#### Abstract

This paper studies quintic residuacity of primes $p$ of the form $$
16 p=v^{4}+250 v^{2}+3125, \quad p=5 f+1
$$ for which the expression for $4^{f}$ modulo $p$ given in the first volume of this journal becomes indeterminate, and replaces it by a much simpler expression.

1980 Mathematics subject classification (Amer. Math. Soc.) (1985 Revision): 11 A 15.

## Introduction

Although the criterion that $D^{f} \equiv 1(\bmod p)$ for $p=k f+1$ if and only if $D$ is a $k$ th power residue of the prime $p$ goes back to Euler, expressions for $D^{f}$ modulo $p$ in case $D^{f} \not \equiv 1(\bmod p)$ so that $D$ is a $k$ th root of unity were first given by the author in [2] for cubic, quartic and quintic residues.

In the quintic case $D^{f}$ modulo $p=5 f+1$ is given in terms of the variables ( $x, u, v, w$ ) in the Dickson form

$$
\begin{gather*}
16 p=x^{2}+50 u^{2}+50 v^{2}+125 w^{2}, \\
x w=v^{2}-u^{2}-4 u v, \quad x \equiv 1(\bmod 5) . \tag{1}
\end{gather*}
$$

The congruence given in [2], namely
(2) $4^{f} \equiv \frac{w\left(125 w^{2}-x^{2}\right)-2(x w+5 u v)(25 w+x+10 u+20 v)}{w\left(125 w^{2}-x^{2}\right)-2(x w+5 u v)(25 w+x-10 u-20 v)} \quad(\bmod p)$
© 1989 Australian Mathematical Society 0263-6115/89 \$A2.00 +0.00
was recently found by Katre and Rajwade [1] to become zero over zero in case $u=-2 v$ with $v$ odd. This is also the case for the expressions for $3^{f}$ and $5^{f}$ of K. S. Williams [6]. Katre and Rajwade [1] find alternative expressions for these quantities which do not become indeterminate. The purpose of this note is to study this special case in detail and to give a very simple expression for $2^{f}$ and $4^{f}$ in this case.

## 1. An expression for $2^{f}(\bmod p)$ in case $u=-2 v$

The form (1) has four solutions, namely

$$
(x, u, v, w), \quad(x,-u,-v, w), \quad(x,-v, u,-w), \quad(x, v,-u,-w)
$$

We choose the unique solution in which $v \equiv-x(\bmod 4)$ is odd. This implies that 2 is a quintic non-residue, which together with $u=-2 v$ implies that $x w=5 v^{2}$ by (1). Also since $x \equiv 1(\bmod 5)$ and since $x$ and $w$ cannot have a common factor with $v$ we have $w= \pm 5$ and $x= \pm v^{2}$. Hence either $v \equiv \pm 1$ $(\bmod 5)$ and $w=5$, or $v= \pm 2(\bmod 5)$ and $w=-5$. Therefore by $(1)$ we have

$$
\begin{equation*}
16 p=v^{4}+250 v^{2}+3125=\left(v^{2}+125\right)^{2}-5 \cdot 50^{2} . \tag{3}
\end{equation*}
$$

The expression for $2^{f}$ in [2] is unambiguous and is

$$
2^{f} \equiv \frac{w\left(125 w^{2}-x^{2}\right)+2(x w+5 u v)(25 w-x+20 u-10 v)}{w\left(125 w^{2}-x^{2}\right)+2(x w+5 u v)(25 w-x-20 u+10 v)} \quad(\bmod p) .
$$

This, is easily seen to simplify with $u=-2 v, x= \pm v^{2}$ and $w= \pm 5$ to

$$
2^{f} \equiv \begin{cases}(5-v) /(5+v)(\bmod p) & \text { if } v \equiv \pm 1(\bmod 5),  \tag{4}\\ (5+v) /(5-v)(\bmod p) & \text { if } v \equiv \pm 2(\bmod 5) .\end{cases}
$$

We see at once that $4^{f}$ is simply the square of these expressions and that the two remaining primitive fifth roots of unity are their reciprocals. We note, by the way, that these can be obtained by changing the sign of $v$. We also note that 5 is always a quintic non-residue of the primes in (3), since the condition for the quintic residuacity of 5 is $u \equiv 2 v(\bmod 5)$ [3].

We also note that the expression (4) can be used to obtain $5^{f}$, provided that the solution of (1) is used for which $2 u+v \equiv 4(\bmod 5)$. (See [6].) Hence for our set of primes in (3) we have $2^{f} \equiv 5^{f}(\bmod p)$ if and only if
$v \equiv 2(\bmod 5)$. We have not discovered a relation between $2^{f}$ and $5^{f}$ in the remaining cases.

## 2. Absolute artiads

Our primes in (3) are a subset of primes for which $u \equiv-2 v(\bmod 5)$ which were called "artiads" by Lloyd Tanner [5]. The author showed in [3] that these primes have the Fibonacci roots $\theta=(1 \pm \sqrt{5}) / 2$ as quintic residues. In our case, by (3) we have $\sqrt{5} \equiv\left(v^{2}+125\right) / 50(\bmod p)$, so that

$$
\theta_{1}=\left(v^{2}+175\right) / 100 \text { and } \theta_{2}=-\left(v^{2}+75\right) / 100 \quad(\bmod p)
$$

are quintic residues of $p$.
The discriminant of the period equation [4] becomes in this case

$$
\begin{equation*}
D=p^{4} v^{4}\left[\left(v^{2}-125\right) / 4\right]^{2}\left[\left(9 v^{2}+125\right) / 2\right]^{2}=p^{4} v^{4} d_{1}^{2} d_{2}^{2} \tag{5}
\end{equation*}
$$

Hence all the prime factors of $v, d_{1}$ and $d_{2}$ are also quintic residues of the primes in (3).

We conclude with a short table of primes less than 10000 together with $v, \theta_{1}$ and $\theta_{2}$ and the prime factors of $d_{1}$ and $d_{2}$.

| $p$ | $v$ | $\theta_{1}$ | $\theta_{2}$ | $d_{1}$ | $d_{2}$ |
| ---: | ---: | ---: | ---: | ---: | ---: |
| 211 | -1 | 179 | 33 | -31 | 67 |
| 1871 | -9 | 1200 | 672 | -11 | 7.61 |
| 3001 | -11 | 123 | 2879 | -1 | 607 |
| 4621 | 13 | 1667 | 2955 | 13 | 11 |
| 9931 | 17 | 5566 | 4366 | 41 | 29.47 |

All the integers in the table are quintic residues of the corresponding prime.
