Abstract

The first comprehensive checklist of the Lepidoptera of Canada and Alaska is presented. Taxonomic papers, historical regional checklists, and many collections were consulted to prepare the list. The known distributions of species are listed for the provinces and territories of Canada and the state of Alaska in the USA. The province of Newfoundland and Labrador is further divided into separate listings. A total of 5431 species belonging to 82 families are confirmed as occurring in Canada and Alaska, as well as 53 species that have been reported from the region but not yet verified, 19 species listed as interceptions or unsuccessful introductions, and 52 species listed as probably occurring in the region. A total of 318 species have been reported in error in historical works, and they are listed as well, clearly indicated as erroneous records. All erroneous records and uncertain listings are detailed with notes. All Nearctic subspecies and synonyms are included in the list, except for butterfly subspecies (and their synonyms) that do not occur in the region.

Preface

Over a century ago, C. Gordon Hewitt (1911, 1912) proposed producing a list of the Lepidoptera (and other insects) of Canada, to update the preliminary list by the Natural History Society of Toronto (NHST) (1883). That project got as far as the assembly of a group of experts (including A. Gibson, H.H. Lyman, A.F. Winn, and F.H. Wolley Dod who were responsible for the Lepidoptera), before it was derailed by the first World War and the untimely deaths of some of the key proponents. Now, over a century later, we have realized that goal of producing a comprehensive list of the Lepidoptera of Canada. Although NHST (1883) listed the butterflies and macromoths of Canada, it omitted most of the microlepidoptera and was far from a comprehensive list. The current list is the first attempt to compile all known records and accessible data, as a baseline for the region. It represents an inventory of species' occurrence here, before the changes in species composition and distribution that are expected from the changing climate that is becoming apparent in the early 21st century, as well as from habitat loss and invasive organisms that are occurring at an unprecedented pace. Our hope is that it will be useful for researchers, collectors, resource managers, and conservation workers. We welcome future workers to improve upon our list by clarifying uncertainties, correcting mistakes, and providing new information.

We are including Alaska in this publication, as it is ecologically very similar to the northern parts of Canada. Therefore it is a list of the Lepidoptera of the northern part of North America, excluding Greenland, at the level of the provinces, territories, and other political units. We have listed the Island of Newfoundland separately from Labrador, which together make up the province of "Newfoundland and Labrador".

This checklist was compiled largely by GRP between 1999 and 2016, with additional information added and the entire list vetted by the other authors. Province-, territory-, and state-level information was extracted from taxonomic and biodiversity publications from the past 100+ years, from label data in public and private collections in Canada, as well as from several online sources of information. A total of over 190,000 data records were extracted from these sources, representing over 24,000 unique provincial/territorial/state-level distribution records of valid species. Data sources are detailed in the materials and methods section. We have not thoroughly verified every record appearing in this list; those that are considered uncertain are indicated as such. We believe it is prudent to make this list available now, with those uncertainties, rather than withholding it until it is perfected. Our intent is to produce regular updates so that some version of this document will remain current and accessible.

Although each of the authors of the list had a significant role in various aspects of the overall publication, specific authorship has also been assigned to each family in the list.

Acknowledgements

Many people helped us over the past 15 years with this project. For providing access to specimens and data in their care, we thank: Gary Anweiler (Edmonton, AB), Libby Avis (Port Alberni, BC), Patricia Baines (CFS, Corner Brook, NL), Carle Bélanger (Havre-Saint-Pierre, QC), Charley Bird (Erskine, AB), Rob Cannings (RBCM, Victoria, BC), Syd Cannings (Whitehorse, YT), Hector Carcamo (AAFC, Lethbridge, AB), Suzanne Carriere (Yellowknife, NT), Alain Charpentier (Saint-Hyacinthe, QC), Tyler Cobb (RAM, Edmonton, AB), Claudia Copley (RBCM, Victoria, BC), Jeff Crolla (Toronto, ON), Doug Currie (ROM, Toronto, ON), Peggy Dixon (AAFC, St. John's, NL), Jim Edsall (Dartmouth, NS), Mario Fréchette (Québec City, QC), Ken Fry (Olds College, Olds, AB), Jeremy Gatten (Sidney, BC), Donna Giberson (University of PEI, Charlottetown, PE), Cedric Gillott (University of Saskatchewan, Saskatoon, SK), Daniel Glaeske (Assiniboia, SK), Jen Gleason (BOLD, University of Guelph, Guelph, ON), Jim Hammond (CFS, Edmonton, AB), Daniel Handfield (Saint-Mathieu de Beloeil, QC), Louis Handfield (Mont-Saint-Hilaire, QC), Robert W. Harding (Summerville, PE), Andrew Hebda (NSPM, Halifax, NS), Gerald Hilchie (Edmonton, AB), Dave Holden, (Port Coquitlam, BC), Reverend Ron Hooper (deceased, Fort Qu'Appelle, SK), Brad Hubley (ROM, Toronto, ON), Lee Humble (CFS, Victoria, BC), Ted Johnson (Lac La Biche, AB), Colin Jones (Peterborough, ON), Normand Juneau (Saint-Maurice, QC), Janis Klapecki (MMMN, Winnipeg, MB), Jan Klimaszewski (CFS, Québec City, QC), Léo-Paul Landry (Shawinigan, QC), David Langor (CFS, Edmonton, AB), "Physics Dave" Lawrie (Edmonton, AB), Chris Majka (Halifax, NS), Don McAlpine (NBPM, Saint John, NB), Fritz McEvoy (Dingwall, NS), Ernest Mengersen (deceased, Olds College, Olds, AB), Randy Mooi (MMMN, Winnipeg, MB), John Morton (deceased, Waterloo, ON), Lori Nichols (Transcona Museum, Winnipeg, MB), Dean Nicholson (Cranbrook, BC), Wayne Nordstrom (Saint Albert, AB), Meghan Noseworthy (CFS, Victoria, BC), Shelley Pardy (NL Dept. of Environment and Conservation, Corner Brook, NL), Caroline Parsons (AAFC, Saint John's, NL), Kenelm Philip (deceased, Fairbanks, AK), Ted Pike (Calgary, AB), Ray Poulin (RSM, Regina, SK), Michel Pratte (Shawinigan, QC), Bob Randell (University of Saskatchewan, Saskatoon, SK), Don Reynard (PFRA, Indian Head, SK), Rob Roughley (deceased, University of Manitoba, Winnipeg, MB), Jan Scott (Medicine Hat, AB), Barb Sharanowski (University of Central Florida, Orlando, FL), Cory Sheffield (RSM, Regina, SK), Jon Sheppard (Corvallis, OR), Danny Shpeley (University of Alberta, Edmonton, AB), Derek Sikes (University of Alaska, Fairbanks, AK), Cyndi Smith (Parks Canada, Waterton, AB), Felix Sperling (University of Alberta, Edmonton, AB), Jonathan Sylvestre (Manseau, QC), Angela Telfer (BOLD, University of Guelph, Guelph, ON), Dragomir Vujnovic (AB Environment and Parks, Edmonton, AB), Ksenija Vujnovic (AB Environment and Parks, Edmonton, AB), Reggie Webster (CFS, Fredericton, NB), Richard Westwood (University of Winnipeg, Winnipeg, MB), Terry Wheeler (deceased, McGill University, Montreal, QC), and Lisa Wilkinson (AB Environment and Parks, Edson, AB).

For providing taxonomic and biological information, and assisting us in identifying specimens, we thank: Leif Aarvik, Gary Anweiler, Kyhl Austin, Charley Bird, Charles Bordelon (deceased), Robert Bouchier, John Brown, Richard Brown, John Calhoun, Charlie Covell, Lars Crabo, Don Davis, Camiel Doorenweerd, Vladimir Dubatolov, Charley Eiseman, Cliff Ferris, Larry Gall, Todd Gilligan, Cris Guppy, Terry Harrison, Jim Hayden, Ron Hodges (deceased), Dave Holden, Lauri Kaila, Ole Karsholt, Norbert Kondla, Jim Kruse, Bernard Landry, Sangmi Lee, Alec McClay, Eric Metzler, Don Miller, Patrick Mrazek, Steve Nanz, Margaret Ormes, Stephen Passoa, Bob Patterson, Jonathan Pelham, Olle Pellmyr, Kenelm Philip (deceased), Ted Pike, Jerry Powell, James Scott, Jan Scott, Jae-Cheon Sohn, Bill Taft, and Tony Thomas.

For assisting us with data collection, and providing encouragement in tangible and intangible ways, we also thank: Gary Anweiler, George Ball, Patrice Bouchard, Mélanie Brochu, Océanne Brochu-Gayle, John Brown, Richard Brown, Lars Crabo, Rob Curtiss, Barbara Deneka, Paul Hebert, Rémi Hébert, Reverend Ron Hooper (deceased), Christi Jaeger, Shashi Juneja, David Langor, Solange Macaulay, Steve Nanz, Shelley Pardy, Bob Patterson, Jonathan Pelham, Kevin Robertson, Bruce Rodrigues, Cyndi Smith, and Felix Sperling. We also thank the taxonomists whose revisionary work provides the names and taxonomic scheme employed here, and the amateur naturalists past and present, whose specimens form a huge part of the data we have

captured for this publication. This work would not have been possible without the aforementioned vast community of colleagues who have shared their time and expertise. If we have missed anyone, we sincerely apologize for the oversight.

The authors thank the institutions several of us are employed at, for supporting our work on this project. In particular we thank Natural Resources Canada, Agriculture and Agri-Food Canada, and the University of Guelph for contributing to publication costs. This paper contributes to the University of Guelph's Food From Thought research program supported by the Canada First Research Excellence Fund.

Introduction

Moths and butterflies comprise the insect order Lepidoptera, characterized by two pairs of scale-covered wings, and, in most groups, reduced mandibles. Evolutionarily, butterflies represent just a small branch of the insect lineage that is the Lepidoptera. Butterflies are primarily day-flying and usually brightly coloured; most moths are nocturnal and tend to be more cryptically coloured. Presently about 158,000 Lepidoptera species are known worldwide, but many more are discovered every year, and the actual total is thought to be between 300,000 and 400,000 (Kristensen et al. 2007). Butterflies are much better known than moths, but moth species outnumber butterfly species by at least 10 to one. An excellent summary of the higher classification of the order was presented by Aarvik et al. (2017).

Canada and the USA state of Alaska comprise the continental portion of northern North America, excluding Greenland (hereafter abbreviated as nNA). This vast area stretches across almost 150 degrees of longitude and over 40 degrees of latitude, and is ecologically diverse. The far North is comprised of treeless tundra, much of it frozen for all or most of the year. South of this region are subarctic and boreal forest regions, with increasing productivity and diversity. To the west are extensive cordilleran regions associated with the Rocky Mountains and Coastal Mountain ranges, with diverse habitats ranging from semidesert and grasslands to alpine tundra and snowfields. South of the boreal forest are the western parkland and grasslands, and the eastern deciduous and Atlantic forests. All these regions provide a vast array of potential habitat for Lepidoptera species. Almost all of this region was covered with thick ice during the last ice age, so virtually the entire biota has moved into the area within the past 10,000 years. Some exceptions to this are some areas of the northwest (Beringia), the Pacific Coast, and Sable Island off the coast of NS, all of which were unglaciated at that time and harbour endemic species. Very few endemic species are known from other parts of nNA. Relative to more ancient habitats such as the Neotropical forests of Central and South America, the Lepidoptera fauna of nNA is much less diverse, and the individual species living there tend to be more widespread and vagile.

Due to human activity over the past 500 years, much of southern NA was converted to agricultural cropland. Today only small islands of some habitats such as native prairie and old growth Carolinian Forest remain. The High Arctic, Subarctic, and Boreal Forest regions remained relatively undisturbed until the 1900s. More recently, the past three decades saw significant climatic changes that will undoubtedly have an impact on the Lepidoptera fauna. International trade in the past 400 years has brought in many exotic species. Historically most of those that have become established have originated in similar temperate climates of Europe, but more recently, species from far eastern Asia, Australia, and Africa became established as well. This checklist, which incorporates extensive historical records, will serve as a baseline for the faunistic changes that are expected to occur as we proceed deeper into the Anthropocene in the 21st century.

Much of our detailed taxonomic knowledge of Lepidoptera of nNA comes from specific taxonomic works, which are cited throughout the list. Most of these cover the entire Nearctic fauna, but a few (for example McDunnough 1934, McGuffin 1967, 1972, 1977, 1981, 1987, 1988, Bolte 1990) are specific to Canada. Lists of the Lepidoptera of all of North America north of Mexico were published by Dyar (1902; the last full catalogue), McDunnough (1938, 1939), Hodges et al. (1983), and Poole (1995). A provisional new list of the Lepidoptera of NA was released by Pohl et al. (2016).

Although this is the first comprehensive list of the Lepidoptera of nNA, smaller portions of this region have been dealt with previously. Alaska (AK) was the subject of a recent checklist of moths (Ferris et al. 2012) and detailed treatment of butterflies (Philip & Ferris 2016), and we are largely simply reiterating those records here for completeness. The Canadian Lepidoptera as a whole were reviewed in a book chapter by Munroe (1979), including a family-level summary of the state of our knowledge, and a rough count of 4692 known species and a total fauna estimated to be 6734 species. (Note that the former number is based on miscalculations; a detailed analysis by GRP (unpublished data) indicates that the number of described species that were known to occur in Canada in 1979 was approximately 4110 species.) The butterflies of

Canada were treated in detail by Layberry et al. (1998), but new discoveries and taxonomic changes continue to accumulate. A series of monographs by McGugan (1958) and Prentice (1962, 1963, 1965) summarized Canadian records of over 1000 species of forest Lepidoptera collected over many years by the Forest Insect and Disease Survey (FIDS) of the Canadian Forest Service (CFS) branch of Natural Resources Canada. Dombroskie (2011) released a matrix key to families, subfamilies, and tribes of Lepidoptera of Canada.

Lepidoptera were included in a list of the insects of Canada that was published by the Natural History Society of Toronto (1883). It is a simple list with no more detailed information, but it includes eastern as well as some western species. However, it excludes the majority of microlepidoptera. Many Palearctic names are among the 933 included species, because at that time many Nearctic species had yet to be distinguished from their Old World counterparts.

Within Canada, the Lepidoptera fauna of Yukon Territory (YT) was compiled by Lafontaine & Wood (1997), but many new records have been discovered since then. No comprehensive lists have been published for the Northwest Territories (NT) or Nunavut (NU), although the butterflies and macromoths of NT were listed by Blades & Pohl (2016a, b). Note that NU was part of NT until 1999, so old specimen locality labels can be misleading. The moths of all Canadian territories are rather poorly known, but the butterflies have been fairly extensively collected. Many butterfly species are endemic to the High Arctic and Alpine ecoregions. Much of AK and some of YT are part of Beringia, a region that included part of northeast Asia, and was not covered by ice sheets during the last ice age. As a result, several endemic species occur there, and many species that are present there also occur in Asia (Kononenko et al. 1989).

British Columbia (BC) has a long history of Lepidoptera inventory work (see Pohl et al. 2015b for a review). Significant lists were published by Anderson (1904), ESBC (1906), Blackmore (1927), Jones (1951), Cannings & Scudder (2007), and Pohl et al. (2015b). The butterflies were thoroughly covered by Guppy & Shepard (2001). Early BC Lepidoptera lists were based almost entirely on records from several active resident collectors in the Victoria and Vancouver areas, and at Kaslo in the Southern Interior. By the time of Jones (1951), other sites in the interior had been partially documented (McDunnough 1927a, Buckell 1947), but the northern half of the province, including the boreal forest and parkland habitats of the Peace River region, are still far from thoroughly surveyed. Recent collecting efforts by Dave Holden have produced many recent additions to the BC fauna. The E-fauna BC website (Klinkenberg 2013) and Pacific Northwest Moths website (Crabo et al. 2015) compile many recent Lepidoptera records in the province.

Alberta (AB) also has a long history of Lepidoptera inventory, with significant lists published by Dod (1901-06 and updates 1908-15), Bowman (1919 and updates 1921-44; 1951), and Pohl et al. (2010 and updates 2011-16). Popular treatments of AB butterflies were published by Acorn (1993) and Bird et al. (1995). Modern Lepidopterists in AB are quite active through the coordinating efforts of the Alberta Lepidopterists' Guild (ALG). Most noteworthy were Alberta Parks bioinventory projects of the Canadian Shield (Schmidt & Pohl 2001, Macaulay & Pohl 2002, 2003) and Subarctic Ecoregion (Schmidt et al. 2004, Macaulay & Pohl 2005), multi-year surveys of Aspen Parkland habitats by Charley Bird (2012a-j), and of several parks and protected areas by ADM (Macaulay & Dunne 2001; Macaulay 2006, 2008, 2009, 2016a-c). Other recent surveys by ALG members include Anweiler (2006a, b), Christensen (2006), Pohl et al. (2004), and Schmidt & Roland (2006). As a result of these efforts, the boreal forest and parkland are well-sampled in AB, but many species await discovery in the grasslands and Rocky Mountains.

