10  
11           ABSTRACT: This article explores research on gender and institutions for the purposes of  
12           informing analytical frameworks for research on institutional change with regard to gender  
13           equality in higher education. Drawing on feminist institutionalist studies that explore the  
14           relationship between gender, institutions and institutional continuity and change, the aim is to  
15           evaluate how this body of scholarship can be adapted to an analysis of the dynamics of  
16           gender equality plan implementation in universities.  
17  
18

19           Key words: Higher education, institutions, institutional change, resistance, informal rules,  
20           gender equality.

28           **Introduction**

29           Over the past decade, the study of gender and institutions has developed into a prolific research  
30           agenda, with distinctive sets of concepts, theoretical frameworks, objectives and tools. Led  
31           mainly by feminist political scientists, gender and institutions research seeks to understand the  
32           role of institutions in the reproduction of gender-power relations; the gendered dimensions of  
33           institutional continuity and change; and the factors leading to success or failure of feminist  
34           strategies such as gender mainstreaming, gender quotas and other gender policies (Mackay,  
35           Kenny and Chappell 2010, Krook and Mackay 2011).  
36  
37

38           Drawing on feminist institutionalist theory, this article aims to inform studies exploring the  
39           interactions between gender and institutional change in universities. It also seeks to understand  
40           the role of resistances to institutional change that accompanies the implementation of gender  
41           equality plans (GEPs). How such resistances can be identified, measured and ultimately  
42           overcome represents a major challenge for both scholars and practitioners in the field of gender  
43           equality in higher education today.  
44  
45

46           Academic explorations of the relationship between gender, institutions, and institutional  
47           continuity and change have been making important strides since the late 1980s, and especially  
48           after the publication of Joan Acker's influential work on gendering processes in organisations  
49           (Acker 1990, 1992). Building on previous feminist contributions to the field (Kanter 1977,  
50           Martin 1985, Smith 1987), in Acker's account, to say that an institution is 'gendered' means  
51           that gender is present in its processes, practices, images, ideologies, and distributions of power  
52           (1992: 567). In their view, the creation and recreation of the gender structure embedded in  
53           organisations requires an investigation into institutional practices.  
54  
55

56           Acker's theory of gendered organisations explains persistent gender inequality in organisations  
57           but is limited in explaining institutional change. Gender scholars seeking to better understand  
58           institutional continuity and change in relation to gender equality have turned to new  
59           institutionalist theory developed in political science. A central tenet of this theory is that  
60  
61

1 change is mainly driven by the internal dynamics of institutions rather than by broader societal  
2 forces or by the properties of individual actors. Therefore, any analysis of institutional change  
3 requires knowledge about the specific institutions under study, including:

4 the internal success criteria, structures, procedures, rules, practices, career structures,  
5 socialization patterns, styles of thought and interpretive traditions, and resources of the  
6 entity (Olsen 2009: 9).  
7

8 Feminist institutionalist scholars draw on the potential of new institutionalism for improving  
9 our understanding of the gender dynamics at play in institutional design, institutional practices  
10 and institutional change. Critiquing the gender blindness of ‘mainstream’ institutionalist  
11 theories, these scholars argue that the application of a gender lens could provide fresh insights  
12 into the field (Chappell 2006, 2011; Chappell & Waylen 2013; Kenny, 2007; Krook & Mackay  
13 2011; Mackay & Waylen, 2009; Mackay, Monro & Waylen 2009; Mackay, Kenny & Chappell  
14 2010).  
15  
16

17 Higher education institutions have their own set of distinctive features when compared to those  
18 most extensively studied by institutionalist scholars—i.e., government bureaucracies and  
19 parliaments, political parties and electoral systems. Therefore, a study of gender and  
20 institutional change in universities informed by a feminist institutionalist approach requires  
21 careful attention to the features described by Olsen and applied to the higher education context.  
22 Consideration must also be given to the significant variations among and within universities.  
23 As Van den Brink and Benschop note, universities are not monolithic institutions, as different  
24 academic fields ‘vary in their core activities, financial resources, career patterns,  
25 epistemological issues and publishing strategies’ (2012: 72). Furthermore, variation between  
26 universities, both among and within countries also needs to be taken into account especially  
27 when comparing institutional change patterns (authors 2017).  
28  
29  
30

31 To date there is little research informed by feminist institutionalist perspectives that examines  
32 institutional continuity and change in higher education contexts. At the same time, there is a  
33 growing body of literature which, informed by gender and organisational theory, explores the  
34 gendered nature of universities (Kezar and Eckel 2002; Erickson 2012; Benschop &  
35 Doorewaard 2012; Lester 2008; Lester, Sallee and Hart 2017). While this research is not  
36 specifically informed by a new institutionalist framework, it is making valuable contributions  
37 to our understanding of gender in higher education.  
38  
39

40 The article is divided in four sections. The first section sets out the contextual background,  
41 providing an overview of efforts to implement gender equality policies in higher education  
42 institutions in Europe and the impact so far in achieving goals. Section two provides a review  
43 of the literature on gender and institutions, while section three turns to the question of how this  
44 knowledge has been applied in research examining resistances to institutional change towards  
45 gender equality, with a special focus on higher education institutions. Finally, section four  
46 explores how feminist institutionalist approaches can inform a study of gender, institutions and  
47 institutional change in universities.  
48  
49  
50

