Contents

Preface ix

Random Matrices and Number Theory 1
J. P. Keating

1 Introduction 1
2 $\zeta(\frac{1}{2}+it)$ and $\log\zeta(\frac{1}{2}+it)$ 9
3 Characteristic polynomials of random unitary matrices 12
4 Other compact groups 17
5 Families of L-functions and symmetry 19
6 Asymptotic expansions 25

References 30

2D Quantum Gravity, Matrix Models and Graph Combinatorics 33
P. Di Francesco

1 Introduction 33
2 Matrix models for 2D quantum gravity 35
3 The one-matrix model I: large N limit and the enumeration of planar graphs 45
4 The trees behind the graphs 54
5 The one-matrix model II: topological expansions and quantum gravity 58
6 The combinatorics beyond matrix models: geodesic distance in planar graphs 69
7 Planar graphs as spatial branching processes 76
8 Conclusion 85

References 86

Eigenvalue Dynamics, Follytons and Large N Limits of Matrices 89
Joakim Arnlind, Jens Hoppe

References 93

Random Matrices and Supersymmetry in Disordered Systems 95
K.B. Efetov

1 Supersymmetry method 104
2 Wave functions fluctuations in a finite volume. Multifractality 118
3 Recent and possible future developments 126
4 Summary 134

Acknowledgements 134

References 134

Hydrodynamics of Correlated Systems 139
Alexander G. Abanov
1 Introduction 139
2 Instanton or rare fluctuation method 142
3 Hydrodynamic approach 143
4 Linearized hydrodynamics or bosonization 145
5 EFP through an asymptotics of the solution 147
6 Free fermions 148
7 Calogero-Sutherland model 150
8 Free fermions on the lattice 152
9 Conclusion 156
Acknowledgements 157
Appendix: Hydrodynamic approach to non-Galilean invariant systems 157
Appendix: Exact results for EFP in some integrable models 158
References 160

QCD, Chiral Random Matrix Theory and Integrability 163
J.J.M. Verbaarschot
1 Summary 163
2 Introduction 163
3 QCD 166
4 The Dirac spectrum in QCD 174
5 Low energy limit of QCD 176
6 Chiral RMT and the QCD Dirac spectrum 182
7 Integrability and the QCD partition function 188
8 QCD at finite baryon density 200
9 Full QCD at nonzero chemical potential 211
10 Conclusions 212
Acknowledgements 213
References 214

Euclidean Random Matrices: Solved and Open Problems 219
Giorgio Parisi
1 Introduction 219
2 Basic definitions 222
3 Physical motivations 224
4 Field theory 226
5 The simplest case 230
6 Phonons 240
References 257

Matrix Models and Growth Processes 261
A. Zabrodin
1 Introduction 261
2 Some ensembles of random matrices with complex eigenvalues 264

3 Exact results at finite N 274
4 Large N limit 282
5 The matrix model as a growth problem 298

References 316

Matrix Models and Topological Strings 319
Marcos Mariño
1 Introduction 319
2 Matrix models 323
3 Type B topological strings and matrix models 345
4 Type A topological strings, Chern-Simons theory and matrix models 366

References 374

Matrix Models of Moduli Space 379
Sunil Mukhi
1 Introduction 379
2 Moduli space of Riemann surfaces and its topology 380
3 Quadratic differentials and fatgraphs 383
4 The Penner model 388
5 Penner model and matrix gamma function 389
6 The Kontsevich Model 390
7 Applications to string theory 394
8 Conclusions 398

References 400

Matrix Models and 2D String Theory 403
Emil J. Martinec
1 Introduction 403
2 An overview of string theory 406
3 Strings in D-dimensional spacetime 408
4 Discretized surfaces and 2D string theory 413
5 An overview of observables 421
6 Sample calculation: the disk one-point function 425
7 Worldsheet description of matrix eigenvalues 434
8 Further results 441
9 Open problems 446

References 452

Matrix Models as Conformal Field Theories 459
Ivan K. Kostov
1 Introduction and historical notes 459
2 Hermitian matrix integral: saddle points and hyperelliptic curves 461
3 The hermitian matrix model as a chiral CFT 470
4 Quasiclassical expansion: CFT on a hyperelliptic Riemann surface 477
5 Generalization to chains of random matrices 483

References 486

Large N Asymptotics of Orthogonal Polynomials from Integrability to Algebraic Geometry 489
B. Eynard
1 Introduction 489
2 Definitions 489
3 Orthogonal polynomials 490
4 Differential equations and integrability 491
5 Riemann-Hilbert problems and isomonodromies 492
6 WKB–like asymptotics and spectral curve 493
7 Orthogonal polynomials as matrix integrals 494
8 Computation of derivatives of $F^{(0)}$ 495
9 Saddle point method 496
10 Solution of the saddlepoint equation 497
11 Asymptotics of orthogonal polynomials 507
12 Conclusion 511

References 511
