#### Abstract

A\) set $D$ of a graph $G=(V, E)$ is a dominating set, if every vertex in $V(G)-D$ is adjacent to some vertex in $D$. The domination number $\gamma(G)$ of $G$ is the minimum cardinality of a dominating set. A dominating set $D$ is called a complementary tree nil dominating set, if the induced subgraph $<V(G)-D>$ is a tree and also the set $V(G)-D$ is not a dominating set. The minimum cardinality of a complementary tree nil dominating set is called the complementary tree nil domination number of $G$ and is denoted by $\gamma_{\mathrm{ctnd}}(\mathrm{G})$. In this paper, complementary tree domination numbers of Cartesian product of some standard graphs are found.

Key words: Domination number, Complementary tree nil domination number, Cartesian product.

## 1. Introduction

Graphs discussed in this paper are finite, undirected and simple connected graphs. For a graph $G$, let $V(G)$ and $E(G)$ denote its vertex set and edge set respectively. A graph $G$ with $p$ vertices and $q$ edges is denoted by $G(p, q)$. The concept of domination in graphs was introduced by Ore[5]. A set $\mathrm{D} \subseteq \mathrm{V}(\mathrm{G})$ is said to be a dominating set of G , if every vertex in $\mathrm{V}(\mathrm{G})$ - Dis adjacent to some vertex in D . The cardinality of a minimum dominating set in G is called the domination number of G and is denoted by $\gamma(\mathrm{G})$. Muthammai, Bhanumathi and Vidhya[5] introduced the concept of complementary tree dominating set. A dominating set $\mathrm{D} \subseteq \mathrm{V}(\mathrm{G})$ is said to be a complementary tree dominating set (ctd-set), if the induced subgraph $<\mathrm{V}(\mathrm{G})-\mathrm{D}>$ is a tree. The minimum cardinality of a ctd-set is called the complementary tree domination number of G and is denoted by $\gamma_{\text {ctd }}(G)$. Any undefined terms in this paper may be found in Harary[2].
The cartesian product of two graphs $G_{1}$ and $G_{2}$ is the graph, denoted by $G_{1} \times G_{2}$ with $V\left(G_{1}\right.$ $\left.\times G_{2}\right)=V\left(G_{1}\right) \times V\left(G_{2}\right)$ (where $x$ denotes the cartesian product of sets) and two vertices $u$ $=\left(u_{1}, u_{2}\right)$ and $v=\left(v_{1}, v_{2}\right)$ in $V\left(G_{1} \times G_{2}\right)$ are adjacent in $G_{1} \times G_{2}$ whenever $\left[u_{1}=v_{1}\right.$ and $\left(u_{2}\right.$, $\left.\left.\mathrm{v}_{2}\right) \in \mathrm{E}\left(\mathrm{G}_{2}\right)\right]$ or $\left[\mathrm{u}_{2}=\mathrm{v}_{2}\right.$ and $\left.\left(\mathrm{u}_{1}, \mathrm{v}_{1}\right) \in \mathrm{E}\left(\mathrm{G}_{1}\right)\right]$. The corona $\mathrm{G}_{1} \odot \mathrm{G}_{2}$ of two graphs $\mathrm{G}_{1}$ and $\mathrm{G}_{2}$ are defined as the graph $G$ obtained by taking one copy of $G_{1}$ of order $p_{1}$ and $p_{1}$ copies of $G_{2}$ and then joining the $\mathrm{i}^{\text {th }}$ vertex of $\mathrm{G}_{1}$ to every vertex in the $\mathrm{i}^{\text {th }}$ copy of $\mathrm{G}_{2}$. The Corona $\mathrm{G}_{1} \odot \mathrm{G}_{2}$ has $\mathrm{p}_{1}\left(1+\mathrm{p}_{2}\right)$ vertices and $\mathrm{q}_{1}+\mathrm{p}_{1} \mathrm{q}_{2}+\mathrm{p}_{1} \mathrm{p}_{2}$ edges. The concept of complementary tree nil dominating set is introduced in [4]. A dominating set $\mathrm{D} \subseteq \mathrm{V}(\mathrm{G})$ is said to be a
complementary tree nil dominating set (ctnd-set), if the induced subgraph $<\mathrm{V}(\mathrm{G})-\mathrm{D}>$ is a tree and the set $\mathrm{V}(\mathrm{G})$ - D is not a dominating set. The minimum cardinality of a ctnd-set is called the complementary tree nil domination number of G and is denoted by $\gamma_{\text {ctnd }}(\mathrm{G})$

