

1 Audit Education and the Real-Time Economy 1

2 Miklos A. Vasarhelyi, Ryan A. Teeter, and JP Krahel 2

3 **ABSTRACT:** The real-time economy (RTE) changes the way accounting information is 3
 4 received, processed, and analyzed. Consequently, it drives demand for auditors who 4
 5 possess enhanced skills and attitudes. Unsurprisingly, the current generation of audit- 5
 6 ing students expects to be well prepared when entering the profession and facing these 6
 7 new challenges. Auditing educators have the unique opportunity to assume a leading 7
 8 role and empower modern auditors, arming them with the best weapons available to 8
 9 combat error and fraud. This position paper discusses the changing function of the 9
 10 auditing profession, analyzes the advancement of auditing technology featuring con- 10
 11 tinuous auditing and monitoring, and identifies three primary attributes (attitudes, tech- 11
 12 nical competences, and behaviors) that will define the RTE auditor. For each of these 12
 13 attributes, this paper identifies educational media (or instructional tools) that may be 13
 14 incorporated into auditing curricula as a way of introducing and developing these skills. 14

15
 16 In years to come, experts predict, many companies will use information technology to become a 16
 17 “real-time enterprise”—an organization that is able to react instantaneously to changes in its busi- 17
 18 ness. And as firms wire themselves up and connect to their business partners, they make the entire 18
 19 economy more and more real-time, slowly but surely creating not so much a “new” but a “now” 19
 20 economy. 20

21 —*The Economist* 2002 21

22 INTRODUCTION 22

23 **T**he real-time economy (RTE) is here. Businesses thrive or fail from one moment to the next, 23
 24 people share information instantaneously, and millions of economic transactions flow from 24
 25 account to account through massive information systems. The “now” economy has forced 25
 26 smartphone-enabled sales forces to endure virtually uninterrupted work hours, and managers to 26
 27 embrace global team-directed efforts. This environment represents a time of great change for 27
 28 financiers, accountants, and auditors. No longer do the old techniques of evaluating business 28
 29 history provide sufficient information to managers and stakeholders; rather, auditors need a pow- 29
 30 erful set of skills to provide enhanced assurance. 30

31 Audit education can lead the way as the audit environment changes. The progressive techno- 31
 32 logical advances that are fundamental to the RTE require auditors to re-think the way they ap- 32
 33 proach an engagement. Audit educators must provide training that is not only sufficient to meet the 33
 33 needs of this new environment, but also empower students to embrace the rapid changes of the 33

34 new economy (Amernic and Craig 2004; Boyce 2004; Howieson 2003). This paper attempts to 34
 35 define and describe the shift needed in auditing education toward the real time economy and 35
 36 continuous auditing. 36

37 Throughout this paper, we identify motivating factors, specific skills, and instructional media 37
 38 that relate to three principal attributes of an RTE auditor: *attitudes* refer to a set of views of the 38
 39 world that should be incrementally transmitted to entrants to the audit profession; *behavior* indi- 39
 40 cates the nature of the interaction between the auditor and clients, regulators, audit teams, and 40
 41 technology; *objective knowledge* includes specific knowledge and skills required to conceptualize, 41
 42 implement, and operate an RTE audit. 42

43 This position paper is organized as follows: the second section provides an overview of the 43
 44 RTE and the continuous auditing model. The third section presents the attitudes, behavior, and 44
 45 objective knowledge components found in the RTE auditor skill set. The fourth section contains a 45
 46 sample of relevant instructional media found in accounting education literature. The fifth section 46
 47 summarizes the paper, reviews the strengths and weaknesses of our proposed approach, and 47
 48 suggests additional areas of research. 48

49 To aid the reader, the main concepts and elements of this paper are summarized in a knowl- 49
 50 edge map, presented in Figure 1. The map follows the progression of this paper from left to right 50
 51 and focuses on the auditor attributes in the central column. The left column identifies motivational 51
 52 elements to this paper, the right identifies instructional media, and arrows delineate paths linking 52
 53 motivation and media to skills. 53

54 THE REAL-TIME ECONOMY AND CONTINUOUS AUDITING 54

55 The RTE adds new requirements for the training of auditors, including ethical attitudes, risk 55
 56 measurement and management competencies as well as the ability to think and make judgments in 56
 57 an unstructured setting. For example, much of the audit burden has shifted from external to 57
 58 internal auditors as a result of Auditing Standard No. 5 (AS5; (PCAOB 2007). Rebalancing allows 58
 59 internal auditors to play a greater role in providing audit evidence. AS No. 5 has been the primary 59
 60 motivator for the audit load rebalancing effort, demonstrated in a recent survey of audit officers 60
 61 (Protiviti 2008). Many leading organizations, anticipating this shift, are adopting technology that 61
 62 allows them to limit their exposure (see Alles et al. 2006). This attitude is quite different from the 62
 63 current ex-post facto audit. This creates an environment that is conducive to the introduction of 63
 64 real-time auditing. 64

