transcript records were used to estimate course enrollments, representing students still attending school, 1982 spring graduates, early graduates, and dropouts.

The estimated total number of students enrolled in a particular course was calculated by the weighted sum of the number of times a course appeared on the transcript records. Since each student's transcript was assumed to represent the course-taking behavior of 9th through 12th graders in 1981-82, repeat courses were counted the number of times that they appeared. Similarly, no consideration was given to whether or not a course was passed or falled, since the purpose of the analysis was to estimate total course enrollment during the 1981-82 academic year, not the successful completion of a course.

All estimated enrollments in the individual courses that were grouped to form a table course title were summed to determine the total enrollment associated with that title. Therefore, unlike the estimates of course offerings, the enrollments in all courses that were grouped were counted.

The estimates of course enrollments were multiplied by a factor of .9394 to adjust for the discrepancy between the estimated total high school membership based on school data and the same estimate based on transcript data. This factor was computed as the ratio of the 'school-based estimate of total U.S. high school enrollment and the estimate derived from the transcript data. The latter estimate was computed by multiplying the sum of the weights of the transcripts data (3,368,967) by four. Use of this estimate was based on the assumption that, at a minimum, the total grade 9-12 enrollment in U.S. secondary schools is four times the enrollment of the senior class.

The total U.S. course enrollment was also computed as a percent of the total U.S. public secondary school enrollment. The adjusted total course enrollment and the school-based estimate of total secondary school student enrollment were used to estimate this percentage.

The last course enrollment estimate related total enrollment in a course to the high school enrollment in those schools that actually offered the course. Whereas the estimate of the course enrollment expressed as a percent of the total public secondary school enrollment used data from all the student transcripts, this last estimate used only the transcripts of students still attending their original 1980 sampled school, i.e., transfer student transcript data were deleted.

Restricting the use of transcript data was a function of the information that was available on transfer students' schools and the assumptions that would need to be made if transfer student data were used. Since the estimate relates course enrollment to the student enrollment in schools offering a course, individual school data on total school enrollment were required. No school-reported enrollment data were available from the transfer schools; thus, the only estimate of school enrollment available for analysis was that derived from the original 862 HS&B public schools. Therefore, if transfer student data were to be used it would have to be assumed that the characteristics (e.g., total student enrollment) of the schools that students had transferred to were the same as the characteristics of the schools that they had originally attended. While

such an assumption was reasonable for an estimate based on all schools (course enrollment as a percent of the total high school enrollment), its validity was more problematic for an estimate that related course enrollments to the student enrollments of a subset of specific schools that offered particular courses.

The estimate of course enrollment as a percent of the student enrollment in schools where a course was offered was computed by taking the weighted sum of the number of occurrences of a course on the 12,010 non-transfer student transcripts, divided by the estimated student enrollment in the non-transfer schools offering the course. The estimate was adjusted by a factor to account for the discrepancy between the school-based estimate of total student enrollment and the total student enrollment based on four times the sum of the weights of the non-transfer students (3,096,564). An adjustment factor of 1.022 was applied to all estimates.

F. STANDARD ERRORS

Each of the 1973 and 1982 samples represent only one of many that could have been selected using the same sample design specifications. Estimates derived from these different samples would vary. Standard errors for the estimated totals and percentages measure the precision of these estimates, i.e., the variation of all possible estimates around the theoretical, complete-coverage values. The standard errors, together with the sample estimates, may be used to define confidence intervals, i.e., ranges that would include the comparable complete-coverage value for a specified percentage of all possible actiples. For example, the complete-coverage value would be included in the range from two standard errors above to two standard errors below the estimate for about 95 percent of all possible samples.

Estimates of course offerings and course enrollments were based on school-reported data, student transcript data, or a combination of the two. There-rore, the methods used to calculate the standard errors of these estimates wary by the source of the data as well as by the type of estimate.

Α. . . .

The methods that were used to compute standard errors for the estimates reported in Tables 1 through 3 are described in the following sections. The standard errors for these estimates are provided in Tables A.1 and A.2.

F.1 Standard Errors for 1972-73 and 1981-82 Course Offerings and School Enrollment Estimates

The standard errors for the estimates reported in Tables 1 through 3 are provided in Tables A.1 and A.2. These standard errors were calculated by adjusting estimates obtained under the assumption of simple random sampling for the sample design that actually was employed in the survey. The equations used in the calculations are discussed in sections F.1 through F.3, and the Cosign effect adjustment factors (D) are given in section F.4.

All of the estimates of the number and percentage of schools offering course titles and the number and percentage of students enrolled in schools where course titles were offered used school-reported data. The standard error (SE) of a percentage (p) estimated from a simple random sample of n schools is approximately:

SE = D
$$\sqrt{(1 - n/N)}$$
 (p)(100-p) /n (1)

where D is the design effect adjustment factor.

The standard error of the estimated number of schools offering a course is computed by multiplying the standard error of the estimated proportion ($SE_p/100$) by the number of schools in the population of U.S. public secondary schools. There were 15,306 public secondary schools in 1972-73 and 15,667 schools in 1981-82.

The standard error of the estimated total high school enrollment in those schools offering a course is computed by multiplying the standard error of the mean of this characteristic by the number of schools (N) in the population. Since only a paper or the schools in each sample offered a given course, the high school concilment for those schools not offering a

Assigning zero values for schools not offering a course takes into account that the estimate is in part a function of the estimate of the number of schools offering a course. The following formula is used to approximate the standard error of the estimated total high school enrollment:

$$SE_{(T)} = D\sqrt{N^2(1 - n/N) S^2/n}$$
 (2)

Where S^2/n is equal to the weighted sampling variance of the high school enrollment in those schools offering a course, n is equal to the number of schools in the sample, N is equal to the number of schools in the population, and D is the design effect adjustment factor.

