<i>Preface</i>	v
<i>List of contributors</i>	vii
<i>Chapter 1. Physical properties and functional roles of lipids in membranes</i>	
<i>Pieter R. Cullis and Michael J. Hope</i>	1
1. Introduction and overview	1
2. Lipid diversity and distribution	3
2.1. Chemical diversity of lipids	3
2.2. Membrane lipid compositions	5
2.3. Transbilayer lipid asymmetry	7
3. Model membrane systems	8
3.1. Lipid isolation and purification	9
3.2. Techniques for making model membrane vesicles	9
3.3. Techniques for making planar bilayers and monolayers	13
3.4. Reconstitution of integral membrane protein into vesicles	13
4. Physical properties of lipids	15
4.1. Gel-liquid-crystalline phase behaviour	15
4.2. Lipid polymorphism	19
4.3. Factors which modulate lipid polymorphism	24
4.4. The physical basis of lipid polymorphism	26
5. Lipids and the permeability properties of membranes	28
5.1. Theoretical considerations	28
5.2. Permeability of water and non-electrolytes	29
5.3. Permeability of ions	30
6. Lipid-protein interactions	31
6.1. Extrinsic proteins	32
6.2. Intrinsic proteins	33
7. Lipids and membrane fusion	34
7.1. Fusion of model systems	34
7.2. Fusion of biological membranes	36
8. Model membranes and drug delivery	38
9. Future directions	40
References	40
<i>Chapter 2. Lipid metabolism in procaryotes</i>	
<i>S. Jackowski, J.E. Cronan Jr. and C.O. Rock</i>	43
1. The study of bacterial lipid metabolism	43
2. Historical introduction	43
3. An overview of phospholipid metabolism in <i>E. coli</i>	44
4. Genetic analysis of lipid metabolism	44
5. Membrane systems of <i>E. coli</i>	48

6.	Lipid biosynthetic pathways in <i>E. coli</i>	50
6.1.	Initiation of fatty acid biosynthesis	50
6.2.	Elongation of acyl chains	51
6.3.	Product diversification	52
6.4.	Transfer to the membrane	53
6.5.	Diversification of polar head groups	54
6.6.	Central role of acyl carrier protein	54
7.	Lipopolysaccharide biosynthesis	58
8.	Degradative pathways	59
8.1.	Phospholipases	59
8.2.	Thioesterases	62
8.3.	Fatty acid oxidation in bacteria	63
9.	Phospholipid turnover	63
9.1.	The diacylglycerol cycle	63
9.2.	The 2-acylglycerolphosphoethanolamine cycle	65
10.	Inhibitors of lipid metabolism	66
10.1.	3-Decynoyl- <i>N</i> -acetylcysteamine	66
10.2.	Cerulenin	66
10.3.	Thiolactomycin	67
11.	Regulation of fatty acid composition in <i>E. coli</i>	68
11.1.	Role of 3-hydroxydecanoyl-ACP dehydrase	68
11.2.	Role of 3-ketoacyl-ACP synthase I	69
11.3.	Role of 3-ketoacyl-ACP synthase II	70
11.4.	Factors affecting fatty acid chain-length distribution	72
11.5.	Synthesis of cyclopropane fatty acids	72
11.6.	Importance of the fatty acid composition of the membrane phospholipids	73
12.	Regulation of phospholipid biosynthesis in <i>E. coli</i>	74
12.1.	Control of fatty acid positional distribution	74
12.2.	Regulation of total phospholipid synthesis	76
12.3.	Coordination of phospholipid synthesis with cellular metabolism	77
12.4.	Regulation of phospholipid head group composition	77
12.5.	<i>E. coli</i> tolerates variations in phospholipid composition	78
12.6.	Outer membrane lipoprotein	79
13.	Lipid metabolism in bacteria other than <i>E. coli</i>	80
13.1.	Bacteria lacking unsaturated fatty acids	80
13.2.	Bacteria containing phosphatidylcholine	81
13.3.	Bacteria synthesizing unsaturated fatty acids by an aerobic pathway	81
13.4.	Bacteria with a multifunctional fatty acid synthase	81
13.5.	Bacteria with intracytoplasmic membranes	82
13.6.	Other bacterial oddities	82
13.7.	Lipids of nonbacterial (but related) organisms	83
14.	Future directions	83
	References	84

