Climate change and human survival

The editorial by McCoy and colleagues (*BMJ* 2014;348:g2351, doi:10.1136/bmj.g2351) stated that “The release of just another 275 gigatonnes of carbon dioxide would probably commit us to a temperature rise of at least 2°C—an amount that could be emitted in less than eight years.” Instead the text should have read, “The release of just another 275 gigatonnes of carbon

would probably commit us to a temperature rise of at least 2°C—an amount that could be emitted in less than 25 years.”