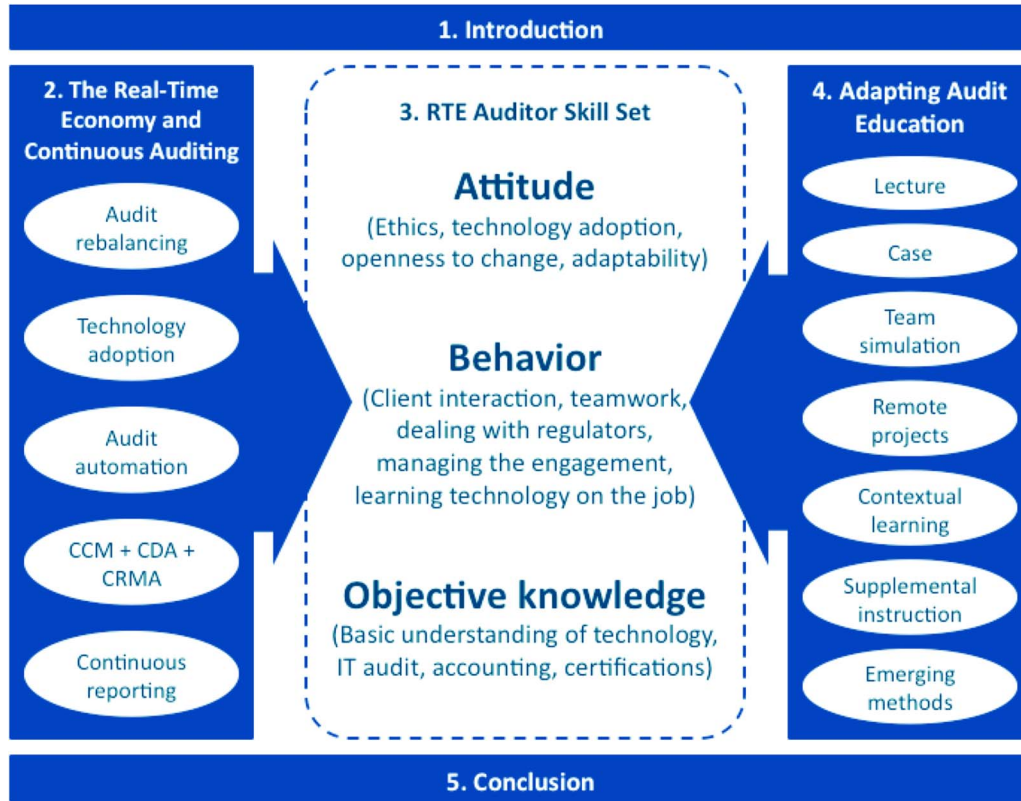

65 The Nature of the Real-Time Economy (RTE) 65

66 The use of internal real-time reporting is substantially increasing. Coming years will see more 66
 67 nimble and adaptive companies integrated into the global economy. The evolution of these tech- 67
 68 nologies and their integration into business will also introduce behavioral effects that may accel- 68
 69 erate or delay progress. 69

70 In addition to the advent of technology, the RTE can be characterized by a substantive 70
 71 reduction in the delays within and between processes (Vasarhelyi and Alles 2008). This is enabled 71
 72 by the progressive digitization through the application of technology (Vasarhelyi and Greenstein 72
 73 2003). Digitization further reduces these delays and, when implemented properly, gives the orga- 73
 74 nization competitive advantage (Powell and Dent-Micallef 1997). Additional benefit can be ob- 74
 75 tained through the acceleration of data transfer, facilitated by XML and XBRL (Bovee et al. 2005). 75

76 The assurance function is being automated to gain efficiencies and cope with the changes that 76
 77 occur in the underlying reporting structure. The auditing function has witnessed a similar phe- 77
 78 nomenon. It took little time from the introduction of PCs for large audit firms to purchase sub- 78
 79 stantial quantities of these devices. They replaced the cumbersome and time-consuming footing, 79
 80 extending, and ticking with data extraction software and user-friendly spreadsheets. While the 80

FIGURE 1
Knowledge Map

81 auditors possessed this clear early advantage, such enthusiasm has not carried through to some of
 82 the newer auditing tools. The literature attributes this mainly to: 1) the ossifying effect of obsolete
 83 and unchanging regulatory statutes, 2) the investment-inhibiting nature of the partnership structure
 84 of auditing firms, and 3) the risk averse nature of accountants (Curtis and Payne 2008). Auditing
 85 education, responding to the needs of the professional accounting firms, has reacted accordingly.

86 The contrast between management information systems and traditional auditing tools is nota-
 87 ble (Figure 3). While business systems are leveraged for cross-application integration, auditing
 88 tools are relegated to data extraction, cumbersome spreadsheets, manual manipulation, and limited
 89 automation. Dashboards and executive information systems provision more timely data (e.g.,
 90 status updates every six hours), but auditors are limited by a statute-driven manual reporting
 91 scheme.

92 Numerous modern companies across various domains have developed a wide array of appli-
 93 cations to explore the benefits of the RTE. Use of progressive automation has enabled them to gain
 94 competitive advantage and become leaders in their fields. Vasarhelyi (2009) has collected several

95 of these examples.¹ Many of these strategic applications dramatically changed the nature of the 95
 96 business and forced competitors to copy or perish. Likewise, by embracing automated audit tools, 96
 97 RTE auditors have the potential to change the nature of audit. 97

98 **Continuous Auditing** 98

99 If the stakeholders in the RTE environment are to make use of real-time data, then auditors 99
 100 have an obligation to provide assurance for that data as it is issued. Unless RTE auditors under- 100
 101 stand the technology and environment, they cannot provide relevant services to modern investors 101
 102 and managers. Audit automation facilitates the transition from the traditional audit of historical 102
 103 financial data to auditing of current, real-time financial and nonfinancial information. 103

104 Continuous auditing provides assurance on real-time information within an organization 104
 105 (Vasarhelyi and Halper 1991). The CICA/AICPA (1999, xiii) defines continuous audit as “a meth- 105
 106 odology that enables independent auditors to provide written assurance on a subject matter using 106
 107 a series of auditors’ reports issued simultaneously with, or a short period of time after, the occur- 107
 108 rence of events underlying the subject matter.” These automated tools are used to determine 108
 109 whether a firm’s data is adequately maintained and internal controls function properly. Extensive 109
 110 research has been conducted regarding the functionality, challenges, and benefits of continuous 110
 111 auditing in academia,² by professional associations (CICA/AICPA 1999; IIA 2005) and public 111
 112 accounting firms (PricewaterhouseCoopers 2002; Searcy et al. 2002). 112

