

# AN EXTENSION OF LINDELÖF'S THEOREM TO MEROMORPHIC FUNCTIONS

S. M. SHAH<sup>1)</sup>

(Received January 6, 1960)

**1. Introduction.** If  $f(z)$  be an entire function of finite order  $\rho$ , then Lindelöf has obtained a set of conditions in order that  $f(z)$  may be of maximum, mean or minimum type [2; 1, 25-30]. A theorem of the similar nature for meromorphic functions is stated by Valiron [8] and Hari Shanker has recently [3] extended the results of Lindelöf by taking comparison function  $r^\rho L(r)$ . In this note we prove three theorems which will include the theorems of Lindelöf, Valiron and Hari Shanker as special cases.

Let  $f(z)$  be a meromorphic function of finite order  $\rho$ . We have

$$(1.1) \quad f(z) = z^k \exp(Cz^{p_3} + \dots) \prod_1^{\infty} E(z/a_n, p_1) / \prod_1^{\infty} E(z/b_n, p_2),$$

where  $Q(z) = Cz^{p_3} + \dots$  is a polynomial of degree  $p_3 \leq [\rho]$ . Write

$$n(r) = n(r, 1/f) + n(r, f), \quad N(r) = N(r, 1/f) + N(r, f).$$

When  $\rho > 0$ , and  $N(r)$  is of order  $\rho$ , we define a proximate order  $\rho(r)$  for  $N(r)$  as follows.

- (i)  $\rho(r)$  is differentiable for  $r > r_0$ , except at isolated points at which  $\rho'(r-0)$  and  $\rho'(r+0)$  exist.
- (ii)  $\lim_{r \rightarrow \infty} \rho(r) = \rho$ .
- (iii)  $\lim_{r \rightarrow \infty} r\rho'(r) \log r = 0$ .
- (iv)  $\limsup_{r \rightarrow \infty} N(r)/r^{\rho(r)} = 1$ .

For the existence of a proximate order see [6] where  $\rho(r)$  is constructed with  $\log M(r)$ ; the argument given there can be utilised to construct  $\rho(r)$  with the above properties (i)–(iv).

When  $\rho$  is integer, we can write  $f(z)$  in the form

$$(1.2) \quad f(z) = z^k \exp(cz^\rho + \dots) \prod_1^{\infty} E(z/a_n, \rho) / \prod_1^{\infty} E(z/b_n, \rho) \\ = z^k \exp(cz^\rho + \dots) P_1/P_2 \text{ (say)}$$

---

1) Abstract presented to Indian Math. Soc., Dec. 1959.

where if  $f$  has no poles,  $P_2$  is to be replaced by 1, and if  $f$  has a finite number of poles then

$$P_2 = \prod_1^M E(z/b_n, \rho).$$

Similarly when  $\lim_{r \rightarrow \infty} n(r, 1/f) < \infty$ .

THEOREM 1. *If  $\rho$  is integer and  $N(r)$  is of order  $\rho$ , then*

$$(1.3) \quad T(r, f) = \frac{r^\rho}{\rho\pi} \left| c\rho + \sum_{|a_n| < r} a_n^{-\rho} - \sum_{|b_n| < r} b_n^{-\rho} \right| + O(r^{\rho(\rho)})$$

where  $f(z)$  is given by (1.2). If  $N(r)$  is of order less than  $\rho$ , then we have from (1.1)

$$(1.4) \quad p_3 = \rho, C \neq 0, T(r, f) = \frac{r^\rho}{\pi} |C| + O(r^\mu), \mu < \rho.$$

THEOREM 2. *Let  $f(z)$  be a meromorphic function of integer order  $\rho$  and let  $L(r)$  be a slowly changing positive function [4; pp. 52-54] and write*

$$(1.5) \quad \limsup_{r \rightarrow \infty} T(r)/r^\rho L(r) = T_L; \quad \limsup_{r \rightarrow \infty} n(r)/r^\rho L(r) = n_L; \\ \limsup_{r \rightarrow \infty} S(r)/r^\rho L(r) = S_L;$$

where

$$(1.6) \quad S(r) = \frac{r^\rho}{\rho\pi} \left| c\rho + \sum_{|a_n| < r} a_n^{-\rho} - \sum_{|b_n| < r} b_n^{-\rho} \right|.$$

(i) *If  $N(r)$  is of order  $\rho$ , then*

$$(1.7) \quad 0 < T_L < \infty \iff 0 < \max(n_L, S_L) < \infty, \\ T_L = \infty \iff \max(n_L, S_L) = \infty, \\ T_L = 0 \iff \max(n_L, S_L) = 0.$$

(ii) *If  $N(r)$  is of order less than  $\rho$ , then*

$$(1.8) \quad T(r) \sim S(r) \sim r^\rho |C|/\pi; \quad n(r) = O(r^\alpha), \alpha < \rho.$$