In this paper, we find an upper bound for complementary tree nil domination number of Cartesian product of $P_{m} \times P_{n}$ and this number found for $K_{m} \times K_{n}, K_{m} \times P_{n}$, $K_{m} \times C_{n}$ and $C_{m} \times P_{n}$.

## 2. Main Results

Theorem 2.1:
If $G \cong K_{m} \times K_{n}(m, n \geq 3 \operatorname{andm} \leq n)$, then $\gamma_{c t n d}(G)=\left\{\begin{array}{l}m(n-2)+3, \text { if } m=n \\ m(n-2)+2, \text { if } m<n\end{array}\right.$
Proof:
Let $\mathrm{G} \xlongequal[=]{\approx} \mathrm{K}_{\mathrm{m}} \times \mathrm{K}_{\mathrm{n}}$.
Let $V(G)=\bigcup_{\mathrm{i}=1}^{\mathrm{m}}\left\{\mathrm{v}_{\mathrm{i} 1}, \mathrm{~V}_{\mathrm{i} 2}, \ldots, \mathrm{v}_{\mathrm{in}}\right\}$ such that $<\left\{\mathrm{V}_{\mathrm{i} 1}, \mathrm{~V}_{\mathrm{i} 2}, \ldots, \mathrm{v}_{\mathrm{in}}\right\}>\cong \mathrm{K}_{\mathrm{n}}^{\mathrm{i}}$, $i=1,2, \ldots, m$ and $<\left\{v_{1 j}, v_{2 j}, \ldots, v_{m j}\right\}>\cong K_{m}^{j}, j=1,2, \ldots, n$, where $K_{n}^{i}$ is the $i^{\text {th }}$ copy of $K_{n}$ and $K_{m}^{j}$ is the $j^{\text {th }}$ copy of $K_{m}$ in $K_{m} x K_{n} .|V(G)|=m n$.
Case 1: $\mathrm{m}=\mathrm{n}$.
Let $\mathrm{D}^{\prime}=\left(\mathrm{U}_{\mathrm{i}=2}^{\mathrm{m}-1}\left\{\mathrm{~V}_{\mathrm{ii}}, \mathrm{V}_{\mathrm{i}, \mathrm{i}+1}\right\}\right) \cup\left\{\mathrm{v}_{\mathrm{m}, \mathrm{m}}\right\}$ and $\mathrm{D}=\mathrm{V}(\mathrm{G})-\mathrm{D}^{\prime}$. Then $\mathrm{V}(\mathrm{G})-\mathrm{D}=$ $\mathrm{D}^{\prime}$ and $\left|\mathrm{D}^{\prime}\right|=2(\mathrm{~m}-2)+1=2 \mathrm{~m}-3$. The vertices $\mathrm{V}_{\mathrm{i}}, \mathrm{V}_{\mathrm{i}, \mathrm{i}+1}$ in $\mathrm{V}(\mathrm{G})-\mathrm{D}$ are adjacent to $\mathrm{v}_{\mathrm{i} 1} \mathrm{inD}, \mathrm{i}=2,3, \ldots, \mathrm{~m}-1$ and the vertex $\mathrm{v}_{\mathrm{mm}}$ is adjacent to $\mathrm{v}_{\mathrm{m} 1}$ in D . Therefore D is a dominating set of G . Also $<\mathrm{V}(\mathrm{G})-\mathrm{D}>\cong \mathrm{P}_{2(\mathrm{~m}-2)+1}=\mathrm{P}_{2 \mathrm{~m}-3}$. Therefore D is a ctd-set of G and since $N\left(v_{11}\right) \subseteq D, D$ is a ctnd-set of $G$. Therefore $\gamma_{\text {ctnd }}(G) \subseteq|D|=|V(G)|-\left|D^{\prime}\right|=$ $m n-(2 m-3)=m(n-2)+3$.