113 Continuous auditing has matured from a pilot test at AT&T Bell Laboratories (Vasarhelyi and 113
 114 Halper 1991) to a progressive reality affecting organizational management, and internal and ex- 114
 115 ternal audit organizations. From large banks to multinational consumer goods firms, the adoption 115
 116 of continuous auditing is driving auditors to reevaluate their functions, tools, processes, and 116
 117 attitudes (Vasarhelyi and Kuenkaikaew 2009). Vasarhelyi and Kuenkaikaew (2009) observe a wide 117
 118 range of audit-like organizations, very slow and heterogeneous adoption of technology, low level 118
 119 of technical competence among auditors, and widely varying methods of audit management. By 119
 120 contrast, empowered internal auditors are adopting technology to monitor their companies’ sys- 120
 121 tems, illustrating the changing and dynamic audit climate. 121

122 Continuous auditing includes three primary components (Figure 2). Continuous controls 122
 123 monitoring (CCM) consists of a set of procedures used for monitoring internal controls. Continu- 123
 124 ous data assurance (CDA) verifies the integrity of data flowing through the information systems. 124
 125 Continuous Risk Monitoring and Assessment (CRMA) is used to dynamically measure risk and 125
 126 provide input for audit planning. 126

127 While continuous monitoring of access controls and authorizations is well developed in com- 127
 128 puter security applications (Jajodia et al. 1997), monitoring enterprise system configuration and 128
 129 business process settings remains an emerging area of development. Implementation strategies for 129
 130 CCM, CDA, and CRMA require skills that will be developed by the RTE auditor. 130

131 **Continuous Controls Monitoring** 131

132 COSO (2009) defines CCM as the “periodic evaluation and testing of controls by internal 132
 133 audit.” CCM has the ability to “enhance the efficiency and effectiveness of the whole internal 133
 134 control system” (COSO 2009) by determining whether errors exist and helping internal auditors 134
 135 and managers resolve controls weaknesses before they perpetuate into larger problems. In recent 135
 136 years, the push for CCM implementation at some firms has originated from management and 136
 137 internal audit requirements, rather than from external audit firms (Brown et al. 2007; COSO 2009). 137

¹ See: <http://raw.rutgers.edu/RTEexamples>.

² See Brown et al. (2007) for an extensive literature review on the subject of continuous auditing.

FIGURE 2
Components of Continuous Auditing

138 Firms that implement CCM are likely to build on the expertise of seasoned auditors who
 139 understand the controls framework and how the firm operates (Vasarhelyi and Alles 2008; Teeter
 140 et al. 2009). This expertise aids the conversion of manual control assessment to automated plat-
 141 forms and provides validation of the effectiveness of the implemented controls. 21st century
 142 auditors need to understand the concepts being shared by seasoned auditors and help incorporate
 143 them into the RTE environment.

144 Examples of CCM include procedures for continuously monitoring:

- 145 • User access control and user account authorizations;
- 146 • System controls configuration; and
- 147 • Settings and workflows related to business processes.

148 Auditors implementing and performing CCM will have to be highly sensitive to the control
 149 environment, be able to talk to the client professionally about controls and their weaknesses,
 150 understand the intricacies of the effects of overlapping controls, be able to work with clients to
 151 define rules that emulate requirements of the IT audit, and possess other related skills.

152 *Continuous Data Assurance*

153 Continuous auditing depends on accurate data, such as personnel information and financial
 154 transaction figures, flowing through information systems. Continuous data assurance evaluates the
 155 integrity of the financial and nonfinancial transactions to ensure that errors in the data are mini-
 156 mized. Valid data translates into valid information upon which management and auditors can base
 157 valid decisions (Vasarhelyi and Halper 1991; Alles et al. 2006; Elliot 2002).

158 Examples of CDA include procedures for verifying:

- 159 • Underlying master data;
- 160 • Transactional data flows; and

161	• Key process metrics using analytics (including continuity equations).	161
162	Auditors performing CDA will have to have improved process design and implementation	162
163	skills, possess a better understanding of statistics, be able to communicate with the client request-	163
164	ing data verification instances (e.g., positives—false and true—data verification), and be very	164
165	sensitive to the nature of errors and potential fraud. While auditors today have a certain degree of	165
166	data extraction skills, auditors (internal and external) will have to be very knowledgeable about	166
167	drawing data from ERPs, flat files, data flows, and data warehouses. Given the frequency of data	167
168	extraction, reliance on IT experts to draw this data for the auditor is not feasible.	168
169	Continuous Risk Monitoring and Assessment	169
170	Risk assessment procedures have been an integral part of the traditional audit for many	170
171	decades. Companies have a portfolio of risk containing risk elements, such as management risk	171
172	and audit risk. Management risk influences audit risk and the weighting of these risks fluctuates in	172
173	response to changing business conditions. The audit planning process encompasses the assessment	173
174	of auditor perceptions and an allocation of audit resources to high-risk areas.	174
175	While there are many forms of guidance in the literature and statutes, this process is still	175
176	vague and <i>ad hoc</i> ; audit firms have their own systematized approaches but are heavily reliant on	176
177	unstructured assessments and judgment. Internal audit departments generally will perform annual	177
178	audit plans and similar risk assessment. They will determine the change in audit risk as it relates	178
179	to the greater management risk portfolio. The allocation of audit resources will tend to respond to	179
180	corporate contingencies and often bend to pragmatic issues such as availability of data, political	180
181	environment, and management concerns (Vasarhelyi and Kuenkaikaw 2009). Often the internal	181
182	audit planning processes will be analogous to those of the large audit firms:	182
183	• Divide the audit risk frame into manageable parts;	183
184	• Understand the basic profile of risk of each of the parts;	184
185	• Work on proposing joint risk profiles; and	185
186	• Create scenarios.	186
187	CRMA takes the COSO (2009) monitoring framework a step further. It includes processes	187
188	that:	188
189	• Measure risk factors on a continuing basis;	189
190	• Integrate different risk scenarios into some quantitative framework; and	190
191	• Provide inputs for audit planning.	191
192	Auditors performing CRMA will have to be very well versed in enterprise risk management	192
193	principles and audit risk assessment practices included in the COSO (2009) framework. They will	193
194	need an openness to change during to react to the risk environment. The audit plan and procedures	194
195	as well as the weighting of audit evidence will have to be rebalanced. Therefore, auditors will need	195
196	to re-parameterize monitoring procedures during the audit.	196
197	Continuous Reporting	197
198	Continuous reporting is the release of financial and nonfinancial information on a near real-	198
199	time basis (Hunton et al. 2004; Gal 2008). It reduces the delay inherent in traditional reporting and	199
200	provides a more accurate picture of a firm's financial position. The adoption of XBRL by compa-	200
201	nies for both external and internal reporting makes consolidation and release of this information	201
202	more feasible (Murthy and Groomer 2004). RTE auditors work with client information and will	202
203	require new specialized tools to aid in this enhanced disclosure.	203
204	Continuous reporting will pose additional challenges for auditors. Continuous measurement is	204
205	necessary for a continuous audit. The monitoring approach will further differentiate, integrate, and	205
206	change the roles of management, internal and external audit, and other audit-like functions (Vasar-	206