The estimate of the student enrollment in schools where a course was offered (x) as a percentage of the total high school enrollment of all schools (y) was computed as a ratio of two random variables. Both the numerator and denominator of the estimate were subject to sampling error. The standard error of this type of ratio estimate can be computed by the following formula:

$$SE_{(p)} = \frac{D}{y} \sqrt{Var_{(x)} + \frac{a^2}{y^2} Var_{(y)} - 2 \times Cov_{(x, y)}}$$
 (3)

Where $Var_{(x)}$ = sampling variance of the estimated total of variable x $Var_{(y)}$ = sampling variance of the estimated total of variable y $Cov_{(x,y)}$ = sampling covariance of the estimated x and y totals.

The sampling variance c: the total student enrollment in schools offering a course is computed by squaring the standard error produced by Equation 2 above. The sampling variance of the total U.S. high school enrollment is also calculated by squaring the standard error of this estimate using Equation 2.

F.2 Standard Errors for 1972-73 Course Enrollment Estimates

All 1972-73 estimates of course enrollments are based on data supplied by the sampled public secondary schools. The standard errors of these estimates are computed by the same methods which were outlined in Section F.1.

The standard error of the number of students enrolled in a course is approximated by Equation 2. As was the case for the high school enrollment in schools where a course was offered, zero enrollment values are entered for those schools reporting that a particular course was not offered.

The standard errors of the percentage of U.S. public secondary school students enrolled in a course and the course enrollment as a percent of student enrollment in schools offered a course are approximated by Equation 3. The variances of the estimated number of students enrolled in a course, the student enrollment in schools offering a course, and the total high school enrollment are computed following the methods outlined earlier.

F.3 Standard Errors for 1981-82 Course Enrollment Estimates

The prevalence of nonresponse to the HS&B survey's request for enrollment data resulted in student transcript data being used to estimate total course enrollments and their accompanying percentages. Consequently, the methods for calculating the standard errors of these estimates deviate somewhat from those summarized in Section F.2 above.

The standard error of the estimated enrollment in a course is approximated by multiplying the standard error of the mean number of students enrolled in a course (see Equation 2) by the total number of students in the population. The standard error of the mean is approximated from the transcript data with the number of students in the population estimated by summing the sampling weights of the students in the transcripts sample.

. .

The standard error of the estimated percentage of all public high school students taking a course is approximated by Equation 3 without the covariance term. The sampling variance of the estimated course enrollment is computed by squaring the standard error, of the estimated course enrollment. The sampling variance of the total public high school membership is calculated in the same manner as it was for the 1972-73 estimate.

The estimate of course enrollment as a percent of the student enrollment in schools offering a course was computed using the subsample of nontransfer student data (i.e., only transcripts of students still attending one of the original HS&B sampled schools were used to estimate the course enrollment for the numerator of this percentage). The standard error of this ratio is approximated by Equation 3 without the covariance term. The sampling variance of the estimated course enrollment of these students is computed by the same procedures which were used to calculate the variance of the course enrollments for the entire transcript sample. The only difference is the N and n used to compute the sampling variance. The sampling variance of the estimated high school enrollment in schools offering a course is the same as that computed for this school-based estimate using Equation 2.

F.4 <u>Design Effects</u>

Since the schools in the 1972-73 survey and the HS&B offerings and enroll-ments survey were selected using a disproportionate stratified; sampling design, simple random sampling formulas will not accurately estimate the

A-18 57

Since the estimates of course enrollment and total high school enrollment are based on two different samples with different n's, it is not possible to compute a covariance for these estimates. Therefore, the standard errors of the estimated percentages will be larger than if the covariance were taken into account. The inability to compute a covariance is a function of the estimation procedure used. Had student transcript data been aggregated to the level of the sampled schools and a school-specific weight been calculated reflecting the sophomore cohort enrollment for each school, all the estimates would be based on the same n. The calculation of a new school enrollment weight would require additional imputation, since not all schools reported grade membership data. As a result, additional nonsampling error would be introduced into the estimates.

variance and standard errors of simple statistics such as percentages. To Compensate for the effects of the sampling designs, it is necessary to adjust for the design effects of the sampling approaches. This is accomplished by multiplying the simple random sampling standard error (SE SRS) by the estimated design effect factor (D):

SE=D × SE SRS.

A conservative approach to the 1982 school data assumes a design effect factor of 1.7. The estimated design effect factor for the 1972-73 school survey is.1.2. For standard errors of transcript-based estimates, the estimated design effect is 1.4 when all data are used and 1.3 when only non-transfer data are used.

F.5 Standard Frror Tables

These design effect factors were employed in equations (1), (2) and (3) to produce the standard error values contained in Tables A.1 and A.2. The standard errors of the 1972-73 estimates are presented in Table A.1, while Table A.2 contains the standard errors of the 1981-82 estimates.

15.0100	Achitectural Technologies, Other
15.0200	Civil Technologies, Other
15.0311	a Audio Electronics
15.0321	Electrical Technology 1
15.0331	Electrical Technology 2
15.0300	Electrical and Electronic Technologies, Other
15.0411	Electromechanical Technology
15.0400	Electromechnical Instrumentation and Maintenance
	Technologies, Other
15.0511	Environmental Control Technologies
15.0500	Environmental Control Technologies, Other
15.0631	Optics Technology

15.0600	Industrial Production Technologies, Other
15.0711	Quality Control Technology
15.0700	Quality Control and Safety Technologies, Other
15.0800	Mechanical and Related Technologies, Other
15.0911	Mining Technology
15.0921	Petroleum Technology
15.0900	Mining and Patroleum Tachrologies. Cther
15.9900	Engineering and Engineering - Related Technologies,
	Other /