Chapter 3. Oxidation of fatty acids

<i>Horst Schulz</i>	87
1. The pathway of β -oxidation: a historical account	87
2. Uptake and activation of fatty acids in animal cells	89

3.	β -Oxidation in mitochondria	91
3.1.	Mitochondrial uptake of fatty acids	91
3.2.	Enzymes of β -oxidation in mitochondria	93
3.3.	β -Oxidation of unsaturated and odd-chain fatty acids	96
3.4.	Regulation of mitochondrial β -oxidation	98
3.5.	Inhibitors of mitochondrial β -oxidation	100
4.	β -Oxidation in peroxisomes	101
5.	Fatty acid oxidation in <i>E. coli</i>	104
6.	Inherited diseases of fatty acid oxidation	106
7.	Future directions	108
	References	109

Chapter 4. Fatty acid synthesis in eucaryotes

<i>Alan G. Goodridge</i>	111
------------------------------------	-----

1.	Introduction	111
2.	Signals in blood that mediate the effects of diet	112
3.	Which enzymes regulate fatty acid synthesis?	114
4.	Regulation of substrate supply	115
4.1.	Production of pyruvate from glucose	115
4.2.	Production of citrate from pyruvate	115
4.3.	Production of NADPH	117
5.	Regulation of the catalytic efficiency of acetyl-CoA carboxylase	117
5.1.	A key regulatory reaction	117
5.2.	Structure and reaction mechanism	118
5.3.	Regulation by citrate	118
5.4.	Regulation by long-chain fatty acyl-CoA	119
5.5.	Regulation by covalent modification	121
6.	Fatty acid synthase	125
6.1.	Animal fatty acid synthase: the component reactions	125
6.2.	Animal fatty acid synthase: the subunits are identical	127
6.3.	Animal fatty acid synthase: structural organization	128
6.4.	Comparison of yeast and animal fatty acid synthases	129
7.	Regulation of enzyme concentration	130
7.1.	Messenger RNA levels regulate enzyme synthesis rates	130
7.2.	Transcription is usually the regulated step	131
7.3.	Regulation in cells in culture	134
7.3.1.	3T3-L1 cells — a pre-adipocyte cell line	134
7.3.2.	Hepatocytes in maintenance culture	135
8.	Future directions	137
	References	138

Chapter 5. Fatty acid desaturation and chain elongation in eucaryotes

<i>Harold W. Cook</i>	141
---------------------------------	-----

1.	Introduction	141
2.	Historical background	143
3.	Chain elongation of long chain fatty acids	144

3.1.	The microsomal elongation system	146
3.2.	The mitochondrial elongation system	147
3.3.	Functions of the two elongation systems	148
4.	Formation of monounsaturated fatty acids by oxidative desaturation	148
4.1.	Nomenclature to describe double bonds	148
4.2.	Characteristics of the monoene-forming desaturation enzymes	149
4.3.	Modification of $\Delta 9$ desaturase activities in vitro	151
4.4.	Dietary and hormonal regulation of $\Delta 9$ desaturase	152
4.5.	Formation of monounsaturated fatty acids in plants	154
5.	Formation of polyunsaturated fatty acids	154
5.1.	Characteristics and restrictions in animal systems	154
5.2.	Essential fatty acids—a contribution of plant systems	155
5.3.	Families of fatty acids and their metabolism	157
5.3.1.	The (n-6) family	157
5.3.2.	The (n-3) family	159
5.3.3.	Competition between the (n-6) and (n-3) families	160
5.3.4.	The (n-9) family	161
5.3.5.	The (n-7) family	161
5.4.	Dietary and hormonal alterations of polyunsaturated acid synthesis	161
5.5.	Two or more double bonds in plants	163
6.	Unsaturated fatty acids with <i>trans</i> double bonds	164
7.	Abnormal patterns of distribution and metabolism of long chain saturated and unsaturated fatty acids	165
7.1.	Essential fatty acid deficiency	165
7.2.	Zinc deficiency	166
7.3.	Other clinical disorders	166
7.4.	Relationship to plasma cholesterol	166
8.	Future directions	167
	References	168