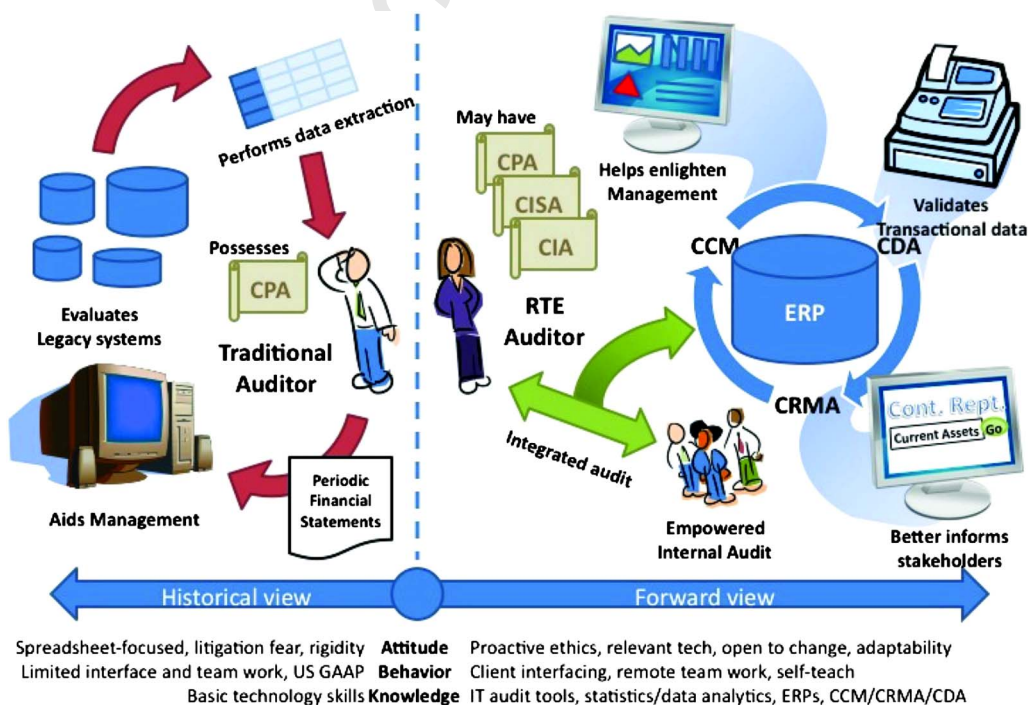

207 helyi and Kuenkaikaew 2009).³ The set of skills developed for this environment will bring an 207
 208 attitude of preference for online monitoring rather than archival analysis, the ability to make rapid 208
 209 decisions based on feedback from these systems, and improved statistical competence. 209

THE RTE AUDITOR SKILL SET

210 Auditors need to possess the skills that will help them meet the demands of the real-time 210
 211 economy and continuous auditing (Zhao et al. 2004). Attitudes and contextual knowledge will help 211
 212 them understand the technology they will be expected to use as they conduct their audits. The 212
 213 auditor’s ability to work effectively in a team and enhance an integrated audit is reflected in the 213
 214 behavior the auditor demonstrates. The left area of Figure 3 illustrates dynamics facing the tradi- 214
 215 tional auditor, and the right area outlines some of the tools and resources available in the RTE. 215

216 The traditional auditor focuses on a firm’s history. Armed with a Certified Public Accountant 216
 217 (CPA) credential, he works to extract sample data from legacy and heterogeneous information 217
 218 systems. In the technology realm, he uses spreadsheets, basic sampling, and analytical techniques. 218
 219 The outcome of his work is a certification of the financial statements prepared by management. 219
 220

FIGURE 3
The Real-Time Audit Environment

³ Vasarhelyi and Kuenkaikaew (2009) found that major organizations have several overlapping and conflicting internal audit-like functions such as fraud, internal control, internal audit, Basel II, etc. They predict that eventually these functions will be rationalized and substantially integrated.