It is to be noted that, any tree in G is a path and $\delta(\mathrm{G})=\mathrm{m}$. Let $\mathrm{D}^{\prime}$ be a $\gamma_{\text {ctnd }}{ }^{-}$ set of $G$. Then there exists a vertex $u \in D^{\prime}$ such that $N(u) \subseteq D^{\prime}$. The longest path that can be obtained from the subgraph of $G$ induced by the vertices of $V(G)-N(u)$ is $P_{2 m-3}$. Therefore $<V(G)-D^{\prime}>\cong P_{2 m-3}$.

Therefore $D^{\prime}$ contains atleast $m n-(2 m-3)=m(n-2)+3$ vertices. Therefore $\gamma_{\text {ctnd }}(G)=\left|D^{\prime}\right| \geq m(n-2)+3$.

Hence $\gamma_{c t n d}(G)=m(n-2)+3$.
Case 2: $\mathrm{m}<\mathrm{n}$.
Let $\mathrm{D}^{\prime}=\bigcup_{\mathrm{i}=2}^{\mathrm{m}}\left\{\mathrm{V}_{\mathrm{ii}}, \mathrm{V}_{\mathrm{i}, \mathrm{i}+1}\right\}$ and $\mathrm{D}=\mathrm{V}(\mathrm{G})-\mathrm{D}^{\prime}$. Then $\mathrm{V}(\mathrm{G})-\mathrm{D}=\mathrm{D}^{\prime}$ and $\left|D^{\prime}\right|=2(m-1)$. The vertices $V_{i i}, V_{i, i+1}(i=2,3, \ldots, m)$ are adjacent to $\mathrm{v}_{\mathrm{i} 1},(\mathrm{i}=2,3, \ldots$, $m)$ in $D$. Therefore $D$ is a dominating set of $G$. Also $<V(G)-D>\cong P_{2(m-2)}=P_{2 m-2}$ Therefore D is a ctd-set of G and since $\mathrm{N}\left(\mathrm{v}_{11}\right) \subseteq \mathrm{D}, \mathrm{D}$ is a ctnd-set of G .

Therefore $\gamma_{c t n d}(G) \leq|V(G)|-\left|D^{\prime}\right|=m n-(2 m-2)=m(n-2)+2$.

As in case 1 , any tree in $G$ is a path and $\delta(G)=m$. Let $D^{\prime}$ be $\gamma_{c t n d}$-set of $G$. Then there exists a vertex $u \in D^{\prime}$ such that $N(u) \subseteq D^{\prime}$. The longest path that can be obtained from the subgraph of $G$ induced by the vertices of $V(G)-N(u)$ is $P_{2 m-2}$.

Therefore $\left.<\mathrm{V}(\mathrm{G})-\mathrm{D}^{\prime}\right\rangle \xlongequal{\cong} \mathrm{P}_{2 \mathrm{~m}-2}$. Therefore $\mathrm{D}^{\prime}$ contains atleast $\mathrm{mn}-(2 \mathrm{~m}-2)=$ $m(n-2)+2$ vertices. Therefore $\gamma_{c t n d}(G)=\left|D^{\prime}\right| \geq m(n-2)+2$.

Therefore $\gamma_{c t n d}(G)=m(n-2)+2$.
Hence $\gamma_{\text {ctnd }}(G)=\left\{\begin{array}{l}m(n-2)+3, \text { if } m=n \\ m(n-2)+2 \text {, if } m<n\end{array}\right.$

## Example 2.1:

For the graph G given in Figure 1.a and Figure 1.b, the set of vertices within the $\bigcirc$ is a minimum ctnd-set of $K_{m} \times K_{n}$ and $\gamma_{c t n d}\left(K_{4} \times K_{4}\right)=11$ and $\gamma_{c t n d}\left(K_{4} \times K_{5}\right)=14$.