Saskatchewan (SK) owes almost all its documentation of Lepidoptera diversity to Reverend Ron Hooper, who published a book on the butterflies (Hooper 1973) and a series of 18 papers on the macromoths (Hooper 1987-2007). He and GRP were working on a checklist of micromoths when Reverend Hooper passed away in 2010. That work has been incorporated here into the current list. Reverend Hooper also almost single-handedly built the insect collection in the Royal Saskatchewan Museum, now called the Ronald R. Hooper Entomology Collection. Due to the work of Reverend Hooper and the FIDS program of Natural Resources Canada, the parkland and forested regions are relatively well known, but the grasslands undoubtedly hold many new discoveries. Prior to 1905, AB and SK were part of NT, so some locality information associated with very old specimens can be misleading and has been the source of errors.

Significant lists of Manitoba (MB) Lepidoptera were published by Hanham (1895-1901), Heath (1895-1908), and Brodie (1929). A thorough popular treatment of the butterflies was published by Klassen et al. (1989). Thanks to the extensive collecting by pioneering entomologist Norman Criddle in the early 1900s, the fauna at Aweme (near Brandon) is particularly well known. There has been little Lepidoptera

collecting in MB in recent years, but the extensive inventory work by Richard Westwood of the University of Winnipeg is a notable exception.

In Ontario (ON), a list of the butterflies and macromoths was published by Riotte (1992). Ward et al. (1974) compiled a list of over 800 species of macromoths from the Kingston area of eastern ON. Sanders (1991) published an extensive list of Lepidoptera records from Black Sturgeon Lake. Recently, Hall et al. (2014) published a detailed popular guide to the butterflies of ON, an update to the earlier list by Holmes et al. (1991). A large community of collectors and enthusiasts has emerged recently in southern ON, and the province continues to reveal many new records, particularly among the micromoths.

Quebec (QC) has a strong tradition of collecting and documenting Lepidoptera, and the butterflies and macromoths are very well known. The first list was published by Winn (1912). Handfield et al. (1997) published a comprehensive list of the Lepidoptera of QC and Labrador (LB), and detailed treatments of the butterflies and macromoths followed (Handfield 1999, with corrections in 2002; revised in 2011).

A list of the butterflies and macromoths of New Brunswick (NB) was published by McIntosh (1898-1904). Little was added to the knowledge for almost a century, but in recent years, several collectors and photographers have been compiling records, including regional surveys by Webster et al. (2005, 2006), Thomas (2001), and Thomas et al. (1998). A revised list of butterflies and macromoths was appended to Webster et al. (2006).

The Lepidoptera of Nova Scotia (NS) are fairly well known, thanks in large part to the work of J.H. McDunnough and D.C. Ferguson at the NS Provincial Museum. The first NS checklist was of butterflies and macromoths, and was published by Perrin & Russell (1912; updated by Perrin 1915), and this was thoroughly updated by Ferguson (1954). Wright (1989) published a list of the Lepidoptera of Sable Island, an ecologically important site that includes several endemic species and subspecies. Many significant new records have resulted from the recent survey work of Fritz McEvoy of Dingwall, NS.

The Lepidoptera of Prince Edward Island (PE) are rather poorly known. Most records are held elsewhere but a public collection exists at the University of PE in Charlottetown. Recent survey work by Bob Harding is filling in many previously unrecorded species.

The Lepidoptera of LB were included in Handfield et al. (1997), and Handfield (1999, 2011), but the region has not been extensively sampled and many records remain undiscovered. Lists of the Newfoundland (NF) and LB butterfly and macromoth fauna were published by Krogerus (1954) and Morris (1980), the latter an avid resident collector for many years. Recent survey work by Shelley Parady of the NF Department of Environment and Conservation and David Langor of Natural Resources Canada, as well as authors ADM and GRP, will fill in many gaps once all the material is processed and identified.

Materials and Methods

Taxonomic nomenclature:

To provide a taxonomic framework for this list, a comprehensive list of all North American Lepidoptera names (species, subspecies, and synonyms) was compiled by GRP, with assistance from B. Patterson and J. Pelham, and it has been made available online in provisional form (Pohl et al. 2016). It was based upon “The Checklist of the Lepidoptera of North America” by Hodges et al. (1983) and “Nomina Insecta Nearctica” by Poole (1995), with corrections and additions to capture new species and taxonomic changes published since 1980. Referred to subsequently as the “P3 list”, it represents the most complete and up to date nomenclature for North American Lepidoptera in existence today. Except as noted, the P3 list is used as the taxonomic framework for the current list. The superfamily and family classification is based primarily upon van Nieukerken et al. (2011), and classification at the subfamily level is primarily from Kristensen (1998). Some parts of the latter have been superseded by more recent changes, notably those introduced by Regier et al. (2015) and van Nieukerken et al. (2016) for non-ditrysian groups; Kawahara et al. (2016) for Gracillariidae; Sohn et al. (2013) for Yponomeutoidea; Heikkilä et al. (2014) and Sohn et al. (2016) for Gelechioidea; Regier et al. (2012) for Tortricidae; Scholtens & Solis (2015) and Nuss et al. (2016) for Pyraloidea; and Lafontaine & Schmidt (2013, 2015) for Noctuoidea. The finding by Kawahara & Breinholt (2014), that the Gelechioidea may be a more advanced clade within the Obtectomera, is somewhat contentious and has not been followed here; we retain the position of Gelechioidea among the basal Apoditrysia following van Nieukerken et al. (2011). Significant recent works that have contributed to the P3 List classification scheme are as follows:

| | |
|-------------------|--|
| Micropterigidae | Davis & Landry (2012) |
| Hepialidae | Nielsen et al. (2000) |
| Nepticulidae | van Nieukerken et al. (2016), van Nieukerken (2016) |
| Opostegidae | van Nieukerken et al. (2016), van Nieukerken (2016) |
| Tischeriidae | Puplesis & Diškus (2003) |
| Tineidae | Robinson (2003) |
| Psychidae | Sobczyk (2011) |
| Gracillariidae | de Prins & de Prins (2005, 2016), Kawahara et al. (2016) |
| Yponomeutoidea | Lewis & Sohn (2015) |
| Heliodinidae | Hsu & Powell (2004) |
| unassigned family | Sohn et al. (2013) (removal of <i>Cycloplasis</i> from the Yponomeutoidea) |
| Douglasioidea | Karsholt & Nielsen (2013) (recognition as a superfamily) |
| Autostichidae | Lee & Brown (2010) (Symmocinae) |
| Blastobasidae | Adamski & Hodges (1996) |
| Coleophoridae | Baldizzone et al. (2006) |
| Scythrididae | Landry (1991) |
| Cosmopterigidae | Sinev (2002) |
| Gelechiidae | Lee et al. (2009) |
| Alucitidae | Gielis (2003) |
| Pterophoridae | Gielis (2003) |
| Tortricidae | Brown (2005) (genus and species-level); Razowski (2009) (Palearctic Tortricidae); Regier et al. (2012) (higher classification); Metzler & Brown (2014) (classification of Cochylini) |
| Papilionoidea | Pelham (2008, 2016); Warren et al. (2008) (new Hesperidae tribe Moncini) |
| Pyraloidea | Munroe et al. (1995); Nuss et al. (2003-2016); Scholtens & Solis (2015) |
| Saturniidae | Tuskes et al. (1996) |
| Sphingidae | Tuttle (2007) |
| Geometridae | Scoble (1999) (species-level taxonomy); Young (2006) (higher taxonomy); Ferguson (2008) (higher taxonomy) |

Noctuoidea Poole (1989) (synonyms and detailed nomenclature of Noctuidae and most Erebidae); Lafontaine & Schmidt (2010, 2011, 2013, 2015), Zahiri et al. (2011, 2013, 2014) (higher taxonomy and valid species list); Schintlmeister (2013) (nomenclature of Notodontidae)

In all but a few exceptional cases we have used the most recent available published taxonomic arrangements. Thus, when conflicting classification schemes and taxonomic interpretations exist, we give the most recent one priority, except in a few cases (detailed in notes within the list) where a newer work is not well-supported, and/or has been widely rejected by experts. We deal entirely with valid named species, except in a few cases where undescribed species have been previously published as such, and are well known despite not having been formally named. Taxa of uncertain placement are treated as such in the list, with an explanation in the notes. Taxa described since the latest revision are inserted after their nearest reported relative. If no comprehensive taxonomic sequence exists for a group, we list taxa alphabetically under the next highest category. We do not recognize forms and aberrations, which have no formal taxonomic standing, although they are generally listed among the synonyms. Common historical misapplications of extralimital names are treated as synonyms, with the term “of authors” appended to the species epithets.

Distribution data sources:

Provincial, territorial, and state distributional data were compiled from a large number of taxonomic publications, published regional works, collections, and selected databases, as follows.

A) taxonomic publications:

Distribution records were obtained from a vast number of taxonomic papers. For moths, we attempted to obtain and check all papers dealing with Nearctic species published between 1950 and 2016. Significant older works and a few newer works were also checked. For butterflies, we did not carry out an exhaustive literature search, but relied primarily on Layberry et al. (1998), Philip and Ferris (2016), and provincial-level works, and augmented that information with taxonomic literature published since 1990.

When multiple revisions have been done on a group, we generally relied only on the most recent one, unless an older work contained more detailed distributional information than the newer work. In total, well over 1000 taxonomic publications were checked for relevant records.

B) regional checklists:

We searched for and gathered information from published checklists at the national, provincial, territorial, and state level, as well as selected works at broader scales and at finer regional scales. These works included the following:

AK: Ferris et al. (2012) (moths)
Philip & Ferris (2016) (butterflies)
Canada: the Natural History Society of Toronto (1883)
YT: Lafontaine & Wood (1997)
BC: Anderson (1904)
ESBC (1906)
Blackmore (1921-24)
Blackmore (1927)
Jones (1951)
Cannings & Scudder (2007)
Pohl et al. (2015b)
Dyar (1904) (Kootenay district)
McDunnough (1927a) (Seton Lake region)
Buckell (1947) (Shuswap Lake region)
Shepard (1999) (Peace River region)
Fischer et al. (2000) (Chilcotin district)
Guppy & Shepard (2001) (butterflies)
deWaard (2010) (several BC interior sites)

- AB: Dod (1901-06 and supplements 1908-15)
 Bowman (1919 and supplements 1921-44)
 Bowman (1951)
 Pohl et al. (2010 and supplements 2011-16)
 Bird et al. (1995) (butterflies)
 Morneau (1998) (EMEND field site near Peace River)
 Pohl et al. (2004) (Lakeland Provincial Park region)
 Schmidt & Roland (2006) (Ministik Hills region)
 Bodeux (2012) (EMEND field site near Peace River)
 Kamunya (2012) (EMEND field site near Peace River)
- SK: Hooper (1973 and supplement 1986) (butterflies)
 Hooper (1987-2007) (macromoths)
 Hooper & Pohl (unpublished data) (draft micromoth checklist)
- MB: Hanham (1895-1901)
 Heath (1895-1908)
 Brodie (1929)
 Kearfott (1905b) (microlepidoptera)
 Klassen et. al. (1989) (butterflies)
- ON: Riotte (1992)
 Ward et al. (1974) (Kingston area)
 Sanders (1991) (Black Sturgeon Lake)
 Hall et. al (2014) (butterflies)
- QC: Winn (1912)
 Handfield et al. (1997)
 Handfield (1999 and supplement 2002, 2011)
- LB: Handfield et al. (1997)
 Handfield (1999 and supplement 2002, 2011)
- NF: Krogerus (1954)
 Morris (1980)
 Morris (unpublished data [1987]) (draft micromoth checklist)
- NB: McIntosh (1898-1901 and supplement 1904)
 Thomas et al. (1998) (Fundy National Park)
 Thomas (2001) (Acadia Research Forest)
 Webster et al. (2005, 2006) (Saint John River region)
- NS: Perrin & Russell (1912), and update (Perrin 1915)
 Ferguson (1954a)
 Wright (1989) (Sable Island)

We have also examined checklists from neighboring states of the USA: Moore (1955) and Nielsen (1998, 1999) (MI), Grehan et al. (1995) (VT), and Brower (1974-1984) (ME). Additionally, several publications treating areas larger than the province/state/territory level were consulted for this project, including Belton (1988), Forbes (1923, 1948, 1954, 1960), Lafontaine (1996), Lafontaine et al. (2001), Lafontaine & Troubridge (2011), The Lepidopterists' Society (1995-2016), McGugan (1958), Pohl et al. (2014), Powell & Opler (2009), and Prentice (1962, 1963, 1965). The list of Canadian Lepidoptera presented in the Wild Species 2015 report (Canadian Endangered Species Conservation Council 2016) was based on a draft version of the present list.

Distribution records were extracted from all the taxonomic works and checklists discussed above, resulting in over 190,000 records which were entered into an electronic database organised following the P3 List of North American nomenclature. Records were captured from all the provinces and territories of Canada, as well as AK. Labrador and insular Newfoundland were reported separately. Records were also captured from the northern tier of states in the contiguous USA, to gather more complete information on species distributions, and to identify species that may occur undiscovered in Canada. Uncertain records were tracked as such. Records were entered under the species epithet (and subspecies or variety if applicable) used in the original publications, so that the records attached to a given name would remain linked to that name when subsequent taxonomic changes were applied to the P3 List. This process resulted in some erroneous records under previous taxonomic arrangements, but the vast majority of these have been noted as such and corrected in the vetting process. Notes were made when extralimital names were used

that were not found in the North American nomenclature list — names that were regularly encountered were added to the nomenclature list as extralimital synonyms with the term “of authors” appended to the species epithet.

We also gathered some other information, such as region of origin and date of introduction (for introduced species), type locality (for some taxonomic groups), and relevant information on past identification and nomenclatural issues. We also ensured that new species and taxonomic changes mentioned in taxonomic works were accurately captured in the North American nomenclature framework of the P3 List.

We have not attempted to systematically extract the records from Covell (1984) or Beadle & Leckie (2012), although we do cite a few specific records from the former. The maps in the latter are an indication of expected distribution, based on general ecological zones rather than verified distribution records. However, we made extensive use of these works when interpreting and evaluating the veracity of records from other sources.

C) Online databases:

Online databases that were consulted for records include the following:

Barcode of Life Data System (Ratnasingham & Hebert 2007) (www.barcodinglife.org). A complete dataset of all Canadian records was made available to GRP in Feb. 2014. Selected newer records have been added as well.

BugGuide (2016) (www.bugguide.net). Selected records based on verified photographs have been extracted from the site, but we have not systematically extracted all records from the region.

iNaturalist (www.iNaturalist.org). Selected records based on verified photographs have been extracted from the site, but we have not systematically extracted all records from the region.

The Macromoths of Canada (Troubridge & Lafontaine 2003) (www.cbif.gc.ca/spp_pages/pdfs/index_e.php). A website with provincial and territorial lists and images of macromoth species of Canada.

The Moth Photographers Group (2013) (<http://mothphotographersgroup.msstate.edu/>). The range maps on this website were consulted, and a few individual records have been included, but Canadian records were not systematically incorporated from this site, because there are significant numbers of unvetted unvouchered records there which could not be properly verified. Most Canadian records on this site are reiterations of data from the sources that we list above.

Pacific Northwest Moths website (Crabo et al. 2013) (<http://pnwmoths.biol.wvu.edu/>). All records pertaining to Canada were extracted, vetted, and incorporated in late 2015.

