Asymptotic Approaches in Nonlinear Dynamics

New Trends and Applications

With 58 Figures

Springer

Contents

1. Introduction: Some General Principles of Asymptotology . 1
1.1 An Illustrative Example 2
1.2 Reducing the Dimensionality of a System 4
1.3 Continualization 5
1.4 Averaging 6
1.5 Renormalization 7
1.6 Localization 8
1.7 Linearization 8
1.8 Padé Approximants 9
1.9 Modern Computers and Asymptotic Methods 10
1.10 Asymptotic Methods and Teaching Physics 11
1.11 Problems and Perspectives 11

2. Discrete Systems 13
2.1 The Classical Perturbation Technique: an Introduction 13
2.2 Krylov–Bogolubov–Mitropolskij Method 19
2.3 Equivalent Linearization 24
2.4 Analysis of Nonconservative Nonautonomous Systems 26
2.4.1 Introduction 26
2.4.2 Nonresonance Oscillations 27
2.4.3 Oscillations in the Neighbourhood of Resonance 31
2.5 Nonstationary Nonlinear Systems 42
2.6 Parametric and Self-Excited Oscillation in a Three-Degree-of-Freedom Mechanical System 55
2.6.1 Analysed System and Equation of Motion 55
2.6.2 Transformation of the Equations of Motion to the Main Coordinates 59
2.6.3 Zones of Instability of the First Order 62
2.6.4 Calculation Examples 74
2.7 Modified Poincaré Method 81
2.7.1 One-Degree-of-Freedom System 81
2.7.2 General Nonlinear Systems 86
2.8 Hopf Bifurcation 93

2.9 Stability Control of Vibro-Impact Periodic Orbit 100
2.9.1 Introduction 100
2.9.2 Control of Vibro-Impact Periodic Orbits 101
2.9.3 Stability Control 103
2.9.4 Simulation Results 105
2.10 Normal Modes of Nonlinear Systems with n Degrees of Freedom 106
2.10.1 Definition 106
2.10.2 Free Oscillations and Close Natural Frequencies 108
2.11 Nontraditional Asymptotic Approaches 118
2.11.1 Choice of Asymptotic Expansion Parameters 118
2.11.2 δ-Expansions in Nonlinear Mechanics 121
2.11.3 Asymptotic Solutions for Nonlinear Systems with High Degrees of Nonlinearity 128
2.11.4 Square-Well Problem of Quantum Theory 130
2.12 Padé Approximants 132
2.12.1 One-Point Padé Approximants: General Definitions and Properties 132
2.12.2 Using One-Point Padé Approximants in Dynamics 134
2.12.3 Matching Limit Expansions 139
2.12.4 Matching Local Expansions in Nonlinear Dynamics 143
2.12.5 Generalizations and Problems 148

3. Continuous Systems 151
3.1 Continuous Approximation for a Nonlinear Chain 151
3.2 Homogenization Procedure in the Nonlinear Dynamics of Thin-Walled Structures 155
3.2.1 Nonhomogeneous Rod 155
3.2.2 Stringer Plate 158
3.2.3 Perforated Membrane 162
3.2.4 Perforated Plate 166
3.3 Averaging Procedure in the Nonlinear Dynamics of Thin-Walled Structures 171
3.3.1 Berger and Berger-Like Equations for Plates and Shells 171
3.3.2 "Method of Freezing" in the Nonlinear Theory of Viscoelasticity 176
3.4 Bolotin-Like Approach for Nonlinear Dynamics 177
3.4.1 Straightforward Bolotin Approach 177
3.4.2 Modified Bolotin Approach 185
3.5 Regular and Singular Asymptotics in the Nonlinear Dynamics of Thin-Walled Structures 191
3.5.1 Circular Rings and Axisymmetric Cylindrical Shells 191
3.5.2 Reinforced and Isotropic Cylindrical Shells 197
3.5.3 Nonlinear Oscillations of a Cylindrical Panel 214

3.5.4 Stability of Thin Spherical Shells Under Dynamic Loading 219
3.5.5 Asymptotic Investigation of the Nonlinear Dynamic Boundary Value Problem for a Rod 228
3.6 One-Point Padé Approximants Using the Method of Boundary Condition Perturbation 229
3.7 Two-Point Padé Approximants: A Plate on Nonlinear Support 236
3.8 Solitons and Soliton-Like Approaches in the Case of Strong Nonlinearity 240
3.9 Nonlinear Analysis of Spatial Structures 247
3.9.1 Introduction 247
3.9.2 Modified Envelope Equation 248

4. Discrete–Continuous Systems 253
4.1 Periodic Oscillations of Discrete–Continuous Systems with a Time Delay 253
4.1.1 The KBM Method 253
4.2 Simple Perturbation Technique 267
4.3 Nonlinear Behaviour of Electromechanical Systems 280
4.3.1 Introduction 280
4.3.2 Dynamics Equations 281
4.3.3 Averaging 282
4.3.4 Numerical Results 285
