# Comparing the Zagreb Indices* 

Pierre Hansen ${ }^{\text {a }}$ and Damir Vukičevićb,**<br>${ }^{\mathrm{a}}$ GERAD and Department of Management Sciences, HEC Montréal 3000, Chemin de la Côte-Sainte-Catherine, Montréal (Québec) Canada, H3T $2 A 7$<br>${ }^{\mathrm{b}}$ Department of Mathematics, University of Split, Nikole Tesle 12, HR-21000 Split, Croatia

RECEIVED SEPTEMBER 21, 2006; REVISED FEBRUARY 12, 2007; ACCEPTED FEBRUARY 14, 2007

Let $\mathrm{G}=(\mathrm{V}, \mathrm{E})$ be a simple graph with $n=|\mathrm{V}|$ vertices and $m=|\mathrm{E}|$ edges; let $d_{1}, d_{2}, \ldots, d_{n}$ denote the degrees of the vertices of G. If $\Delta=\max d_{i} \leq 4$, G is a chemical graph. The first and second Zagreb indices are defined as

Keywords extremal graphs

Zagreb index
AGX chemical graphs

$$
M_{1}=\sum_{i \in \mathrm{~V}} d_{i}^{2} \text { and } M_{2}=\sum_{i, j \in \mathrm{E}} d_{i} d_{j} .
$$

We show that for all chemical graphs $M_{1} / n \leq M_{2} / m$. This does not hold for all general graphs, connected or not.

## INTRODUCTION

We follow the graph theoretical terminology of Berge, ${ }^{1}$ to which we refer for undefined terms. Let $G=(V, E)$ denote a simple graph with $n=|\mathrm{V}|$ vertices and $m=|\mathrm{E}|$ edges. Let $d_{1}, d_{2}, \ldots, d_{n}$ denote the degrees of the vertices of G. If $\Delta=\max d_{i} \leq 4$, G is called a chemical graph. The first and second Zagreb indices were defined 35 years ago ${ }^{2}$ as:

$$
M_{1}=\sum_{i \in \mathrm{~V}} d_{i}^{2} \text { and } M_{2}=\sum_{i, j \in \mathrm{E}} d_{i} d_{j}
$$

They were among the first topological indices ${ }^{3-6}$ to be proposed and were often applied, as explained in a recent paper called »The Zagreb Indices 30 Years Later«.7 That paper and a couple of further surveys ${ }^{8,9}$ spurred research on mathematical properties of the Zagreb indi-
ces. ${ }^{10-18}$ A natural issue is to compare the values of the Zagreb indices on the same graph. Observe that, for general graphs, the order of magnitude of $M_{1}$ is $\mathrm{O}\left(n^{3}\right)$ ( $n$ vertices and degrees in $\mathrm{O}(n)$, squared) while the order of magnitude of $M_{1}$ is $\mathrm{O}\left(n^{4}\right)\left(m=\mathrm{O}\left(n^{2}\right)\right.$ edges and degrees in $\mathrm{O}(n)$, squared). This suggests comparing $M_{1} / n$ with $M_{2} / m$ instead of $M_{1}$ and $M_{2}$.

Use of the AutoGraphiX system ${ }^{19-21}$ led to the following:

Conjecture 1. - For all simple connected graphs G:

$$
\begin{equation*}
M_{1} / n \leq M_{2} / m \tag{1}
\end{equation*}
$$ and the bound is tight for complete graphs.

As will be shown below, this conjecture turned out to be false for general graphs but true for chemical graphs.

[^0]
## MAIN RESULT

We now state a result slightly more general than the Conjecture and valid for chemical graphs.

Theorem 1. - For all chemical graphs $G$ with order $n$, size $m$, first and second Zagreb indices $M_{1}$ and $M_{2}$ :
$M_{1} / n \leq M_{2} / m$.
Moreover, the bound is tight if and only if all edges $(i, j)$ have the same pair $\left(d_{i}, d_{j}\right)$ of degrees or if the graph is composed of disjoint stars $\mathrm{S}_{5}$ and cycles $\mathrm{C}_{p}, \mathrm{C}_{q}, \ldots$ of any length.

