

Biologically Inspired Optimization Methods

An Introduction

M. Wahde

Chalmers University of Technology, Sweden

WITPRESS Southampton, Boston

Contents

Abbreviations	xi
Preface	xiii
Notation	xvii
Acknowledgements	xix
1 Introduction	
1.1 The importance of optimization	1
1.2 Inspiration from biological phenomena	2
1.3 Optimization of a simple behaviour for an autonomous robot	5
2 Classical optimization	
2.1 Introduction	9
2.1.1 Local and global optima	9
2.1.2 Objective functions	10
2.1.3 Constraints	11
2.2 Taxonomy of optimization problems	11
2.3 Continuous optimization	12
2.3.1 Properties of local optima	12
2.3.2 Global optima of convex functions	14
2.3.2.1 Convex sets and functions	14
2.3.2.2 Optima of convex functions	16
2.4 Algorithms for continuous optimization	16
2.4.1 Unconstrained optimization	17
2.4.1.1 Line search	17
2.4.1.2 Gradient descent	19
2.4.1.3 Newton's method	21
2.4.2 Constrained optimization	24
2.4.2.1 The method of Lagrange multipliers	25
2.4.2.2 An analytical method for optimization under inequality constraints	29
2.4.2.3 Penalty methods	30

2.5	Limitations of classical optimization	33
	Exercises	34
3	Evolutionary algorithms	
3.1	Biological background	35
3.2	Genetic algorithms	40
3.2.1	Components of genetic algorithms	46
3.2.1.1	Encoding schemes	46
3.2.1.2	Selection	48
3.2.1.3	Crossover	52
3.2.1.4	Mutation	53
3.2.1.5	Replacement	55
3.2.1.6	Elitism	55
3.2.1.7	A standard genetic algorithm	55
3.2.1.8	Parameter selection	56
3.2.2	Properties of genetic algorithms	59
3.2.2.1	The schema theorem	59
3.2.2.2	Exact models	60
3.2.2.3	Premature convergence	67
3.3	Linear genetic programming	72
3.3.1	Registers and instructions	73
3.3.2	LGP chromosomes	74
3.3.3	Evolutionary operators in LGP	75
3.4	Interactive evolutionary computation	78
3.5	Biological vs. artificial evolution	82
3.6	Applications	83
3.6.1	Optimization of truck braking systems	83
3.6.2	Determination of orbits of interacting galaxies	86
3.6.3	Prediction of cancer survival	92
	Exercises	96
4	Ant colony optimization	
4.1	Biological background	100
4.2	Ant algorithms	104
4.2.1	Ant system	105
4.2.2	Max–min ant system	109
4.3	Applications	111
4.3.1	Single-machine scheduling	112
4.3.2	Co-operative transport using autonomous robots	114
	Exercises	116
5	Particle swarm optimization	
5.1	Biological background	117
5.1.1	A model of swarming	118

5.2	Algorithm	120
5.3	Properties of PSO	124
5.3.1	Best-in-current-swarm vs. best-ever	125
5.3.2	Neighbourhood topologies	125
5.3.3	Maintaining coherence	126
5.3.4	Inertia weight	127
5.3.5	Craziness operator	128
5.4	Discrete versions	129
5.4.1	Variable truncation	129
5.4.2	Binary PSO	130
5.5	Applications	130
5.5.1	Optimization of neural networks	131
5.5.1.1	Prediction of pollutant levels	133
5.5.1.2	Prediction of elephant migration patterns	134
5.5.2	Optimization of cancer chemotherapy	136
	Exercises	137

6 Performance comparison

6.1	Unconstrained function optimization	140
6.2	Constrained function optimization	143
6.3	Optimization of feedforward neural networks	145
6.4	The travelling salesman problem	146

A Neural networks

A.1	Biological background	151
A.1.1	Neurons and synapses	151
A.1.2	Biological neural networks	152
A.1.3	Learning	153
A.1.3.1	Hebbian learning	154
A.1.3.2	Habituation and sensitization	154
A.2	Artificial neural networks	156
A.2.1	Artificial neurons	158
A.2.2	Feedforward neural networks and backpropagation	159
A.2.2.1	The Delta rule	159
A.2.2.2	Limitations of single-layer networks	161
A.2.2.3	Backpropagation	161
A.2.3	Recurrent neural networks	169
A.2.4	Other networks	171
A.3	Applications	172

B Analysis of optimization algorithms

B.1	Classical optimization	173
B.1.1	Global minima of convex functions	173
B.1.2	Properties of the gradient	174

B.2	Genetic algorithms	174
B.2.1	The schema theorem	174
B.2.2	The genetic algorithm as a Markov process	176
B.2.2.1	Number of populations of a given size	176
B.2.3	Infinite population models	177
B.2.3.1	Representing the crossover operator	177
B.2.3.2	Initial distribution of chromosomes	178
B.2.3.3	Elementary properties of binomial coefficients	178
B.2.3.4	The mutation operator for functions of unitation	179
B.2.3.5	Selection and mutations for the Onemax problem	180
B.2.4	Expected runtime of a simple GA	181
B.2.5	Estimating optimal mutation rates	182
B.3	Ant colony optimization	183
B.3.1	Pheromone limits in MMAS	183
B.3.2	Convergence proof	184
B.3.3	Runtime analysis for a simple ACO algorithm	184
B.4	Particle swarm optimization	188
B.4.1	Particle trajectories in PSO	188
C	Data analysis	
C.1	Hypothesis evaluation	193
C.2	Experiment design	200
D	Benchmark functions	
D.1	The Goldstein–Price function	206
D.2	The Rosenbrock function	206
D.3	The Sine square function	207
D.4	The Colville function	208
D.5	A multidimensional benchmark function	208
	Answers to selected exercises	209
	Bibliography	211
	Index	215