## 51 **Contextual background**

52

53 In European universities, policy action towards gender equality, typically in the form of gender  
54 equality plans (GEPs), is becoming widespread. As one might expect, there is variation in  
55 relation to national coverage as well as the time when these initiatives were first introduced in  
56 each country. For example, German universities began to develop GEPs as far back as the  
57 1980s; universities in Austria and Sweden in the mid-1990s; those in the United Kingdom in  
58 the late 1990s; in Italy and Spain in the mid-2000s; in France and Ireland in the mid- 2010s;  
59  
60  
61  
62  
63  
64  
65

1 while in other European countries, GEPs in universities are only beginning to emerge  
2 (European Commission 2019a).

3 At European Union (EU) level, the 2015 Council conclusions on advancing gender equality in  
4 the European research area invited EU Member States and research funding organisations to  
5 provide incentives to encourage higher education institutions and research organisations to  
6 develop gender equality plans (GEPs) and to mobilise adequate resources to implement these  
7 plans (Council of the European Union, 2015). The EU has actively promoted these actions,  
8 mainly through its research and innovation programmes (FP6, FP7, Horizon 2020) and other  
9 supportive instruments, such as the European Institute for Gender Equality's GEAR online tool  
10 designed to inform and guide universities in setting up and implementing GEPs (EIGE 2016).  
11 There are also transnational initiatives in place, such as the commitment of the League of  
12 European Research Universities (LERU) to develop and implement GEPs in all its member  
13 institutions (LERU 2012).  
14  
15

16  
17 Data on progress in gender equality in higher education institutions suggest that those policy  
18 and legislative efforts have had some impact. For example, in the EU the proportion of women  
19 at senior levels in the academic hierarchy rose from 15% in 2004 (EU-25) to 22% in 2013 (EU-  
20 28), and to 24% in 2016. However, data continue to portray a sector in which significant gender  
21 inequalities persist. These concern the gender distribution of staff at different stages of their  
22 academic/research careers (vertical segregation) and across different disciplines (horizontal  
23 segregation), as well as in university governance structures. In 2013, women made up only 22  
24 % of grade A staff (full professorial level) in the EU, and this gap was even more pronounced  
25 in the field of science and engineering, where women represented only 13% of academics at  
26 this grade (European Commission, 2016:126; 2019b:115). Gender gaps also persist in  
27 governance bodies: in 2014 the proportion of women among heads of higher education  
28 institutions in the EU-28 was a mere 20 %, which increased modestly to 22% in 2017  
29 (European Commission 2019: 129).  
30  
31  
32

33 If these figures are contrasted with similar data in other sectors, it becomes clear that progress  
34 towards gender equality in higher education institutions is less advanced than it is in other  
35 sectors. For instance, in 2017 women made up 25% of public company board members, 28%  
36 of senior ministers and 29% of Members of Parliament (European Commission 2018: 65).  
37  
38

39 Quantitative data, however, only reveal the tip of an iceberg and are symptomatic of endemic  
40 gender inequality practices in academic institutions. Furthermore, experiences in gender  
41 equality initiatives elsewhere have shown that even if women reach parity with men in different  
42 structures of the academy, there is no guarantee that those institutions will operate in a more  
43 egalitarian manner (Penney, Brown and Oliveria 2007). As Van den Brink and Benschop  
44 (2012: 71) observe 'gender inequality resembles an unbeatable seven-headed dragon that has  
45 a multitude of faces in academic life'.  
46  
47

48 In understanding why policy efforts towards gender equality are not being translated into  
49 desired outcomes or why the pace of progress in this regard is slow and uneven, the literature  
50 on gender and institutions, particularly its feminist institutionalist variants, can provide an  
51 illuminating analytical framework.  
52  
53

### 54 **Gender and institutions**

55 Feminist scholars have been interested in gender and institutions since Kanter's (1977)  
56 pioneering work on gender and the dynamics of organisational behaviour. The focus of that  
57 research was not on the inherently gendered nature of institutional structures, but rather on the  
58 numerical composition of management teams. However, their work had an important influence  
59  
60  
61  
62  
63  
64  
65

1 on research into gender parity in a variety of institutions, as they considered how male-  
2 dominated decision-making groups react when women join in varying proportions.

