

**AN ALTERNATIVE PROOF OF THE REPRESENTATION
 THEOREM FOR ISOTROPIC, LINEAR ASYMMETRIC
 STRESS-STRAIN RELATIONS***

By

GUO ZHONG-HENG

The Johns Hopkins University

THEOREM. Let $\mathbb{F} : \text{Lin} \rightarrow \text{Lin}$ be linear and isotropic. Then there are scalars λ , μ , and α such that

$$\mathbb{F} : \mathbf{T} = \lambda(\text{tr } \mathbf{T})\mathbf{I} + (\mu + \alpha)\mathbf{T} + (\mu - \alpha)\mathbf{T}^* \quad (\forall \mathbf{T} \in \text{Lin}). \quad (1)$$

Conversely, any such function is linear and isotropic.

This statement, proved in [1], provides a general representation for linear isotropic tensor-valued functions of tensors. The statement (1) was given in coordinate form and proved in a different way earlier in [2]. Along lines of reasoning exploited in [3, 4], we offer in this brief note an alternative proof of the following.

REPRESENTATION THEROEM. For some set Set of Lin , the following statements are equivalent:

- (i) $\text{Set} = \text{lst}$.
- (ii) The subspaces Sph , Dev , and Skw of Lin are invariant characteristic spaces of Set .
- (iii) There are scalars $\lambda(\mathbb{F})$, $\mu(\mathbb{F})$, and $\alpha(\mathbb{F})$ such that

$$\mathbb{F} : \mathbf{T} = \lambda(\text{tr } \mathbf{T})\mathbf{I} + (\mu + \alpha)\mathbf{T} + (\mu - \alpha)\mathbf{T}^* \quad (\forall \mathbf{T} \in \text{Set}, \mathbf{T} \in \text{Lin}). \quad (2)$$

The notations used above and later on are as follows.

Let \mathcal{R} be the space of scalars and \mathcal{V} a 3-dimensional Euclidean space with scalar product $\mathbf{u}\mathbf{v}$ and vector product $\mathbf{u} \wedge \mathbf{v}$. Lin is the space of all linear transformations (or simply tensors) on \mathcal{V} , with identity \mathbf{I} . Given a tensor \mathbf{T} , \mathbf{T}^* denotes its transpose and $\text{tr } \mathbf{T}$ its trace. The transpose of the tensor product $\mathbf{u} \otimes \mathbf{v}$ is $(\mathbf{u} \otimes \mathbf{v})^* = \mathbf{v} \otimes \mathbf{u}$. Given an orthonormal basis $\{\mathbf{e}_i\}$ of \mathcal{V} , any $\mathbf{u} \in \mathcal{V}$ and $\mathbf{T} \in \text{Lin}$ may be expressed in dyadic form:

$$\mathbf{u} = u_i \mathbf{e}_i, \quad \mathbf{T} = T_{ij} \mathbf{e}_i \otimes \mathbf{e}_j, \quad (3)$$

and all the following operations may be interpreted in the language of scalar products of the corresponding basis vectors of the elements concerned, e. g.

$$\mathbf{u}\mathbf{v} = (u_i \mathbf{e}_i)(v_j \mathbf{e}_j) = u_i v_j (\mathbf{e}_i \mathbf{e}_j) = u_i v_j \delta_{ij} = u_i v_i, \quad (4)$$

$$\mathbf{T}\mathbf{u} = (T_{ij} \mathbf{e}_i \otimes \mathbf{e}_j)(u_k \mathbf{e}_k) = T_{ij} u_k (\mathbf{e}_j \mathbf{e}_k) \mathbf{e}_i = T_{ij} u_j \mathbf{e}_i, \quad (5)$$

* Received May 10, 1982. The research reported here was done with the partial support of a grant from the National Science Foundation to The Johns Hopkins University. The author is grateful to Professor C. Truesdell for his encouragement.