221	Much of what he does is delegated by the audit manager with minimal interaction with internal	221
222	auditors. The constant concern about litigation keeps him risk averse and understandably resistant	222
223	to change. All of the work is performed several months after the occurrence of relevant events. As	223
224	a result, any material errors or instances of fraud that have occurred in that past period have had	224
225	time to propagate and create additional difficulty for his team.	225
226	The RTE auditor, on the other hand, is ready to work with current information. Past data can	226
227	certainly help model the future, but her forward-looking view allows her to react to problems as	227
228	they occur and work with management to solve them. She may possess other certifications in	228
229	addition to a CPA license. She realizes that events occur in real time, so she is proactive in treating	229
230	new forms of ethical dilemmas, open to change, and always searching for tools that will help her	230
231	client remain a going concern. Working alongside an empowered internal audit team, she coordi-	231
232	nates, delegates, and evaluates the integrated information systems that ingest millions of transac-	232
233	tions, ensure that management knows that controls are working, and give stakeholders an accurate	233
234	picture of the client's standing. In order to conceptualize, implement, and operate these systems,	234
235	the RTE auditor understands the technology and statistics that provide a continuous audit and	235
236	assurance of the system. Spreadsheets become one of many tools that she uses. Finally, she has the	236
237	ability to work remotely and find solutions to problems if she is unsure in a situation. The RTE	237
238	auditor's skill set is the key to her success. The attitude, behavior, and objective knowledge	238
239	differentiate her from the traditional auditor.	239
240	Attitudes	240
241	Attitudes drive the dynamic transition from traditional auditing to an RTE paradigm. Many of	241
242	these attitudes are developed long before a student enters an accounting program. However,	242
243	exposure to the issues facing the RTE, such as technology adoption and change management,	243
244	should enable students to refine these skills and anticipate the situations they may encounter.	244
245	Ethics	245
246	While there is open debate over whether ethics can be taught (Leung and Cooper 1994),	246
247	accounting education has witnessed a remarkable incorporation of ethical discussion into class-	247
248	room protocol. The RTE introduces new ethical quandaries related to information provisioning,	248
249	the automation of entire sub-processes, the global nature of business activities, and the emerging	249
250	use of technology in the workplace. ⁴	250
251	Technology Adoption	251
252	The development and application of technology within business requires auditors to have an	252
253	attitude of constant technology discovery. Greenstein-Prosch et al. (2008, 45) state "[a]uditors	253
254	would normally be expected to have higher knowledge than the average accountant since they	254
255	must audit the work of many different clients with diverse information systems." They find that	255
256	auditors are already well versed in e-commerce, general office automation, and some audit auto-	256
257	mation. We assert that RTE auditors must be able to evaluate technology and match capabilities	257
258	and features to the needs of the audit.	258
259	Openness toward Change	259
260	Change in technology, social trends, business processes, accounting standards, and accountant	260
261	behavior is a part of life. As the audit requirements change, the RTE auditor must possess an	261
262	attitude that allows her to respond. This skill increases the effectiveness of the audit. Auditors need	262

⁴ For a well-documented list of resources for ethics in accounting, see the work of Thomas (2004).

263	to possess the ability to adjust their behavior in the RTE. The same adaptability is required for	263
264	progressively dynamic standards, business activities, and, most of all, changes in risk profile.	264
265	Behavior	265
266	The RTE will require many changes in the behavior of the auditor. These changes can be	266
267	facilitated and encouraged by audit educators. The primary focus should be on encouraging stu-	267
268	dents to foster an attitude of lifelong learning. They should understand what the RTE is and how	268
269	it will affect their function as auditors.	269
270	Client Interaction	270
271	Future engagements will typically involve substantially more remote interaction and data	271
272	transfer with less face-to-face interaction. Educators will need to define and demonstrate the	272
273	balance between a need for audit deterrence, a decreasing auditor presence in the facility, constant	273
274	auditor-client interface, and an increased “audit by exception” approach. As remote audits become	274
275	increasingly common, auditing students will also need to learn how to deal with clients and team	275
276	members when they are far apart and unable to meet in person.	276
277	Working with a Team	277
278	As is the case in many other business processes, virtual teams will turn from the exception to	278
279	the norm, aiming to explore and exploit niche competencies, diverse geographic locations, unco-	279
280	ordinated and often unpredictable audit actions and plans (Blackburn et al. 2003). Audit educators	280
281	must emphasize the importance of proper virtual teamwork, discussing the attributes of a success-	281
282	ful virtual team as distinct from a group operating in physical proximity to one another.	282
283	Dealing with Standard Setting Entities and Regulators	283
284	To meet the needs of RTE participants, there will be an increased set of regulations. Conse-	284
285	quently, auditors will be required to interface with government entities and standard setters on a	285
286	more frequent basis. The relationship between auditors and standard setters will eventually entail	286
287	a wide range of knowledge management and information provisioning tools. For example, the	287
288	SEC has been provisioning an XBRL instance reader during the deployment of the rule in the U.S.	288
289	Educators must account for this eventuality by both familiarizing students with the most up-to-	289
290	date standards-retrieval methodologies available and empowering them to discover future tools	290
291	later on in their careers.	291
292	Managing the Engagement	292
293	Audit educators must anticipate and address the challenges posed by the virtual team, the	293
294	auditor’s virtual presence over a virtually uninterrupted time frame, and the existence of a wide	294
295	gamut of bespoke audit tools. Furthermore, as most audit entities will have engagement manage-	295
296	ment tools that are complex and often not tailored for one particular auditor, company, or client,	296
297	the educator’s inclusion of training for any engagement management software ⁵ would represent a	297
298	tremendous benefit to students.	298
299	Learning Technology on the Job	299
300	Due to the rapid and constant changing of technology and standards, educators will need to	300
301	focus more of their time on imparting an understanding of key underlying accounting concepts.	301
302	The minutiae of standards and procedures are already extensively embedded in ERPs. Students	302
303	should know where to efficiently locate auditing and accounting standards on the Internet and	303

⁵ For example, Thomson provides online training for and a free trial of its Engagement CS software at <http://cs.thomsonreuters.com/engagement>.