3 Joan Acker was the first scholar to fully theorise the institutional embeddedness of gender.  
4 Acker coined and defined the term ‘gendered institutions’ to mean that gender ‘is present in  
5 the processes, practices, images, ideologies, and distributions of power in the various sectors  
6 of social life’ (1992: 567). While the norms of values of organisations are presented as ‘gender  
7 neutral’ (i.e., wrapped in a veil of objectivity and assuming a disembodied and universal  
8 worker) they are *de facto* deeply androcentric. Acker (1990) identified the multiple ways in  
9 which gender inequalities manifest in organisations. First, it is manifest in a division of labour  
10 where men are almost always in greater numbers in the highest positions of organizational  
11 power (e.g. higher faculty ranks in universities and in management and governance structures).  
12 Second, gendered organisations have symbols, language, and images that reinforce those  
13 unequal labour divisions (e.g., image of a professor as a successful white man endowed with  
14 epistemic authority). Third, gender inequalities in gendered organisations are manifest in  
15 interactions of dominance and submission between actors (e.g., women being interrupted more  
16 often than men in a faculty meeting). Fourth, in gendered organisations, actors take on gendered  
17 ways of thinking about work (e.g., that to have a successful academic career, it is necessary to  
18 work all hours). Fifth, gendering is embedded in organizational logic in a way that, for example,  
19 systems of job evaluation favour male characteristics and preferences for work roles (e.g.,  
20 evaluative criteria in academia that favour careers with no interruptions, research over teaching  
21 and pastoral work, and international mobility).

22 However, Acker’s theory has been criticised for its limitations in explaining how institutional  
23 change can occur. If individuals in a gendered organisation operate through gendered identities  
24 that are shaped by organisational norms, individual agency to change gendered organisations  
25 is suspended. It may be far more difficult to individually change and challenge the gendered  
26 system than to replicate existing norms and structures, yet evidence exists that some  
27 individuals, and more particularly groups, can alter organisational structures and cultures  
28 through acts of agency (Meyerson 2003; Kezar and Lester 2011). For example, Hart’s research  
29 (2008) found that feminist faculty groups were successful at improving the climate for women  
30 in their campuses. It showed that the degree to which women in these movements felt  
31 constrained by the organization and their profession was not universal and that change was  
32 possible through the promotion of more equitable practices over time.

33 Connell’s work on ‘gender regimes’ has also provided an important contribution to the thinking  
34 on gender and institutions. Institutions, according to them, can be seen as ‘gender regimes’ –  
35 a patterning of four sets of gender relations that includes: the gender relations of power; the  
36 gender division of labour; the gender dimension of emotion and human relations; and the  
37 gender dimension of culture and symbolism (Connell 2002). Acknowledging the existence of  
38 a gender regime is important because it provides new insights into how power relations in  
39 institutions produce and contest gender inequalities.

40 Feminist political scholars have made significant contributions to these questions, as they have  
41 been long interested in the factors conducive to institutional change through institutions,  
42 movements and policies such as women’s policy agencies, positive action interventions and  
43 gender mainstreaming. This research has analysed in detail the interaction between women’s  
44 movements and political institutions within the context of political opportunity structures, with  
45 the aim to understand the factors facilitating and constraining change towards gender equality  
46 (Outshoorn and Kantola 2007, Lovenduski 2008, McBride and Mazur 2010). However, in  
47 understanding the varying degrees of success of those initiatives, this research has come up  
48 against important limitations. One such limitation is a narrow focus on gender-specific

1 institutions, which makes it difficult to uncover the internal gender dynamics of institutions  
2 and institutional change more generally (such as institutions of higher education). A second  
3 limitation is a tendency to overemphasise women's agency without paying sufficient attention  
4 to structural constraints in achieving institutional change (Waylen 2014: 215)

5 Against this backdrop, gender and politics scholars sought to improve the analytical  
6 frameworks for understanding institutional continuity and change in relation to gender equality  
7 and the gap between formal rhetoric and the practice of gender policy initiatives. Feminist  
8 institutionalism developed in the early 2000s in response to the scholarship of new  
9 institutionalism, which was rediscovering and theorising on the inter- and intra- dynamics of  
10 political institutions (Mackay, Kenny and Chappell 2010).  
11  
12

13 For feminist institutionalists, to say that an institution is gendered means that constructions of  
14 masculinity and femininity are intertwined in its daily life and logic rather than existing  
15 independently of the institution (Kenney, 1996: 456). Feminist institutionalism also brings  
16 power to the forefront of institutional analyses. While issues of gender and power have long  
17 been a central concern of feminist scholarship in general, it is only recently that feminist  
18 political scientists have turned to the importance of institutions in both reflecting and  
19 reinforcing gender-power relations (Mackay, Kenny and Chappell 2010: 578).  
20  
21

22 A major point of commonality between feminist approaches to institutionalism and new  
23 institutionalist analysis is a focus on both formal and informal institutional rules. The  
24 distinction between formal and informal rules can be useful for understanding why the  
25 introduction of new formal rules (e.g., gender parity in evaluation panels) is not always  
26 translated into intended actions and desired outcomes, since informal rules - which often take  
27 subtle forms, such as patronising, shunning or social ostracism - can play an important role in  
28 undermining institutional change (Chappell and Waylen 2013, Waylen 2014). Thus, a change  
29 in the formal rules of an organisation may end officially sanctioned gender inequalities without  
30 ending gender inequality in all its forms.  
31  
32

33 Feminist institutionalism also emphasises the importance of strategic agency in institutional  
34 change, highlighting the ways in which actors initiate change within a context of opportunities  
35 and constraints (Chappell 2002, 2006). Resistance to change appears when individuals  
36 internalise the existing informal gender norms of an organisation. As Acker observed "a belief  
37 that there is no point in challenging the fundamental gender, race, and class nature of things is  
38 a form of control. These are internalized, often invisible controls" (2016, 454). Yet research  
39 on gender and organisations has shown how actors can change the norms and institutional  
40 structures in which they operate (Fox 2008; Kezar 2014; O'Meara and Stromquist 2015; Ward  
41 and Wolf-Wendel, 2012). Institutions, in sum, are not only gendered but they can be de-  
42 gendered as actors make changes to the status quo.  
43  
44  
45

