The disparity in health between Aboriginal and Torres Strait Islander people in Australia and their non-Indigenous peers is core business for the Aboriginal community controlled health service (ACCHS) sector. The Closing the Gap framework commits to reducing this disadvantage, with cross-government-sector initiatives and investment, reflecting the need to improve the social and emotional wellbeing of the Aboriginal community.¹ Activity in the primary health care sector, with its focus on prevention, early intervention and coordination of care complements these efforts to build healthier communities. With their model of comprehensive primary health care and community governance, ACCHSs have reduced unintentional racism, barriers to access to health care, and are progressively improving individual health outcomes for Aboriginal people.

So what is known about the performance of ACCHSs and mainstream general practice? Why should support for ACCHSs be both continued and enhanced?

Models of care and program delivery

The models of comprehensive primary health care, developed with government and research partners, that are used in ACCHSs are well described.^{2,3} Clinical services, health promotion, cultural safety, community engagement all underpinned by research, evaluation and planning activity are the essential components in these models. In addition, particularly for maternal and child health, models of family-centred primary health care³⁻⁵ extend comprehensive team-based care of individuals to members of families or households, often with outreach services. These models complement the resources, time and evidence base needed to manage more problems of greater complexity at each consultation⁶ than are usually seen in mainstream general practices.

The patient-centred medical home (PCMH) model,⁷ now suggested as best practice for general practice,^{8,9} is not dissimilar to the model used by ACCHSs since their inception in the 1970s.¹⁰ Leadership in ACCHS involves both ACCHS management and the community, and the care model is more team-based than general practitioner-focused. Nonetheless, the ACCHS and PCMH models have much in common. Care: is patient-focused; may encompass the family; has significant physician input; is integrated with allied health specialists, mental health professionals and community services, preferably delivered in the home; and is underpinned by participation in clinical quality-improvement programs. Importantly, with increasing regionalisation and with government policy supporting

Summary

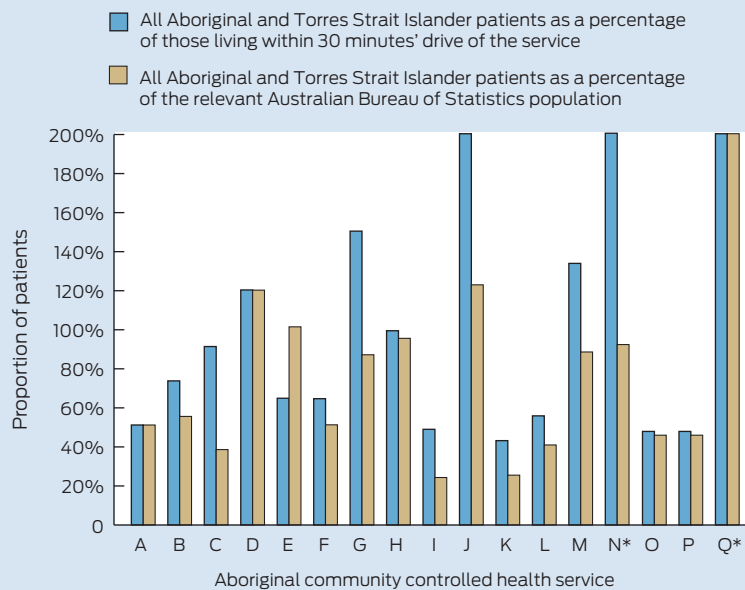

- The national Closing the Gap framework commits to reducing persisting disadvantage in the health of Aboriginal and Torres Strait Islander people in Australia, with cross-government-sector initiatives and investment.
- Central to efforts to build healthier communities is the Aboriginal community controlled health service (ACCHS) sector; its focus on prevention, early intervention and comprehensive care has reduced barriers to access and unintentional racism, progressively improving individual health outcomes for Aboriginal people.
- There is now a broad range of primary health care data that provides a sound evidence base for comparing the health outcomes for Indigenous people in ACCHSs with the outcomes achieved through mainstream services, and these data show:
 - ▶ models of comprehensive primary health care consistent with the patient-centred medical home model;
 - ▶ coverage of the Aboriginal population higher than 60% outside major metropolitan centres;
 - ▶ consistently improving performance in key performance on best-practice care indicators; and
 - ▶ superior performance to mainstream general practice.
- ACCHSs play a significant role in training the medical workforce and employing Aboriginal people.
- ACCHSs have risen to the challenge of delivering best-practice care and there is a case for expanding ACCHSs into new areas.
- To achieve the best returns, the current mainstream Closing the Gap investment should be shifted to the community controlled health sector.