Figure 1.a

Figure 1.b

Theorem 2.2:
If $G \cong K_{m} \times P_{n}(4 \leq m \leq n)$, then $\gamma_{\text {ctnd }}(G)=n(m-2)+2$.

## Proof:

$$
\text { Let } \mathrm{G} \cong \mathrm{~K}_{\mathrm{m}} \times \mathrm{P}_{\mathrm{n}} .
$$

Let $\mathrm{V}(\mathrm{G})=\mathrm{U}_{\mathrm{i}=1}^{\mathrm{m}}\left\{\mathrm{v}_{\mathrm{i} 1}, \mathrm{~V}_{\mathrm{i} 2}, \ldots, \mathrm{v}_{\mathrm{in}}\right\}$ such that $<\left\{\mathrm{v}_{\mathrm{i} 1}, \mathrm{~V}_{\mathrm{i} 2}, \ldots, \mathrm{v}_{\mathrm{in}}\right\}>\cong \mathrm{K}_{\mathrm{n}}^{\mathrm{i}}$, $\mathrm{i}=1,2, \ldots, \mathrm{~m}$ and $<\left\{\mathrm{v}_{1 \mathrm{j}}, \mathrm{v}_{2 \mathrm{j}}, \ldots, \mathrm{v}_{\mathrm{mj}}\right\}>\cong \mathrm{P}_{\mathrm{m}}^{\mathrm{j}}, \mathrm{j}=1,2, \ldots, \mathrm{n}$, where $\mathrm{K}_{\mathrm{n}}^{\mathrm{i}}$ is the $\mathrm{i}^{\text {th }}$ copy of $K_{n}$ and $K_{m}^{j}$ is the $j^{\text {th }}$ copy of $P_{m}$ in $K_{m} \times P_{n}$.

Let $D^{\prime}=\left\{\begin{array}{l}{\left[\bigcup_{i=2}^{n}\left\{v_{2 i}\right\}\right] \cup\left[\bigcup_{i=1}^{\frac{n-1}{2}}\left\{v_{3,2 i}, v_{1,2 i+1}\right\}\right] \text {, if } n \text { is odd }} \\ {\left[\bigcup_{i=2}^{n}\left\{v_{2 i}\right\}\right] \cup\left[U_{i=1}^{\frac{n}{2}}\left\{v_{1,2 i-1}, v_{3,2 i}\right\}\right], \text { if } n \text { is even }}\end{array}\right.$
Then $\left|D^{\prime}\right|=2(n-1)$. If $D=V(G)-D^{\prime}$, then $D$ is a dominating set of $G$ and $\mathrm{N}\left(\mathrm{v}_{11}\right) \subseteq \mathrm{D}$. Also $\langle\mathrm{V}(\mathrm{G})-\mathrm{D}\rangle=\left\langle\mathrm{D}^{\prime}\right\rangle \cong \mathrm{P}_{\mathrm{n}-1}{ }^{\circ} \mathrm{K}_{1}$. Therefore D is a ctnd-set of G .
$\gamma_{\text {ctnd }}(\mathrm{G}) \leq|\mathrm{D}|=\mathrm{mn}-2(\mathrm{n}-1)=\mathrm{mn}-2 \mathrm{n}+2=\mathrm{n}(\mathrm{m}-2)+2$.
Hence $\gamma_{\text {ctnd }}(G) \leq n(m-2)+2$.
Let $D^{\prime}$ be a $\gamma_{\text {ctnd }}$-set of $G$. Since $D^{\prime}$ is a ctd-set of $G, D^{\prime}$ contains atleast ( $m-2$ ) vertices in each of $(n-1) K_{m}$ 's and since, $V(G)-D^{\prime}$ is not a dominating set, $D^{\prime}$ contains
all the vertices of the remaining $K_{m}$. Hence $D^{\prime}$ contains atleast $(m-2)(n-1)+m=m n-$ $m-2 n+2+m=n(m-2)+2$ vertices. Therefore $\gamma_{c t n d}(G)=\left|D^{\prime}\right| \geq n(m-2)+3$.