D) Collection Holdings:

Records were obtained from a large number of insect collections. Those that were extensively or completely inventoried are marked with an asterisk (*); others were inventoried only for particular groups, or had only significant new records noted. Collections examined are as follows:

| | |
|-------------|---|
| Acorn | John H. Acorn collection and data, Edmonton, AB |
| ACSJ* | AAFC Research Station, St. John's, NF |
| ADM | A. Douglas Macaulay collection, Devon, AB |
| AFC* | CFS Atlantic Forestry Centre, Fredericton, NB |
| AGRL* | AAFC Research Station, Lethbridge, AB |
| AMNH | American Museum of Natural History, New York, NY |
| Anweiler | Gary G. Anweiler collection and data, Edmonton, AB |
| Avis | E. (Libby) Avis collection and data, Port Alberni, BC |
| BDUC | University of Calgary, Calgary, AB |
| Bélanger | Carle Bélanger collection, Havre-Saint-Pierre, QC |
| BIRD | Charles D. Bird collection, Erskine, AB (recently donated to UASM) |
| BMNH | British Museum of Natural History, London, England |
| CanFIAS | CFS Canadian Forest Invasive and Alien Species database, Edmonton, AB |
| CFIA | Canadian Food Inspection Agency data, Ottawa, ON |
| CFS-CB | CFS Laboratory, Corner Brook, NF |
| Charpentier | Alain Charpentier collection, Saint-Hyacinthe, QC |

| | |
|---------------|---|
| CLRC* | University of P.E.I., Research Collection, Charlottetown, PE |
| CMNH | Carnegie Museum of Natural History, Pittsburgh, PA |
| CNC* | Canadian National Collection of Insects and Arachnids, Ottawa, ON |
| Crabo | Lars Crabo collection and data, Bellingham, WA |
| CUIC* | Cornell University Insect Collection, Ithaca, NY |
| DEBU | University of Guelph collection, Guelph, ON |
| deWaard | Jeremy R. deWaard personal data, Guelph, ON |
| Dombroskie | Jason J. Dombroskie datafile, Ithaca, NY |
| FMNH | Field Museum of Natural History, Chicago, IL |
| Glaeske | Daniel Glaeske collection, Assiniboia, SK |
| GRP* | Gregory R. Pohl personal collection, Sherwood Park, AB |
| Handfield, D. | Daniel Handfield collection, Saint-Mathieu de Beloeil, QC |
| Handfield, L. | Louis Handfield collection, Mont-Saint-Hilaire, QC |
| Harding* | R.W. (Bob) Harding personal photo voucher collection, Summerville, PE |
| Harp | Chuck E. Harp data, Littleton, CO |
| Hilchie | Gerald Hilchie collection, Edmonton, AB |
| Holden | Dave Holden collection, Port Coquitlam, BC |
| Juneau | Normand Juneau collection, Saint-Maurice, QC |
| Kondla | Norbert G. Kondla collection, Calgary, AB |
| Kozial | Ron Kozial collection, Bjorkdale, SK |
| Landry, B. | Bernard Landry collection, Geneva, Switzerland |
| Landry, L.P. | Léo-Paul Landry collection, Shawinigan, QC |
| LEMQ* | Lyman Entomological Museum, McGill University, Montreal, QC |
| Leuschner | Ron H. Leuschner collection, Manhattan Beach, CA (deceased) |
| Marshall | Steven Marshall data, Guelph, ON |
| McEvoy* | Fritz McEvoy collection, Dingwall, NS |
| MCZ | Museum of Comparative Zoology, Harvard University, Cambridge, MA |
| MMMN* | Manitoba Museum of Man and Nature, Winnipeg, MB |
| MUN* | Memorial University, St. John's, NF (on long-term loan to NFRC) |
| MZHF | Zoological Museum, University of Helsinki, Helsinki, Finland |
| NBPM | New Brunswick Provincial Museum, Saint John, NB |
| NFEC | NF Environment and Conservation research collection, Corner Brook, NF |
| NFRC* | CFS Northern Forestry Centre collection, Edmonton, AB |
| Nicholson | Dean Nicholson collection, Cranbrook, BC |
| NSPM* | Nova Scotia Provincial Museum, Halifax, NS |
| OLDS* | Olds College collection, Olds, AB |
| OSU | Oregon State University collection, Corvallis, OR |
| Pardy | Shelley Pardy personal data, Corner Brook, NF |
| Pellmyr | Olle Pellmyr data, Moscow, ID |
| PFC* | CFS Pacific Forestry Centre Collection, Victoria, BC |
| PFRA* | Prairie Farm Rehabilitation Administration collection, Indian Head, SK (recently relocated to the CNC) |
| Pike | E.M. (Ted) Pike collection, Calgary, AB |
| PMNH | Peabody Museum of Natural History, Yale University, New Haven, CT |
| Quelch* | Quelch collection, Transcona Museum, Winnipeg, MB |
| RAM* | Royal Alberta Museum, Edmonton, AB |
| RBCM* | Royal British Columbia Museum, Victoria, BC |
| RMNH | Naturalis Biodiversity Center, Leiden, Netherlands (formerly Rijksmuseum van Natuurlijke Historie) |
| Roever | Killian Roever collection, Phoenix, AZ |
| ROM* | Royal Ontario Museum, Toronto, ON |
| RSM* | Royal Saskatchewan Museum, Regina, SK |
| Schmidt | B. Chris Schmidt personal collection and observations, Ottawa, ON |

| | |
|-----------|--|
| Scott | Jan Scott collection, Medicine Hat, AB |
| Shepard | Jon Shepard collection, Corvallis, OR |
| Stead* | Ken Stead collection, Port Franks, ON |
| Sylvestre | Jonathan Sylvestre collection, Manseau, QC |
| UAM* | University of Alaska (Fairbanks) Museum, Fairbanks, AK |
| UASM* | University of Alberta Strickland Museum, Edmonton, AB |
| UBC* | University of British Columbia, Spencer Biodiversity Museum, Vancouver, BC |
| UCB | University of California (Berkeley), Berkeley, CA |
| UMB* | University of Manitoba Wallis Museum collection, Winnipeg, MB |
| USDA | USA Department of Agriculture data, Washington, DC |
| USK | University of Saskatchewan, Saskatoon, SK |
| USNM | United States National Museum, Washington, DC |
| UWPG* | University of Winnipeg, Winnipeg, MB |
| Vargo | Jim Vargo collection, Mishawaka, IN |
| Webster* | Reginald Webster collection, Charters Settlement, NB |
| WLNP | Waterton Lakes National Park collection, Waterton, AB |
| WSU | Washington State University, Pullman, WA |

After compiling records from taxonomic works, checklists, online sources, and collections, a master list was compiled of species by province, state, or territory. This was then thoroughly vetted by the authors. Many problematic species and records were investigated; this included old records of taxa in groups that have undergone recent taxonomic work, species that have frequently been misidentified, and species that have been referred to by other names under previous taxonomic arrangements. We have not systematically checked and verified all records that resulted in this list. In assessing the veracity of records, we generally accepted without question the records from newer taxonomic works, and also favoured records from recent published checklists and from collections curated by Lepidoptera experts. Many other collection records were accepted at face value, but unusual and unlikely records were investigated, or at least flagged as unconfirmed. Unpublished collection records that were deemed erroneous are not noted here, but all published records are reported in some manner; either “confirmed”, “unconfirmed”, or “erroneous”. Inevitably the interpretation and vetting of records required some value judgements to be made; we have attempted to do so consistently, and we have documented our reasoning in such matters in the species notes.

Format of the List

Nomenclature:

We list higher taxonomic groups from superfamily to subtribe, but do not list synonyms of these higher taxa. Genera and species are listed in italics in taxonomic order, or alphabetically when no definitive taxonomic order is available. Synonyms are listed alphabetically below the valid taxon. Most generic synonyms are not listed, but we include a few that have been used in recent publications pertaining to nNA. All Nearctic species synonyms are listed. All Nearctic subspecies and synonyms of subspecies are listed for moths, but for butterflies we list only those subspecies (and their synonyms) that have been reported from nNA. Extralimital names that have been commonly used (in at least three publications) in nNA are listed as synonyms of the valid Nearctic species, with the term “of authors” appended to the name. Names that have been used in nNA more sparingly are listed only in the notes to the valid species.

Except as noted in a few cases, we accept the most recent published subspecies concepts, even though many may not represent valid entities depicting geographic variation. For species that have been historically reported in error for nNA, we do not list subspecies or synonyms, unless those names have been used in publications referring to records in nNA.

Author and year of description (the taxonomic authority) are given for all scientific names, separated by a comma to distinguish these entries from literature references. For taxonomic authorities of species-level names, round brackets around the author and date indicate that the name was originally described in a genus other than that in which it is currently placed. Square brackets around the author and/or date indicate an attributed authorship and/or publication date that is different from that stated in the work itself. For all species-level names, the genus that the name was originally described in, is given in italics and brackets after the taxonomic authority.

We adhere to the International Code of Zoological Nomenclature (International Commission on Zoological Nomenclature 1999), with one exception: we present species names in their original spelling, rather than with endings altered to conform with the gender of the current generic name (ICZN article 34.2). This exception follows the practice by most lepidopterists in leading catalogues and checklists, as discussed by Sommerer (2002) and formally adopted by the Societas Europaea Lepidopterologica.

Distribution Data:

Distribution of all species is summarized for the state of AK and the provinces and territories of Canada, with the exception of five species complexes which cannot be adequately separated at the species level. For taxa that are well understood at the subspecific level, we depict distribution at the subspecific level, but for other taxa the subspecies are simply listed with no distribution information.

Species Numbers:

Species numbers are taken from Pohl et al. (2016), except that the species of Nepticuloidea have been renumbered since then, following the phylogenetic sequence of van Nieuwerkerken et al. (2016). Newly documented taxa are inserted with decimal numbers. Species numbers comprise a two-digit superfamily number in smaller font, and a four-digit species number in larger font. An “E” is appended to the number for species reported from nNA in error or only as interceptions, and a “P” is appended to the number for species expected but not yet documented from nNA, but expected there. The five unresolved species complexes have an “X” appended to the number of the first species in the complex.

Abbreviations:

North America (abbreviation “NA”) refers to the portion of North America that is north of Mexico; this is not the entire continent but it corresponds closely to the Nearctic faunal region, which is widely used by biologists. The abbreviation “nNA” represents northern North America, which comprises Canada and

Alaska. Standard two-letter postal abbreviations of the provinces and territories of Canada and the states of the United States of America (USA) are used throughout the publication. Abbreviations for the provinces, territories and other political regions covered by this list are the following:

| | |
|----|--|
| AK | Alaska |
| YT | Yukon Territory |
| NT | Northwest Territories |
| NU | Nunavut |
| BC | British Columbia |
| AB | Alberta |
| SK | Saskatchewan |
| MB | Manitoba |
| ON | Ontario |
| QC | Quebec |
| LB | Labrador (mainland portion of the province of Labrador and Newfoundland) |
| NF | The island of Newfoundland |
| NB | New Brunswick |
| NS | Nova Scotia |
| PE | Prince Edward Island |

Species that are confirmed residents are indicated with upper case abbreviations; confirmed resident subspecies records (where known) are indicated with lowercase abbreviations. Species records are assigned to the following categories:

- R** **confirmed resident** (designated with postal abbreviations for state, province, and territory records).
- H** in **human environments** only.
- M** regular seasonal **migrant** that does not survive year-round in the region but sometimes immigrates and breeds there.
- S** occasional **stray**, with no signs of reproducing or overwintering in the region.
- XT** **extirpated** from the region
- U** **unconfirmed** presence in the region; these are either plausible old literature records for which no vouchers are known, or known collection records for which the determinations are uncertain or unverified.
- XI** **unestablished introduction**. These are listed but excluded from the fauna of the region.
- IC** **interception** of specimens on luggage, trade goods, on vehicles, boats, etc., for which there is no evidence of a wild or reproducing population. These are listed but are excluded from the fauna of the region.
- P** **probable** occurrence. These species are expected in the region, but they have not yet been found there.
- EP** **erroneous but probable**. Indicates that previous records of the species in the region are erroneous, but the species is expected there.
- E** **erroneous** record. Published records that have been deemed incorrect, either because they have been documented as incorrect in a reliable publication, or the specimens in question have been redetermined as another species by an expert, or the record is thought to be so unlikely that an error is the only reasonable explanation.

Initials of the authors of this publication are used as follows:

Other abbreviations used in the document:

AAFC Agriculture and Agri-Food Canada, the Canadian Department responsible for the CNC.
BOLD Barcode of Life Data Systems (<http://www.boldsystems.org/>), a program at the University of Guelph, in Guelph, ON, to sequence a short portion of variable DNA from living organisms to aid in diagnoses and to assess evolutionary relationships. A large number of Canadian Lepidoptera have been DNA barcoded.
CFS The Canadian Forest Service, a branch of the Canadian Department of Natural Resources.
FIDS the Forest Insect and Disease Survey of the Canadian Forest Service (CFS); a large monitoring program that gathered thousands of rearing and collection records between 1938 and 1995. Some records have been published in McGugan (1958) and Prentice (1962, 1963, 1965), and others are available in an internal NRCan database, but no comprehensive datafile of all FIDS records exists other than on the original paper slips that have been archived at regional CFS centres.

Introduced and Holarctic species:

Species that were introduced to the Nearctic region are indicated with a plus symbol “+” following the original genus. Species that were introduced to nNA from other parts of NA are not indicated in this manner, but that information is included in a note. Holarctic species are indicated with an asterisk “*”; taxa of unknown origin (either holarctic or introduced) are indicated with a double-dagger “‡”.

Notes:

Notes on uncertain, questionable, and erroneous records are given beneath the species in question. Nomenclature issues and other information may be listed here as well. A total of 2040 species have accompanying notes.

Erroneous Records:

Erroneous records are included within the main list, but clearly indicated with an “E” in the column(s) of the region(s) reported in error. Nearctic species that do not occur at all in nNA are clearly marked with an “E” appended to the species number. Palaearctic species that have been reported in error from nNA are either listed as synonyms with “of authors” appended, or are mentioned in the notes on the valid species; see the *Nomenclature* section above.

Summary of Lepidoptera Diversity in Canada and AK:

The current checklist includes 5431 species of Lepidoptera that occur nNA, and an additional 53 species that have been reported from the region but are considered uncertain because the records have not yet been verified. Of the 5431 confirmed species, 70 are strays, 19 are migrants, 10 occur only in human environments, and five have been extirpated from the region. An additional 14 species are listed as unsuccessful introductions, 5 species are known only as interceptions, and 52 species are listed as probably occurring in nNA. A total of 318 species have been reported in error from nNA, and they are listed as well, clearly indicated as erroneous records. A more detailed summary of these records appears in Tables 1, 2, and 3. The province of Newfoundland and Labrador, treated as two separate regions here, has a combined Lepidoptera fauna of 1047 confirmed records, as well as 31 unconfirmed, 41 erroneous, and 16 probable records. A total of 23 species are confirmed only from the state of AK, and three more are reported as unconfirmed only from AK. Thus the Canadian fauna contains 5408 confirmed records and 50 unverified records. Two erroneous records were reported only from AK. It is estimated that approximately 1250 more species occur in nNA, as yet undiscovered, for a total fauna of approximately 6750 species.

Table 1. Summary table of Lepidoptera species in AK and Canada, by family. “Known” species include residents, strays, migrants, extirpated species, and species confined to human environments, but species known only via interceptions or unsuccessful introductions are excluded from the numbers. Numbers in brackets in the “Introduced species” field are the number of species of uncertain origin. The numbers of species in North America north of Mexico and worldwide are derived from Pohl et al. (2016), and van Nieukerken et al. (2011), respectively, with a few modifications to incorporate more recent information. Proportions are the known and unconfirmed AK and Canadian records as a proportion of the NA and World records.

THE LIST

Suborder ZEUGLOPTERA Chapman, 1917

Superfamily MICROPTERIGOIDEA Herrich-Schäffer, 1855

1. Family MICROPTERIGIDAE Herrich-Schäffer, 1855 (mandibulate moths)

by J.-F. Landry and G.R. Pohl

Mandibulate moths are very small moths (wingspans of 10 to 15 mm) with functional mandibles. The adults are usually diurnal and are attracted to flowers and feed on pollen, which they crush with their mandibles. Larvae feed on moss and liverworts.

Worldwide, 265 species of micropterigids are known, but many undescribed species likely exist. Three species are known in the Nearctic region; two of which occur in nNA. These moths are extremely localized and inconspicuous, and seldom noticed by the non-specialist. As a result the group is poorly collected, and their distribution in nNA is incompletely known. The family was recently revised for NA by Davis and Landry (2012).

NOTE: This species is not known from Canada. Historical BC records refer to *E. bimaculella*.

Suborder GLOSSATA Fabricius, 1775

Infraorder DACNONYPHA Hinton, 1946

Superfamily ERIOCRANIOIDEA Rebel, 1901

2. Family ERIOCRANIIDAE Rebel, 1901 (sparkling archaic sun moths)

by G.R. Pohl

Eriocraniid moths are very small diurnal moths (wingspans of 10 to 15 mm) with vestigial mandibles. Adults of most species are brightly coloured. Larvae are leaf-blotch miners.

Twenty-nine species of eriocraniids are known worldwide, 13 of which occur in the Nearctic region. Three of these occur in nNA, and a fourth is expected. The family was revised by Davis (1978a).