$$\mathbf{uT} = (u_k \mathbf{e}_k)(T_{ji} \mathbf{e}_j \otimes \mathbf{e}_i) = u_k T_{ji} (\mathbf{e}_k \mathbf{e}_j) \mathbf{e}_i = u_j T_{ji} \mathbf{e}_i, \quad (6)$$

$$\mathbf{A} : \mathbf{B} = (A_{ij} \mathbf{e}_i \otimes \mathbf{e}_j) : (B_{mn} \mathbf{e}_m \otimes \mathbf{e}_n) = A_{ij} B_{mn} (\mathbf{e}_i \mathbf{e}_m)(\mathbf{e}_j \mathbf{e}_n) = A_{ij} B_{ij}, \quad (7)$$

$$\mathbf{I} : \mathbf{T} = T_{ii} = \text{tr } \mathbf{T}, \quad (8)$$

where $\mathbf{u}, \mathbf{v} \in \mathcal{V}$ and $\mathbf{A}, \mathbf{B}, \mathbf{T} \in \text{Lin}$. Every \mathbf{T} possesses at least one right proper direction \mathbf{r} ($\neq \mathbf{0}$),

$$\mathbf{T}\mathbf{r} = \lambda\mathbf{r}, \quad (9)$$

and one left proper direction \mathbf{l} ($\neq \mathbf{0}$),

$$\mathbf{I}\mathbf{T} = \lambda\mathbf{l}, \quad (10)$$

λ being the associated proper value. If $\mathbf{r} = \mathbf{l}$, we call \mathbf{r} simply a proper direction. Further, let Sym, Skw, Orth, Sph, and Dev denote, respectively, the sets of symmetric, skew, orthogonal, spherical (scalar multiples of \mathbf{I}), and deviatoric (traceless symmetric) tensors. Given noncoplanar $\mathbf{u}, \mathbf{v}, \mathbf{w} \in \mathcal{V}$, every $\mathbf{A} \in \text{Skw}$ may be expressed as (with $\xi, \eta, \zeta \in \mathcal{R}$):

$$\mathbf{A} = \xi(\mathbf{u} \otimes \mathbf{v} - \mathbf{v} \otimes \mathbf{u}) + \eta(\mathbf{v} \otimes \mathbf{w} - \mathbf{w} \otimes \mathbf{v}) + \zeta(\mathbf{w} \otimes \mathbf{u} - \mathbf{u} \otimes \mathbf{w}). \quad (11)$$

The space Lin may be viewed as the direct sum of subspaces Sph, Dev, and Skw:

$$\text{Lin} = \text{Sph} \oplus \text{Dev} \oplus \text{Skw}. \quad (12)$$

It means that every $\mathbf{T} \in \text{Lin}$ has a unique additive decomposition in the form

$$\mathbf{T} = \mathbf{S} + \mathbf{D} + \mathbf{A}, \quad (13)$$

where

$$\mathbf{S} [= \frac{1}{3}(\text{tr } \mathbf{T})\mathbf{I}] \in \text{Sph}, \quad (14)$$

$$\mathbf{D} [= \frac{1}{2}(\mathbf{T} + \mathbf{T}^*) - \frac{1}{3}(\text{tr } \mathbf{T})\mathbf{I}] \in \text{Dev}, \quad (15)$$

$$\mathbf{A} [= \frac{1}{2}(\mathbf{T} - \mathbf{T}^*)] \in \text{Skw}. \quad (16)$$

Now let $\mathbb{L}\text{in}$ be the space of all linear transformations on Lin. We shall call them simply mappings, omitting the adjective "linear". The dyadic form of $\mathbb{F} \in \mathbb{L}\text{in}$ is

$$\mathbb{F} = F_{ijkl} \mathbf{e}_i \otimes \mathbf{e}_j \otimes \mathbf{e}_k \otimes \mathbf{e}_l, \quad (17)$$

and the action of \mathbb{F} upon $\mathbf{T} \in \text{Lin}$ is effectuated by means of a double dot (7) as follows:

$$\mathbb{F} : \mathbf{T} = (F_{ijkl} \mathbf{e}_i \otimes \mathbf{e}_j \otimes \mathbf{e}_k \otimes \mathbf{e}_l) : (T_{mn} \mathbf{e}_m \otimes \mathbf{e}_n) = F_{ijkl} T_{kl} \mathbf{e}_i \otimes \mathbf{e}_j. \quad (18)$$

For the proof of the stated representation theorem, some definitions and lemmata are needed. Those lemmata already proved by other authors are indicated in every case.