46 According to feminist institutionalists, change is made possible because institutions are full of  
47 contradictions and conflicting interests and, therefore, can create opportunities for the exercise  
48 of feminist agency (Kantola 2006). Nonetheless, the institutional context in which actors  
49 operate can constrain or facilitate actions in important ways. Understanding this context  
50 involves paying close attention to the gender dimensions of both the formal and informal rules  
51 that exist in an organisation.  
52  
53

54 The task of identifying informal rules and evaluating their role in facilitating and constraining  
55 institutional change towards gender equality poses methodological challenges. This is because  
56 informal rules are hidden. They are embedded in everyday gendered practices that are disguised  
57 as standard behaviour and are, therefore, taken for granted. Overcoming this challenge requires  
58 carefully designed research methodologies (Chappell and Waylen 2013). How feminist  
59  
60  
61  
62  
63  
64  
65

1 institutionalist theory – in its different variants - can be used as a framework for an analysis of  
2 institutional continuity and change in specific academic contexts is a question to which we will  
3 return in section 4.

#### 4 **Resistance to gender equality in higher education: the role of merit**

5  
6 An increasing number of universities across Europe are developing gender equality action  
7 plans (GEPs). While their adoption can be unproblematic, their impact on institutional change  
8 depends on a variety of factors such as knowledge and awareness of gender issues through  
9 gender theory and research evidence, commitment from senior management, sufficient levels  
10 of human and financial resources, leadership at all levels, and sustained stakeholder  
11 engagement (EIGE 2016, see also, Thomas et al. 2017).  
12  
13

14 Traditionally, the focus of research on institutional change has been on understanding success,  
15 although cases of unsuccessful implementation of gender equality initiatives are common.  
16 Erikson-Zetterquist and Renemark (2016) make a distinction between formal and informal  
17 elements of institutional change. Gender equality principles may be easily introduced into the  
18 formal structures of an organisation, yet for these formal elements to make an impact on the  
19 day-to-day routines, they need to be translated into stabilised practices, otherwise gender  
20 equality goals can easily fade away.  
21  
22

23 In analysing cases of implementation failure, authors are using the concept of resistance as an  
24 organising principle of research with a powerful explanatory potential. Mergaert and Lombardo  
25 (2013, 2014) unpacked the concept of resistance to institutional change in a study examining  
26 failure in the implementation of gender mainstreaming in EU research policy. As a typical case  
27 of unproblematic policy adoption but of little tangible progress resulting from policy  
28 implementation, their analysis focused on the concept of ‘resistance’ as a primary factor  
29 explaining lack of success. They defined resistance as:  
30  
31

32 a phenomenon that emerges during processes of change—such as when gender equality  
33 policies are implemented—and that is aimed at maintaining the status quo and opposing  
34 change (2013: 299).  
35

36 Resistance is a largely invisible phenomenon which only becomes manifest during processes  
37 of change. For analytical purposes, these authors make a distinction between two main types  
38 of resistances - institutional and individual- both of which can be expressed either explicitly or  
39 implicitly. Institutional resistance, in their definition, is ‘revealed by a pattern of aggregated  
40 action or inaction that is systematically repeated and that suggests a collective orchestration  
41 against gender change’ (Mergaert and Lombardo 2014, 9), while individual types of resistance  
42 are exercised by individual actors and manifested in action or inaction opposing change.  
43  
44

45 Resistance to change towards gender equality is of special interest to scholars analysing  
46 implementation failure from a feminist institutionalist perspective. Yet, its analysis presents a  
47 number of challenges. The first one is how to select case-studies of implementation failure.  
48 Bergqvist, Bjarnegård and Zetterberg (2013) draw a distinction between two forms of non-  
49 decision-making – ‘failure’ and ‘status-quo’ – and contend that for ‘failure’ to happen the  
50 ‘status-quo’ must be challenged in one way or another. It is only in such cases that resistances  
51 can emerge and, therefore, be identified.  
52  
53

54 Once the case-studies of implementation failure have been selected, a second challenge is how  
55 to identify instances of resistance. If the concept is not adequately defined and operationalised,  
56 resistance can be either misidentified or misrecognised. An added difficulty is that both  
57 institutional and individual types of resistance can be expressed implicitly. Explicit  
58 manifestations of institutional resistance will be easier to detect as these ‘can take the form of  
59  
60  
61  
62  
63  
64  
65