Chapter 6. Metabolism of triacylglycerols

David N. Brindley 171

1.	Introduction	171
2.	Biosynthesis of triacylglycerols	173
2.1.	Biosynthesis of phosphatidate	173
2.2.	Conversion of phosphatidate to triacylglycerol	178
2.3.	Conversion of monoacylglycerol to triacylglycerol	179
3.	Digestion, absorption and transport of lipids	181
3.1.	Digestion of lipids	181
3.2.	Absorption of lipids from the small intestine	183
3.3.	Formation of chylomicrons and VLDL	184
3.4.	Partitioning of fatty acids between the portal blood and the lymphatic system	186
4.	Control of triacylglycerol synthesis	187
4.1.	Control of phosphatidate synthesis in the liver	188
4.2.	Control of the conversion of phosphatidate to triacylglycerol in liver	189
4.3.	Diacylglycerol as a precursor of triacylglycerol, phosphatidylcholine and phosphatidylethanolamine	193
5.	Metabolism of triacylglycerols when the action of insulin is high	195
6.	Triacylglycerol metabolism in conditions of metabolic stress	198

7. Future directions	200
References	201

Chapter 7. Phospholipid metabolism and cell signalling in eucaryotes

<i>Dennis E. Vance</i>	205
1. Introduction	205
2. Phosphatidylcholine biosynthesis	206
2.1. Historical background	206
2.2. Choline transport and oxidation	207
2.3. Enzymes of the CDP-choline pathway	207
2.4. Phosphatidylethanolamine- <i>N</i> -methyltransferase	208
3. Regulation of phosphatidylcholine biosynthesis	209
3.1. The rate-limiting reaction	209
3.2. The translocation hypothesis	210
3.3. Regulatory mechanisms	210
3.3.1. Fatty acids are important regulators of phosphatidylcholine biosynthesis in cultured cells	211
3.3.2. Diacylglycerol may also regulate phosphatidylcholine biosynthesis	211
3.3.3. Phosphorylation–dephosphorylation reactions	212
3.3.4. Feedback regulation	212
3.3.5. Cholinephosphotransferase	213
3.4. Substrate channeling	213
4. Sphingomyelin biosynthesis	214
5. Phosphatidylserine biosynthesis	215
5.1. Historical developments and biosynthesis	215
5.2. CHO mutants and regulation	217
6. Phosphatidylethanolamine biosynthesis	218
6.1. Historical background	218
6.2. Enzymes of the CDP-ethanolamine pathway	218
6.3. Regulation of the CDP-ethanolamine pathway	219
6.3.1. Regulation at the cytidyltransferase reaction	219
6.3.2. Diacylglycerol	220
6.4. Phosphatidylserine decarboxylation and the relative importance of the various pathways for phosphatidylethanolamine biosynthesis	221
6.5. <i>N</i> -acyl-phosphatidylethanolamine	221
7. Polyglycerophospholipids	222
7.1. Historical developments and biosynthetic pathways	222
7.2. Enzymes and subcellular location	224
8. Inositol phospholipids	224
8.1. Historical developments	224
8.2. Biosynthetic enzymes	225
9. Phospholipids as precursors of cellular second messengers	226
9.1. Discovery of the phosphatidylinositol cycle	226
9.2. Degradation of phosphatidylinositol-4,5-bisphosphate by phospholipase C	227
9.3. Metabolism of the inositol phosphates	228
9.4. Function of inositol phosphates	229
9.5. Diacylglycerol and protein kinase C	230
9.6. Phosphatidylcholine cycles and formation of diacylglycerol	231

10. Phospholipid catabolism and remodeling of the acyl substituents	231
11. Phospholipid biosynthesis in yeast	233
12. Phosphonolipids	234
12.1. Historical perspective	234
12.2. Biosynthesis	235
13. Glycosyl phosphatidylinositols for attachment of cell surface proteins	236
14. Future directions	238
References	238

Chapter 8. Metabolism, regulation, and function of ether-linked glycerolipids and their bioactive species