Hence $\gamma_{\text {ctnd }}\left(K_{m} \times P_{n}\right)=n(m-2)+2$.

## Example 2.2:

For the graph $G$ given in Figure 2, the set of vertices within the $\bigcirc$ is a minimum ctnd-set of $K_{m} \times K_{n}$ and $\gamma_{c t n d}\left(K_{4} \times K_{9}\right)=20$.

Figure 2

## Remark 2.1:

In view of Theorem 2.2,
$\gamma_{\text {ctnd }}\left(K_{m} \times C_{n}\right)=n(m-2)+3$.
Theorem 2.3:
If $G \cong P_{m} \times P_{n}(m, n \geq 2)$, then $\gamma_{c t n d}(G) \leq \gamma_{c t d}(G)+2$.

## Proof:

Let $G \xlongequal{\cong} \mathrm{P}_{\mathrm{m}} \times \mathrm{P}_{\mathrm{n}}$. Then $\delta(\mathrm{G})=2$.
Let D be a $\gamma_{\mathrm{ctd}}$ - set of G . Let $\mathrm{u} \in \mathrm{D}$ be a vertex of minimum degree in G and $\operatorname{deg}(\mathrm{u})=\boldsymbol{\delta}(\mathrm{G})$. Then $\mathrm{D}^{\prime}=\mathrm{DUN}(\mathrm{u})$ is a ctnd - set of G , since $\mathrm{N}(\mathrm{u}) \subseteq \mathrm{D}^{\prime}$. Therefore
$\gamma_{\text {ctnd }}(\mathrm{G}) \leq\left|\mathrm{D}^{\prime}\right|=|\mathrm{D}|+|\mathrm{N}(\mathrm{u})|=\gamma_{\mathrm{ctd}}(\mathrm{G})+\delta(\mathrm{G})=\gamma_{\mathrm{ctd}}(\mathrm{G})+2$.
Hence $\gamma_{\text {ctnd }}(G) \leq \gamma_{\text {ctd }}(G)+2$.
Equality holds, if $G \cong \mathrm{P}_{2} \times \mathrm{P}_{\mathrm{n}, \mathrm{n}} \geq 3$.

## Theorem 2.4:

If $G \cong C_{3} \times P_{n}$, then $\gamma_{\text {ctnd }}(G)=n+2, n \geq 3$.

## Proof:

Let $G \cong C_{3} \times P_{n}$

$$
\text { Let } V(G)=\bigcup_{i=1}^{n}\left\{v_{1 i}, v_{2 i}, v_{3 i}\right\} \text { such that }<\left\{v_{i 1}, v_{i 2}, \ldots, v_{i n}\right\}>\cong P_{n}^{i}, i=1,2,3
$$

and $<\left\{\mathrm{v}_{1 \mathrm{j}}, \mathrm{v}_{2 \mathrm{j}}, \mathrm{v}_{3 \mathrm{j}}\right\}>\cong \mathrm{C}_{3}^{\mathrm{j}}, \mathrm{j}=1,2, \ldots, \mathrm{n}$, where $P_{n}^{i}$ is the $\mathrm{i}^{\text {th }}$ copy of $P_{n}$ and $C_{3}^{j}$ is the $\mathrm{j}^{\text {th }}$ copy of $\mathrm{C}_{3}$ in $\mathrm{C}_{3} \times \mathrm{P}_{\mathrm{n}}$.