Proof: Let G be a chemical graph, i.e., $\Delta(\mathrm{G}) \leq 4$. Denote by $m_{i j}$ the number of edges that connect vertices of degrees $i$ and $j$ and by $n_{i}$ the number of vertices of degree $i$ in G. On the one hand, we have:

$$
\begin{aligned}
& \frac{M_{1}(\mathrm{G})}{n}=\frac{\sum_{v \in \mathrm{~V}(\mathrm{G})} d(v)^{2}}{\sum_{i \in N} n_{i}}=\frac{\sum_{i \in N} n_{i} \cdot i^{2}}{m_{i \in N}+\sum_{j \in N} m_{i j}}= \\
& \frac{\sum_{i \in N}\left(\frac{m_{i}+\sum_{j \in N} m_{i j}}{i} \cdot i^{2}\right)}{\sum_{i \leq j} m_{i j} \cdot\left(\frac{1}{i}+\frac{1}{j}\right)}=\frac{\sum_{i \in N}\left(\left(m_{i i}+\sum_{j \in N} m_{i j}\right) \cdot i\right)}{\sum_{i \leq j} m_{i j} \cdot\left(\frac{1}{i}+\frac{1}{j}\right)}= \\
& \frac{\sum_{i \leq j} m_{i j} \cdot(i+j)}{\sum_{i \leq j} m_{i j} \cdot\left(\frac{1}{i}+\frac{1}{j}\right)}
\end{aligned}
$$

On the other hand, we have:

$$
\begin{equation*}
\frac{M_{2}(\mathrm{G})}{m}=\frac{\sum_{(u, v) \in \mathrm{E}(\mathrm{G})} d(u) \cdot d(v)}{m}=\frac{\sum_{i \leq j \in N} m_{i j} \cdot i \cdot j}{\sum_{i \leq j \in N} m_{i j}} \tag{3}
\end{equation*}
$$

Putting (2) and (3) into (1), we get:

$$
\frac{\sum_{i \leq j} m_{i j} \cdot(i+j)}{\sum_{i \leq j} m_{i j} \cdot\left(\frac{1}{i}+\frac{1}{j}\right)} \leq \frac{\sum_{i \leq j \in N} m_{i j} \cdot i \cdot j}{\sum_{i \leq j \in N} m_{i j}}
$$

or equivalently:

$$
\frac{\sum_{i \leq j} m_{i j} \cdot(i+j)}{\sum_{k \leq l} m_{k l} \cdot\left(\frac{1}{l}+\frac{1}{k}\right)} \leq \frac{\sum_{i \leq j \in N} m_{i j} \cdot i \cdot j}{\sum_{k \leq l \in N} m_{k l}}
$$

Hence:

$$
\begin{aligned}
& {\left[\sum_{i \leq j \in N} m_{i j} \cdot i \cdot j\right]\left[\sum_{k \leq l} m_{k l} \cdot\left(\frac{1}{l}+\frac{1}{k}\right)\right]-} \\
& {\left[\sum_{i \leq j} m_{i j} \cdot(i+j)\right]\left[\sum_{k \leq l \in N} m_{k l}\right] \geq 0}
\end{aligned}
$$

and

$$
\sum_{\substack{i \leq j \\ k \leq l \\ i, j, k, l \in N}}\left[\left(i \cdot j \cdot\left(\frac{1}{k}+\frac{1}{l}\right)-i-j\right) \cdot m_{i j} \cdot m_{k l}\right] \geq 0
$$

Now, collecting in the same summand the cases where roles of $(i, j)$ and $(k, l)$ are reversed, one gets relation (4).

$$
\sum_{\substack{i \leq j \\ k \leq l \\(i, j),(k, l) \in N^{2}}}\left[\left(i \cdot j \cdot\left(\frac{1}{k}+\frac{1}{l}\right)+k \cdot l \cdot\left(\frac{1}{i}+\frac{1}{j}\right)-i-j-k-l\right) \cdot m_{i j} \cdot m_{k l}\right] \geq 0
$$

and

$$
\begin{equation*}
\sum_{\substack{i \leq j \\ k \leq l \\(i, j),(k, l) \in N^{2}}}\left[\left(i^{2} j^{2} l+i^{2} j^{2} k+k^{2} l^{2} j+k^{2} l^{2} i-i^{2} j k l-i j^{2} k l-i j k^{2} l-i j k l^{2}\right) \cdot \frac{m_{i j} \cdot m_{k l}}{i \cdot j \cdot k \cdot l}\right] \geq 0 \tag{4}
\end{equation*}
$$