Definition 1: A mapping \mathbb{F} is isotropic if and only if

$$\mathbf{Q}(\mathbb{F} : \mathbf{T})\mathbf{Q}^* = \mathbb{F} : (\mathbf{Q}\mathbf{T}\mathbf{Q}^*) \quad (\forall \mathbf{T} \in \text{Lin}, \mathbf{Q} \in \text{Orth}). \quad (19)$$

The set of all isotropic mappings is denoted by lst .

Definition 2: A scalar λ is called a proper value of a mapping \mathbb{F} if there is a tensor \mathbf{R} such that

$$\mathbb{F} : \mathbf{R} = \lambda\mathbf{R}. \quad (20)$$

We call \mathbf{R} a proper direction corresponding to λ . The characteristic space for \mathbb{F} corresponding to λ is the subspace of Lin consisting of all tensors satisfying (20). Generally, the

characteristic spaces of different mappings are different. If every mapping from some set of $\mathbb{L}\text{in}$ has the same characteristic space (the corresponding proper values may be distinct), we say that this characteristic space is invariant for this set of mappings.

LEMMA 1 (Rivlin-Ericksen, Serrin, Noll). Every proper direction of the symmetric or skew argument $\mathbf{T} \in \mathbb{L}\text{in}$ of an $\mathbb{F} \in \mathbb{I}\text{st}$ is also a proper direction of the value $\mathbb{F} : \mathbf{T}$.

This lemma holds also for non-linear mappings. For the proof the reader is referred to [5, p. 167].

LEMMA 2 (Lew). Let $\mathbf{D} \in \mathbb{D}\text{ev}$. Then there is an orthonormal basis $\{\mathbf{u}, \mathbf{v}, \mathbf{w}\}$ such that

$$\mathbf{D} = \xi(\mathbf{u} \otimes \mathbf{v} + \mathbf{v} \otimes \mathbf{u}) + \eta(\mathbf{v} \otimes \mathbf{w} + \mathbf{w} \otimes \mathbf{v}) + \zeta(\mathbf{w} \otimes \mathbf{u} + \mathbf{u} \otimes \mathbf{w}) \quad (21)$$

with $\xi, \eta, \zeta \in \mathcal{R}$.

The proof of this lemma was furnished by J. Lew to M. E. Gurtin in a private communication in 1968 (cf. [3, pp. 36–37]).

LEMMA 3. Sph is an invariant characteristic space for $\mathbb{I}\text{st}$.

Proof. Taking into account that every $\mathbf{S} \in \text{Sph}$ is a scalar multiple of \mathbf{I} , and the mapping is linear, it suffices at first to use the isotropy definition (19) for unity argument to get

$$\mathbf{Q}(\mathbb{F} : \mathbf{I}) = (\mathbb{F} : \mathbf{I})\mathbf{Q} \quad (\forall \mathbb{F} \in \mathbb{I}\text{st}, \mathbf{Q} \in \text{Orth}). \quad (22)$$

Assume that \mathbf{r} is a proper direction of the value $\mathbb{F} : \mathbf{I}$:

$$(\mathbb{F} : \mathbf{I})\mathbf{r} = \beta\mathbf{r}. \quad (23)$$

Then, from (22),

$$(\mathbb{F} : \mathbf{I})\mathbf{Q}\mathbf{r} = \mathbf{Q}(\mathbb{F} : \mathbf{I})\mathbf{r} = \beta\mathbf{Q}\mathbf{r}. \quad (24)$$