Let $D= \begin{cases}\left\{v_{11}, v_{21}\right\} \cup\left[U_{i=1}^{\frac{n}{2}}\left\{v_{2,2 i,}, v_{3,2 i-1}\right\}\right], & \text { if } n \text { is even } \\ \left\{v_{11}, v_{21}, v_{31}\right\} \cup\left[U_{i=1}^{\frac{n-1}{2}}\left\{v_{2,2 i}, v_{3,2 i+1}\right\}\right], & \text { if } n \text { is odd. }\end{cases}$
Then D is a dominating set of G and $\mathrm{N}\left(\mathrm{v}_{11}\right) \subseteq \mathrm{D}$. Also $<\mathrm{V}(\mathrm{G})-\mathrm{D}>\cong \mathrm{P}_{\mathrm{n}}{ }^{\circ} \mathrm{K}_{1}$. Therefore D is a ctnd-set of G.
$\gamma_{\text {ctnd }}(\mathrm{G}) \leq|\mathrm{D}|=\left\{\begin{array}{l}2\left(\frac{\mathrm{n}}{2}\right)+2=\mathrm{n}+2, \text { if } \mathrm{n} \text { is even } \\ 2\left(\frac{\mathrm{n}-1}{2}\right)+3=\mathrm{n}+2, \text { if } \mathrm{n} \text { is odd. }\end{array}\right.$
Let $\mathrm{D}^{\prime}$ be a $\gamma_{\text {ctnd }}{ }^{-s e t}$ of G . Then $\mathrm{D}^{\prime}$ contains atleast one vertex from each cycle. Since $C_{3} \times P_{n}$ contains $n$ copies of $C_{3}, D^{\prime}$ contains atleast $n$ vertices. Also, since $V(G)-D^{\prime}$ is not a dominating set, the remaining vertices of first cycle $C_{3}$ in $C_{3} \times P_{n}$ must be included in $\mathrm{D}^{\prime}$.
Therefore $D^{\prime}$ contains atleast $n+2$ vertices and $\gamma_{\text {ctnd }}(G)=\left|D^{\prime}\right| \geq n+2$.
Hence $\gamma_{\text {ctnd }}\left(C_{3} \times P_{n}\right)=n+2, n \geq 3$.

## Theorem 2.5:

$$
\text { If } \mathrm{G} \cong \mathrm{C}_{4} \times \mathrm{P}_{\mathrm{n}} \text {, then } \gamma_{\text {ctnd }}(\mathrm{G})=\left\lfloor\frac{3 \mathrm{n}+4}{2}\right\rfloor, \mathrm{n} \geq 2
$$

