Contents

<i>Preface</i>	vii
<i>Introduction</i>	1
1 Abbe's sine condition	9
2 Fourier optics	23
3 Effect of polarization on diffraction in systems of high numerical aperture	46
4 Gaussian beam optics	53
5 Coherent and incoherent imaging	63
6 First-order temporal coherence in classical optics	75
7 The van Cittert–Zernike theorem	89
8 Partial polarization, Stokes parameters, and the Poincaré sphere	101
9 What in the world are surface plasmons?	114
10 The Faraday effect	125
11 The magneto-optical Kerr effect	139
12 Fabry–Pérot etalons in polarized light	155
13 The Ewald–Oseen extinction theorem	168
14 Reciprocity in classical linear optics	183
15 Linear optical vortices	200
16 Geometric-optical rays, Poynting's vector, and the field momenta	212
17 Diffraction gratings	222
18 The Talbot effect	251
19 Some quirks of total internal reflection	263
20 Evanescent coupling	271
21 Internal and external conical refraction	288
22 The method of Fox and Li	303
23 The beam propagation method	315
24 Michelson's stellar interferometer	333
25 Bracewell's interferometric telescope	343

26	Scanning optical microscopy	353
27	Zernike's method of phase contrast	374
28	Polarization microscopy	383
29	Nomarski's differential interference contrast microscope	396
30	The van Leeuwenhoek microscope	406
31	Projection photolithography	416
32	The Ronchi test	429
33	The Shack–Hartmann wavefront sensor	440
34	Ellipsometry	448
35	Holography and holographic interferometry	458
36	Self-focusing in nonlinear optical media	471
37	Laser heating of multilayer stacks	482
	<i>Index</i>	495
