ABSTRACT

Phytochemical study on the roots of Achyranthes bidentata Blume led to the isolation of sixteen compounds including three new ones (1-3). Their chemical structures were determined as 28-O- β -D-glucopyranoside-3-O- $[\beta$ -D-glucopyranosyl- $(1\rightarrow 3)$ - β -Doleanolic acid galactopyranoside) (1), methyl (8Z,11Z)-5,6,7-trihydroxytetradeca-8,11-dienoate (2), methyl (6*E*,11*Z*)-5,8,9-trihydroxytetradeca-6,11-dienoate (3), fulgidic acid **(4)**, (9E,11E)-13oxooctadeca-9,11-dienoic acid (5), (9Z,11E,15Z)-13-hydroxyoctadeca-9,11,15-trienoic acid (6), oleanolic 28-*O*-β-D-glucopyranoside-3-*O*-α-L-rhamnopyranosyl- $(1\rightarrow 4)$ -β-Dacid glucuronopyranoside (7), oleanolic acid 28-O-β-D-glucopyranoside-3-O-β-D-glucopyranosyl- $(1\rightarrow 2)$ - $[\alpha$ -L-rhamnopyranosyl- $(1\rightarrow 3)]$ - β -D-glucuronopyranoside (8), oleanolic acid 3-O- β -Dglucopyranosyl- $(1\rightarrow 2)$ - $[\alpha$ -L-rhamnopyranosyl- $(1\rightarrow 3)]$ - β -D-glucuronopyranoside (9), oleanolic acid 3-O- α -L-rhamnopyranosyl- $(1\rightarrow 3)$ - β -D-glucuronopyranoside (10), blumenol C glucoside (11), citroside A (12), 6S,9S-roseoside (13), ginsenoside Rg1 (14), 20-hydroxyecdysone (15), and benzyl α -L-rhamnopyranosyl- $(1\rightarrow 6)$]- β -D-glucopyranoside (16) by spectroscopic analysis. Compounds 1, 7 and 11-16 inhibited NO production in LPS-activated RAW264.7 cells with IC₅₀ values in the range from 28.03 to 54.23 μ M (positive control, L-NMMA: IC₅₀ = 35.52 μ M). Compounds 14 and 15 showed anti α -glucosidase activity with IC₅₀ values of 176.24 and 156.92 μ M, respectively, compared with the positive control, acarbose, IC₅₀ = 160.99 μ M.

Keywords: *Achyranthes bidentata*, Amaranthaceae, achyranbiden A, achyranbiden B, achyranbiden C, NO production inhibitory activity, antidiabetic activity.

Experimental

General

The IR spectra were recorded on a Spectrum Two FT-IR spectrometer. The optical rotations were measured on a Jasco P2000-polarimeter. The HR-ESI-MS was measured on an Agilent 6530 Accurate Mass Q-TOF LC/MS. The NMR spectra were recorded on a Bruker 600 MHz spectrometer. The preparative HPLC were run on an Agilent-1100 system including quaternary pump, DAD detector, autosampler, and preparative HPLC column YMC J'sphere ODS-H80 (4 μ m, 20 \times 250 mm). Isocratic mobile phase with the flow rate of 3 mL/min was used in pre-HPLC. The compound was monitored at wavelengths of 205, 230, 254, and 280 nm. Flash column chromatography was run using silica gel, reversed phase C-18, and diaion HP-20 resins as stationary phase. Thin layer chromatography was carried out on pre-coated silica gel 60 F₂₅₄ and RP-18 F_{254S} plates. The spots were detected by spraying with aqueous solution of H₂SO₄ 5% followed by heating with a heat gun.

Nitric oxide assay

The RAW264.7 cells were received from Perugia University, Italy and were maintained in DMEM containing 10% FBS, 2 mM L-glutamine, 10 mM HEPES and 1 mM sodium pyruvate. The cells were dispensed into a 96-well plate (2×10^5 cells/well) and incubated at 37°C in a humidified atmosphere (5% CO₂ and 95% air). After 24 h incubation, the culture medium was replaced with DMEM without FBS and continuously incubated for 3 h. The cells were treated with either compounds or vehicle solution and then stimulated with LPS (1 µg/mL) in the next 2 h. After an additional 24 h incubation, the cell culture medium (100 µL) was mixed with an equal volume of Griess reagent (Promega, Fitchburg, WI, USA) for 10 min and the absorbance was read at 540 nm. The amount of nitrite, an indicator of NO production in the medium, was obtained from a standard curve, which was constructed by NaNO₂ serial dilution. N^G-monomethyl-L-arginine acetate salt (L-NMMA) was used as a positive control. Cell viability was determined by adding 10 µL MTT solution (5 mg/mL) and incubating for 4 h. Formazan crystals were dissolved in 50 µL of DMSO. Absorbance was read at 540 nm and compared with the vehicle group. Experiments were performed in triplicate and data are expressed as the mean \pm standard deviation. Statistical analysis was performed using GraphPad Prism software.

a-Glucosidase inhibitory assay

The α -glucosidase (G0660-750UN, Sigma-Aldrich, St. Louis, MO) enzyme inhibition assay was performed according to the previously described method. The sample solution (20 μ L, dissolved in dimethyl sulfoxide (DMSO) and buffer) and 0.5 U/mL α -glucosidase (40 μ L) were mixed in 100 μ L of 0.1 M phosphate buffer (pH 7.0). After 5 min pre-incubation, 5 mM p-nitrophenyl- α -D-glucopyranoside solution (40 μ L) was added, and the solution was incubated at 37 °C for 30 min. The absorbance of released 4-nitrophenol was measured at 405 nm by using a microplate reader (Molecular Devices, Sunnyvale, CA).

Acid hydrolysis and confirmation of monosaccharide

Compound **1** (8.0 mg) was separately dissolved in 1.0 M HCl (dioxane–H₂O, 1:1, v/v, 1.0 mL) and heated to 80 °C in a water bath for 3 h. The acidic solution was dried under N₂ overnight. After extraction with CHCl₃, the aqueous layer was dried using N₂ to give aqueous residue. This aqueous residue was separated by silica gel CC eluting with CH₂Cl₂–EtOH (10:1, v/v) and then further fractionated by RP-18 CC using a solvent gradient of EtOH–H₂O (6:4, 7:3, and 8:2, v/v) to give the saccharide. The specific rotations ($[\alpha]_D^{25}$) of sugars were determined after dissolving in H₂O for 24h and compared to the literature (lit): D-glucose (1.5 mg): found +49.0 (c 0.1, H₂O), lit +48.0 (Abe et al. 1999); D-galactose (0.9 mg): found +46.5 (c 0.1, H₂O), lit 45.0 (Voutquenne-Nazabadioko et al. 2013).
