Algebraic Number Theory and Code Design for Rayleigh Fading Channels

Frédérique Oggier

Institut de Mathématiques Bernoulli
École Polytechnique Fédérale de Lausanne
Lausanne 1015, Switzerland

Emanuele Viterbo

Dipartimento di Elettronica Politecnico di Torino
C.so Duca degli Abruzzi 24
Torino 10129, Italy

now

the essence of knowledge

Contents

Chapter 1 Introduction 1

Chapter 2 The Communication Problem 5

2.1 The Fading Channel Model 5
2.2 The Transmission System 6
2.3 Signal Space Diversity and Product Distance 8
2.4 Rotated $\mathbb{Z}^n$–lattice Constellations 11

Chapter 3 Some Lattice Theory 15

3.1 First Definitions 15
3.2 Sublattices and Equivalent Lattices 19
3.3 Two Famous Lattices 21
3.4 Lattice Packings and Coverings 23

Chapter 4 The Sphere Decoder 25

4.1 The Sphere Decoder Algorithm 26

4.2 The Sphere Decoder with Fading 32
4.3 Conclusions 33

Chapter 5 First Concepts in Algebraic Number Theory 37

5.1 Algebraic Number Fields 38
5.2 Integral Basis and Canonical Embedding 42
5.3 Algebraic Lattices 46
5.4 Algebraic Lattices over Totally Real Number Fields 50
5.5 Appendix: First Commands in KASH/KANT 51

Chapter 6 Ideal Lattices 57

6.1 Definition and Minimum Product Distance of an Ideal Lattice 57
6.2 $\mathbb{Z}^n$ Ideal Lattices 60

Chapter 7 Rotated $\mathbb{Z}^n$–lattices Codes 63

7.1 A Fully Worked Out Example 63
7.2 The Cyclotomic Construction 64
7.3 Mixed Constructions 69
7.4 A Bound on Performance 71
7.5 Some Simulation Results 73
7.6 Appendix: Programming the Lattice Codes 74

Chapter 8 Other Applications and Conclusions 79

8.1 Dense Lattices for the Gaussian Channel 79
8.2 Complex Lattices for the Rayleigh Fading Channel 80
8.3 Space–Time Block Codes for the Coherent MIMO Channels 80
8.4 Conclusions 82