<i>Fred Snyder</i>	241
1. Introduction	241
2. Nomenclature	241
3. Historical events	243
4. Analytical approaches	245
5. Physical properties	247
6. Occurrences in nature	248
7. Biologically active ether lipids	249
8. Biosynthesis	250
8.1. Ether lipid precursors	250
8.1.1. Acyl-CoA reductase	250
8.1.2. Dihydroxyacetone-P acyltransferase	250
8.2. Ether lipids in membranes	252
8.2.1. Biosynthesis of the ether bond	252
8.2.2. Biosynthesis of the alkyl analogue of phosphatidic acid	254
8.2.3. Biosynthesis of complex neutral glycerolipids and phospholipids with <i>O</i> -alkyl bonds	254
8.2.4. Biosynthesis of plasmalogens	255
8.3. Bioactive ether lipids	256
9. Catabolism	258
9.1. Ether lipid precursors	258
9.1.1. Long-chain fatty alcohols	258
9.1.2. Dihydroxyacetone-P and acyldihydroxyacetone-P	258
9.2. Ether lipids in membranes	259
9.2.1. Alkyl cleavage enzyme	259
9.2.2. Plasmalogenases	260
9.2.3. Phospholipases and lipases	260
9.3. Bioactive ether lipids	262
10. Regulatory controls	263
11. Functional roles	264
11.1. Membrane components	264
11.2. Cell mediators (activities and mechanisms of action)	265
12. Future directions	266
References	267

Chapter 9. Phospholipases

<i>Moseley Waite</i>	269
1. Overview	269
1.1. Definition of phospholipases	269
1.2. Assay of phospholipases	271
1.3. Interaction of phospholipases with interfaces	272
2. The phospholipases	276
2.1. Phospholipase A ₂	276
2.2. Phospholipase B and lysophospholipases	278
2.3. Phospholipase A ₂	280
2.4. Phospholipase C	287
2.5. Phospholipase D	290
2.6. Phospholipases in signal transduction	292
3. Future directions	292
References	294

Chapter 10. The eicosanoids: cyclooxygenase, lipoxygenase, and epoxygenase pathways

<i>William L. Smith, Pierre Borgeat and Frank A. Fitzpatrick</i>	297
1. Introduction	297
2. Prostanoids	298
2.1. Structures and nomenclature	298
2.2. Prostanoid chemistry	299
2.3. Prostanoid biosynthesis	299
2.4. Arachidonate release	299
2.5. Prostaglandin endoperoxide formation	300
2.6. Physico-chemical properties of PGH synthase	302
2.7. PGH synthase and nonsteroidal anti-inflammatory drugs	302
2.8. Anti-inflammatory steroids	303
2.9. PGH synthase active site	304
2.10. Regulation of PGH synthase gene expression	304
2.11. PGH ₂ metabolism	305
2.12. Catabolism: prostanoids as local hormones	306
3. Hydroxy- and hydroperoxy-eicosanoic acids and leukotrienes	308
3.1. Introduction and overview	308
3.2. Mechanism of leukotriene biosynthesis in human neutrophils	309
3.3. The enzymes of the 5-lipoxygenase pathway	312
3.4. Regulation of leukotriene synthesis	313
3.5. The metabolism of lipoxygenase products	315
3.6. Biological activities of leukotrienes	317
4. Epoxygenase products	318
4.1. Introduction	318
4.2. Structures, nomenclature, and biosynthesis	318
4.3. Occurrence of epoxyeicosatrienoic acids	321
4.4. Metabolism of epoxygenase metabolites of arachidonic acid	321
4.5. Biological actions of 'epoxygenase' derived EpETrEs and HETrEs	322

5. Future directions	322
5.1. Cyclooxygenase metabolites	322
5.2. Lipoxygenase metabolites	323
5.3. Epoxygenase metabolites	323
References	323