1 policy discourse that expresses ideas and aims that distance themselves from the goal of  
2 promoting gender equality, or it can take the form of actual policy actions that go against that  
3 goal' (Lombardo and Mergaert 2013: 301). By contrast, implicit resistance does not manifest  
4 overtly and it can find an expression in lack of action (Mergaert and Lombardo 2014: 8). This  
5 renders its identification rather problematic as not all instances of inaction can be interpreted  
6 as expressions of implicit resistance. Identifying this type of resistance thus requires an  
7 empirical analysis of data collected through qualitative methods such as participant  
8 observation, semi-structured interviews and/or focus groups. The main focus of these data-  
9 gathering exercises will be on actors and the strategies used to resist change. These actors may  
10 work either collectively or individually, but they may also work across institutional boundaries  
11 so that so that it may be necessary to look beyond the organisation to understand the dynamics  
12 of resistance in the implementation of a GEP (Annesley and Gains, 2010).  
13  
14

15 Once resistances have been identified, new institutionalist theory posits that they should be  
16 traceable to institutional rules, whether these are formal or informal. However, not all  
17 identified resistances may traceable to institutional rules that are specifically about gender.  
18 Gains and Lowndes (2014: 528) contend that, in studies of gender and institutional change, the  
19 focus should rather be on rules that have gendered effects. Examples include informal rules  
20 about what makes a good leader, about timing and location of meetings, or about the  
21 appropriate age for specific roles within the organisation. Similarly, in a study of faculty  
22 women in Science, Technology, Engineering and Mathematics (STEM), Hart (2016)  
23 uncovered a variety of informal institutional rules and practices around access to networks,  
24 assignment of workloads, promotion processes and pathways to leadership, all of which have  
25 powerful gender effects as they have been shown to disadvantage women academics.  
26  
27

28 Experiences in GEP implementation have detected a variety of resistances, yet systematic  
29 analyses are rare. Using qualitative content analysis of interviews as their main methodology,  
30 Van den Brink and Benschop (2012) conducted an empirical study of the obstacles in the  
31 implementation of gender equality initiatives in the recruitment and selection of full professors  
32 in seven Dutch universities. The objective of their study was to reach a better understanding of  
33 the limited effect of gender equality practices in achieving sustained institutional change in  
34 academic institutions. Their study found a myriad of gender inequality practices that hinder,  
35 obstruct, and even hijack, practices aimed at a more balanced representation of women and  
36 men in professorial posts. These include, amongst others, opaque selection and promotion  
37 criteria and procedures; persistence of patriarchal support networks; a paternalistic view that  
38 combining a career with family responsibilities is too hard for women, and gender stereotypes  
39 shaping the image of the 'ideal scientist'.  
40  
41  
42  
43

44 However, one particularly salient resistance to gender equality initiatives found in all the fields  
45 analysed in their study was a pervasive attachment to the principle dictating that candidates  
46 should be appointed on the basis of their merit. This is a principle that is inherently gender  
47 biased, although it is based on the assumption that the academic recruitment system is gender  
48 neutral, offering equal opportunities to all candidates irrespective of their gender, insofar as  
49 they are equally meritorious (see also Heward 1994; Bagilhole and Goode 2001; Scully 2002;  
50 Krefting 2003; Morley and Lugg 2009; Thornton 2013; Trevino et. al 2015). The authors  
51 conclude that the deep institutional entrenchment of merit renders invisible the discrepancy  
52 between academic values and actual practices and outcomes. As a result, institutional rules go  
53 unquestioned as standards for promotion and appointments are viewed as fair, offering the  
54 same opportunities to all candidates. Furthermore, as institutional rules in recruitment and  
55 selection are perceived to be beyond reproach, gender inequality is regarded as a problem of  
56 'supply'; in other words, women lack the profile, record or experience required to be  
57 meritorious candidates and successful applicants.  
58  
59  
60  
61  
62  
63  
64  
65

1 To sum up, the study revealed the role of ‘merit’ as a core institutional principle that is at the  
2 root of much resistance to change, not just in policy implementation but as early as policy  
3 formulation, as their approach identified resistances at the very early stages of the policy  
4 process. If it is assumed that the ‘merit’ principle governs not only the processes of selection,  
5 recruitment and promotion of academic staff, but other academic activities as well (e.g.,  
6 publication and dissemination activities, research grant allocations, and so on) then this concept  
7 must be deconstructed and its role in gender practices in academic institutions unveiled. As one  
8 feminist scholar puts it, this is a concept that ‘lies at the heart of the intractable gender binary  
9 within the academy’ (Thornton 2013: 128).

10  
11 The task is not without challenges, as merit is a concept that goes unquestioned while it shapes  
12 the way we interpret reality. This means that any evidence of gender gaps in relation to  
13 percentage of professors, research project leaders, or publications, is not seen as a problem with  
14 merit but rather as one of gender barriers that keep women from reaching the standard of  
15 excellence required, such as, for example, difficulties in balancing work and family life, or lack  
16 of confidence (Ward and Wolf-Wendel 2012).