more community-driven models of care (with the advent of Medicare Locals and Health and Hospital Networks), the ACCHSs provide prototypes for community-operated health services.

Access

Do Aboriginal people use general practices more than ACCHSs as is sometimes claimed?¹¹ In Queensland, 27 ACCHSs are spread across a diverse, decentralised area of 1.7 million square kilometres. The service data suggest that, in regional areas, the use of ACCHSs by people identifying as Aboriginal may be higher than the 50–50 split with general practice indicated by Medicare Australia data.¹² Employing various strategies such as the Practice Incentives Program copayments, social marketing campaigns and

1 Aboriginal and Torres Strait Islander patients with one recorded visit to an Aboriginal community controlled health service in Queensland in the 2 years to September 2012

* Services N and Q are shown with the values for all patients as a proportion of those within 30 minutes' drive truncated (actual values, 211% for N and 479% for Q). Service Q is also shown with the value for all patients as a percentage of the relevant Australian Bureau of Statistics population truncated.

targets set in a clinical quality-improvement (CQI) collaborative, ACCHSs in Queensland have been increasing their patient enrolments.

Based on Australian Bureau of Statistics-estimated catchment data for the Queensland services by local government areas or by drive time,¹³ the number of Aboriginal patients making one visit in 2 years to these regional ACCHSs is higher than the resident Indigenous population (Box 1). For 11 of 17 services, over 60% of Aboriginal people living in their catchments within a 30-minute drive had visited in the 2 years to September 2012; for six of these ACCHSs, all classified Remoteness Area 2 or 3, the data suggest up to 100% of the Aboriginal population living within a 30-minute drive are using their services, with many patients travelling longer than 30 minutes. Coverage is lower in the large metropolitan centres, for example in Brisbane where three ACCHSs serve a population of 40 000.

Access to services is critical and, where ACCHSs exist, the community prefers to and does use them,¹⁴ suggesting that patterns of use reflect patchy supply.

Need

There are ongoing drivers of ill health among adult Aboriginal patients who use ACCHSs. In Queensland, 49% of adults remain current tobacco users, over 70% are overweight or obese, 25% have hypertension, and 18% have type 2 diabetes mellitus.¹⁵ These problems must be tackled by individuals, families and the community. To effect change, health providers need well resourced allied health teams, preferably operating from their clinics, where people feel respected and are given assistance with transport.⁴ Sustaining programs run by the Tobacco and Health

Life Style teams established in ACCHSs from 2010¹⁶ will continue to support downward trends, for example, in tobacco use.

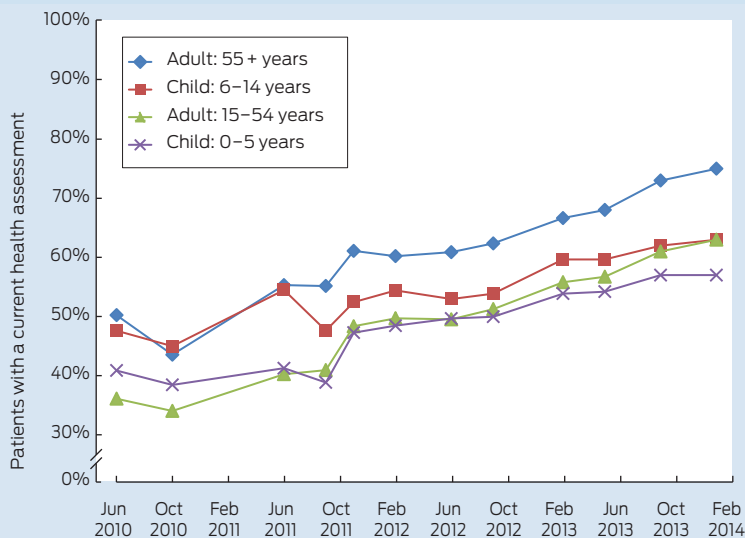

Traditional general practice is ill equipped to deal with ongoing problems in Aboriginal health and the necessary complex challenges in behaviour change.