Because \mathbf{Q} is arbitrary, (24) leads to the conclusion that every direction is a proper direction for $\mathbb{F} : \mathbf{I}$ with the same proper value $\beta(\mathbb{F})$; in other words,

$$\mathbb{F} : \mathbf{I} = \beta\mathbf{I}, \quad (25)$$

or, by virtue of the linearity of \mathbb{F} ,

$$\mathbb{F} : \mathbf{S} = \beta(\mathbb{F})\mathbf{S} \quad (\forall \mathbb{F} \in \mathbb{I}\text{st}, \mathbf{S} \in \text{Sph}). \quad (26)$$

Lemma 4. Let $\mathbb{F} \in \mathbb{I}\text{st}$. Then there are scalars φ_{\pm} (in general $\varphi_{+} \neq \varphi_{-}$) such that

$$\mathbb{F} : (\mathbf{u} \otimes \mathbf{v} + \mathbf{v} \otimes \mathbf{u}) = 2\varphi_{\pm}(\mathbf{u} \otimes \mathbf{v} \pm \mathbf{v} \otimes \mathbf{u}) \quad (\forall \text{ non-collinear } \mathbf{u}, \mathbf{v} \in \mathcal{V}). \quad (27)$$

Proof. The argument $\mathbf{u} \otimes \mathbf{v} \pm \mathbf{v} \otimes \mathbf{u}$ has a proper direction

$$\mathbf{w} := \mathbf{u} \wedge \mathbf{v}. \quad (28)$$

By virtue of Lemma 1, we have

$$[\mathbb{F} : (\mathbf{u} \otimes \mathbf{v} \pm \mathbf{v} \otimes \mathbf{u})]\mathbf{w} = \mathbf{w}\mathbb{F} : (\mathbf{u} \otimes \mathbf{v} \pm \mathbf{v} \otimes \mathbf{u}) = \beta_{\pm}\mathbf{w}. \quad (29)$$

Referred to the basis $\{\mathbf{u}, \mathbf{v}, \mathbf{w}\}$, the value $\mathbb{F} : (\mathbf{u} \otimes \mathbf{v} \pm \mathbf{v} \otimes \mathbf{u})$ may be expressed in the dyadic form:

$$\begin{aligned} \mathbb{F} : (\mathbf{u} \otimes \mathbf{v} \pm \mathbf{v} \otimes \mathbf{u}) = & \beta_{11}\mathbf{u} \otimes \mathbf{u} + \beta_{12}\mathbf{u} \otimes \mathbf{v} + \beta_{13}\mathbf{u} \otimes \mathbf{w} + \beta_{21}\mathbf{v} \otimes \mathbf{u} \\ & + \beta_{22}\mathbf{v} \otimes \mathbf{v} + \beta_{23}\mathbf{v} \otimes \mathbf{w} + \beta_{31}\mathbf{w} \otimes \mathbf{u} + \beta_{32}\mathbf{w} \otimes \mathbf{v} + \beta_{33}\mathbf{w} \otimes \mathbf{w}. \end{aligned} \quad (30)$$

Generally, the β_{ij} ($i, j = 1, 2, 3$) depend on \mathbf{u} and \mathbf{v} , and of course on the sign “ \pm ”. Inserting (30) into (29), we obtain

$$\beta_{13}\mathbf{u} + \beta_{23}\mathbf{v} + (\beta_{33} - \beta_{\pm})\mathbf{w} = \mathbf{0}, \quad (31)$$

$$\beta_{31}\mathbf{u} + \beta_{32}\mathbf{v} + (\beta_{33} - \beta_{\pm})\mathbf{w} = \mathbf{0}. \quad (32)$$

The linear independence of $\mathbf{u}, \mathbf{v}, \mathbf{w}$, leads to

$$\beta_{13} = \beta_{31} = \beta_{23} = \beta_{32} = 0, \quad (33)$$

$$\beta_{33} = \beta_{\pm}(\mathbf{u}, \mathbf{v}) = \hat{\beta}_{\pm}/|\mathbf{w}|^2. \quad (34)$$