304	through various other sources, and how to extract information in order to formulate integrative	304
305	knowledge from these sources. By gaining this core competency, students will ideally possess	305
306	enough basic accounting understanding to knowledgeably search for information, but they will not	306
307	be overloaded by an overabundance of detail. Their integrative knowledge will combine basic and	307
308	acquired information to formulate an integration of accounting rules, audit evidence, and relevant	308
309	business facts on which to base judgment.	309
310	Objective Knowledge	310
311	Audit education must ensure that students understand the key concepts underpinning modern	311
312	accounting software (Greenstein-Prosch et al. 2008). While they need not be IT professionals,	312
313	students should have an understanding that reaches beyond the level of office software. They need	313
314	to understand what the “black box” is doing to produce the evidence they will evaluate and the	314
315	analytics being used in common algorithms. For example, many CCM procedures are rule-based.	315
316	Appreciating how key performance indicators are monitored provides insight into how controls	316
317	function.	317
318	Basic Understanding of Technology	318
319	Interacting with corporate IT requires a set of skills that goes far beyond basic PC compe-	319
320	tences, similar to attitudes toward technology adoption and an individual’s ability to change.	320
321	Advancing beyond this basic level will require accounting educators to foster an understanding of	321
322	essential principles in hardware, software, and business applications.	322
323	IT Audit	323
324	There is virtually no limit to the power, speed, or granularity of future audit technology. In	324
325	tandem with the need to ensure understanding of basic IT principles, audit educators must famil-	325
326	iarize their students with audit automation tools and more advanced software aimed at data ex-	326
327	traction, manipulation, control evaluation, sampling, exception reporting, separation of duties,	327
328	fraud detection, etc. Specially designed continuous audit software will become a critical part of the	328
329	day-to-day lives of auditors; it is the job of the educator to prepare them for it today.	329
330	Accounting and Auditing Knowledge	330
331	Anticipating the coming confluence of IFRS GAAP and U.S. GAAP (Thomas 2009), account-	331
332	ing education in the RTE will be forced to deemphasize factual details and emphasize the ability	332
333	to intelligently seek details in databases and knowledge bases that have only recently become	333
334	available.	334
335	Certifications	335
336	While the CPA certification remains dominant, the broader set of career paths available to	336
337	accounting professionals is increasing the value and visibility of alternative certifications (Charron	337
338	and Lowe 2009). Rather than focusing entirely on the CPA exam, students should be shown	338
339	alternatives and complementary certifications that may more accurately match their interests and	339
340	competences. Examples include:	340
341	• Certified Information Systems Auditor (CISA), given by ISACA;	341
342	• Certified Internal Auditor (CIA), given by IIA;	342
343	• Certified Fraud Examiner (CFE), given by ACFE; and	343
344	• Certified Information Technology Professional (CITP), given by the AICPA to qualifying	344
345	CPAs.	345

ADAPTING AUDIT EDUCATION

Accountants and auditors need to be equipped with a sufficient understanding of how changes will affect their work. The traditional accounting education model tends to rely on knowledge of accounting concepts and rules (Figure 3, left side). Audit education must shift students' focus onto attitudes, behavior, and objective knowledge. Putting these three dynamics at the core of an audit education program will prove immensely beneficial to the RTE auditor.

Just as the RTE will force managers and auditors to re-consider current practice (Stewart 2000), it will also require a substantial rethinking of educational objectives and processes. Undergraduate audit education has adapted, to a certain degree, with the introduction of additional offerings such as second audit and forensic courses, increased emphasis on IT audit, adoption of cases, and substantial inclusion of vendor-provided teaching materials. However, any further steps taken by audit educators to foster improved attitudes toward lifelong learning of IT will immensely benefit students.

Audit educators are a critical link between today's auditing students and tomorrow's technology-laden auditing environment (Auditing Section Education Committee American Accounting Association 2003). Because new technologies are driven by the state of the art, it is imperative to teach future auditors these skills while they are still young, as younger people have been found to be most likely to adopt new technology (Morris et al. 2005). Educators owe it to their students to present the approaching 'real world' with as much accuracy and candor as possible. These emerging ranks of new auditors, armed with the right tools and competency in their usage, will be the ones to simultaneously handle and drive the change within their audit firms.

The attributes we advocate in this position paper will ideally be taught primarily in undergraduate auditing courses and fraud courses, as well as their graduate level equivalents. They should not, however, be omitted from other introductory and intermediate courses, as these courses form the foundation upon which auditors base their expertise. Some of the more technical attributes may be supplemented by additional courses in subjects such as statistics and management information systems.

Educating the RTE Auditor

Students should understand what goes into CDA, CCM, and CRMA, and how it will affect their future audit engagements. CA instruction can open students' minds to business process automation. Students can practice using analytical and statistical tools, such as ACL or SAS, and lecture time should be dedicated to explaining the mechanics behind the analytics being performed. The instructor can then link engagement steps to audit objectives and help students adjust their plans as evidence from the continuous audit is introduced.

Educating Attitudes

The attitudes adopted by auditors in relation to ethics, technology adoption, change, and adaptability are currently based upon a static paradigm. Moving from traditional, detached views of technology to a more open and proactive view requires a shift that can be addressed using many existing forms of instructional media. In Table 1, we link those media to changing attitudes and show how to address these changes.

Educating Behavior

The way auditors react is as important as their *a priori* attitude. In shifting from traditional auditor behavior to skills required in the RTE, identifying sources of information and conducting additional team simulations will help students determine correct responses, interact with different

TABLE 1
Teaching Attitudes in the RTE

Skill	Traditional Approach	RTE Approach	Sample Instructional Media
Ethics	A segmented approach to ethical behavior.	A proactive integrative attitude towards ethical behavior and consideration for new dilemmas related to the RTE.	Case/Simulation: Use cases tied to team simulation, with additional ethical ambiguity.
Technology adoption	Spreadsheet-based approach.	Constant search for new relevant technologies.	Context: Identify resources for students to explore. Remote: Assign projects that require an online/remote component.
Openness toward change	Change limited by regulation and litigation considerations. Substantial conformity to rigid audit and accounting standards.	Openness to change. Adaptability—risk-based assurance and principle-based accounting.	Simulation: Run team simulations incorporating cost/benefit analysis and examples of successful implementation. Lecture: Expand the discussion of risk and IFRS.