Chapter 11. Sphingolipids

<i>Charles C. Sweeley</i>	327
-------------------------------------	-----

1. Introduction	327
2. Chemistry and distribution	330
2.1. Sphingoid bases	330
2.2. Ceramides	332
2.3. Glycosphingolipids	333
2.3.1. Neutral glycosphingolipids	333
2.3.2. Acidic glycosphingolipids	334
2.3.2.1. Gangliosides	334
2.3.2.2. Phosphorus-containing glycosphingolipids	336
2.3.2.3. Sulfatoglycosphingolipids	337
3. Biosynthesis of sphingolipids	337
3.1. Sphingoid bases and ceramide	338
3.2. Sphingomyelin	340
3.3. Sulfatoglycosphingolipids	340
3.4. Neutral glycosphingolipids	341
3.4.1. Cell surface glycosyltransferases	345
3.5. Gangliosides	345
4. Turnover of sphingolipids	347
4.1. Lysosomal metabolism of sphingolipids	348
4.1.1. Sphingomyelin	348
4.1.2. Ceramide	349
4.1.3. Glycosphingolipids	349
4.2. Glycosphingolipid storage diseases	350
4.2.1. Tay-Sachs disease and related disorders	351
4.2.1.1. α -Subunit mutations	352
4.2.1.2. β -Subunit mutations	353
4.2.1.3. Defective G_{M2} activator protein	353
4.2.2. Fabry's disease and Schindler's disease	353
5. Regulation of glycosphingolipid metabolism	354
5.1. Developmental changes	355
5.1.1. Glycosphingolipid markers in leukocyte differentiation	355
5.1.2. Early embryonic markers	356
5.2. Oncogenic transformation and immunomodulation by shed gangliosides	356
6. Biological activities and functional roles of sphingolipids	357
6.1. Adherence of microorganisms to cell surface glycosphingolipids	357
6.2. Modulation of signal transduction	358
6.2.1. Glycosphingolipids	358
6.2.2. Sphingoid bases	359
7. Future directions	359
References	360

Chapter 12. Cholesterol: evolution of structure and function

<i>Konrad Bloch</i>	363
1. Natural occurrence of sterols	363
2. Metabolic and precursor functions of the sterol molecule	364
3. Sterol patterns	366
4. Sterols and membrane function	368
4.1. Function of sterols in animal membranes	368
4.2. Sterol auxotrophs	369
4.3. Metabolic regulation in the membrane environment	370
4.4. Fluidity control	371
5. Regulatory roles for sterols in membranes	372
5.1. Fungi and invertebrates	372
5.2. Sterol effects on hormone and neurotransmitter receptors	373
5.3. Sterols and fusion of viral membranes	374
5.4. Capping of surface immunoglobulin	375
5.5. Sterol effects on enzyme activities	375
5.6. Effects of cholesterol on phospholipid synthesis	376
6. Evolution of the sterol structure	377
7. Future directions	380
References	381

Chapter 13. Regulation of sterol biosynthesis and isoprenylation of proteins

<i>Peter A. Edwards</i>	383
1. Introduction	383
2. Regulation of cholesterol synthesis	385
3. Regulation of cholesteryl ester synthesis	387
4. Transcriptional control of cholesterol synthesis	389
5. Posttranscriptional regulation	390
6. Identification of the physiological regulators	392
7. Regulation of bile acid synthesis	394
8. Isoprenylation of proteins	396
9. Future directions	399
References	400

Chapter 14. Lipoprotein structure and secretion

<i>Roger A. Davis</i>	403
1. Introduction	403
2. Structure and function of plasma lipoproteins	404
2.1. Chylomicrons and very low density lipoproteins	404
2.2. Structure: surface components	405
2.3. Core components	408
2.4. Low density lipoproteins: structure	408
2.4.1. Origin of low density lipoproteins	409
2.4.2. High density lipoproteins: structure and function	409
2.4.3. Discoidal high density lipoproteins	409

3.	Assembly of nascent lipoproteins	411
3.1.	Triacylglycerol-rich lipoproteins	411
3.1.1.	Role of lipids	412
3.2.	Core lipids	412
3.2.1.	Role of apolipoproteins	413
3.2.2.	Apolipoprotein B structure	413
3.3.	Vitellogenin: the primordial apolipoprotein	415
3.4.	Very low density lipoprotein assembly: ejection of a ball of fat out of the endoplasmic reticulum	417
3.5.	Filling the hydrophobic core: a thermodynamic dilemma	422
3.6.	High density lipoprotein synthesis and secretion	422
4.	Future directions	423
	References	424