Quality of care, evaluation and performance

The medical literature has many reports of well implemented research programs, often integrated with everyday care in ACCHSs, showing improved health outcomes. Sexual health,¹⁷ maternal and child health,¹⁸ smoking cessation¹⁹ and cardiovascular programs^{20,21} have been successfully run and monitored in ACCHSs. Recently ACCHSs have been building their capacity to collect and use health service data, enabling review of service delivery, performance tracking and monitoring of the health status of their patient cohorts.

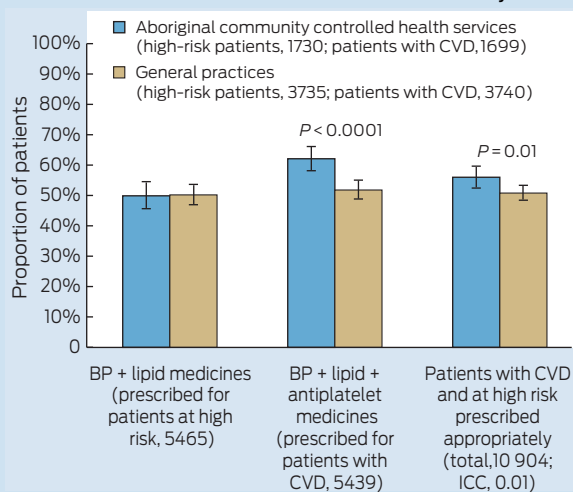

Care delivered in ACCHSs for prevention and chronic disease management appears to be equal to if not better than that delivered by general practices. Queensland Aboriginal and Islander Health Council (QAIHC) data show good performance in risk factor monitoring and the management of hypertension and chronic disease.¹⁵ Box 2 shows improving performance in completion of health assessments — a first step in prevention activity— over the past 4 years.²² The Torpedo study, a randomised controlled trial of the use of an electronic decision-support system measuring absolute cardiovascular risk, shows ACCHSs outperforming general practices in managing risk.²¹ Data collected in late 2011 show that the ACCHSs sites had significantly more patients at high risk being prescribed best-practice medications than the general practice sites at baseline, and this gap was sustained through the intervention period (Box 3).²³

2 Aboriginal and Torres Strait Islander adults who regularly attended participating health services in Queensland between February 2010 and January 2014 and who had a current health assessment*²²

* A comprehensive review of patients' health (Medicare Item 715) within the past 2 years (formerly the Aboriginal and Torres Strait Islander health check).

3 Baseline data for the Torpedo study²³ before random allocation — management of patients with high cardiovascular risk or established cardiovascular disease in 40 general practices and 20 Aboriginal community controlled health services for the 12 months to May 2012

BP = blood pressure. CVD = cardiovascular disease. ICC = intraclass correlation coefficient.

Data from the Australian Primary Care Collaboratives (APCC) program, often not published, can examine performance between ACCCHSs and general practice clusters. Data for 2012, from Wave 2 of the APCC e-health program, show that ACCCHSs in Queensland had more diagnoses coded (as opposed to use of free text) in medical histories and a higher proportion of medications on their current medication lists prescribed within the preceding 6 months than their general practice counterparts (Box 4). This pattern is similar to that reported for cardiac and diabetes care in 2011³ and seen in recent years in the QAIHC Closing the Gap Collaborative, where ACCCHSs were the higher performers in identification of risk factors and completion of health checks (K Panaretto, unpublished data). These data reflect the commitment to delivering evidenced-based care by clinical teams and the voluntary participation in clinical quality-improvement programs seen in ACCCHSs, resulting in these services leading the primary health care sector in monitoring clinical performance.