391 personalities, and determine where to find answers to open questions. Table 2 provides guidelines 391
392 for instruction based on these changes. 392

393 ***Educating Objective Knowledge—Accounting and Technology*** 393

394 Objective accounting knowledge can aid students in identifying how to use emerging tools to 394
395 perform more efficient and effective audits for their clients. Table 3 links a series of changed 395
396 knowledge base needs of the auditor to a more modern knowledge set. These needs are segmented 396
397 based on the usage and context of basic IT and other wider learning needs. 397

398 **Instructional Media** 398

399 An instructional medium is defined here as any method or tool designed to facilitate learning 399
400 and instruction to satisfy a set of learning objectives. Lectures, cases, software instruction, soft- 400
401 ware exercises, classroom presentations, projects, group assignments, and other tools can be used 401
402 independently or aggregated as instructional media. To help educators in developing students' RTE 402
403 skills, we have gathered some examples from the literature and our own experience. This section 403
404 will link the new auditor skill set to a series of instructional media. 404

405 While these media are extensively discussed in the literature, they are only beneficial if they 405
406 are adopted, fundamentally altering the traditional stand-and-deliver approach. It is not enough to 406
407 give lip service to a new technique; the educator must understand and appreciate the reasoning 407
408 behind the technique in order to use it effectively. For example, our own anecdotal evidence 408
409 suggests that students arbitrarily assigned case studies feel there is not sufficient time and discus- 409
410 sion dedicated to maneuvering the details of the case. Students perceive poorly used media and 410
411 learning aids as a waste of time (Jones and Wright 2010). Thoughtful and deliberate inclusion of 411
412 the media discussed in this section is intended to provide value to an auditing course. 412

TABLE 2
Modifying Behavior in the RTE

<u>Skill</u>	<u>Traditional Approach</u>	<u>RTE Approach</u>	<u>Sample Instructional Media</u>
Client interaction	Face-to-face interaction	Traditional client interaction with remote/distance coordination	Simulation: Audit simulation teamwork with role-playing of both auditor and client; have teams perform the simulation using online conferencing tools.
Teamwork	On-site teams	Remote team management	Remote: Require distance interaction for the audit team in the case above.
Managing the engagement	Predetermined audit plan	Dynamic engagement	Lecture: Identify steps of an engagement with tight linkage to audit objectives. Context: Introduce evidence that forces teams to make adjustments to original audit plan.
	Sequential audits	Simultaneous remote engagements	Simulation/remote: Run an auditor/client team simulation with remote participation feature.
	Focus on U.S. GAAP	Wider consideration of business process measurement	Case: Introduce an international case with cross-nation consolidation
Learning technology on the job	Extensive focused training	Ability to self-teach new technology tools	Context: Show students where tutorials and help can be found; Do not provide detailed instructions.

413 The media include lectures, cases, team simulation, remote projects, contextual learning re- 413
 414 sources, supplemental instruction, and emerging methods. While we attempt to identify use of 414
 415 these tools to enhance the RTE auditor instruction, this list is by no means intended to be com- 415
 416 prehensive or exhaustive. 416

417 **Lecture** 417

418 Lectures remain central to the current learning process, but there remains ample opportunity 418
 419 to tweak them for the RTE skill set. Through exposure to lecture-enhancing tools, such as tablet 419
 420 PCs and real-time classroom response systems, students are more likely to get accustomed to new 420
 421 uses of technology and experience the process of technology adoption firsthand. 421

422 Using lectures simply to explain how technology works or provide a hands-off demonstration 422
 423 may not be sufficient for students to gain confidence with these tools. Altering the traditional 423
 424 lecture format to include more hands-on experience may spark a student's intellectual curiosity 424
 425 and problem solving skills in a controlled environment. Guest speakers, discussions, and other 425

TABLE 3
Focusing on Objective Knowledge

Skill	Traditional Approach	RTE Approach	Sample Instructional Media
Basic knowledge of technology	Introduction to technology	Fundamental understanding of the concepts and methodologies of IT	Lecture/exercise: Enhanced traditional approach with hands-on component
IT audit	Basic IT audit	Greater focus on IT audit	Lecture: More thorough discussion of IT audit tools. Exercise: Include IT audit software assignments
Technological audit tools	Limited mention of audit-specific software tools	Automated work papers Performance of data extraction Use of statistical analytical tools Understanding of ERPs Understanding of mid-level accounting packages	Exercise: Cloud computing exercise to manage auditor/audit client simulation Exercise: ACL/IDEA utilization assignments Lecture: Identify statistical methods to be used and provide exercises with a focus on the usage of advanced analytics; Basic overview of a statistical package like SAS or SPSS Lecture: Discuss cases on ERP usage, as well as the basics of ERP Exercise/case: Bookkeeping assignment using an accounting package (e.g., QuickBooks) and an audit case around it.
Accounting and audit knowledge	Memorization of essential accounting and auditing facts	Wider knowledge set aimed at improving search and information acquisition skills	Context/case: Discuss auditing cases and have students hunt for specific procedures or standards.
Certification	Primary focus on passing the CPA exam	Passing a variety of professional certification exams; Ability to find information in online and offline sources; Knowledge of existing sources; Ability to extract/find information and form a story.	Supplemental: Emphasis on broad basic knowledge ... reliance on "test prep courses" Exercise: Series of practical exercises of rapid information search and contextual reporting

426 complementary elements can help students focus on experiencing an active dialog. As an example, 426
 427 Radtke (2004) shares a model for transforming a lecture into an ethical conversation with students, 427
 428 incorporating instruction, discussion, and group simulation. 428

