CAMBRIDGE
UNIVERSITY PRESS

Contents

	Preface		*page* vii
1	**Introduction**		1
	1.1	Basic concepts in statistical learning	1
	1.2	Statistical models and learning machines	10
	1.3	Statistical estimation methods	18
	1.4	Four main formulas	26
	1.5	Overview of this book	41
	1.6	Probability theory	42
2	**Singularity theory**		48
	2.1	Polynomials and analytic functions	48
	2.2	Algebraic set and analytic set	50
	2.3	Singularity	53
	2.4	Resolution of singularities	58
	2.5	Normal crossing singularities	66
	2.6	Manifold	72
3	**Algebraic geometry**		77
	3.1	Ring and ideal	77
	3.2	Real algebraic set	80
	3.3	Singularities and dimension	86
	3.4	Real projective space	87
	3.5	Blow-up	91
	3.6	Examples	99
4	**Zeta function and singular integral**		105
	4.1	Schwartz distribution	105
	4.2	State density function	111

4.3	Mellin transform	116
4.4	Evaluation of singular integral	118
4.5	Asymptotic expansion and b-function	128
5	**Empirical processes**	133
5.1	Convergence in law	133
5.2	Function-valued analytic functions	140
5.3	Empirical process	144
5.4	Fluctuation of Gaussian processes	154
6	**Singular learning theory**	158
6.1	Standard form of likelihood ratio function	160
6.2	Evidence and stochastic complexity	168
6.3	Bayes and Gibbs estimation	177
6.4	Maximum likelihood and *a posteriori*	203
7	**Singular learning machines**	217
7.1	Learning coefficient	217
7.2	Three-layered neural networks	227
7.3	Mixture models	230
7.4	Bayesian network	233
7.5	Hidden Markov model	234
7.6	Singular learning process	235
7.7	Bias and variance	239
7.8	Non-analytic learning machines	245
8	**Singular statistics**	249
8.1	Universally optimal learning	249
8.2	Generalized Bayes information criterion	252
8.3	Widely applicable information criteria	253
8.4	Singular hypothesis test	258
8.5	Realization of *a posteriori* distribution	264
8.6	From regular to singular	274
Bibliography		277
Index		284