Infraorder EXOPORIA Common, 1975

Superfamily HEPIALOIDEA Stephens, 1829

3. Family HEPIALIDAE Stephens, 1829 (ghost moths)

by G.R. Pohl

Ghost moths are medium-sized to large moths (wingspans from 25 to 100 mm), and are an exception to the generalization that primitive moths are all small. Adults are primarily crepuscular or nocturnal, and females of some species broadcast large numbers of eggs over the ground while in flight. Larvae bore into stems or roots, or tunnel in the ground.

Worldwide, about 630 species of ghost moths are known. Of the 19 species that occur in the Nearctic region, 13 occur in nNA. There are few modern taxonomic works on the group in NA, but a few species are covered in general and regional works such as Forbes (1923). Nielsen et al. (2000) provided a global catalogue and bibliography.

***Gazoryctra* Hübner, 1820**

tax info: Barnes & Benjamin (1925)

- 110001 *hyperboreus* (Möschler, 1862) (*Hepialus*) R -- -- -- -- EP AB SK MB ON QC LB -- -- -- --
NOTE: Reported from BC by Anderson (1904) and ESBC (1906), based on a misidentified specimen from Duncan in the RBCM that has been redetermined as *G. mathewi*. Although no BC records are currently known, this species is known from boreal habitat in AB and likely occurs in the Peace River region in BC.

Infraorder NEOPSEUSTINA Davis & Nielsen, 1980

Superfamily NEOPSEUSTOIDEA Hering, 1925

4. Family ACANTHOPTEROCTETIDAE Davis, 1978

by G.R. Pohl and J.-F. Landry

Acanthopteroctetids are very small moths (wingspans of 10 to 16 mm) that resemble caddisflies, but may be brightly marked. They can be separated from most other moths by the vestigial mandibles. This is a small group that is rarely collected and poorly known.

Eight species of acanthopteroctetids are known worldwide; four of these occur in the Nearctic region. Two species have been reported from nNA, and a third is expected. The family was revised by Davis (1978a).

***Acanthopteroctetes* Braun, 1921**

Infraorder HETERONEURA Tillyard, 1918

Superfamily NEPTICULOIDEA Stainton, 1854

5. Family NEPTICULIDAE Stainton, 1854 (pygmy moths)

by E.J. van Nieukerken

Nepticulids are extremely small moths, with wingspans typically from three to 10 mm. The adult head has a rough vertex and erect seta-like scales, and the antennal scape is enlarged and covers the eye. Nepticulid larvae are normally leafminers on woody plants, but can occur in woody twigs, fruit or galls; a few mine herbaceous plants. Most nepticulid species are highly host specific.

Worldwide, about 860 species are recognized, with many more remaining to be discovered (Doorenweerd et al. 2016). So far, 99 species have been reported in the Nearctic region; 69 of these are reported from nNA, and three more are expected. The group is poorly collected, and the distribution of many species is incompletely known and new species await description. The Canadian Nepticulidae were revised by Wilkinson and Scoble (1979), but that work is largely out of date. Van Nieukerken (1986) contains a more up to date key to genera. A world catalogue was published by van Nieukerken et al. (2016) and is available online (van Nieukerken (2016); the phylogenetic numbers herein follow that sequence rather than Pohl et al. (2016).

saginella group Wilkinson & Scoble, 1979

| | | | | | | | | | | | | | | | | | | | |
|--------|---|---|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 160011 | <i>castaneaeefoliella</i> (Chambers, 1875) (<i>Nepticula</i>) | R | -- | -- | -- | -- | -- | -- | -- | -- | ON | -- | -- | -- | -- | -- | -- | -- | -- |
| 160012 | <i>flavipedella</i> (Braun, 1914) (<i>Nepticula</i>) | U | -- | -- | -- | -- | -- | -- | -- | -- | U | -- | -- | -- | -- | -- | -- | -- | -- |
| | NOTE: This species is unconfirmed for Canada. Wilkinson & Scoble (1979), in their treatment of <i>S. castaneaeefoliella</i> , excluded a series of specimens from that species but accidentally omitted a further discussion of them elsewhere in the paper. Those specimens, labelled "specimens 1 to 8" by Wilkinson & Scoble, were deemed "conspecific with <i>S. flavipedella</i> " by Newton & Wilkinson (1982). Their "specimen 4", from Simcoe (ON), is a misidentified <i>S. quercipulchella</i> (slide in CNC, examined by EJvN). Of the other "Specimens 1 to 8", "specimen 5" is from FL; the origin and current location of the remaining 6 specimens is unknown, but they may include true <i>S. flavipedella</i> from nNA. As well, a specimen collected recently at Port Franks by KS has been tentatively identified as this species via DNA barcoding. | | | | | | | | | | | | | | | | | | |

betulicola group Johansson, 1971

- 160017 *betulicola* (Stainton, 1856) (*Nepticula*)* R -- YT NT -- U AB SK -- ON QC LB NF -- NS --
NOTE: Recently recognized in NA (van Nieukerken et al. 2016). BC material could not be identified with certainty.
- 160018 *microtheriella* (Stainton, 1854) (*Nepticula*)+ R -- -- -- -- BC -- -- ON QC -- -- NB -- --
NOTE: New for Canada, based on several BOLD records that have been confirmed by EJvN.
- 160019 *caryaefoliella* (Clemens, 1861) (*Nepticula*) R -- -- -- -- -- -- ON QC -- -- -- -- --
NOTE: New for Canada. This species has been historically confused with *S. ostryaefoliella*; most records of the former probably belong to this species.
- 160020 *corylifoliella* (Clemens, 1861) (*Nepticula*) R -- -- NT -- U AB SK MB ON QC -- NF NB NS --
NOTE: The BC record may be *S. betulicola*.
exasperata (Braun, 1930) (*Nepticula*)
minimella (Chambers, 1873) (*Nepticula*)
opulifoliella (Braun, 1914) (*Nepticula*)
paludicola (Braun, 1917) (*Nepticula*)
virginiella (Clemens, 1861) (*Nepticula*)
- 160021 *juglandifoliella* (Clemens, 1861) (*Nepticula*) R -- -- -- -- -- -- ON P -- -- -- -- --
NOTE: New for Canada, based on leafmines deposited in the CNC, and DNA barcode records from Thousand Islands (ON).
- 160023 *myricafoliella* (Busck, 1900) (*Nepticula*) R -- -- -- -- -- -- U -- -- -- NS --
NOTE: Both this species and *S. corylifoliella* can feed on *Myrica* and *Morella*, and are not easy to separate. The published records were all females that cannot be reliably identified, unless DNA barcodes are available.
obscurella (Braun, 1912) (*Nepticula*)
- 160024 *ostryaefoliella* (Clemens, 1861) (*Nepticula*) U -- -- -- -- E -- -- -- U P -- -- -- -- --
NOTE: Occurrence of this species in Canada is uncertain. The record from BC by Braun (1923), based on a specimen reared from *Betula*, is erroneous. It was later re-identified as *S. corylifoliella* (Wilkinson & Scoble 1979), but more likely is *S. betulicola*. The species as treated by Wilkinson & Scoble (1979) is a composite species; true *S. ostryaefoliella* feeds only on *Ostrya* and possibly *Carpinus*.

tiliella group Puplesis et al., 2002

- 160025 *tiliella* (Braun, 1912) (*Nepticula*) R -- -- -- -- -- -- -- QC -- -- -- -- --
NOTE: New for Canada, based on a single characteristic leafmine deposited in the CNC.

6. Family OPOSTEGIDAE Meyrick, 1893 (white eye-cap moths)

by G.R. Pohl and E.J. van Nieukerken

Opostegids are very small moths, with wingspans typically from six to 12 mm, and with wings that are slender, lanceolate, and predominantly white. The head has erect seta-like scales; the vertex is rough; the antennal scape is enlarged and covers the eye. Larvae are leafminers.

About 190 species of opostegids are known worldwide, with many undescribed species expected to be found. Ten species are known from the Nearctic region, four of which are known from nNA. Van Nieukerken et al. (2016) published a world catalogue, which is also available online (van Nieukerken 2016). Davis and Stonis (2007) published a monograph of the New World fauna; the phylogenetic numbers herein follow that sequence rather than Pohl et al. (2016).

accessoriella (Frey & Boll, 1876) (*Opostega*)

Superfamily ADELOIDEA Bruand, 1850

7. Family PRODOXIDAE Riley, 1881 (yucca moths and allies)

by G.R. Pohl

Prodoxids are very small to small moths, with wingspans of 10 to 28 mm, and wings that are held tentiform over the body. The adults are usually diurnal and often have white or golden wings. Larvae bore into fruit, leaves, or shoots. They overwinter as larvae, with the last-instar larvae in some cases diapausing for many years. The species of *Tegeticula* are the well-known yucca moths, which have a well-studied interdependent relationship with yucca plants.

Worldwide, about 100 species of Prodoxidae are known, with most occurring in the Nearctic region. Sixty-four species have been recorded from NA, 22 of which have been reported from nNA.

8. Family TRIDENTAFORMIDAE Davis, 2015 (manzanita moths)

by J.-F. Landry

These small moths (wingspan from 8 to 20 mm) have faintly shiny grey forewings suffused with white and an indistinct dark discal dot. This recently described family comprises a single genus and species which occurs in western NA. The adults fly around manzanita (*Arctostaphylos*; Ericaceae) in early spring but nothing is known of their biology. The sole species was originally described in the prodoxid genus *Lampronia*, and the genus was originally placed in the Incurvariidae.

Bird in 2002; and a photo of an individual taken at Camas Hill near Victoria (BC) by J. Gatten in 2016. | | | | | | | | | | | | | | | | | | |

9. Family INCURVARIIDAE Spuler, 1898 (leafcutter moths)

by G.R. Pohl

Leafcutter moths are very small moths with wingspans of six to 15 mm, and with iridescent forewings in most species. Larvae are leafminers in the early instar stages; later, they construct cases using silk and cut pieces of leaf, from which they skeletonize leaves.

Approximately 50 species of leafcutter moths are known worldwide. Six species are known from the Nearctic region, two of which occur in nNA. The family has not been revised for many years.

10. Family HELIOZELIDAE Heinemann & Wocke, 1876 (shield-bearer moths)

by E.J. van Nieukerken and G.R. Pohl

Heliozelids are extremely small moths, with wingspans from four to 10 mm. The head has a vertex that is typically smooth, with broad, laminate, iridescent scales directed downward over the smooth frons. The antennae are shorter than the wings, with the scape entirely covered by iridescent scales. Adults are diurnal and larvae are leafminers. They construct a flat, oval case by cutting sections from the upper and lower epidermis of the mine, and join these together with silk to form a case, which gives these moths their common name. Hosts are usually trees or shrubs.

Worldwide, about 120 species are known, with 30 species reported from the Nearctic region. A total of 17 species occur in nNA.

Superfamily TISCHERIOIDEA Spuler, 1898

12. Family TISCHERIIDAE Spuler, 1898 (trumpet leafminer moths)

by G.R. Pohl

Tischeriids are extremely small moths, with wingspans from five to 11 mm. The head has a smooth frons and a somewhat roughened vertex; the antennal scape has a prominent tuft of slender scales projecting over the eye. The larvae are leafminers, forming either trumpet-shaped or blotch mines in leaves of deciduous trees and shrubs.

There are about 110 known species of tischeriids worldwide. A total of 46 species are reported from the Nearctic region; 14 of these occur in nNA and one more is expected. The North American species were revised by Braun (1972).

Superfamily TINEOIDEA Latreille, 1810

13. Family MEESSIIDAE Căpușe, 1966

by J.-F. Landry and G.R. Pohl

These very small moths are similar to other tineoids, although they have narrower wings than most others. The larvae construct portable cases from which they feed on lichens.

This family was very recently removed from the Tineidae by Regier et al. (2014). Currently only two genera and 71 species are confirmed as members of it; many of the genera previously placed in the tineid subfamily Meessiinae by Davis & Robinson (1998) were explicitly excluded from the Meessiidae by Regier et al. (2014) based on genetic analysis. Three species of meessiids are known in the Nearctic region, one of which is reported from nNA. That species was treated by Forbes (1923), within the Tineidae. The group is clearly in need of further work, to determine its composition and defining characters.

14. Family PSYCHIDAE Boisduval, 1829 (bagworm moths)

by J.-F. Landry and G.R. Pohl

Bagworm moths are small to medium-sized moths, with wingspans ranging from eight to 50 mm. Males are fully winged; many females are brachypterous, apterous, or wormlike, with all body appendages vestigial or absent. Some species exist only as parthenogenetic females, and are best recognized by the larval cases. Larvae of psychids are leaf or lichen feeders and form portable bags or cases, which they carry around with them as they feed. Pupation takes place within the larval bags or cases. Males leave the bag on emergence, and fertilize the female in the bag, through one end of the case.

Worldwide, 1350 species of psychids are known, with most occurring in the Old World. Of the 28 species known from the Nearctic region, 11 occur in nNA. Davis (1964) revised the New World species. Sobczyk (2011) published a world catalogue, which included many new synonyms, status changes, and new combinations. A tribal classification has been proposed for the Palaearctic fauna (Sauter & Hättenschwiler 1991), but genera that are restricted to the Nearctic region remain unplaced below the subfamily level.

15. Family DRYADAULIDAE Bradley, 1966

by J.-F. Landry

Dryadaulids are very small moths that are similar to other tineoids. They are differentiated by several obscure characters of the wings, genitalia, and mouthparts. Larvae are detritivores or feed on lichens and fungi.

Like Meessiidae, this group was very recently removed from the Tineidae by Regier et al. (2014), and its composition is not entirely settled. About 50 species of dryadaulids are known worldwide; two occur in the Nearctic region, one of which occurs in nNA. The latter was treated by Forbes (1923), within the Tineidae.

16. Family TINEIDAE Latreille, 1810 (fungus moths and clothes moths)

by J.-F. Landry and G.R. Pohl

Most tineid moths are very small, with wingspans of eight to 18 mm. The wings are usually dull and brownish in colour, and they move with a characteristic scuttling run. Most tineid larvae are fungivorous, some feed on detritus, and a few are pests of stored food products, fabrics, fur, or feathers. Many tineid larvae build portable cases, from which they feed. The family includes several stored product pests.

Worldwide, about 2300 species of tineids occur; 190 are known from the Nearctic region, 62 of which have been reported in nNA, and two more are expected. Little taxonomic work has been done on the family in the past 100 years, other than the higher-level taxonomic work of Regier et al. (2014).

Superfamily GRACILLARIOIDEA Stainton, 1854

17. Family BUCCULATRICIDAE Fracker, 1915

by G.R. Pohl and J.-F. Landry

Bucculatricids are extremely small moths, with wingspans of four to 11 mm. The head is usually elongate, with the vertex usually large and bearing an erect tuft of piliform scales. Most species have larvae in which the first two instars are leafminers, and the third instar emerges to feed externally on leaves. The fourth-instar larva constructs a flattened moulting cocoon under the leaf used by the third instar. The fifth-instar larva, before pupation, constructs a silken, longitudinally ribbed cocoon, which is typical for the family.

Worldwide, about 300 species of bucculatricids are known. One genus, *Bucculatrix*, with 103 species, is known from the Nearctic region; 39 species are recorded from nNA. Braun (1963) revised the North American species.

18. Family GRACILLARIIDAE Stainton, 1854 (leafblotch miner moths)

by G.R. Pohl and J.-F. Landry

Gracillariids are extremely small to small moths, with wingspans of four to 21 mm. The head is usually smooth scaled; the antennae are filiform and are about as long as the forewings. The wings are slender, with a broad fringe. Larvae are leaf, bark, or fruit miners, and they undergo hypermetamorphosis. Early larval instars are flattened legless sap feeders, while later instars feed on leaf parenchyma. Larvae typically form blotch mines on leaves, hence the common name, although some groups form serpentine mines or are leaf rollers. Most are strongly host specific. Pupation takes place in the mines.

Worldwide, about 1865 species of gracillariids are known; 309 species are known from the Nearctic region, and 165 of these have been reported from nNA with four more expected. There are no comprehensive taxonomic works on the group, but De Prins & De Prins (2005) published a world species catalogue, which has been updated and made available online (De Prins & De Prins 2016). A higher phylogenetic analysis was published by Kawahara et al. (2016), and the subfamily arrangement presented here follows that work.

subfamily Lithocolletinae Stainton, 1854

Protolithocolletis Braun, 1929

tax info: Braun (1929)

Superfamily YPONOMEUTOIDEA Stephens, 1829

19. Family YPONOMEUTIDAE Stephens, 1829 (ermine moths and allies)

by J.-F. Landry and G.R. Pohl

Yponomeutids are small moths with wingspans that range from five to 30 mm, and with narrow, often brightly coloured wings. Larvae have diverse feeding habits, including leafmining and leaf tying.