429	Case	429
430	Case studies present the real-world experiences of companies. Used properly, they help read-	430
431	ers identify factors that lead to success or failure. The use of cases in accounting curricula is well	431
432	documented in the literature, with examples of cases touching on integrated audit (Gelinás et al.	432
433	2008), team management (McConnell and Sasse 1999), and other audit-related themes. Textbooks	433
434	are lined with cases that present real-world examples in an effort to provoke student thought.	434
435	For the future RTE auditor, cases containing more challenging ethical ambiguity can lead to	435
436	deeper discussion and reflection and enhance ethical training. Additional cases on ERP use and	436
437	consolidation with international financial reporting standards can help students hone more special-	437
438	ized and relevant skills.	438
439	Team Simulation and Exercises	439
440	In team simulation, students assume roles of professionals and deal with real-world situations.	440
441	Examples of simulation use in teaching concepts from sampling to audit risk are prevalent in the	441
442	literature (Gelinás et al. 2008; Green and Calderon 2005; Springer and Borthick 2004; Hiltner	442
443	1983). Green and Calderon (2005) show that a student's level of learning and satisfaction increase	443
444	with simulation use.	444
445	Several approaches to team development are also present in the literature (McConnell and	445
446	Sasse 1999). Bryant and Albring (2006) conduct an extensive review of psychology and organi-	446
447	zational behavior literature to provide guidance on team building in an accounting environment.	447
448	Team simulation helps auditing students develop client-interfacing skills, particularly when	448
449	dealing with the remote audit. One approach we have attempted divides students into auditor/	449
450	auditor client teams and presents challenges that these two groups face, including time and man-	450
451	agement constraints. In this example, teams are assigned to participate as both auditors of one	451
452	team and audit client of another. Throughout the simulation, planning, working papers, etc. can be	452
453	maintained on a collaboration website (such as Google Sites) to incorporate a remote/cloud ele-	453
454	ment (see remote projects) into the scenario. Additionally, teams work through the cost/benefit	454
455	analysis of implementing different forms of audit automation.	455
456	Remote Projects	456
457	Increasingly, audit teams conduct remote audit engagements and access electronic work pa-	457
458	pers through an online portal provided by their firm. Cloud computing, which enables data storage	458
459	and access over the Internet or a virtual private network, is becoming more and more relevant as	459
460	business processes and workflows gravitate toward online storage. Exposing students to online	460
461	tools, such as Adobe ConnectNow (http://connectnow.acrobat.com) for web conferencing and	461
462	Google Sites (http://sites.google.com) for collaborative wikis may prove valuable for them as they	462
463	begin their careers. Many of these services are available for students to use free of charge.	463
464	Contextual Learning	464
465	Contextual learning is a valuable skill that allows students to identify resources used to help	465
466	them solve problems. Understanding how standards and procedures work and knowing where to	466
467	locate their definitions and interpretation are vital to the contextual learning paradigm. This is	467
468	particularly important in the advent of international standards integration.	468
469	Understanding the tools that aid contextual learning is one of the key behavioral skills that	469
470	accounting students should possess. As accounting education moves away from a primarily	470
471	memorization-based scheme, knowing where to find supplemental information on accounting rules	471
472	(e.g., online databases, expertise of seasoned auditors, and personal libraries) becomes a vital tool	472
473	for students. Knowing how to search is as important as knowing where to look. Brief instruction	473
474	in this area can go a long way to help students be effective auditors.	474

475 Assignments can couple contextual learning with an emphasis on specialization to enhance 475
 476 team simulations. As they work in teams, students are assigned specialties and then refer to each 476
 477 other when issues arise. Some courses have benefited from accounting “treasure hunts.” In this 477
 478 exercise, students are provided only limited information to solve a problem. In lieu of full disclo- 478
 479 sure, a list of resources is provided where answers can be found. 479

480 *Supplemental Instruction* 480

481 As we move away from a CPA-centric curriculum, greater reliance will be placed on certifi- 481
 482 cation test prep courses (e.g., Becker, Kaplan, etc.). Jones and Fields (2001) suggest that supple- 482
 483 mental instruction effectively increases academic performance. As more students move to these 483
 484 supplemental instructional resources, the audit educator’s syllabus can be diversified into more 484
 485 engaging instruction and conceptual learning. 485

486 *Emerging Methods* 486

487 New methods of conveying knowledge and identifying resources are continually being dis- 487
 488 cussed and implemented. Additional work should be done to determine instructional media that 488
 489 can be used to better convey the concepts outlined in this paper. Ideally, audit educators will 489
 490 spearhead this movement, sharing new ideas and methodologies to help one another prepare 490
 491 auditing students for the environment that awaits them in the real world. 491

492 **CONCLUSION** 492

493 The arrival of the RTE represents a major tipping point for the auditing profession, one that 493
 494 cannot be ignored. Audit education must catch up with the progress being made in the rest of the 494
 495 business world in order to maintain relevance. The change we advocate is neither revolutionary 495
 496 nor impossible, but rather evolutionary and necessary. By taking proactive steps, today’s univer- 496
 497 sity instructors can train tomorrow’s auditors not only to be aware of the state of the art, but also 497
 498 to be able to take advantage of further progression of the field. 498

499 We contribute to the literature by linking the RTE environment to specific auditor skills. We 499
 500 further provide value by proposing educational media that can be integrated into the traditional 500
 501 educational context and provide opportunities for students to acquire these skills. While none of 501
 502 the media are new, the context is unique and provides accounting academics with a framework to 502
 503 creatively train future professionals and a basis for future empirical pedagogical research. 503

504 While the discussion in this paper is focused primarily on the RTE’s impact on auditor 504
 505 training, this issue cannot be separated from current standard setting practices and other extrinsic 505
 506 factors. For example, in the United States, individual state societies determine educational require- 506
 507 ments for accountants, and these requirements may not fully incorporate RTE concepts. The 507
 508 reality is that students come to the educational environment to acquire employment, which is 508
 509 universally contingent on professional certification. Without a dramatic shift in the focus of these 509
 510 certifications, the educational approach may not be perceived as value adding and will create a 510
 511 clear double bind. 511

512 Predicting the direction of future technology is a task fraught with difficulties (Christensen 512
 513 1997). Disruptive events, such as the emergence of the Internet, have substantially changed audit 513
 514 practice and consequently education needs. The ability of future auditors to apply their newfound 514
 515 skills and knowledge is based upon the reaction time of audit firms and standard setters. Once 515
 516 again, the closed loop between auditing education and audit practice necessitates a proactive 516
 517 approach from both sides. 517

518 Finally this position paper is forward-looking and incorporates a vision of what audit educa- 518
 519 tion can become, not a description of current practice. This paper is mainly normative and based 519
 520 in internal logic and experiential evidence. There is a tremendous and as yet unfilled need for 520

521 serious empirical research on audit education and consequent auditor career development, includ- 521
 522 ing attitudes, technical competences, behavioral skills, and career paths. The educational media 522
 523 discussed in this paper are educational tools used over the years, following what we feel is a 523
 524 natural succession from current trends. Objective assessment and long term career monitoring and 524
 525 tracking (cf. Schein 1971) are needed to guide the profession to a more RTE-relevant set of 525
 526 procedures. 526
