ELSEVIER

Amsterdam—Oxford—New York—Tokyo

PWN — POLISH SCIENTIFIC PUBLISHERS

Warszawa

1990

## Contents

- Chapter 1. Group-theoretical methods, 1
  - 1.1 Introduction, 1
  - 1.2 Group actions, 5
  - 1.3 The complete rational integrity basis of invariants, 10
  - 1.4 Crystallographic colour groups, 22
  - 1.5 Magnetic group corepresentations, 37
  - 1.6 The basis functions of tensor field representations, 58
  - 1.7 Superspace groups, 63
  - 1.8 Symmetry of modulated crystals, 67
  
- Chapter 2. Developments of Landau's theory, 72
  - 2.1 Introduction, 72
  - 2.2 Landau's theory and group actions, 82
  - 2.3 The inverse Landau problem in symmetry changes, 87
  - 2.4 Symmetry changes with the thermodynamic potential depending on the complete rational integrity basis, 90
  - 2.5 Phase transitions with two order parameters, 94
  - 2.6 Phase transitions to modulated structures, 112
  - 2.7 Space-dependent basis functions and space-independent expansion coefficients in modulated structure calculations, 120
  
- Chapter 3. Developments of Birman's theory, 128
  - 3.1 Introduction, 128
  - 3.2 Symmetry restoration, 134
  - 3.3 Physical applications of crystallographic colour groups, 136
  - 3.4 Hermann's space-group decomposition theorem and chain subduction criterion, 142
  - 3.5 Symmetry restrictions implied by group-subgroup relation, 153
  - 3.6 Symmetry changes in two-dimensional systems, 154

- Chapter 4. Improper ferroelectrics, 159
- 4.1 Introduction, 159
  - 4.2 The phase transition in gadolinium molybdate, 161
  - 4.3 Phase transitions in boracites, 167
  - 4.4 Improper ferroelectric nonferroelastic phase transitions, 172
  - 4.5 The susceptibility tensor, 176
- Chapter 5. Symmetry changes in ferroic crystals, 179
- 5.1 Introduction, 179
  - 5.2 Ferroic crystals, 182
  - 5.3 Purely ferroelastic phase transitions, 192
  - 5.4 Phase transitions of nonmagnetic ferroics, 197
  - 5.5 Nonferroic phase transitions, 199
- Chapter 6. Modulated structures, 204
- 6.1 Introduction, 204
  - 6.2 Examples of incommensurate crystal phases, 208
  - 6.3 The internal dimensions of a supercrystal, 212
  - 6.4 Bravais classes for incommensurate crystals, 217
  - 6.5 Superspace-group symmetry operations, 231
  - 6.6 Determination of superspace groups for modulated crystals, 236
  - 6.7 Space-group representations and superspace symmetry, 242
  - 6.8 Superspace symmetry without a supercrystal, 244
  - 6.9 The commensurate-to-incommensurate phase transition in a dysprosium crystal, 249
  - 6.10 The commensurate-to-incommensurate phase transition in a neodymium crystal, 277
- Chapter 7. Symmetry changes in metamagnets, 292
- 7.1 Introduction, 292
  - 7.2 Field-induced metamagnetic phase transitions, 297
  - 7.3 Phase transitions at the tricritical point in metamagnets, 306
  - 7.4 Symmetry changes at the tricritical point in metamagnets, 311
  - 7.5 Symmetry changes at the tricritical point of an  $\text{FeCl}_2$ -type crystal, 319
  - 7.6 Symmetry changes at the tricritical point of a metamagnet with  $P6_3/mmc(D_{6h}^4)$  space-group symmetry and an hcp lattice, 328
- Chapter 8. Symmetries of liquid crystals, 346
- 8.1 Introduction, 346

- 8.2 "Statistical" symmetry with applications to phase transitions, 348
- 8.3 Phase transitions from an isotropic liquid to liquid crystals, 360
- 8.4 Symmetry of ferroelectric liquid crystals, 361
- 8.5 The subgroups of the symmetry group of an *A*-type smectic with a symmetry centre, 366
- 8.6 The relation of critical X-ray scattering in liquid crystals to their symmetry, 376

Appendix, 388