The Yponomeutidae, as well as the superfamily Yponomeutoidea, was redefined recently, following molecular analyses by Sohn et al. (2013). As currently delimited, the family Yponomeutidae contains about 360 named species worldwide; 28 species are known in NA, 19 of which have been reported from nNA. There is little modern species-level work on this group in NA.

subfamily Yponomeutinae Stephens, 1829

tribe Yponomeutini Stephens, 1829

20. Family YPSOLOPHIDAE Guenée, 1845 (sickle-winged moths)

by G.R. Pohl

Ypsolophids are small moths (wingspans from 15 to 20 mm) with no metallic markings; the forewings of many species are hooked at the tip. The larvae of most species live in open webs on the leaves of plants.

This is a small family with about 160 known species, primarily from the temperate Northern Hemisphere; 39 species live in the Nearctic region, 15 of which have been reported in nNA. The fauna here is dominated by the genus *Ypsolopha*, which is in need of a modern taxonomic revision.

21. Family PLUTELLIDAE Guenée, 1845 (diamondback moths)

by J.-F. Landry and G.R. Pohl

Plutellids are small moths with wingspans of 15 to 20 mm, and narrow wings that are often brightly patterned, but normally are not metallic. Larvae are solitary leaf-rollers or live in loose webs and skeletonize leaves; most pupate in a characteristic, open-mesh cocoon. Adult moths hold their antennae forward when at rest.

The family Plutellidae is worldwide but small, with about 150 known species. Sixteen species occur in the Nearctic region, 11 of which are reported from nNA. The genus *Plutella* was split into three genera by Baraniak (2007) for the Palaearctic fauna, but that classification has not been widely adopted and we do not follow it here. The website Fauna Europaea (<https://fauna-eu.org>) lists them as subgenera of *Plutella* (Agassiz et al. 2017).

22. Family GLYPHIPTERIGIDAE Stainton, 1854 (sedge moths and allies)

by J.-F. Landry and G.R. Pohl

Glyphipterigids have wingspans ranging from four to 30 mm, but most are very small, with wingspans of about 10 mm. The adults are frequently strikingly marked, usually with transverse bands or lines, and often with metallic marks. Larvae bore in stems and leaves, mainly in monocots.

The family Glyphipterigidae contains about 535 described species. In the Nearctic region, 48 species are known, 15 of which have been recorded from nNA. A world catalogue of the Acrolepiinae was published by Gaedike (1997).

23. Family ARGYRESTHIIDAE Bruand, 1850 (shiny head-standing moths)

by G.R. Pohl

Argyresthiid moths are extremely small to very small, with wingspans of five to 15 mm, and with narrow, usually golden wings. The larvae are bud, fruit, leaf, and twig miners.

This family has often been placed as a subfamily within the Yponomeutidae. It includes about 160 species worldwide, all in the genus *Argyresthia*. There are 54 species known in the Nearctic region, 33 of which have been reported from nNA. The group was revised by Busck (1907) but that is long out of date. Many species were treated by Forbes (1923) and Freeman (1972) but a modern revision is needed.

***Argyresthia* Hübner, 1825**

24. Family LYONETIIDAE Stainton, 1854

by G.R. Pohl

Lyonetiids are extremely small moths, usually with wingspans of five to 10 mm. The frons is smooth scaled, and the base of the antenna forms an eye cap. The larvae are leaf or twig miners, usually of dicots.

The family Lyonetiidae is cosmopolitan and consists of about 200 described species. There are 19 named species in NA; 11 of these are recorded from nNA. The group is poorly known and is in need of taxonomic work.

25. Family ATTEVIDAE Mosher, 1916

by G.R. Pohl and J.-F. Landry

Attevids are small moths (wingspan of about 20 mm in our species), with brightly coloured wings. Larvae live and feed in loose communal webs.

The Attevidae were historically considered to be a subfamily of Yponomeutidae, but were elevated to family status by van Nieukerken et al. (2011). Worldwide, about 50 species are known, primarily in the tropics. A single species is known in the Nearctic region; it is native to southern TX but it has adapted to feed on an introduced plant (*Ailanthus altissima*; “Tree-of-Heaven”) that has become naturalized in temperate NA, and the moth has now spread as far north as eastern Canada. Our species was treated taxonomically by Wilson et al. (2010).

26. Family PRAYDIDAE Moriuti, 1977

by G.R. Pohl

Praydids are very small moths with wingspans of 10 to 15 mm, and relatively broad wings.

This group was recently split from the Yponomeutidae by van Nieukerken et al. (2011). It contains about 50 species worldwide, mostly in the Old World. Four species are known from the Nearctic region, two of which have been reported in nNA.

Prays Hübner, 1825

27. Family HELIODINIDAE Heinemann & Wocke, 1876

by J.-F. Landry and G.R. Pohl

Heliodinids are very small moths, with wingspans of about eight to 15 mm, and with orange and metallic markings on the forewings. Larvae of most species are leafminers, or stem and fruit borers.

About 70 species of heliodinids are known worldwide. There are 31 species known from the Nearctic region, four of which occur in nNA. The entire family was treated by Hsu & Powell (2004).

28. Family BEDELLIIDAE Meyrick, 1880

by J.-F. Landry

The Bedelliidae are very small grey moths, with elongate wings spanning 10 mm or less. They are defined by several wing and larval characteristics. The larvae are leaf miners in several plant families; young larvae make a linear mine, and later instars create blotch mines.

The family Bedelliidae contains 16 species, all in the genus *Bedellia*, in all regions except the Neotropical. Only two species occur in the Nearctic region; one of which occurs in nNA.

Unassigned Superfamily

29. Unassigned APODITRYSIA family

by J.-F. Landry and G.R. Pohl

The genus *Cycloplasis* is currently not assigned to any superfamily or family. It has historically been placed in the Heliodinidae, but was excluded from that group by Hsu & Powell (2004), and was further excluded from the Yponomeutoidea by Sohn et al. (2013). It was provisionally placed immediately following

the Yponomeutoidea by Pohl et al. (2016). The genus contains five species worldwide, two of which occur in NA. One of these has been discovered recently in nNA.

Superfamily DOUGLASIOIDEA Heinemann & Wocke, 1876

30. Family DOUGLASIIDAE Heinemann & Wocke, 1876

by G.R. Pohl

Douglasiidae are very small moths, with wingspans of eight to 12 mm. They have short, drooping palps, and the head is covered with a smooth layer of scales. Larvae are stem borers and flower-petiole miners of Rosaceae and other plants.

Twenty-nine species of Douglasiidae are known worldwide, all but one from the Holarctic. Nine species are known from NA, five of which are recorded from nNA. Gaedike (1990) revised the Nearctic species (in German).

Superfamily GELECHIOIDEA

31. Family AUTOSTICHIDAE Le Marchand, 1947

by G.R. Pohl

Autostichids are very small to small moths (wingspans of 10 to 20 mm), with relatively broad wings. The adults superficially resemble oecophorids or gelechiids, and are not easily distinguished from other gelechioid groups. Larvae of species in this family are poorly known, but most Glyphidocerinae are saprophagous.

As currently defined (Heikkilä et al. 2014), the Autostichidae comprise a diverse group of several subfamilies that had previously been placed in their own families (Glyphidoceridae, Deoclonidae) or in the Elachistidae, Oecophoridae, and Blastobasidae. Approximately 650 species of autostichids are known worldwide; 25 are known from the Nearctic region, seven of which occur in nNA.

32. Family LECITHOCERIDAE Le Marchand, 1947

by G.R. Pohl

This group is made up primarily of small moths with broad wings and long antennae. The larvae have secondary setae and feed on detritus.

About 1200 species of lecithocerids are known worldwide. The group is restricted to the southern Palearctic, Africa, and Australia, except for the Nearctic genus *Martyringa* which was tentatively included in the family by Heikkilä et al. (2014). Two species of *Martyringa* are known in the Nearctic region, one of which occurs in nNA. Both were treated by Hodges (1974), within the family Oecophoridae.

33. Family OECOPHORIDAE Bruand, 1850

by G.R. Pohl

Most Oecophorids are small to medium-sized moths with broad wings and long, upcurved palps. Most characters are extremely variable. Larvae of many oecophorid species feed on fungi and detritus in leaf litter and bark; some tie leaves or make cases from twigs or bits of leaves. A few are pests of stored food and household goods.

Many groups have recently been moved out of the Oecophoridae to other families in the Gelechioidea, including the speciose group Depressariinae, now treated as a separate family (Heikkilä et al. 2014). The Stathmopodidae, considered a subfamily of Oecophoridae by Hodges (1998), were excluded by van Nieukerken et al. (2011). As currently defined, the family Oecophoridae is distributed nearly worldwide, with approximately 3400 described species, primarily in Australia. Thirty-eight species are known from the Nearctic region; 20 of these occur in nNA. Most species currently placed in the family were treated

in revisions by Clarke (1941) and Hodges (1974). The former is based on outdated nomenclature, and the latter does not adequately illustrate the genitalia, so both monographs are required to make reliable identifications.

34. Family DEPRESSARIIDAE Meyrick, 1883 (flat moths)

by G.R. Pohl and J.-F. Landry

Flat moths are small moths with broad wings (wingspans of 10 to 25 mm) and upturned palps. The group is united by abdominal and pupal features. Larvae of Depressariinae are leaf tiers, stem borers and seed feeders of many plant families. Species of Ethmiinae mainly feed beneath light webbing on Boraginaceae and Hydrophyllaceae.

Until recently, this group was considered to be a subfamily of the Elachistidae, and prior to that it was placed in the Oecophoridae. The Depressariidae are distributed worldwide, with about 2300 described species. There are 201 species known in the Nearctic region; 87 of these have been reported from nNA, and another two are expected. Our knowledge of this family is reasonably complete, as most have been treated in the past 50 years (see references below).

36. Family GELECHIIDAE Stainton, 1854

by G.R. Pohl, J.-F. Landry, and V. Nazari

Gelechiid moths, in NA at least, are very small to small moths, with wingspans of six to 25 mm. Most species are cryptically coloured in shades of brown or grey. The forewing is often narrowly rounded or pointed at the apex, and the hind wing usually has a sinuous margin leading to an acute tip. Gelechiid larvae roll or mine leaves, bore in stems and roots, produce galls, or feed on seed heads or dried seeds.

The family Gelechiidae is cosmopolitan and diverse, with about 4700 described species. About 900 species are known in the Nearctic region; 370 of these have been reported in nNA, and two more are expected. Significant taxonomic works have been published on the Dichomeridinae (Hodges 1986) and on the genus *Chionodes* (Hodges 1999), but overall the family is poorly known, and many species await discovery and description. A checklist of North American species was published by Lee et al. (2009). The higher-level taxonomy of the group has been the subject of several recent studies; the scheme employed here follows Karsholt et al. (2013) and Heikkilä et al. (2014).

37. Family ELACHISTIDAE Bruand, 1850 (grass moths)

by G.R. Pohl and J.-F. Landry

Elachistids are extremely small to very small, narrow-winged moths, with wingspans of about six to 15 mm. The group is united by abdominal and pupal features. The wings are narrow; the hind wings are often broadly fringed, and the head is usually smooth scaled. Larvae of Elachistinae are leafminers, mostly of monocots such as grasses, sedges, and rushes. Larvae of Agonoxeninae are borers or miners on a variety of plant families.

Several groups that had historically been included within the group (Stenomatinae, Ethmiinae, Depressariinae) have been moved recently to the Depressariidae. Elachistids are distributed worldwide, with about 830 described species. There are 156 species known in the Nearctic region; 68 of these have been reported from nNA, and two more are expected. Most Nearctic species of the subfamily Elachistinae have been revised recently by Kaila (1995b, 1996, 1997, 1999a, 1999b). Kaila (1999a) provides a checklist of species of the subfamily Elachistinae.

| NOTE: We list records here only of the true <i>B. bicristatella</i> . The taxon <i>placendiella</i> , currently treated as a synonym, occurs in ON and QC and likely represents a biological species (JFL, <i>in litt.</i>). Another much larger undescribed species is known from BC to NS, and was incorrectly treated as <i>B. bicristatella</i> by Pohl et al. (2010, 2014). To further complicate matters, true <i>B. bicristatella</i> has been erroneously referred to in many publications as <i>Blastodacna curvilineella</i> . There is no such taxon, and is the result of confusion with <i>Batrachedra curvilineella</i> in the Batrachedridae. | | | | | | | | | | | | | | | | | |

| NOTE: A specimen collected in Wood Buffalo National Park in extreme northern AB was identified as this species via DNA barcoding, and reported as such by Šumpich & Huemer (2016). The determination has not been verified via dissection, and is hereby deemed uncertain. If it is correct, the remote location suggests the species would be naturally holarctic rather than introduced. | | | | | | | | | | | | | | | | | |

38. Family COLEOPHORIDAE Bruand, 1850 (casebearer moths)

by J.-F. Landry

Coleophorid moths are very small moths that usually have narrow, strongly pointed wings that span six to 20 mm. Most coleophorid larvae are leafminers in the first instar, then build cryptic cases out of silk, excrement, pieces of leaves, or other plant parts.

The family Coleophoridae ranges worldwide and contains about 1450 species. In the Nearctic region, the family has 154 described species, all in the genus *Coleophora*. The group is poorly known, and probably hundreds more species await description. Thus far, 109 species have been reported from nNA. Baldizzone et al. (2006) published a world catalogue of the family.

Coleophora Hübner, 1822

NOTE: Numerous recent generic synonyms are omitted here; see Baldizzone et al. (2006).

NOTE: Reported from PE by Lafontaine et al. (2001), but that is deemed erroneous. *Coleophora therinella* is not known to occur in NA. These records may refer to *C. benestrigatella*.

39. Family BATRACHEDRIDAE Heinemann & Wocke, 1876

by J.-F. Landry and G.R. Pohl

These are very small moths with narrow, pointed wings, spanning seven to 17 mm. Batrachedrid larvae feed on a wide variety of plant material, from fern sporangia to *Juncus* seeds. Canadian species live on aspen catkins and as inquilines in the galls of *Pontania* sawfly larvae on willow leaves.

Historically the batrachedrids had been placed as a subfamily of the Coleophoridae, but were considered to be a separate family by Hodges (1998). The Batrachedridae comprises about 100 named species, with 26 species known from NA, six of which occur in nNA. The New World species were revised by Hodges (1966a).

40. Family SCYTHRIDIDAE Rebel, 1901 (teardrop moths)

by J.-F. Landry

Scythridids are very small moths with wingspans of 10 to 30 mm. Most species are teardrop shaped, with dark, narrow wings. Larvae feed externally on buds, flowerheads and leaves, or they mine inside leaves. Many scythridids, especially northern and montane species, fly in the daytime.

There are about 650 species of scythridids known around the world. In the Nearctic region, the family is poorly known, with 44 described species, but the true diversity is probably much higher. Fourteen species have been reported from nNA. Landry (1991) revised the known NA fauna.

41. Family BLASTOBASIDAE Meyrick, 1894

by G.R. Pohl and J.-F. Landry

Blastobasids are very small elongate moths, with eight to 15 mm wingspans. The wings of most species are grey with black marks. Larvae of most species are scavengers; a few feed on living plants or are opportunistic predators.

The family Blastobasidae was raised from subfamily status within the Coleophoridae, by Heikkilä et al. (2014). It comprises about 430 described species and is particularly diverse in the New World. A total of 73 species are known from the Nearctic region; 19 species have been reported from nNA. The last comprehensive work on the family was by Dietz (1910), and the group is in need of modern treatment. Adamski & Hodges (1996) published a nomenclature review and a checklist of the known North American species.

42. Family STATHMOPODIDAE Meyrick, 1913

by G.R. Pohl and J.-F. Landry

Stathmopodids are very small, narrow moths with smooth-scaled heads. The larvae have diverse feeding habits.

Until recently, stathmopodids were included as a subfamily within the Oecophoridae (Hodges 1998), but were elevated to family status by Heikkilä et al. (2014). About 100 species of stathmopodids are known worldwide; five of these occur in the Nearctic region, and one is known from nNA. The group has not been the subject of modern taxonomic revision.

***Stathmopoda* Herrich-Schäffer, 1853**

- 421809 *aenea* (Braun, 1918) (*Erineda*) R -- -- -- -- -- -- -- -- ON QC -- NF NB NS --
 NOTE: This taxon was inadvertently omitted from Hodges et al. (1983).

43. Family MOMPHIDAE Herrich-Schäffer, 1857

by G.R. Pohl and J.-F. Landry

Momphids are very small moths (wingspans of six to 18 mm) with narrow, pointed wings. Many species have black wings with transverse white marks. The larvae eat buds, seeds, and flowers, or are stem borers or gall makers. Many species feed on the plant family Onagraceae.