Chapter 15. Dynamics of lipoprotein transport in the circulatory system

<i>Phoebe E. Fielding and Christopher J. Fielding</i>	427
---	-----

1.	Overview	427
2.	Lipoprotein lipase and the initial metabolism of lipoprotein triacylglycerol	430
2.1.	Initial events	430
2.2.	Lipoprotein lipase structure	431
2.3.	Synthesis and transport of lipoprotein lipase	431
2.4.	The lipoprotein lipase reaction and the role of apolipoprotein C-2	432
2.5.	Lipoprotein lipase activity at the vascular surface	434
2.6.	Regulation of lipoprotein lipase activity by products of lipolysis	435
2.7.	Physiological regulation of lipoprotein lipase	436
2.8.	Congenital lipoprotein lipase deficiency	437
3.	Hepatic triacylglycerol lipase and the later metabolism of lipoprotein triacylglycerol	437
3.1.	Introduction	437
3.2.	Structure of hepatic triacylglycerol lipase	437
3.3.	Acyl group hydrolysis and exchange catalyzed by hepatic triacylglycerol lipase	438
3.4.	Hepatic triacylglycerol lipase and the hydrolysis of lipoprotein lipids	438
3.5.	Regulation of hepatic triacylglycerol lipase activity	439
3.6.	Human hepatic triacylglycerol lipase deficiency	440
3.7.	Phospholipid exchange protein and its activity	440
4.	Lecithin:cholesterol acyltransferase and the initial metabolism of lipoprotein cholesterol	440
4.1.	Introduction	440
4.2.	'Forward' cholesterol transport by very low density lipoprotein and its product, low density lipoprotein	444
4.3.	Origin of the major high density lipoprotein proteins	445
4.4.	Classification of plasma and lymph high density lipoprotein	446
4.5.	Apoprotein transfers in high density lipoprotein	446
4.6.	Origin of plasma lecithin:cholesterol acyltransferase	447
4.7.	Structure of plasma lecithin:cholesterol acyltransferase	447
4.8.	Mechanism of plasma lecithin:cholesterol acyltransferase activity	448
4.9.	Role of apo A-1 in the plasma lecithin:cholesterol acyltransferase reaction	449
4.10.	Transfer of cholesterol among high density lipoprotein species	450
4.11.	Physiological regulation of plasma lecithin:cholesterol acyltransferase activity	452
4.12.	Studies of plasma lecithin:cholesterol acyltransferase deficiency	452

5.	Cholesteryl ester transfer protein and the later metabolism of lipoprotein cholesterol	452
5.1.	Introduction	452
5.2.	Structure of cholesteryl ester transfer protein	454
5.3.	Mechanism of cholesteryl ester transfer protein activity	454
5.4.	Quantitation of cholesteryl ester transfer	456
5.5.	Physiological regulation of cholesteryl ester transfer protein	456
5.6.	Congenital cholesteryl ester transfer protein deficiency	457
5.7.	Cholesteryl ester transfer protein inhibitor protein	457
6.	Summary and future directions	457
	References	458

Chapter 16. Removal of lipoproteins from plasma

	<i>Wolfgang J. Schneider</i>	461
1.	Introduction	461
2.	Removal of low density lipoprotein from the circulation	464
2.1.	Receptor-mediated endocytosis	464
2.2.	The low density lipoprotein receptor pathway	465
2.2.1.	Familial hypercholesterolemia: clinical consequences of low density lipoprotein receptor dysfunction	466
2.2.2.	Biochemical findings in cultured fibroblasts from familial hypercholesterolemia homozygotes	467
2.3.	Biosynthesis and structure of the low density lipoprotein receptor	467
2.3.1.	The low density lipoprotein receptor protein	468
2.3.2.	The ligand binding domain	469
2.3.3.	The EGF precursor homology domain	470
2.3.4.	The third domain	470
2.3.5.	The membrane anchoring domain	470
2.3.6.	The cytoplasmic tail	471
2.4.	Molecular defects in low density lipoprotein receptors of patients with familial hypercholesterolemia	471
2.4.1.	The gene for the human low density lipoprotein receptor	471
2.4.2.	Four groups of low density lipoprotein receptor mutations	472
2.4.2.1.	Class 1: no detectable precursor	472
2.4.2.2.	Class 2: slow or absent processing of precursor	472
2.4.2.3.	Class 3: abnormal ligand binding	473
2.4.2.4.	Class 4: internalization defective	474
3.	Catabolism of chylomicrons	475
4.	High density lipoprotein as a transport vehicle	477
5.	Atherosclerosis	478
5.1.	Uptake and modification of low density lipoprotein in the intima	478
5.2.	Scavenger receptors	480
6.	Lipoprotein transport in the laying hen	481
7.	Low density lipoprotein metabolism by rat serosal mast cells	483
8.	Future directions	485