THEOREM 3. *Let  $f(z)$  be a meromorphic function of order  $\rho$ .*

(i) *If  $\rho > 0$  be non-integer, and  $T_L$  etc. be defined as in (1.5), then*

$$(1.9) \quad 0 < T_L < \infty \iff 0 < n_L < \infty, \\ T_L = \infty \iff n_L = \infty, \\ T_L = 0 \iff n_L = 0.$$

(ii) *When  $\rho = 0$ , let the comparison function be  $L(r) = (\log r) L_1(r)$  where  $L_1(r)$  is slowly changing and  $\uparrow \infty$  with  $r$ . Write*

$$T_L = \limsup_{r \rightarrow \infty} T(r)/L(r); \quad N_L = \limsup_{r \rightarrow \infty} \frac{\{N(r, 1/f) + N(r, f)\}}{L(r)}.$$

Then

$$(1.10) \quad T_L \leq N_L \leq 2T_L,$$

and the relations (1.9) hold with  $N_L$  instead of  $n_L$ . If  $f(z)$  be entire function of zero order, then  $T_L = N_L$ .

2. **Proof of Theorem 1.** Write (1.2) in the form

$$f(z) = \phi_0 \phi_1 \phi_2 \phi_3 \phi_4^{-1} \phi_5,$$

where

$$\begin{aligned} \phi_0(z) &= z^c \exp(c_1 z^{\rho-1} + \dots), \\ \phi_1(z) &= \exp \left\{ cz^\rho + \frac{z^\rho}{\rho} \left( \sum_{|a_n| < 2r} a_n^{-\rho} - \sum_{|b_n| < 2r} b_n^{-\rho} \right) \right\}, \\ \phi_2(z) &= \prod_1^{n_0} E(z/a_n, \rho - 1) / \prod_1^{n_0} E(z/b_n, \rho - 1), \\ \phi_3(z) &= \prod_{n > n_0}^{|a_n| < 2r} E(z/a_n, \rho - 1), \\ \phi_4(z) &= \prod_{n > n_0}^{|b_n| < 2r} E(z/b_n, \rho - 1), \\ \phi_5(z) &= \prod_{|a_n| \geq 2r} E(z/a_n, \rho) \Big/ \prod_{|b_n| \geq 2r} E(z/b_n, \rho). \end{aligned}$$

Now for  $\phi_0, \phi_2$

$$T(r) = O(r^{\rho-1}) + O(\log r).$$

Further

$$\log^+ |\phi_3(z)| = O \left( N(r, 1/f) + r^{\rho-1} \int_{r_0}^{2r} n(x, 1/f) x^{-\rho} dx + n(2r, 1/f) \right).$$

Hence

$$T(r, \phi_3) = O(r^{\rho(r)}).$$

Similarly

$$\begin{aligned} T(r, \phi_4) &= O(r^{\rho(r)}), \\ T(r, \phi_5) &= O \left( r^{\rho+1} \int_{2r}^\infty x^{\rho(x)-\rho-2} dx \right) = O(r^{\rho(r)}). \end{aligned}$$

Hence

$$T(r, f) = \frac{r^\rho}{\rho\pi} \left| c\rho + \sum_{|a_n| \leq r} a_n^{-\rho} - \sum_{|b_n| \leq r} b_n^{-\rho} \right| + O(r^{\rho(r)})$$

$$= S(r) + O(r^{\rho(r)}).$$

If  $N(r) = O(r^\alpha)$ , where  $\alpha < \rho$  then

$$T(r, P_i) = O(r^\beta), \quad i = 1, 2, \quad \alpha < \beta < \rho.$$

Hence

$$P_3 = \rho, \quad C \neq 0, \quad T(r, f) = \frac{|C|r^\rho}{\pi} + O(r^\mu), \quad \mu < \rho.$$

**3. Proof of Theorem 2.** (i) Suppose  $N(r)$  is of order  $\rho$ . If  $n_L < \infty$ , then we obtain as in the first part of Theorem 1,

$$(3.1) \quad T(r, f) = S(r) + O(r^\rho L(r));$$

and if  $n_L = 0$ , then

$$(3.2) \quad T(r, f) = S(r) + o(r^\rho L(r)).$$

Hence if  $S_L < \infty$ , then  $T_L < \infty$ . If  $T_L < \infty$ , then  $T(r) < Ar^\rho L(r)$ ,  $N(r) < A_1 r^\rho L(r)$ ,  $n(r) < A_2 r^\rho L(r)$ . Hence  $n_L < \infty$  and from (3.1)  $S_L < \infty$ . If  $n_L > 0$  then  $T_L > 0$ . If  $T_L > 0$ , then  $\max(n_L, S_L) > 0$ , for if  $n_L = 0$ , then from (3.2),  $T_L = S_L > 0$ . If  $T_L = \infty$ , then  $\max(n_L, S_L) = \infty$ , for if this expression is less than  $\infty$ , then from (3.1) we get  $T_L < \infty$ . If  $n_L = \infty$  then  $T_L = \infty$  and if  $S_L = \infty$ ,  $n_L < \infty$  then from (3.1)  $T_L = \infty$ . If  $T_L = 0$ , then  $n_L = 0$  and from (3.2)  $S_L = 0$ . If  $n_L = S_L = 0$  then  $T_L = 0$ .