The Momphidae were placed as a subfamily within the Coleophoridae by Hodges (1998), but elevated to family status by Heikkilä et al. (2014). There are 60 described species known worldwide, mostly in the genus *Mompha*. Forty-seven species are known from the Nearctic region, 24 of which have been reported from nNA, and one more is expected. The group is in need of taxonomic work.

44. Family PTEROLONCHIDAE Meyrick, 1918

by G.R. Pohl

This small group of very small moths is defined by wing venation characters and obscure characters of the abdomen.

This group was treated as a subfamily within the Coleophoridae by Hodges (1998), but elevated to family status by Heikkilä et al. (2014) and grouped with the Coelopoetinae (formerly placed in the Elachistidae). About 30 species of Pterolonchidae are known worldwide. Four of these occur in the Nearctic region, and two are known from nNA.

45. Family LYPUSIDAE Herrich-Schäffer, 1857

by G.R. Pohl

Lypusids are small, broad-winged moths defined as a group by characters of the genitalia and other structures. In larvae the hind tibia and tarsus are swollen.

This group was historically placed in the Tineoidea, but was moved to the Gelechioidea by Heikkilä & Kaila (2010), and given full family status by Heikkilä et al. (2014). About 150 species of lypusids are known worldwide, all from the Palearctic. One species has been introduced to the Nearctic region, and it occurs in nNA. It was treated by Hodges (1974) within the Oecophoridae.

Superfamily ALUCITOIDEA Leach, 1815

46. Family ALUCITIDAE Leach, 1815 (many-plumed moths)

by J.-F. Landry

Alucitids are very small to small moths (wingspans from 10 to 22 mm) that have characteristic, deeply divided wing membranes: the forewing has six narrow, scale-edged feather-like plumes, and the hind wings are six- or seven-plumed. A few tropical species have wings that are only partly or hardly divided. Larvae of Alucitidae are concealed feeders that bore in flowers, buds, shoots, and fruits, or make galls.

About 215 species of Alucitidae are known worldwide, but only three species, all in the genus *Alucita*, are known in the Nearctic region. All of them occur in nNA. For many years, all Nearctic *Alucita* were considered to be *A. hexadactyla* Linnaeus, but Landry & Landry (2004) revised the Nearctic species, and recognized three valid species, none of which is the Palearctic *A. hexadactyla*. Gielis (2003) published a world catalogue of Alucitoidea.

Superfamily PTEROPHOROIDEA Latreille, 1802

47. Family PTEROPHORIDAE Latreille, 1802 (plume moths; tee moths)

by A.D. Macaulay and G.R. Pohl

Plume moths are small to medium-sized slender moths with long, narrow wings, and wingspans ranging from 15 to 30 mm. The forewing is normally notched into two to four lobes, the hind wing into three more deeply cut, feather-like plumes. The wings are rolled and held outstretched horizontally at rest, forming a T-shape with the body. Most pterophorid larvae are leaf rollers or borers in plant stems, buds, and roots.

The family Pterophoridae occurs worldwide, with about 1320 described species; 162 species are recorded in the Nearctic region, 82 of which occur in nNA, with one more expected. There has been no comprehensive taxonomic work on the family since it was revised by Barnes and Lindsey (1921). Gielis (2003) published a checklist of the world Pterophoroidea.

Superfamily CARPOSINOIDEA Walsingham, 1897

48. Family COPROMORPHIDAE Meyrick, 1905

by G.R. Pohl

Copromorphids are small moths with wingspans from 12 to 20 mm. They have more-or-less rounded wing tips and are coloured for camouflage. The larvae tunnel in fruit, leaf veins, twigs, or flower inflorescences, or feed between joined leaves.

The Copromorphidae is a small, weakly defined family whose present make-up may not stand up to future taxonomic study. They are represented by about 40 species, and occur in all regions except the Palaearctic. The family is mainly Oriental and Australian. Five species are known in the Nearctic region, two of which occur in nNA.

49. Family CARPOSINIDAE Walsingham, 1897 (fruitworm moths)

by G.R. Pohl and J.-F. Landry

Carposinids are very small to small moths with broad, lanceolate wings; wingspans in North American species range from 10 to 20 mm. Males frequently have raised scale tufts on the forewings. Larvae are internal feeders, in leaf and flower buds, shoots, fruits, living bark, galls, and tree wounds.

The family Carposinidae contains 283 named species, mostly in Asia and the Australo-Pacific region. Eleven species are recorded in the Nearctic region, four of which occur in nNA. Davis (1968) revised the North American species.

Superfamily SCHRECKENSTEINIOIDEA Fletcher, 1929

50. Family SCHRECKENSTEINIIDAE Fletcher, 1929 (bristle-legged moths)

by G.R. Pohl

Schreckensteiniids are very small, narrow-winged moths, with wingspans usually of eight to 12 mm. Adults have stiff spines on the upper margin of the hind tibiae. Larvae are external feeders on various plants; pupation takes place in a mesh cocoon.

The family Schreckensteiniidae contains only eight species. Three species are known in the Nearctic region, all of which occur in nNA.

Superfamily EPERMENIOIDEA Spuler, 1910

51. Family EPERMENIIDAE Spuler, 1910 (fringe-tufted moths)

by G.R. Pohl and J.-F. Landry

Epermeniids are very small to small moths, with narrow, fringed wings spanning six to 20 mm. The forewings usually have one or more tufts of erect scales on the trailing margin. Known larvae begin life as concealed feeders, but feed externally in later instars.

Worldwide, 126 species occur in all regions; 12 are known from the Nearctic region, and eight of these occur in nNA. These moths are rarely encountered and poorly known. The North American members of the family were revised by Gaedike (1977), in German, with an updated key by Gaedike (2008). Gaedike (1996) published a world catalogue of the family.

Superfamily URODOIDEA Kyrki, 1988

52. Family URODIDAE Kyrki, 1988 (false burnet moths)

by J.-F. Landry

Urodids are small to medium-sized moths, with wingspans from 15 to 40 mm. The front margin of the male hind wing has a pencil of hairs, and the antennae of males are lamellate. The few known larvae of the Urodidae feed on broadleaved trees.

This small family consists of 66 described species, most of which are Neotropical. Two species live in the Nearctic region; one occurs in nNA.

Superfamily CHOREUTOIDEA Stainton, 1858

53. Family CHOREUTIDAE Stainton, 1858 (metalmark moths)

by G.R. Pohl

The Choreutidae are very small to small moths, with wingspans of five to 20 mm. The wings are usually broad, and usually have metallic markings or contrasting patterns. The species now placed in the Choreutidae had historically been placed in various other families, and often had been incorrectly associated with the Glyphipterigidae. Choreutid larvae are mainly leaf webbers or skeletonizers, but a few species are borers in flower inflorescences. Pupae are encased in a lace-like, often double, cocoon in folded leaves.

About 400 species of Choreutidae are known worldwide. There are 33 species in the Nearctic region, 19 of which occur in nNA. The group is poorly known and in need of modern work. Rota (2011) and Rota & Wahlberg (2012) revised the higher classification of the group.

Superfamily GALACTICOIDEA Minet, 1986

54. Family GALACTICIDAE Minet, 1986

by G.R. Pohl

Galacticids are very small moths with wingspans from 10 to 20 mm, relatively broad wings, and short maxillary palps. The larvae feed gregariously.

This recently recognized family originated in the Old World, and contains 19 species. One of these has been introduced to NA, and it occurs in nNA. The group is in need of work and its composition has not been settled. Until recently the family was placed in the Tineoidea.

Superfamily TORTRICOIDEA Latreille, 1802

55. Family TORTRICIDAE Latreille, 1802 (bell moths and leafroller moths)

by G.R. Pohl and J.J. Dombroskie

Tortricids are very small to medium-sized moths, with wingspans ranging from about seven to 35 mm, rarely to 60 mm. The forewings of most species are broad and usually square tipped, giving the adult a characteristic bell or shield shape when adults are at rest with the wings folded; the main exception being the diverse Eucosmini which typically has narrower wings that are tightly rolled around the body when at rest. The moths are usually cryptically coloured, but some have shiny, metallic markings. Tortricid larvae feed upon a vast array of plant families. Many species are leafrollers, but larvae of some species have other feeding habits. The family contains many agricultural and forest pests.

The family Tortricidae is a large group with about 10,400 named species. In the Nearctic region, about 1390 species are described, with 842 reported in nNA, making it the second-largest family of Lepidoptera in the region. A further eight species are expected in the region. Despite the importance of many tortricid species as pests, many groups within the family are not well known. Some major published works cover the Tortricini (Razowski 1966), Archipini (Freeman 1958), and Sparganothini and Atteriini (Powell & Brown 2012). Most of the Olethreutinae were treated by Heinrich (1923, 1926), publications that are badly out of date but have been only partially replaced by more modern comprehensive works. Other significant regional works are Miller (1987) and Gilligan et al. (2008). Brown (2005) recently published a world catalogue, which is kept up to date online (Gilligan et al. 2014).

| | NOTE: Old reports of this species in western Canada and in LB are erroneous. Some of these are due to Heinrich's (1926) confusion of this species with <i>O. metallicana</i> , which he mistakenly treated as " <i>O. puncticostana major</i> " (the true <i>puncticostana</i> is a synonym of <i>O. coruscana</i>). <i>Olethreutes coruscana</i> is known with certainty as far west as SK, and is not confirmed in LB. | | | | | | | | | | | | | | | | |
| | <i>constellatana</i> (Zeller, 1876) (<i>Sericoris</i>) | | | | | | | | | | | | | | | | |

NOTE: This species has historically been treated as a subspecies of *A. muricana* but is now listed as a valid species (Gilligan et al. 2014). The BC record by ESBC (1906) was listed as “unconfirmed” under *A. muricana* by Pohl et al. (2015b), but it is hereby deemed erroneous. Neither *A. cornifoliata* nor *A. muricana* are known in western NA. *Ancylis cornifoliata* is not known to occur in Canada, and eastern Canadian specimens under that name in collections are probably *A. muricana*.

geminana group Gilligan et al., 2016
tax info: Gilligan et al. (2016)

- 620668 *diminuatana* Kearfott, 1905 (*Ancylis*) R AK YT NT -- BC AB SK MB ON QC U U NB U PE
NOTE: The Old World names *A. diminuatana* (note the slightly different spelling from the correct Nearctic species), *A. geminana* (Donovan), and *A. biarcuana* (Stephens) (a synonym of *A. geminana*) have all been used historically for this species in NA (Gilligan et al. 2016). Some records refer to *A. goodelliana*; the figures of this taxon in Gilligan et al. (2008) refer to *A. goodelliana*. Records from LB, NF, and NS have not been verified.
- diminuatana* of authors (not Haworth, 1811) (*Tortrix*)

Superfamily COSSOIDEA Leach, 1815

56. Family COSSIDAE Leach, 1815 (carpenterworm moths; goat moths)

by G.R. Pohl

Most Cossidae are medium-sized to very large heavy-bodied moths, with wingspans ranging from about 25 to 100 mm in Nearctic species, and up to 236 mm in other parts of the world. The forewings usually are long and narrow, and the abdomen extends beyond the hind wing. Cossid larvae are woodborers or, in a few cases, tunnel in the soil and feed externally on roots. A few species are pests.

The family Cossidae contains about 970 described species throughout the world. Forty-six species are recorded in the Nearctic region; six occur in nNA. Little taxonomic work has been done on the group in the past century, but the nNA species are well known.

subfamily Zeuzerinae Boisduval, [1828]

***Zeuzera* Latreille, 1804**

- 640005 *pyrina* (Linnaeus, 1761) (*Phalaena*)⁺ R -- -- -- -- -- -- -- -- ON S -- -- -- -- --
 NOTE: The historical QC record from Montreal (Handfield 2011) is probably an accidental introduction.

subfamily Hypoptinae Neumögen & Dyar, 1894

***Givira* Walker, 1856**

- 640013 *cornelia* (Neumögen & Dyar, 1893) (*Hypopta*) R -- -- -- -- BC -- -- -- -- -- -- -- -- -- --

57. Family SESIIDAE Boisduval, 1828 (clearwing moths)

by G.R. Pohl

Clearwing moths are primarily medium-sized moths that mimic wasps. The wingspan in Nearctic species ranges from about 13 to 70 mm. The body is stout, elongate, and frequently marked and banded with white, yellow, orange, or red. The scales often are iridescent, and the wings have extensive areas that lack scales. Adult clearwing moths are diurnal. The larvae bore in roots, trunks and branches of trees, or in the stems and roots of herbaceous plants.

The Sesiidae consists of about 1400 named species worldwide; in the Nearctic region, 135 species are recorded, 62 of which occur in nNA, and one more is expected. The family was revised by Eichlin and Duckworth (1988), and a world checklist was published by Pühringer & Kallies (2004) and is maintained online by Pühringer & Kallies (2015).

subfamily Tinthiinae Le Cerf, 1917

tribe Tinthiini Le Cerf, 1917

***Zenodoxus* Grote & Robinson, 1868**

Superfamily ZYGAENOIDEA Latreille, 1809

58. Family LIMACODIDAE Duponchel, 1845 (slug caterpillar moths)

by G.R. Pohl

Limacodids are small to medium-sized moths with stout bodies and broadly rounded wings. The larvae are short and sluglike, and many bear stinging hairs or spines. Abdominal prolegs are highly reduced; specialized suckers and semifluid silk help the insects cling to foliage. They feed on diverse trees, shrubs and grasses; some species are pests.

The family Limacodidae contains about 1670 described species worldwide, but is most diverse in the tropics. There are 49 named species in the Nearctic region, 18 of which occur in nNA. The group has not been revised in many years but the species in nNA are reasonably well-known.

59. Family ZYGAENIDAE Latreille, 1809 (burnet moths)

by G.R. Pohl

Zygaenids are medium-sized, primarily brightly coloured moths with elongate wings. Most adults are diurnal, and some have mimetic patterns of blue and orange similar to some arctiine moths and various beetles. The larvae also are usually brightly coloured, and can synthesize hydrogen cyanide as a defense against predators. Most are exposed feeders on herbs, shrubs, and trees, often skeletonizing leaves in the early instars.

About 1040 species of zygaenids are known worldwide, with the center of diversity in Asia and the Palearctic. Twenty-seven species of zygaenids occur in the Nearctic region, three of which occur in nNA. The Nearctic genera were revised by Tarmann (1984, in German); the species have not been revised in many years.

Superfamily THYRIDOIDEA Herrich-Schäffer, 1846

60. Family THYRIDIDAE Herrich-Schäffer, 1846 (window-winged moths)

by G.R. Pohl

Thyridid moths are small to large moths, with wingspans up to 72 mm outside of NA. Nearctic species are primarily small, with the wings often dark and patterned in reticulated rows of spots, frequently with translucent patches (hence the common name). Adults rest in a distinctive posture with the front of the body strongly raised and the wings outstretched or swept back. Many mimic dead leaves. The larvae are stem borers or leaf tiers and folders.

The family Thyrididae consists of about 940 described species, mostly in the tropics and subtropics. Twelve species are recorded in the Nearctic region, two of which occur in nNA. The group has not been revised for many years, but the two nNA species are reasonably well-known.

Superfamily PAPILIONOIDEA Latreille, 1802 (butterflies and skippers)

The butterflies have been treated extensively in scientific and popular literature, and we present only a basic treatment here. Much more information is available in Layberry et al. (1998) and in several excellent regional guides (Philip & Ferris 2016, Northwest Territories Environment and Natural Resources 2012, Guppy & Shepard 2001, Bird et al. 1995, Hooper 1973, Klassen et al. 1989, Hall et al. 2014, Handfield 2011, Maritimes Butterfly Atlas 2016, Morris 1980). Butterflies are relatively well-understood taxonomically, but some uncertainties exist and new species and subspecies continue to be described. Pelham (2008) published a comprehensive catalogue, which is kept up to date online (Pelham 2016).

61. Family HESPERIIDAE Latreille, 1809 (skippers)

by G.R. Pohl, B.C. Schmidt, J.D. Lafontaine, and A.D. Macaulay

Skippers are small to medium-sized butterflies, with characteristic rapid, darting flight. The head is broad, the antennae are usually clubbed or hooked at the tip, and the wings are usually brown, grey, and/or orange. The larvae of most species live in silk-lined nests that they construct on the food plant by cutting and folding leaves or by binding several leaves together. A few bore into plant tissues. They feed on a variety of flowering plants.

The family HesperIIDae contains over 4100 species worldwide. There are almost 300 species in the Nearctic region; 74 of which have been reported from nNA. A further four species are expected in the region.