Chapter 17. Lipid assembly into cell membranes

<i>Dennis R. Voelker</i>	489
1. Introduction	489
2. The diversity of lipids	489
3. Methods to study intra- and inter-membrane lipid transport	492
3.1. Fluorescent probes	494
3.2. Spin labeled analogs	494
3.3. Asymmetric chemical modification of membranes	495
3.4. Phospholipid transfer proteins	496
3.5. Rapid plasma membrane isolation	497
3.6. Organelle specific lipid metabolism	498
4. Lipid transport processes	498
4.1. Intramembrane lipid translocation and model membranes	498
4.2. Intramembrane lipid translocation and biological membranes	502
4.2.1. Procaryotes	502
4.2.2. Eucaryotes	503
4.2.2.1. Transbilayer movement at the endoplasmic reticulum	503
4.2.2.2. Transbilayer movement of phosphatidylcholine in erythrocytes	504
4.2.2.3. Transbilayer movement of phosphatidylcholine in nucleated cells	505
4.2.2.4. ATP dependent transbilayer movement of aminophospholipids at the plasma membrane of eukaryotic cells	506
4.3. Intermembrane lipid transport	507
4.3.1. Transport in procaryotes	507
4.3.2. Transport in eucaryotes	510
4.3.2.1. Phosphatidylcholine	510
4.3.2.2. Phosphatidylethanolamine	512
4.3.2.3. Phosphatidylserine	513
4.3.2.4. Sphingolipids	515
4.3.2.5. Cholesterol	517
4.3.2.6. Phospholipid transfer proteins and phosphatidylinositol transport	518
5. Future directions	521
References	522

Chapter 18. Assembly of proteins into membranes

<i>Reinhart A.F. Reithmeier</i>	525
1. Organization of membrane proteins	525
1.1. Classification of membrane proteins	525
1.2. Membrane protein structure and energetics	528
1.3. Assembly of membrane proteins	530
2. Secretion of proteins and the signal hypothesis	532
2.1. The Palade secretion pathway	533
2.2. The Blobel signal hypothesis	533
2.3. In vitro translation and translocation systems	535
2.4. The Milstein experiment: secreted proteins are made with an amino terminal signal sequence	538
2.5. Signal sequences	540

3.	The targeting and translocation machinery	541
3.1.	The signal recognition particle	542
3.2.	The signal recognition particle receptor	543
3.3.	Translocation components	544
3.4.	Ribosome-binding proteins	545
3.5.	Signal peptidase	546
4.	Biosynthesis of type I simple membrane proteins	546
4.1.	IgM and the relationship between the biosynthesis of secreted proteins and simple membrane proteins	546
4.2.	Vesicular stomatitis virus glycoprotein and hemagglutinin	549
4.3.	Loop models and insertion into the lipid bilayer	551
4.4.	Evidence for a loop structure for insertion of signal sequences	553
5.	Biosynthesis of type II simple membrane proteins	554
5.1.	Ovalbumin, a secreted protein made without a cleaved signal sequence	556
5.2.	Asialoglycoprotein receptor	557
5.3.	Sucrase-isomaltase	557
6.	Biosynthesis of cytochrome P-450 and cytochrome b_5	558
6.1.	Cytochrome P-450	558
6.2.	Cytochrome b_5	559
7.	Biosynthesis of complex membrane proteins	559
7.1.	Artificial membrane proteins	559
7.2.	Band 3, the anion transport protein of the erythrocyte membrane	561
7.3.	Glucose carrier	561
7.4.	Rhodopsin	561
7.5.	Ca^{2+} ATPase and calsequestrin	562
8.	Glycosylation of proteins	562
8.1.	<i>N</i> -glycosylation	562
8.2.	Processing of the oligosaccharide chain	563
8.3.	<i>O</i> -glycosylation	566
9.	Attachment of lipid to proteins	566
9.1.	Fatty acylation	566
9.2.	Phosphatidylinositol anchors	567
10.	Protein folding and exit from the endoplasmic reticulum	567
10.1.	Protein folding	567
10.2.	Disulfide formation	568
10.3.	Assembly of multisubunit systems	569
10.4.	Exit from the endoplasmic reticulum	570
10.5.	KDEL, an endoplasmic reticulum retention signal	570
11.	Transport and targeting of proteins	571
11.1.	Vesicles move proteins between organelles	571
11.2.	Role of GTP-binding proteins	573
11.3.	Lysosomal targeting	575
11.4.	Protein sorting in epithelial cells	576
12.	Future directions	577
	References	577