17  
18  
19 Measures to tackle gender bias when assessing academic merit in recruitment and promotion  
20 processes are now included in a large number of GEPs of European universities. Two typical  
21 types of measures are gender parity in selection committees and compulsory gender bias  
22 training for committee members. In addition to this, a variety of initiatives aimed at changing  
23 how excellence is measured have been set in place with a view to tackling not only gender  
24 biases in assessments of merit but also to change the criteria by which those assessments are  
25 made, addressing its gendered assumptions. One such initiative is the Code of Conduct for the  
26 Recruitment of Researchers, adopted by the European Commission in 2005. The Code consists  
27 of a set of general principles and requirements that should be followed by employers and/or  
28 funders when appointing or recruiting researchers, providing a common policy framework in  
29 the European Research Area (ERA). The Code contains a number of non-legally binding  
30 principles that are relevant to gender equality. It recommends that selection committees should  
31 have an adequate gender balance and that recruitment and selection processes should be open  
32 and transparent. It also recommends that evaluations of merit should focus on ‘results within  
33 a diversified career path and not only on the number of publications’; that bibliometric  
34 measures ‘should be properly balanced within a wider range of evaluation criteria, such as  
35 teaching, supervision, teamwork, knowledge transfer, management of research and innovation  
36 and public awareness activities’, and that career breaks or variations in the chronological order  
37 of CVs should not be penalised but regarded as an ‘evolution of a career’ (European  
38 Commission 2005: 25-26). The Code incorporated many recommendations of a previous  
39 European Commission report on “minimising gender bias in the definition and measurement  
40 of scientific excellence” (European Commission 2004). These recommendations covered five  
41 areas where gender bias was identified: a) the characterisation of scientific excellence; b) the  
42 criteria used to assess it; c) the choice of the explicit and implicit indicators for scientific  
43 excellence;(c) the way the criteria are applied to men and women; d) the failure to integrate  
44 women in scientific networks; and e) the procedures through which criteria are applied to  
45 people.

46  
47  
48 However, the impact of these initiatives on GEP design and implementation is still intangible.  
49 A recent analysis of GEP actions to redress gender inequalities in the hiring and promotion of  
50 academic staff included in the GEPs of six European universities (authors 2018) found that  
51 only two universities (Barcelona and Science Po) had measures in place to tackle gender  
52 discrimination in the criteria used in assessments of merit. Furthermore, the wording of these  
53 measures was vague, providing next to no detail. In the GEP of Science Po this was included  
54 in a more general action to implement the European Code of Practice for the Recruitment of  
55  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

1 Researchers. The GEP of Barcelona guaranteed that the criteria used in the evaluation of CVs  
2 did not contain any element of indirect discrimination, yet it failed to explain how this  
3 guarantee was to be implemented.

4 Given the invisibility of the gendered construction of academic merit, uncovering its role in  
5 perpetuating gender inequalities and hindering institutional change in higher education settings  
6 requires carefully designed analytical frameworks and methodological approaches.  
7

### 8 **Researching gender and institutional change in academia. A feminist institutionalist** 9 **framework.**

10 In researching the origins, continuity and change of gendered institutions, feminist  
11 institutionalists have developed their own analytical frameworks by drawing on different  
12 variants of new institutionalism: rational choice (RCI), historical (HI), sociological (SI) and  
13 discursive (DI). While each of them have been used for understanding different aspects of the  
14 relationship between gender and institutions, the choice of approaches largely depends on the  
15 type of institutions under study and the specific questions, objectives and focus of the research.  
16

17 Rational choice institutionalists (RCI) focus on the role of institutional rules in constraining  
18 actors' behaviour. In their view, actors' behaviour is driven by a strategic calculus that is aimed  
19 at maximising their own interests, although this calculus will be affected by expectations about  
20 how others are likely to behave. Institutional rules structure these interactions by restricting  
21 actors' choices but also by eliminating uncertainty (Hall and Taylor 1996). Rational choice and  
22 feminist institutionalists exist in an uneasy relationship to one another. Feminists consider  
23 rational choice theory to be based on assumptions about the gendered world that are both sexist  
24 and androcentric, while rational choice scholars ignore the intellectual contribution of feminist  
25 scholarship to understanding motivation, interests and behaviour (Driscoll and Krook 2009,  
26 238-239). Nonetheless, their very different starting points can create a strong analytical  
27 perspective when combined, as Driscoll and Krook (2009) illustrate in relation to explaining  
28 the adoption of gender quotas in politics. There are increasing examples of various forms of  
29 preferential action, up to and including quotas, being put into effect in higher education. One  
30 example is the creation of full professorial and other academic posts to which women's  
31 applications are given preferential treatment. Instances include the Senior Academic  
32 Leadership Initiative (SAL Initiative) of the Irish government, the University of Delft  
33 (Netherlands) scheme for women-only fellowships and the University of Melbourne, Australia  
34 female-only posts in the School of Mathematics and Statistics. Each of these initiatives is  
35 designed to address the lack of female representation in disciplines and seniority in higher  
36 education. A feminist institutionalist rational choice approach could illuminate why male  
37 academic elites approve of measures that on the face of it affect their self-interests. However,  
38 to date, there has been very little appetite among feminist scholars to expand on what a feminist  
39 RCI approach would look like, and to apply it in any field, including higher education studies.  
40

41 Sociological institutionalists (SI) emphasise the social rather than the structural features of  
42 institutions. In their view, institutions are 'systems of meaning' that reflect shared  
43 understandings of the way the world works. Thus, institutions do not only include rules and  
44 practices, but are also 'symbol systems, cognitive scripts and moral templates that provide the  
45 frames of meaning guiding human behaviour' (Hall and Taylor, 1996: 947). Institutional actors  
46 are, in sum, social beings who act in habitual ways, following a 'logic of appropriateness' that  
47 both prescribes and proscribes certain types of behaviour (March and Olsen 1989).  
48