Ephyriades Hübner, [1819]

- 770085 *brunnea* (Herrich-Schäffer, 1865) (*Nisoniades*) U -- -- -- -- -- -- -- -- U -- -- -- -- -- --
 NOTE: The synonym *Eudamus electra* was described from a specimen that was apparently collected at Hamilton (ON) in 1877 by J.A. Moffat. Details of its collection are documented in Lintner (1881), and the locality is accepted to be genuine. Tantalizingly, the collector reported that the type specimen in question was one of two specimens seen, and that the other avoided capture. This record has been overlooked for decades, and it is a remarkable one, as *E. brunnea* is otherwise restricted in NA to southern FL, with no other records of strays northwards. The type of *electra*, which is deposited in the CMNH, has been examined by experts and has been satisfactorily determined to be conspecific with *E. brunnea*. However, it does not match the description of Lintner (1881) very well; it is pale and larger than a typical *Erynnis juvenalis*, rather than dark and the size of a small *E. juvenalis* as stated in the description. There is a possibility that this is an improbable stray, or a human introduction (unlikely in the 1870s before the age of modern road and air transportation). However, another possibility is that the label from the original *electra* type has somehow been switched with another specimen since the original description. Given this uncertainty about the provenance of the *electra* type, we list this species as uncertain for ON and Canada.

62. Family PAPILIONIDAE Latreille, 1802 (swallowtails and apollo)

by G.R. Pohl, B.C. Schmidt, J.D. Lafontaine, and A.D. Macaulay

Papilionids are large butterflies with hairless eyes, short antennae, and three fully developed pairs of legs. North American species range from about 40 to 110 mm in wingspan. Many are boldly coloured in patterns of black, white, and yellow. Larvae of papilionids eat a variety of food plants. Some species sequester toxic plant compounds and have aposematic warning colours.

The family Papilionidae contains about 570 species worldwide. About 40 papilionid species occur in the Nearctic region, 18 of which occur in nNA.

subfamily Parnassiinae Duponchel, [1835]

tribe Parnassiini Duponchel, [1835]

- 770289 *corybas* Fischer von Waldheim, 1823 (*Parnassius*)* R AK YT NT -- BC -- -- -- -- -- -- -- -- -- -- --
 NOTE: For many years this species has been referred to in NA and Europe as *P. phoebus* (Fabricius), but that was based on a longstanding misidentification. Following a recent ruling of the ICZN (2017), true *P. phoebus* (Fabricius) refers to a different species that is restricted to the Altai Mountains in Asia. Reports of the Asian species *P. nomion* from Sitka (AK) by Edwards (1877), and from "Canada" by The Natural History Society of Toronto (1883) likely refer to this species as well.

| | NOTE: Rocky Mountain populations (including all known AB and BC material) have recently been recognized as a distinct species, <i>C. skinneri</i> (Pelham 2016). Western Arctic records portrayed on the range map of Layberry et al. (1998) are misidentifications; this species is not known west of ON. As detailed by Klassen et al. (1989), records of this species from MB are also based on mislabelled material, but the species may occur in the far north of the province. | |

64. Family LYCAENIDAE Leach, 1815 (gossamer-wings: coppers, hairstreaks, and blues)

by G.R. Pohl, B.C. Schmidt, J.D. Lafontaine, and A.D. Macaulay

Lycaenids are small to medium-sized butterflies, with wingspans of about 20 to 50 mm. They are often brightly coloured, frequently in iridescent blues, greens, and coppery tones. Many have small, hair-like tails on the hind wings. The forelegs of male adults are reduced in length (the tarsal segments are fused) and lack claws, but the forelegs of females have a normal structure and are fully functional. The larvae are oval, flattened and grub-like; many have glands that produce sweet liquids. The larvae feed on many groups of dicotyledonous plants. Some larvae are symbiotic with ants, which protect them from predators in exchange for the honeydew from their abdominal glands.

The family contains about 5200 named species worldwide. There are about 165 species in the Nearctic region, 66 of which have been reported from nNA. One more is expected in the region.

|--------|--|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

NOTE: This species is known in Canada from a single fresh specimen in the CNC, apparently collected at Limerick (SK) on 1 August 1955 by A.R. Brooks (Hooper 1973; Layberry et al. 1998). It is otherwise a resident of southeastern USA, with strays only as far north as MI, MN, and IL. The fresh SK specimen is almost certainly either mislabelled or a human-aided introduction, and the species is treated as such herein. It was considered an expected species in ON by Hall et al. (2014) but that is unlikely.

65. Family RIODINIDAE Grote, 1895 (metalmarks)

by G.R. Pohl, B.C. Schmidt, J.D. Lafontaine, and A.D. Macaulay

The metalmarks are small to medium-sized butterflies; Nearctic species seldom have wingspans over 50 mm. Most are coloured in browns, orange, and black, and often rest with their wings spread flat or held angled at 45 degrees. Some species have metallic-coloured marks on the wings, hence the common name.

About 1530 described species of metalmarks occur worldwide, primarily in the New World tropics. There are 29 species in the Nearctic region; one species occurs in nNA.

66. Family NYMPHALIDAE Rafinesque, 1815 (brush-footed butterflies)

by G.R. Pohl, B.C. Schmidt, J.D. Lafontaine, and A.D. Macaulay

Most Nearctic nymphalids are medium-sized to large butterflies with 40 to 70 mm wingspans, and orange or brown wings with dark markings. Both sexes have forelegs reduced in length and covered in long brush-like hairs, thus the common name of the group. Many nymphalids are strong fliers, and some species are migratory and number among the most cosmopolitan of insects. The larvae commonly have branched spines; the pupae are often strongly angled and bear thorn-like projections.

The Nymphalidae contain several subfamilies that were historically treated as separate families (e.g., Danaidae, Satyridae, and Heliconiidae). It is the largest family of butterflies, with about 6150 species worldwide. The Nearctic region has about 230 species, 106 of which have been reported from nNA. One more is expected in the region.

subgenus *Danaus* Kluk, 1780

- 770588 *plexippus* (Linnaeus, 1758) (*Papilio*) M S -- S -- M M M M M M -- S M M M
NOTE: This species is a true migrator that moves north into Canada each summer. It breeds in southern Canada but returns to CA and Mexico to overwinter. It has recently been upgraded from “Special Concern” to “Endangered” in Canada (COSEWIC 2017). The sole AK specimen is known from wings found in a building in Hyder (Philip & Ferris 2016).

subgenus ***Boloria*** Moore, 1900

- 770610 *alaskensis* (Holland, 1900) (*Brenthis*) R AK YT NT NU BC AB -- -- -- -- -- -- --
 NOTE: Historically, the Old World name *B. napaea* has been used for this species in NA. As well, the names "*Brenthis andersonii* Dyar" and "*Brenthis euphrosyne andersoni* Dyar" were used on historical BC lists by ESBC (1906) and Blackmore (1927), respectively, to refer to *B. alaskensis*. The taxon *B. andersoni* Dyar, a synonym of the Palearctic *B. euphrosyne* (Linnaeus), was described from Old World material that was mislabelled as coming from "Kootenay, BC" (Pelham 2008). Jones (1951) used the Palearctic name *B. pales* ([Denis & Schiffermüller]) for this species.

| | NOTE: This species is an occasional migrant that breeds in southern ON and probably in MB (Layberry et al. 1998). Recent records further west in SK and AB are considered strays. Fletcher (1897) reported four specimens from NB in the NB Natural History Society collection, but their current whereabouts is unknown. This distinctive species could not be mistaken for anything else. | | | | | | | | | | | | | | | | |

| | NOTE: This species was reported from BC by Anderson (1904) from Vernon and Osoyoos. Jones (1951) also reported it from BC, under the name <i>S. snyderi</i> , now considered to be a subspecies of <i>S. coronis</i> . Jones (1951) cited only a Vernon specimen, which cannot be located and was flagged therein as either rare or doubtful. This species is known from central WA, very close to the BC border (Guppy & Shepard 2001), so it is possible that it occurs in BC as well. Subspecies <i>simaetha</i> , described from Okanogan County (WA), would be the nearest subspecies to BC. | | | | | | | | | | | | | | | | |

| | | NOTE: This species is known in Canada from a single specimen collected at Whiskey Gap (AB) by N. Kondla (Pohl et al. 2010). Other specimens may be misidentified in collections. There is no evidence that a breeding colony exists. The BC record by Anderson (1904), as subspecies <i>oweni</i> , is assumed to be erroneous, although the species is expected there. It is reasonably common in the USA south of SK and BC. This species was grouped with <i>S. zerene</i> in the treatment by Layberry et al. (1998). | | | | | | | | | | | | | | | | |

 NOTE: Erroneous AB record by Bowman (1921b), corrected by Bowman (1924). Western Canadian populations (subspecies *paradoxa*) have been treated by many as a subspecies of *E. chalcedona*.
 b *colon* (Edwards, 1881) (*Melitaea*) e -- -- -- -- e -- -- -- -- -- -- -- -- -- --
perdiccas (Edwards, 1881) (*Melitaea*)
 f *paradoxa* McDunnough, 1927 (*Euphydryas*) r -- yt -- -- bc -- -- -- -- -- -- -- -- -- --
nigrisupernipennis Gunder, 1926 (*Euphydryas*)

770702 *ancia* (Doubleday, 1847) (*Melitaea*) R AK YT -- -- BC AB SK MB -- -- -- -- -- -- -- -- -- --
 NOTE: This species is known in MB only from two specimens collected at Riding Mountain National Park. Subspecies of *ancia*, *colon*, and *chalcedona* have complex relationships that have not been entirely worked out. The taxon *howlandi* was used by Pyle (2002) for populations along the southeastern border of BC, but it was not recognized in recent Canadian works (Layberry et al. 1998; Guppy & Shepard 2001). The taxon *bernadetta* was listed as a valid species in Pohl et al. (2010) because three *Euphydryas* taxa (*ancia*, *bernadetta*, and *editha*) occur sympatrically in the Cypress Hills (AB/SK). It is here listed as a subspecies of *E. anicia* following Pelham (2016).

| | NOTE: This species has recently been recognized as distinct from <i>P. cocyta</i> , and older records may refer to the latter. Guppy & Shepard (2001) continue to treat <i>P. cocyta</i> as a subspecies of <i>P. tharos</i> , and their BC, YT, and NT records of <i>P. tharos</i> refer to what we consider to be <i>P. cocyta</i> . Similarly, records of <i>P. tharos</i> from eastern QC and the maritimes refer to <i>P. cocyta</i> . <i>Phyciodes tharos</i> is known from the prairie provinces, and southern ON as far north and east as Ottawa, with a few records from the Aylmer area of extreme southwestern QC (Layberry et al. 1998). The status of subspecies <i>orantain</i> is uncertain. | | | | | | | | | | | | | | | | | |

| | NOTE: The validity of this name versus <i>P. pratensis</i> was disputed by Layberry et al. (1998), and the matter has not been satisfactorily resolved. We follow Pelham (2008) herein. Historical reports of this species from MB were corrected to <i>P. cocyta</i> by Klassen et al. (1989). This species was reported from SK by Hooper (1973) and Layberry et al. (1998) but the latter contradictingly reports that the SK records are based on misidentified <i>P. batesii</i> specimens. The nominate subspecies, described from CA, does not apply to more northerly populations (Kondla & Guppy 2002). | | | | | | | | | | | | | | | | | |

Superfamily PYRALOIDEA Latreille, 1809

67. Family PYRALIDAE Latreille, 1809

by G.R. Pohl and A.D. Macaulay

Pyalids are small to large moths, with wingspans ranging from about 10 to 75 mm. Most North American species have wingspans less than 35 mm. The family is defined by the unique arrangement of the tympanal organs, which are on the ventral part of the abdomen base and include a narrow opening that faces forward towards the thorax. Pyalids have diverse feeding habits, including leaf rollers, plant tissue borers, inquilines, and stored product pests.

The family Pyralidae is a large group of cosmopolitan moths. There are about 5900 described species; about 680 are found in the Nearctic region and 244 are reported from nNA. The subfamily Phycitinae is fairly well known, with significant revisions published by Heinrich (1956) and Neunzig (1986, 1990, 1997, 2003). The other subfamilies are generally poorly known and require taxonomic work. Scholtens & Solis (2015) provide an online catalogue of world Pyraloidea.

68. Family CRAMBIDAE Latreille, 1810 (snout moths and grass moths)

by G.R. Pohl and A.D. Macaulay

Crambids are very small to large moths, with wingspans ranging from about 10 to 100 mm, but seldom exceeding 30 mm in Nearctic species. They were historically placed within the Pyralidae. Like pyralids, they have tympanal chambers on the abdomen, but they differ from pyralids in the details of the tympanal opening. Larvae of most crambid species are borers or concealed feeders of plants. Larvae of the subfamily Acentropinae are almost all aquatic as immatures, and feed on aquatic plants or algae.

The family Crambidae is distributed around the world and contains about 9650 described species. About 875 species are known in the Nearctic region, 295 of which are reported from nNA. Several major subgroups of crambids have been revised by Munroe (1972a, 1972b, 1973b, 1976a, 1976b), but other groups are poorly known. Scholtens & Solis (2015) provide an online catalogue of world Pyraloidea.

subfamily Schoenobiinae Duponchel, 1846

***Carectocultus* Blanchard, 1975**

funerellus (Hampson, 1901) (*Chilo*)
repugnatalis (Walker, 1863) (*Chilo*)
serriradiellus (Walker, 1863) (*Crambus*)

Donacula Meyrick, 1890

tax info: Martinez (2010)

NOTE: This genus was revised by Martinez (2010), but that work was not a formal publication as recognized by the ICZN. We accept the interpretations of Martinez (2010) regarding previously described species, but the taxa named therein are not valid species and they are not listed herein.

- 800707 *sordidellus* (Zincken, 1821) (*Chilo*) R -- -- -- -- -- -- -- -- E ON -- -- -- -- -- --
 NOTE: The MB record by Kearfott (1905b) could not be verified, and is assumed to be erroneous. It likely refers to another species not described at that time. The ON record is based on DNA barcode data.
- 800708 *unipunctellus* (Robinson, 1870) (*Schoenobius*) R -- -- -- -- -- -- -- -- E -- U -- -- -- -- NS --
 NOTE: The MB records by Kearfott (1905b) and Brodie (1929) are assumed to be erroneous; Martinez (2010) reported this species only from eastern USA and NS. The QC records at the LFC and LEMQ are also unverified but are considered plausible (Martinez (2010) did not examine specimens from Canadian collections other than the CNC).
- 800709E *tripunctellus* (Robinson, 1870) (*Schoenobius*) E -- -- -- -- -- -- -- -- E -- -- -- -- -- -- -- --
 NOTE: The Cartwright (MB) record by Brodie (1929) is erroneous; vouchers in the UMB Heath collection are another *Donacula* species. The species has been reported as far north as VT and ME, but verified records are all from southeastern USA (Martinez 2010).
- 800710 *melinellus* (Clemens, 1860) (*Schoenobius*) R -- -- -- -- -- E E E E ON E -- -- E E --
 NOTE: True *D. melinellus* is known in Canada only from ON. All other records are *D. albicostellus* or *D. dispersellus*, both proposed as full species by Martinez (2010).
- 800711 *dispersellus* (Robinson, 1870) (*Schoenobius*) R -- -- -- -- -- AB SK MB ON QC -- -- U NS PE
 NOTE: We treat this taxon as a full species following Martinez (2010), although that is not a formally recognized publication for taxonomic purposes. Material from NB was not mentioned by Martinez (2010) and is considered to be unverified.
- 800712 *albicostellus* (Fernald, 1888) (*Schoenobius*) R -- -- -- -- -- BC AB SK MB ON U -- -- -- -- --
 NOTE: We treat this taxon as a full species following Martinez (2010), although that is not a formally recognized publication for taxonomic purposes.
- uniformellus* (Dyar, 1917) (*Schoenobius*)
- 800713E *aquilellus* (Clemens, 1860) (*Schoenobius*) E -- -- -- -- -- -- -- -- E -- E -- -- E E --
 NOTE: This species has been reported from across most of Canada, but all those records refer to other species of *Donacula* not properly delimited at the time. Martinez (2010) reports no authentic Canadian specimens of this species.
- clemensellus* (Robinson, 1870) (*Schoenobius*)
- 800715 *longirostrallus* (Clemens, 1860) (*Schoenobius*) R -- -- -- -- -- E -- -- ON QC -- -- U NS --
 NOTE: As defined by Martinez (2010), this is an eastern species, so the AB records reported by Pohl et al. (2010) are deemed erroneous. No NB specimens were mentioned by Martinez, so the CNC NB records are considered to be unverified. Included herein is the taxon *Schoenobia amblyptepennis*, informally synonymized by Martinez (2010). The Old World name *Schoenobius* [= *Donacula*] *forficella* has been used historically for this species in NA.
- amblyptepennis* (Dyar, 1917) (*Schoenobius*)
forficella of authors (not Thunberg, 1794) (*Tinea*)
longirostellus of authors, [no date] (*Donacula*)
- 800717 *nitidellus* (Dyar, 1917) (*Schoenobius*) R -- -- -- -- -- AB -- -- -- -- -- -- -- -- -- --
 NOTE: This species is known primarily from eastern USA as far north as NY, but Martinez (2010) lists two specimens confirmed from central AB.