Workforce and training

ACCCHSs are significant employers of Indigenous people. In 2012, the 150 ACCCHSs employed nearly 4000 people nationally. Of these, some 95% of health workers, 85% of drivers and 32% of allied health professionals (55% overall) identified as Aboriginal and/or Torres Strait Islander. The proportion of Indigenous doctors and nurses remains low (5% and 10%, respectively).²⁴ The Leaders in Indigenous Medical Education (LIME) Network has recently signed an agreement with the National Aboriginal Community Controlled Health Organisation seeking to increase Aboriginal medical student placements in Indigenous primary health care settings with a view to increasing participation in and enhancing the effectiveness of the medical workforce. Similar initiatives are underway in nursing, including innovative programs that are graduating new cohorts of Indigenous

midwives.²⁵ In addition, the ACCCHSs have always had a major role in Aboriginal health worker (AHW) training, and the introduction of national AHW registration will standardise the quality of this important component of the health workforce.²⁶ The services' ability to deal with the impact of social determinants and lower health literacy is due, in part, to ACCCHSs being significant providers of Aboriginal employment and training.

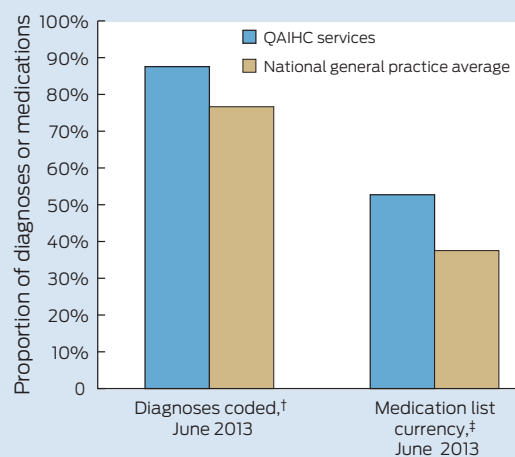

The way forward

When challenged to deliver best-practice care, ACCCHSs have risen to the task, assuming a rightful place in the broader Australian health system. Based on the evidence available, health care delivered by ACCCHSs is of a high standard, compares favourably with mainstream services on key aspects of clinical care and warrants continued funding support. ACCCHSs are committed to improving the health of their communities, leading the way with improved governance and use of data to ensure they deliver the best evidence-based services possible today. They are focused on delivering systematic patient-centred care and are embracing innovations in e-health, the personally controlled electronic health record and electronic prescribing, to promote continuity of care and coordination across ACCCHSs and mainstream services.

In view of the possible cuts to funding to the ACCCHSs sector with the rationalisation of Indigenous programs announced in the recent Budget, the data suggest that to enhance the quality of care and reach national targets requires:

- policy and funding support to provide additional ACCCHSs in both regional and metropolitan areas, where there are currently large populations with poor access to comprehensive primary health care;

4 Comparison of participating general practices with participating Queensland Aboriginal and Islander Health Council (QAIHC) services for performance in coding of diagnoses and currency of the medication list*

* Unpublished data from Australian Primary Care Collaborative e-health program, Wave 2, 2012–13. † Proportion of total diagnoses in past medical history that are coded. ‡ Proportion of medications on the current medication list that have been prescribed in the past 6 months.

- recurrent funding support for initiatives to sustain clinical and administrative quality-improvement programs; and
- mainstream primary health care providers continuing to enhance their recognition of their Aboriginal patients through clinical quality-improvement initiatives and by partnering with the community controlled sector to monitor performance and value across both sectors.

In conclusion, ACCHSs are key players in the Indigenous community in exercising self-determination, taking responsibility in action, improving Aboriginal and Torres Strait Islander health, and setting the frameworks to underpin the shift to healthy or well communities. The government must acknowledge and continue to support ACCHSs as leaders in Aboriginal primary health care.