TABLE I. Value of function $g(i, i, k, l)$

|  |  | $i, j$ |  |  |  |  |  |  |  |  |  |
| :---: | :---: | ---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\{1,1\}$ | $\{1,2\}$ | $\{1,3\}$ | $\{1,4\}$ | $\{2,2\}$ | $\{2,3\}$ | $\{2,4\}$ | $\{3,3\}$ | $\{3,4\}$ | $\{4,4\}$ |  |
|  | $\{1,1\}$ | 0 | 1 | 4 | 9 | 12 | 35 | 70 | 96 | 187 | 360 |
|  | $\{1,2\}$ | 1 | 0 | 1 | 4 | 8 | 32 | 72 | 105 | 220 | 448 |
|  | $\{1,3\}$ | 4 | 1 | 0 | 1 | 4 | 27 | 70 | 108 | 243 | 520 |
|  | $\{1,4\}$ | 9 | 4 | 1 | 0 | 0 | 20 | 64 | 105 | 256 | 576 |
|  | $\{2,2\}$ | 12 | 8 | 4 | 0 | 0 | 8 | 32 | 60 | 160 | 384 |
|  | $\{2,3\}$ | 35 | 32 | 27 | 20 | 8 | 0 | 8 | 27 | 108 | 320 |
|  | $\{2,4\}$ | 70 | 72 | 70 | 64 | 32 | 8 | 0 | 6 | 64 | 256 |
|  | $\{3,3\}$ | 96 | 105 | 108 | 105 | 60 | 27 | 6 | 0 | 27 | 168 |
| $\{3,4\}$ | 187 | 220 | 243 | 256 | 160 | 108 | 64 | 27 | 0 | 64 |  |
| $\{4,4\}$ | 360 | 448 | 520 | 576 | 384 | 320 | 256 | 168 | 64 | 0 |  |

It remains to prove relation (4). It is sufficient to show that:

$$
\begin{gathered}
g(i, j, k, l)=i^{2} j^{2} l+i^{2} j^{2} k+k^{2} l^{2} j+k^{2} l^{2} i-i^{2} j k l- \\
i j^{2} k l-i j k^{2} l-i j k l^{2} \geq 0
\end{gathered}
$$

for each $(i, j),(k, l) \subseteq\{1,2,3,4\}^{2}$. The values of $g(i, j, k, l)$ are given in Table I.

One can see that all entries are non-negative, which proves the claim.

To show when relation (4) is satisfied as an equality, consider again function $g(i, j, k, l)$ and its values as given in Table I. To have equality in (1), one must have $g(i, j, k, l)=0$ for all $m_{i j} \cdot m_{k l}>0$. This can only happen if there is a single pair of degrees for all edges, or if either $i=k=1, j=l=4$ or $i=j=k=l=2$ for all edges. This last case corresponds to a set of disjoint stars $\mathrm{S}_{5}$ and cycles $\mathrm{C}_{p}, \mathrm{C}_{q}, \ldots$ of any length.

To finish, we show that (1) does not hold for general graphs. If G is not connected the condition $\Delta \leq 4$ cannot be relaxed. Indeed, let us observe graph $G_{1}$ presented in Figure 1.

We have:

$$
\begin{gathered}
\frac{M_{1}\left(\mathrm{G}_{1}\right)}{n}=\frac{5 \cdot 1^{2}+1 \cdot 5^{2}+3 \cdot 2^{2}}{9}=\frac{42}{9}=\frac{14}{3}=4.66 \ldots \\
\frac{M_{2}\left(\mathrm{G}_{1}\right)}{m}=\frac{5 \cdot(5 \cdot 1)+3 \cdot(2 \cdot 2)}{8}=\frac{37}{8}=4.625 .
\end{gathered}
$$

Obviously, the relation (1) does not hold.
Finding a connected counterexample is a bit more difficult.

Figure 1. A non-connected counterexample to Conjecture 1.

Let $\mathrm{G}_{1}^{\prime}$ be the disjoint union of $\mathrm{K}\left(\mathrm{U}_{1}, \mathrm{~V}_{1}\right), \ldots$, $K\left(U_{4}, V_{4}\right)$ where each $K(X, Y)$ is a complete bipartite graph with classes $X$ and $Y$. Let $\left|\mathrm{U}_{1}\right|=\left|\mathrm{U}_{2}\right|=3,\left|\mathrm{~V}_{1}\right|=$ $\left|\mathrm{V}_{2}\right|=10$ and $\left|\mathrm{U}_{3}\right|=\left|\mathrm{U}_{4}\right|=\left|\mathrm{V}_{3}\right|=\left|\mathrm{V}_{4}\right|=5$.