Superfamily MIMALLONOIDEA Burmeister, 1878

69. Family MIMALLONIDAE Burmeister, 1878 (sackbearer moths)

by B.C. Schmidt and J.D. Lafontaine

Mimallonids are medium-sized to large moths with stout bodies and broad wings. They usually have bipectinate antennae. The larvae are usually brightly coloured, and most species live in folded leaves or a silken nest in the younger instars, and then construct a mobile case of silk and frass in the older instars (hence the common name).

About 195 species of mimallonids are known worldwide, primarily in the neotropics. Four species occur in the Nearctic region, two of which are known from eastern Canada. The NA species were treated by Franclemont (1973).

Superfamily DREPANOIDEA Boisduval, 1828

70. Family DREPANIDAE Boisduval, 1828 (lutestring moths and hooktip moths)

by B.C. Schmidt and J.D. Lafontaine

Drepanids are medium-sized moths, ranging in size from about 35 to 45 mm. In NA, this group includes two superficially dissimilar subfamilies that have been treated as separate families in the past; they are united based on the unique structure of the tympanum. Most drepanid larvae feed on the foliage of trees or shrubs and are gregarious when young.

The family Drepanidae contains about 660 described species. Twenty-one species are known in the Nearctic region, 12 of which occur in nNA. One more species is expected in the region. There has been no recent taxonomic work on the group at the species level, but the Nearctic species are well known.

Superfamily LASIOCAMPOIDEA Harris, 1841

71. Family LASIOCAMPIDAE Harris, 1841 (tent caterpillars and lappet moths)

by B.C. Schmidt, J.D. Lafontaine, and G.R. Pohl

Lasiocampids are small to very large, stout-bodied, hairy moths. North American species are medium-sized, with wingspans of 25 to 35 mm. The mouthparts are nonfunctional, the eyes are often hairy, and

the antennae are somewhat feathery, especially in males. Lasiocampid larvae feed primarily on deciduous trees and shrubs. Tent caterpillars live in silken colonies and often cause severe defoliation during cyclical outbreaks.

Approximately 1950 species of lasiocampids are known worldwide, primarily in the tropics. In the Nearctic region, 35 species are known, eight of which occur in nNA. The family in NA was revised by Franclemont (1973).

Superfamily BOMBYCOIDEA Latreille, 1802

72. Family APATELODIDAE Neumögen & Dyar, 1894

by B.C. Schmidt and G.R. Pohl

Apatelodids are small to medium-sized moths with stout bodies and pectinate antennae. The larvae are hairy, and feed on a variety of shrubs and trees.

About 145 species of apatelodids are known worldwide, primarily in the Neotropics. Six species occur in the Nearctic region, two of which are known in nNA. The NA species were treated by Franclemont (1973).

73. Family BOMBYCIDAE Latreille, 1802 (silkworm moths)

by B.C. Schmidt and G.R. Pohl

Bombycids are medium-sized moths with stout bodies and reduced mouthparts. The larvae are covered in fine setae.

The bombycids are an Old World group of about 185 species, known in NA only by the domesticated silkworm moth *Bombyx mori* (Linnaeus), which is cultured in captivity. It was treated taxonomically by Franclemont (1973).

74. Family SATURNIIDAE Boisduval, 1837 (giant silk moths)

by B.C. Schmidt and G.R. Pohl

Giant silk moths are medium-sized to very large moths, with wingspans of about 30 to 280 mm. North American species range from 30 to 160 mm in wingspan. The body is heavy and covered in hair-like scales, and the mouthparts are reduced and non-functional. Larvae often have tubercles or spines on the body; the pupae usually are enclosed in silken cocoons, often incorporating leaves. The larvae are frequently polyphagous.

There are about 2350 species of saturniids worldwide, with 76 species recorded in the Nearctic region, 24 of which have been reported from nNA. The NA saturniids were treated in detail by Ferguson (1971, 1972) and Tuskes et al. (1996).

- 890074 *cynthia* (Drury, 1773) (*Phalaena*)+ XT -- -- -- -- -- -- -- -- XT -- -- -- -- -- --
NOTE: This species was introduced to NA for silk production. It was introduced or escaped captivity in various localities over the past century, but only maintains a viable wild population in the eastern USA between New York City and Washington, DC. It is known in Canada from a specimen in the MMMN collected at London (ON) by Norman Criddle that emerged at Aweme (MB) on 20 July 1905, and from a specimen in the ROM from downtown Toronto (ON). It may well have established temporary populations in these places, but it is deemed to be extirpated in Canada. Four specimens labelled as being from Miniota (MB) in the MMMN are thought to be imported reared material, as no host plant is available there.

75. Family SPHINGIDAE Latreille, 1802 (sphinx moths; hornworms)

by B.C. Schmidt and G.R. Pohl

Sphinx moths are medium-sized to large moths (wingspans of 30 to 180 mm), with heavy bodies, long, narrow forewings and relatively small hind wings. Most larvae lack obvious hairs and usually have a spine or button-like process near the end of the body, thus giving them the name hornworms. The adults of many species are nectar feeders; larvae feed on a variety of plants.

About 1460 species of Sphingidae are known worldwide. The Nearctic region has approximately 130 species, 60 of which have been reported from nNA. One more is expected in the region. Hodges (1971) and Tuttle (2007) covered the North American Sphingidae; Kitching and Cadiou (2000) provided a complete world catalogue.

Superfamily GEOMETROIDEA Leach, 1815

76. Family URANIIDAE Leach, 1815 (swallowtail moths)

by B.C. Schmidt and G.R. Pohl

Uraniids are small to very large moths, usually with slender bodies. Nearctic species are small, with wingspans of 15 to 20 mm. The family is defined by characters of the abdominal tympanum and wing venation. Some species, including the species in nNA, have notched hind wings.

The family Uraniidae consists of almost 700 described species, mostly in the tropics. Thirteen species are known in the Nearctic region, two of which occur in nNA.

erosiata Packard, 1876 (*Calledapteryx*)

77. Family GEOMETRIDAE Stephens, 1829 (inchworm moths; loopers)

by B.C. Schmidt, G.R. Pohl, and J. deWaard

Geometrids are small to very large moths, but Nearctic species are primarily medium-sized, with wingspans ranging from 10 to 70 mm. They are typically slender bodied, with broad, delicate wings. In our fauna, adult wing colours are usually subdued, with browns, greys, whites, and rusts predominating. In a few species, the females have short wings or are wingless. Most larvae have lost the front three of the usual five pairs of prolegs, but some species have retained more than two pairs (with some prolegs reduced). The loss of prolegs results in the looping habit of the moving larva, hence the common name. Most larvae are externally feeding defoliators, although some eat fruits, dead leaves, and stored food products; a few are carnivorous.

The family Geometridae is huge, containing about 23,000 species globally. About 1450 species are described in the Nearctic region; 538 of these have been reported from nNA, and one more is expected. Geometrids are the third-most diverse family in the region. Most Canadian species of geometrids were treated by McGuffin (1967, 1972, 1977, 1981, 1987, 1988) and Bolte (1990), but many genera in the subfamily Larentiinae remain poorly known. Other significant North American works are by Ferguson (1985, 2008). A global catalogue of the Geometridae was published by Scoble (1999), and an updated checklist derived from it is available online (Scoble & Hausmann 2007).

NOTE: This species is known in Canada only from a BC specimen in the PFC collection that was reared from Garry Oak (*Quercus garryana* Dougl.), identified via DNA barcoding (deWaard et al. 2011). Historical reports from elsewhere in Canada are deemed erroneous, as no Canadian vouchers east of BC are known.

Superfamily NOCTUOIDEA Latreille, 1809

78. Family NOTODONTIDAE Stephens, 1829 (prominents)

by B.C. Schmidt, J.D. Lafontaine, and J.T. Troubridge

Notodontid moths are robust, small to large moths, with wingspans of 25 to 60 mm in North American species. Many adults are strongly hairy and often bear backwards-projecting tufts on the hind margins of the forewings that protrude when the wings are folded. The common name, “prominents”, refers to these projections. Some larvae produce defensive secretions when disturbed, and others flaunt warning colours of red or yellow, sometimes raising the front and rear of the body or extruding long tails. Most notodontids feed on the foliage of trees and shrubs. Some larvae are gregarious when young, but become solitary as they mature.

Approximately 3800 notodontid species are known worldwide, and the Neotropical fauna is especially diverse. There are 137 species known in the Nearctic region; 57 of these have been reported in nNA. Despite the prominence of this group, there are no recent taxonomic works on the NA fauna. A world catalogue was published by Schintlmeister (2013).

930036E *major* Grote & Robinson, 1866 (*Datana*) E -- -- -- -- -- -- -- -- E -- -- -- E --
 NOTE: The ON record by Riotte (1992) is based on an unvouchered record of a larva from St. Williams, in dry Carolinian forest. However, this species is otherwise restricted to bogs, it is very difficult to identify, and it is not known from other parts of the Great Lakes region; all these facts suggest the identification is in error. The NS record by Ferguson (1954) is based on a misidentification of *D. drexelii* material.

79. Family EREBIDAE Leach, [1815] (tussock moths, tiger moths, underwings and relatives)

by B.C. Schmidt, J.D. Lafontaine, J.T. Troubridge, and G.R. Pohl

Erebids are a diverse group of very small to very large moths (10 to 280 mm wingspan), that have been united in this recently recognised family by a feature of the wing venation. In erebids, forewing vein M2 lies in the lower part of the discal cell, so that the cubital vein appears to have four branches. The group includes the Lymantriinae (tussock moths), Arctiinae (tiger moths) and several other subfamilies that were considered to be primitive noctuids until recently (Zahiri et al. 2011). Most species have forewings coloured in dull grey-and-brown patterns, but many Arctiinae are brightly coloured to warn potential predators of the poisonous chemicals they sequester from their food plants. Most erebid larvae feed on living plants, but a few feed on dead leaves, fungi, lichens, dried fruit, or dung. Most erebid adults feed on nectar or sap; a few (Scoliopteryginae) have mouthparts modified for piercing fruit.

The Erebidae are the most speciose Lepidoptera family in the world, with about 24,570 described species. In the Nearctic region, about 960 species are known; 346 have been recorded from nNA, and three more are expected. The only comprehensive revision of a major erebid group is by Ferguson (1978) for the Lymantriinae, but many species are covered and illustrated in field guides and other popular works. A checklist (and errata) of valid NA species and recent taxonomic changes appears in Lafontaine & Schmidt (2010, 2011, 2013, 2015); a more complete catalogue of the Arctiinae, including all synonyms, was published by Schmidt & Opler (2008). Most Erebidae as currently defined are included in the world catalogue of the Noctuidae by Poole (1989). Crumb (1956) treated the larvae of many species.

subfamily Lymantriinae Hampson, [1893]

| | <i>combinata</i> (Walker, 1858) (<i>Ophiusa</i>) | | | | | | | | | | | | | | | |
| | <i>scissa</i> (Walker, 1865) (<i>Poaphila</i>) | | | | | | | | | | | | | | | |
| 931091E | <i>repanda</i> (Walker, [1858]) (<i>Siavana</i>) | E | -- | -- | -- | -- | -- | -- | -- | E | -- | -- | -- | E | -- | -- |

NOTE: Reports of this species from Canada, from ON by Riotte (1992), and from NB by Lafontaine et al. (2001), are based on the frequent misidentification of the pale form of *P. rufimargo*. *Panopoda repanda* is not known to occur north of NC and KY.

80. Family EUTELLIIDAE Grote, 1882 (rolled-wing moths)

by B.C. Schmidt, J.D. Lafontaine, and J.T. Troubridge

Eutelliids are medium-sized moths, with wingspans of about 30 mm. The group is defined by internal abdominal structures. Adults usually have brightly coloured wings, and an unusual resting posture, with the wings rolled and held out from the body. The larvae of most Nearctic species feed on sumac (*Rhus* spp.) and poison ivy (*Toxicodendron* spp.).

Eutelliids comprise a small group of moths with 520 species worldwide, mostly in arid regions of the tropics. Seventeen species occur in the Nearctic region, eight of which are reported from nNA.

81. Family NOLIDAE Bruand, 1846 (tuft moths)

by B.C. Schmidt, J.D. Lafontaine, and J.T. Troubridge

Nolid moths are small to medium-sized moths (wingspans of 15 to 25 mm in North American species) that are united by a complex of internal structures that are not entirely consistent in all groups. Many Nearctic species have tufts of raised scales on the upper surfaces of the forewings, and the ocelli are usually absent. Adults of some species feed on mammal tears, and have been implicated in the transmission of diseases. Larvae of Nolididae feed on vascular plants or lichens.

Approximately 1740 species of nolidids are known worldwide, primarily in the Old World tropics. In the Nearctic region, 39 species are known, 18 of which have been recorded from nNA.

82. Family NOCTUIDAE Latreille, 1809 (owlet moths)

by B.C. Schmidt, J.D. Lafontaine, J.T. Troubridge, and G.R. Pohl

Owlet moths are primarily medium-sized to large, heavy-bodied moths, with wingspans ranging from 20 to 80 mm in NA species. The forewings are usually finely mottled or figured in browns and greys, and the hind wings are pale and more unicolourous. Most noctuid larvae are naked or clothed in fine, sparse hairs; a few are more densely hairy.

Most adults are nocturnal. Many feed on plant nectar, sap, and fermenting fruit. Some tropical species pierce thick-skinned fruits to feed on juices, and a few species use their piercing proboscis to suck blood from mammals. Noctuid larvae feed on a huge variety of plants. Many are stem and root borers. Others feed openly on leaves and stems, or eat fruits, buds, and flower heads. Included in the family are the cutworms, which rest in the soil during the day and emerge at night to feed on the bases of young plants or to climb higher to eat shrub and tree foliage.

The family Noctuidae, as defined by Zahiri et al. (2011), consists of about 11,800 described species. About 2520 species are recognized in the Nearctic region; 1190 are reported from nNA, and 10 more are expected, making it the most speciose family in the region. A world catalogue of Noctuidae was published

by Poole (1989). Other comprehensive works include Lafontaine & Poole (1991; Plusiinae), Poole (1995; Cuculliinae), Hardwick (1996; Heliiothinae), and (Lafontaine 1987, 1998, 2004; Noctuinae). Crumb (1956) treated the larvae of many species.

 NOTE: This species was confirmed for southern ON in 2017. The erroneous QC record by Handfield (1999) was pointed out by Handfield (2011), but the species is expected there. The MB record by Heath (1904) is unsupported by vouchers and assumed to be erroneous.

INDEX

All Lepidoptera taxa up to the family level are included here (plant names and other names are not indexed). **Numbers in the index are species numbers rather than page numbers.** Valid names are in plain text; synonyms are in italics. For taxa above the species level, the number listed is the number of the first listed species in that group. Names below family level but above the species level are followed by the family in square brackets. Names of species groups and complexes are followed by the genus in round brackets, and the family in square brackets. Species-level names are followed by the author, and the current genus in round brackets. For synonyms of species and subspecies, the number listed is the number of the valid species or subspecies. Where multiple numbers are listed for a name, the additional numbers in italics indicate other species entries where the name in question is mentioned in the notes.

A definitive species list is the foundation of biodiversity and conservation work. As we deal with massive climatic changes in the Anthropocene, knowing which species make up our diverse ecosystems will be critically important if we wish to protect and restore them.

The Lepidoptera, moths and butterflies, are the fourth-largest insect order in terms of global diversity, with approximately 158,000 described species. Here we report the distributions of 5431 species that occur in Canada and Alaska, as well as 53 species that have been reported from the region but not yet verified. Additionally, 19 species are listed as interceptions or unsuccessful introductions, and 52 species are listed as probably occurring in the region.

The list is based on records from taxonomic papers, historical regional checklists, and specimen data from collections and online databases. All valid species and their synonyms, and all Nearctic subspecies and synonyms are included, except for butterfly subspecies (and their synonyms) that have never been reported from the region. The list is presented in taxonomic order, with the author, date of description, and original genus provided for each name.