49 Feminist revisions of SI, particularly in the attention given to culture, can counterbalance a  
50 rational-choice conception of institutional actors and illuminate the role of informal rules in  
51 resisting gender equality in academic settings. For SI scholars, institutional practices are not  
52  
53  
54  
55  
56  
57  
58  
59  
60

1 rooted in rationality but rather in a ‘logic of appropriateness’ based on norms which are widely  
2 valued within a culture and which enhance the legitimacy of a given institution (Mackay,  
3 Monro and Waylen 2009). Borrowing from these SI main tenets, feminist institutionalists have  
4 unveiled the gender dimensions of the ‘logic of appropriateness’ and its role in resistances to  
5 institutional change. More specifically, they have shown how the ‘logic of appropriateness’ is  
6 presented in a gender-neutral disguise and how, the more embedded and enforced this norm of  
7 gender neutrality is, the harder it is for feminists to advance claims of gender bias (Chappell  
8 2006). This finding resonates with the deep entrenchment of the norm of neutrality of the merit  
9 principle and can help explain how hard it is for feminists to contest it and subvert it. By  
10 focusing on the role of culture, SI analyses of gender and institutions can be quite useful for  
11 explaining institutional similarities (for example, isomorphisms in institutional norms,  
12 procedures and practices in universities across different countries). Nonetheless, it cannot  
13 adequately explain differences resulting from institutional change, particularly endogenous  
14 institutional change (Mackay, Monro and Waylen 2009).  
15  
16

17 Historical institutionalism focuses on the evolution of institutions over time and aims to unveil  
18 the causal mechanisms underlying institutions’ historical development. This is carried out  
19 through methods of comparative research and historical process-tracing (Waylen 2009: 246).  
20 In this analytical framework, once an institution is created, it tends towards a ‘path  
21 dependency’, embedding a set of both formal and informal rules that constrain future  
22 opportunities for institutional change (Pierson, 2004). The notion of ‘path dependence’ does  
23 not imply that institutions are historically determined (Kenny 2007: 93), but rather that these  
24 path-dependency processes provide the conditions that render a certain course of action more  
25 or less appropriate than others (Kulawik 2009: 265).  
26  
27  
28

29 Feminist institutionalists have found HI very valuable for understanding the role played by  
30 historical factors in resistance to institutional change towards gender equality. As gender norms  
31 become entrenched in the structures and practices of an institution over time, they shape what  
32 is considered ‘normal’ or ‘common sense’, and therefore these norms become invisible  
33 (Kronsell 2016). The notion of ‘path dependence’ is useful for addressing questions concerned  
34 with the role of institutional legacies in resisting change towards gender equality in higher  
35 education. It helps to understand the deep entrenchment of the neutrality of the merit principle  
36 and why it is so difficult to contest and subvert this norm. It also helps to explain why a change  
37 in the formal institutional rules of an organisation (for example, a rule dictating that selection  
38 panels in academic recruitment and promotion should be gender balanced) is not sufficient to  
39 tackle gender bias in decision-making processes.  
40  
41  
42

43 HI can also illuminate comparative analyses of varying outcomes of gender practices, not only  
44 in different academic institutions but also in different academic fields. As we have seen in the  
45 previous section, academic institutions are not monolithic entities, and one of the explanations  
46 for this is that they are historically constituted. Historical institutionalism can help illuminate  
47 how the merit principle became a core institutional rule (both formal and informal) in academic  
48 practices and procedures; how this is being interpreted in different universities and academic  
49 fields and why it produces varying gendered outcomes.  
50  
51

52 Another advantage of HI is its attention to power. As Hall and Taylor contend (1996: 941), HI  
53 is more likely than other variants to assume a world in which institutions have historically  
54 privileged some groups over others, giving them more access to decision-making processes,  
55 and more rewards and recognition from the institution.  
56

57 However, this variant of new institutionalism has limitations. One such limitation is a strong  
58 focus on causal factors, which can be inadequate for studies examining resistances to change  
59 in academic institutions that aim to go beyond an understanding of its causes. Put differently,  
60  
61  
62

1 the question of how the merit principle is created, re-created, reinforced, contested and/or  
2 subverted through institutional (gendered) practices goes beyond the historical, path-  
3 dependence, legacy explanation offered through HI.