(ii) Since  $N(r)$  is of order  $< \rho$ ,  $\sum a_n^{-\rho}$ ,  $\sum b_n^{-\rho}$  are both convergent, and if  $f$  has an infinity of zeros and an infinity of poles,

$$c\rho = C\rho - \sum_1^\infty a_n^{-\rho} + \sum_1^\infty b_n^{-\rho}.$$

Hence

$$S(r) = \frac{r^\rho}{\rho\pi} \left| C\rho - \sum_{|a_n| > r} a_n^{-\rho} + \sum_{|b_n| > r} b_n^{-\rho} \right|$$

and so

$$(3.3) \quad S(r) \sim r^\rho |C|/\pi.$$

Similarly we can prove (3.3) when  $f$  has a finite number of poles or zeros

or both. Hence from (1.4) and (3.3)

$$T(r) \sim S(r); n(r) = O(N(2r)) = O(r^\alpha), \alpha < \rho.$$

**4. Proof of Theorem 3.** (i) We have from (1.1), [7]

$$\begin{aligned} T(r, f) &\leq O(r^{p_3}) + O(\log r) + \log M(r, P_1) + \log M(r, P_2) \\ &\leq O(r^\mu) + O(\log r) + A \int_0^\infty \frac{n(x) r^{1+\mu}}{x^{1+\mu}(x+r)} dx \end{aligned}$$

where  $\mu = [\rho]$ . Hence if  $n_L < \infty$ ,

$$\begin{aligned} T(r, f) &\leq A_1 \left\{ r^\mu + \log r + r^\mu \int_1^r x^{\rho-\mu-1} L(x) dx \right. \\ &\quad \left. + r^{1+\mu} \int_r^\infty x^{\rho-\mu-2} L(x) dx \right\} \\ &\leq A_1 \left\{ r^\mu + \log r + \frac{r^\rho L(r)}{\rho - \mu} + \frac{r^\rho L(r)}{1 + \mu - \rho} \right\} \\ &< A_2 r^\rho L(r), \end{aligned}$$

and (1.9) follows provided  $n_L < \infty$ . If  $n_L = \infty$  then  $T_L = \infty$  and from above if  $T_L = \infty$  then  $n_L = \infty$ .

(ii) We have [5]

$$N(r) \leq 2T(r, f) + O(1),$$

$$T(r, f) \leq \{1 + o(1)\} r \int_r^\infty \{N(t)/t^2\} dt$$

and (1.10) follows. If  $f$  be entire then  $N(r) \leq T(r, f) + O(1)$ ,  $T_L = N_L$ .

**5. Remarks.** (i) If  $f$  is entire and  $p_1 = \rho$  then from (1.3) we have, since  $c = C$ ,

$$T(r, f) = \frac{r^\rho}{\rho\pi} \left| C\rho + \sum_{|a_n| < r} a_n^{-\rho} \right| + O(r^{\rho(r)}). \tag{4.1}$$

Further since

$$T(r, f) \sim T(r, fP)$$

where  $P$  is any polynomial, (4.1) holds also for functions with a finite number of poles and  $p_1 = \rho$ . We can get this result directly from (1.3) for we will have

$$T(r, f) = \frac{r^\rho}{\rho\pi} \left| \left( C + \frac{1}{\rho} \sum_1^k b_n^{-\rho} \right) \rho + \sum_{|a_n| < r} a_n^{-\rho} - \sum_1^k b_n^{-\rho} \right| + O(r^{\rho(r)}).$$

A similar remark applies when  $f$  has a finite number of zeros.

(ii) The formula (1.3) is useful when  $S(r)$  is large compared to  $r^{\rho(r)}$ . For instance if

$$f(z) = \Gamma(z), S(r) \sim \{r \log r\} / \pi, r^{\rho(r)} = O(r).$$

But for functions of the form (1.2) with

$$c\rho + \sum_{|a_n| < r} a_n^{-\rho} - \sum_{|b_n| < r} b_n^{-\rho} = O(1); N(r) > \alpha r^\rho, \alpha > 0, r > r_0,$$

(1.3) does not give much information.

(iii) If  $f$  be meromorphic function of integer order  $\rho$  and such that  $\max(p_1, p_2) = \rho - 1$ , then we get from (1.3)

$$(4.2) \quad T(r, f) = \frac{r^\rho}{\rho\pi} \left| C\rho - \sum_{|a_n| > r} a_n^{-\rho} + \sum_{|b_n| > r} b_n^{-\rho} \right| + O(r^{\rho(r)}).$$

If  $f$  be entire function with  $p_1 = \rho - 1$ ,  $p_2 < \rho$  and such that  $n_L < \infty$ , then from (3.1) and (4.2)

$$T(r, f) = \frac{r^\rho}{\rho\pi} \left| \sum_{|a_n| > r} a_n^{-\rho} \right| + O(r^\rho L(r)).$$

It is not necessary to suppose here that  $L(r)$  be monotone except when  $\rho = 0$  (see Theorem 3(ii)).