Obviously, we have $n_{3}\left(\mathrm{G}_{1}^{\prime}\right)=20, n_{10}\left(\mathrm{G}_{1}^{\prime}\right)=6$ and $n_{5}\left(\mathrm{G}_{1}^{\prime}\right)=20$. Also, $m_{3,10}\left(\mathrm{G}_{1}^{\prime}\right)=60$ and $m_{5,5}\left(\mathrm{G}_{1}^{\prime}\right)=50$.

Let $u_{i}, u_{i}^{\prime} \in \mathrm{U}_{i}$ and $v_{i}, v_{i}^{\prime} \in \mathrm{V}_{i}$ be arbitrary (pairwise different) but fixed vertices. Let $\mathrm{G}_{2}^{\prime}$ be the graph defined by:

$$
\begin{gathered}
\mathrm{G}_{2}^{\prime}=\mathrm{G}_{1}^{\prime}-\left\{u_{1} v_{1}, u_{2}^{\prime} v_{2}^{\prime}, u_{2} v_{2}, u_{3}^{\prime} v_{3}^{\prime}, u_{3} v_{3}, u_{4} v_{4}\right\} \cup \\
\left\{u_{1} v_{2}^{\prime}, u_{2}^{\prime} v_{1}, u_{2} v_{3}^{\prime}, u_{3}^{\prime} v_{2}, u_{3}^{\prime} v_{4}, u_{4} v_{3}^{\prime}\right\}
\end{gathered}
$$

which is illustrated in Figure 2 (dashed lines are deleted and solid lines are added).

Figure 2. A connected counterexample to Conjecture 1.

Obviously, no vertex has changed its degree. Note that $m_{3,10}\left(\mathrm{G}_{2}^{\prime}\right)=m_{3,10}\left(\mathrm{G}_{1}^{\prime}\right)-3+2=59 ; m_{5,5}\left(\mathrm{G}_{2}^{\prime}\right)=$ $m_{5,5}\left(\mathrm{G}_{2}^{\prime}\right)-3+2=49, m_{5,10}\left(\mathrm{G}_{2}^{\prime}\right)=1$ and $m_{3,5}\left(\mathrm{G}_{2}^{\prime}\right)=1$.

We have:

$$
\begin{aligned}
& \frac{M_{1}\left(\mathrm{G}_{2}^{\prime}\right)}{n}=\frac{20 \cdot 5^{2}+6 \cdot 10^{2}+20 \cdot 3^{2}}{20+6+20}=\frac{1280}{46} \approx 27.826 \\
& \frac{M_{2}\left(\mathrm{G}_{2}^{\prime}\right)}{m}=\frac{59 \cdot(3 \cdot 10)+49 \cdot(5 \cdot 5)+1 \cdot(3 \cdot 5)+1 \cdot(5 \cdot 10)}{59+49+1+1}= \\
& \quad \frac{1770+1225+15+50}{110}=\frac{3060}{110} \approx 27.818 .
\end{aligned}
$$

## CONCLUSION

The Zagreb indices $M_{1}$ and $M_{2}$, divided by order $n$ and size $m$, respectively, have been compared. The AutoGraphiX system conjectured that $M_{1} / n \leq M_{2} / m$ for simple connected graphs. A counterexample with 48 vertices (and beyond the range of AutoGraphiX) shows that this is not so. However, we have proven that this relation holds for chemical graphs, which are the most interesting ones in practice.

## SAŽETAK

## Usporedba zagrebačkih indeksa

## Pierre Hansen i Damir Vukičević

Neka je $\mathrm{G}=(\mathrm{V}, \mathrm{E})$ jednostavan graf $\mathrm{s} n=|\mathrm{V}|$ vrhova i $m=|\mathrm{E}|$ bridova; neka $d_{1}, d_{2}, \ldots, d_{n}$ označavaju stupnjeve vrhova u G. Ako je $\Delta=\max d_{i} \leq 4$, tada G nazivamo kemijskim grafom. Prvi i drugi zagrebački indeks definirani su formulama:

$$
M_{1}=\sum_{i \in \mathrm{~V}} d_{i}^{2} \quad \mathrm{i} \quad M_{2}=\sum_{i, j \in \mathrm{E}} d_{i} d_{j} .
$$

U radu je dokazano da je $M_{1} / n \leq M_{2} / m$ za sve kemijske grafove, te da se ova tvrdnja ne može poopćiti na sve grafove, kako povezane tako i nepovezane.