Taking these results and

$$\mathbf{Q}(\mathbf{u} \otimes \mathbf{v} \pm \mathbf{v} \otimes \mathbf{u})\mathbf{Q}^* = (\mathbf{Q}\mathbf{u}) \otimes (\mathbf{Q}\mathbf{v}) \pm (\mathbf{Q}\mathbf{v}) \otimes (\mathbf{Q}\mathbf{u}), \quad (35)$$

$$(\mathbf{Q}\mathbf{u}) \wedge (\mathbf{Q}\mathbf{v}) = \mathbf{Q}(\mathbf{u} \wedge \mathbf{v}) = \mathbf{Q}\mathbf{w} \quad (36)$$

into account, and applying the isotropy definition (19) to the expression (30), we have, $\forall \mathbf{Q} \in \text{Orth}$,

$$\begin{aligned} &(\beta_{11} - \beta_{11}^{\mathbf{Q}})(\mathbf{Q}\mathbf{u}) \otimes (\mathbf{Q}\mathbf{u}) + (\beta_{12} - \beta_{12}^{\mathbf{Q}})(\mathbf{Q}\mathbf{u}) \otimes (\mathbf{Q}\mathbf{v}) \\ &+ (\beta_{21} - \beta_{21}^{\mathbf{Q}})(\mathbf{Q}\mathbf{v}) \otimes (\mathbf{Q}\mathbf{u}) + (\beta_{22} - \beta_{22}^{\mathbf{Q}})(\mathbf{Q}\mathbf{v}) \otimes (\mathbf{Q}\mathbf{v}) \\ &+ [\beta_{\pm}(\mathbf{u}, \mathbf{v}) - \beta_{\pm}(\mathbf{Q}\mathbf{u}, \mathbf{Q}\mathbf{v})](\mathbf{Q}\mathbf{w}) \otimes (\mathbf{Q}\mathbf{w}) = \mathbf{0}, \end{aligned} \quad (37)$$

where $\beta_{ij}^{\mathbf{Q}} = \beta_{ij}(\mathbf{Q}\mathbf{u}, \mathbf{Q}\mathbf{v})$. By virtue of the linear independence of the dyadic basis above, we get from (37)

$$\beta_{ij}(\mathbf{u}, \mathbf{v}) = \beta_{ij}(\mathbf{Q}\mathbf{u}, \mathbf{Q}\mathbf{v}) \quad (i, j = 1, 2), \quad (38)$$

$$\beta_{\pm}(\mathbf{u}, \mathbf{v}) = \beta_{\pm}(\mathbf{Q}\mathbf{u}, \mathbf{Q}\mathbf{v}). \quad (39)$$

Since \mathbf{Q} is arbitrary, these coefficients depend on the sign “ \pm ” only. Thus, (30) reduces to

$$\mathbb{F} : (\mathbf{u} \otimes \mathbf{v} \pm \mathbf{v} \otimes \mathbf{u}) = \beta_{11}\mathbf{u} \otimes \mathbf{u} + \beta_{12}\mathbf{u} \otimes \mathbf{v} + \beta_{21}\mathbf{v} \otimes \mathbf{u} + \beta_{22}\mathbf{v} \otimes \mathbf{v} + \beta_{\pm}(\mathbf{u} \wedge \mathbf{v}) \otimes (\mathbf{u} \wedge \mathbf{v}). \quad (40)$$

The assumed linearity of \mathbb{F} makes it also linear relative to \mathbf{u} and \mathbf{v} ; therefore

$$\beta_{11} = \beta_{22} = \beta_{\pm} = 0, \quad (41)$$

and, consequently,

$$\mathbb{F} : (\mathbf{u} \otimes \mathbf{v} \pm \mathbf{v} \otimes \mathbf{u}) = \beta_{12}\mathbf{u} \otimes \mathbf{v} + \beta_{21}\mathbf{v} \otimes \mathbf{u}. \quad (42)$$

Using the linearity again with (42), we have

$$\mathbb{F} : (\mathbf{u} \otimes \mathbf{v} \pm \mathbf{v} \otimes \mathbf{u}) = \pm \mathbb{F} : (\mathbf{v} \otimes \mathbf{u} \pm \mathbf{u} \otimes \mathbf{v}) = \pm(\beta_{21}\mathbf{v} \otimes \mathbf{u} + \beta_{21}\mathbf{u} \otimes \mathbf{v}). \quad (43)$$

A comparison of (42) and (43), by virtue of the linear independence of $\mathbf{u} \otimes \mathbf{v}$ and $\mathbf{v} \otimes \mathbf{u}$, gives

$$\beta_{12} = \pm \beta_{21} \equiv 2\varphi_{\pm} \quad (44)$$

and, finally, from (42) the representation (27).