4 Discursive institutionalism (DI), the most recent variant of new institutionalism, can overcome  
5 some limitations of HI. Focusing on ideas and on the interactive processes of discourse through  
6 which these ideas are generated and communicated, this approach views institutions and their  
7 rules as ‘simultaneously constraining structures and enabling constructs of meaning which are  
8 internal to strategic actors seeking to realize complex and contingent goals (Schmidt 2010: 4).  
9

10 DI has been particularly amenable to feminist appropriation and it is thus the preferred variant  
11 of many scholars investigating the interplay between gender, institutions and institutional  
12 continuity and change. On the one hand, DI highlights the importance of discourse and its  
13 relationship to power in generating and legitimising ideas and cementing the gendered ‘status  
14 quo’ of an institution. Dominant ideas become so accepted that their very existence may be  
15 forgotten, yet they structure people’s taken-for-granted views (such as those in relation to the  
16 merit principle) as well as the methods, instruments and goals used (for example, in merit  
17 assessments). However, DI also highlights the role of agency, as it focuses on the interactive  
18 processes by which ideas are generated, communicated, deliberated, and/or contested. In doing  
19 so, it acknowledges the existence of discursive struggles and can show how the ‘status quo’ is  
20 capable of change (Fischer 2003).  
21  
22  
23

24 One problem with DI is that it erases the distinction between institutions and discourses  
25 (Freidenvall and Krook 2007). Once this distinction is blurred, it is hard to identify the  
26 conditions under which actors ‘use’ discourse to effect institutional change (that is, a change  
27 in the formal/informal rules of the organisation) or the moments when actors are being ‘used’  
28 by discourse in resisting such change.  
29  
30

31 Kulawik (2009) shows how historical and discursive variations of new institutionalism  
32 complement each other and how they can be used in an integrated (feminist) approach by  
33 deconstructing the dichotomy of causal explanation versus meaning and description, and  
34 reformulating (rather than eschewing) the concept of causality. In their view, an adequate  
35 explanation must include the concept of meaning. In conducting comparative analyses, it is  
36 important to take into account that countries differ not only in terms of their institutions ‘but  
37 also in the way that problems and their causes are interpreted, which, in turn, influence the  
38 solutions that are deemed appropriate’ (Kulawik 2009: 266).  
39  
40

41 At this point in the evolution of feminist institutionalist theory, an integrated approach that  
42 borrows from the strengths of both HI and DI can be particularly useful for an analysis of  
43 institutional change towards gender equality and the resistances to such changes in academic  
44 settings. This facilitates discourse analyses of how gendered institutional rules such as the merit  
45 principle is interpreted, who holds the power and legitimacy over these interpretations and how  
46 change can come about through discursive contestations. At the same time, the HI concept of  
47 ‘path dependence’ can illuminate a meso-level analysis of differences among and within higher  
48 education institutions with regards to varying interpretations of institutional rules such as the  
49 merit principle. HI also allows for an analysis of the wider institutional context in which change  
50 occurs, looking for critical junctures and opening up the possibility that change may be  
51 unforeseen at the time, or be the outcome of unintended consequences.  
52  
53  
54

## 55 **Conclusions**

56 This article has explored research on gender and institutions for the purposes of informing  
57 analytical frameworks for research on institutional change in higher education contexts.  
58 Drawing on the feminist institutionalist literature that explores the relationship between  
59  
60  
61  
62  
63  
64  
65

1 gender, institutions and institutional continuity and change, the aim was to evaluate how this  
2 body of work, together with contributions from gender and organisational studies, could be  
3 adapted to a study seeking to understand the dynamics of implementation of gender equality  
4 action plans (GEPs) in higher education institutions around Europe.

5 While GEPs in universities are becoming the norm and there is evidence of some progress  
6 towards gender equality in this sector, legislative and policy efforts are not sufficiently  
7 translated into desired outcomes. In understanding the factors hindering implementation, this  
8 article turned to the concept of resistances to institutional change. This concept has been  
9 unpacked by gender scholars working with new institutionalist frameworks with the aim of  
10 gaining a better grasp of cases of failure (or partial success) in the implementation of gender  
11 equality initiatives in the political realm. Their work uncovers the role of informal  
12 (gendered) institutional rules in hindering change towards gender equality and also highlights  
13 their informal and implicit nature. In the light of this insight, this article discussed the  
14 difficulties involved in the construction of appropriate methodologies for the identification,  
15 analysis and evaluation of resistances in the context of empirical research.

16 However, while the gender and politics literature inspired by new institutionalist frameworks  
17 can provide useful conceptual and methodological tools for constructing a research design  
18 focused on academic institutions, an isomorphism with political institutions cannot be  
19 assumed. For this reason, this study turned to research, mostly inspired by gender and  
20 organisational studies, which examines resistances to institutional change towards gender  
21 equality in the specific setting of academia. Among the many factors hindering gender  
22 equality initiatives and practices in universities, that research highlights the role of academic  
23 merit as a major obstacle. Disguised as a gender neutral and objective norm, it constrains  
24 transformative change not only in implementation processes but also in earlier processes of  
25 policy formulation and adoption.

26 There are different feminist institutionalist approaches (each drawing on the different variants  
27 of new institutionalist theory) that can be used to inform a research design aimed at a better  
28 understanding of the merit principle as a major source of resistance constraining the design and  
29 implementation of GEPs. This article ends with a discussion of the merits and weaknesses of  
30 these approaches for a study focussed on academic institutions, concluding that an integrated  
31 approach borrowing from more than one variant has two advantages. First, it provides the  
32 flexibility needed for a study where there is little research available to date, and second, it can  
33 remedy the shortcomings associated with the rigid adoption of just one individual approach. At  
34 any rate, the choice of approach ultimately depends on the specific research questions,  
35 objectives and methodologies of the study.