Introducing the notation

$$\mu(\mathbb{F}) = \varphi_{+}, \quad \alpha(\mathbb{F}) = \varphi_{-}, \quad (45)$$

we apply (27) in sequence to the expressions (21) and (11); because \mathbb{F} is linear, we get the following

COROLLARY. Dev and Skw are invariant characteristic spaces for lst , i.e., $\forall \mathbb{F} \in \text{lst}$,

$$\mathbb{F} : \mathbf{D} = 2\mu(\mathbb{F})\mathbf{D} \quad (\forall \mathbf{D} \in \text{Dev}), \tag{46}$$

$$\mathbb{F} : \mathbf{A} = 2\alpha(\mathbb{F})\mathbf{A} \quad (\forall \mathbf{A} \in \text{Skw}), \tag{47}$$

At this point we are already able to prove the representation theorem. On the basis of Lemma 3 and corollary, (i) implies (ii) directly. In order to show the implication (iii) by (ii), we assume that for $\mathbb{F} \in \text{Set}$, $3k(\mathbb{F})$, $2\mu(\mathbb{F})$ and $2\alpha(\mathbb{F})$ are the proper values corresponding to the characteristic spaces Sph , Dev and Skw , respectively. Introducing the scalar $\lambda(\mathbb{F})$:

$$3k(\mathbb{F}) = 2\mu(\mathbb{F}) + 3\lambda(\mathbb{F}), \tag{48}$$

and taking the linearity of \mathbb{F} and (14–16) into account, we use Lemma 3 and the Corollary to $\mathbf{T} \in \text{Lin}$ expressed in (13) and obtain

$$\begin{aligned} \mathbb{F} : \mathbf{T} &= \frac{1}{3}(\text{tr } \mathbf{T})(2\mu + 3\lambda)\mathbf{I} + \mu(\mathbf{T} + \mathbf{T}^*) - \frac{2\mu}{3}(\text{tr } \mathbf{T})\mathbf{I} + \alpha(\mathbf{T} - \mathbf{T}^*) \\ &= \lambda(\text{tr } \mathbf{T})\mathbf{I} + \mu(\mathbf{T} + \mathbf{T}^*) + \alpha(\mathbf{T} - \mathbf{T}^*). \end{aligned} \tag{49}$$

This is just the expression (2) in (iii). Finally, to verify the implication (iii) \Rightarrow (i) means to check whether every \mathbb{F} of the form (2) satisfies the isotropy condition (19). To this end, taking $\text{tr } (\mathbf{Q}\mathbf{T}\mathbf{Q}^*) = \text{tr } \mathbf{T} \forall \mathbf{Q} \in \text{Orth}$ into account, from (2) we have

$$\begin{aligned} \mathbb{F} : (\mathbf{Q}\mathbf{T}\mathbf{Q}^*) &= \lambda(\text{tr } \mathbf{T})\mathbf{I} + (\mu + \alpha)\mathbf{Q}\mathbf{T}\mathbf{Q}^* + (\mu - \alpha)\mathbf{Q}\mathbf{T}^*\mathbf{Q}^* \\ &= \mathbf{Q}[\lambda(\text{tr } \mathbf{T})\mathbf{I} + (\mu + \alpha)\mathbf{T} + (\mu - \alpha)\mathbf{T}^*]\mathbf{Q}^* = \mathbf{Q}(\mathbb{F} : \mathbf{T})\mathbf{Q}^*, \end{aligned} \tag{50}$$

which shows that (iii) \Rightarrow (i).