## Proof:

Let $G \cong C_{4} \quad x \quad P_{n}$ and $V(G)=\bigcup_{i=1}^{n}\left\{v_{1 i}, V_{2 i}, V_{3 i}, V_{4 i}\right\}$ such that $<\left\{\mathrm{v}_{\mathrm{i} 1}, \mathrm{v}_{\mathrm{i} 2}, \ldots, \mathrm{v}_{\mathrm{in}}\right\}>\cong \mathrm{P}_{\mathrm{n}, \mathrm{i}}^{\mathrm{i}}=1,2,3,4$ and $<\left\{\mathrm{v}_{1 \mathrm{j}}, \mathrm{v}_{2 \mathrm{j}}, \mathrm{v}_{3 \mathrm{j}}, \mathrm{v}_{4 \mathrm{j}}\right\}>\cong \mathrm{C}_{4}^{\mathrm{j}}, \mathrm{j}=1,2, \ldots, \mathrm{n}$, where $P_{n}^{i}$ is the $i^{\text {th }}$ copy of $P_{n}$ and $C_{4}^{j}$ is the $j^{\text {th }}$ copy of $C_{4}$ in $C_{4} \times P_{n}$ and $|V(G)|=4 n$.
Case 1: n is even.
Let $D^{\prime}=\left\{v_{31}, v_{3 n}\right\} \cup\left[\bigcup_{i=1}^{\frac{n-2}{2}}\left\{v_{1,2 i+1}, v_{4,2 i+1}, v_{3,2 i}\right\}\right] \cup\left[\bigcup_{i=2}^{n}\left\{v_{2 i}\right\}\right]$ and $\mathrm{D}=\mathrm{V}(\mathrm{G})-\mathrm{D}^{\prime}$. Then $\left|\mathrm{D}^{\prime}\right|=2+3\left(\frac{\mathrm{n}-2}{2}\right)+\mathrm{n}-1=\frac{5 \mathrm{n}-4}{2}$. Then D is a dominating set of G and $\mathrm{N}\left(\mathrm{v}_{11}\right) \subseteq \mathrm{D}$. Also $\left.<\mathrm{V}(\mathrm{G})-\mathrm{D}\right\rangle=\left\langle\mathrm{D}^{\prime}\right\rangle$ is a tree obtained from a path $\mathrm{P}_{\mathrm{n}-1}=$ $<\left\{\mathrm{v}_{2, \mathrm{i}}, \mathrm{i}=2,3, \ldots, \mathrm{n}\right\}>,(\mathrm{n} \geq 2)$ by attaching $\mathrm{P}_{3}$ at each of the vertices $\mathrm{v}_{22}, \mathrm{v}_{23}, \mathrm{v}_{25}, \ldots, \mathrm{v}_{2, \mathrm{n}-1}$ and attaching a pendant edge at each of the vertices $\mathrm{V}_{24}, \mathrm{~V}_{26} \ldots, \mathrm{v}_{2, \mathrm{n}}$. Therefore D is a ctnd-set of G .
$\gamma_{\text {ctnd }}(\mathrm{G}) \leq|\mathrm{D}|=\left|\mathrm{V}(\mathrm{G})-\mathrm{D}^{\prime}\right|=4 \mathrm{n}-\left(\frac{5 \mathrm{n}-4}{2}\right)=\frac{3 \mathrm{n}+4}{2}$.
Hence $\gamma_{\text {ctnd }}(G) \leq \frac{3 n+4}{2}$.
Let $D^{\prime}$ be a $\gamma_{\text {ctnd }}$-set of $G$. Since $<V(G)-D^{\prime}>$ is not a dominating set, $D^{\prime}$ contains a vertex u such that $\mathrm{N}(\mathrm{u}) \subseteq \mathrm{D} . \mathrm{u}$ is taken to be a vertex of minimum degree $\delta(\mathrm{G})=3$ in G . The blocks A, B, C are constructed as given below.

Figure 3
$G$ is obtained by concatenating the blocks $A, B^{\frac{n-2}{2}}$ andC. That is, $G \cong A B^{\frac{n-2}{2}} C$. The vertices with the symbol $\bigcirc$ in each of the blocks represent the vertices that are to be included in $D^{\prime}$.

Therefore $\mathrm{D}^{\prime}$ contains 3 vertices from block A and atleast 3 vertices from each block $B$ of $B^{\frac{n-2}{2}}$ and 2 vertices from block C.Therefore $\gamma_{c t n d}(G)=\left|D^{\prime}\right| \geq 3+3\left(\frac{n-2}{2}\right)+$ $2=\frac{3 n+4}{2}$.
and hence $\gamma_{\text {ctnd }}(G)=\frac{3 n+4}{2}$.
Case 2: n is odd.
Let $D^{\prime}=\left\{\mathrm{v}_{31}\right\} \cup\left[\bigcup_{\mathrm{i}=1}^{\frac{\mathrm{n}-2}{2}}\left\{\mathrm{v}_{1,2 \mathrm{i}+1}, \mathrm{v}_{4,2 \mathrm{i}+1}, \mathrm{v}_{3,2 \mathrm{i}}\right\}\right] \cup\left[\mathrm{U}_{\mathrm{i}=2}^{\mathrm{n}}\left\{\mathrm{v}_{2 \mathrm{i}}\right\}\right]$.
Then $\left|D^{\prime}\right|=1+3\left(\frac{\mathrm{n}-1}{2}\right)+\mathrm{n}-1=\frac{5 \mathrm{n}-3}{2}$ and $\mathrm{D}=\mathrm{V}(\mathrm{G})-\mathrm{D}^{\prime}$. Then D is a dominating set of G and $\mathrm{N}\left(\mathrm{v}_{11}\right) \subseteq \mathrm{D}$. Also $\langle\mathrm{V}(\mathrm{G})-\mathrm{D}\rangle=\left\langle\mathrm{D}^{\prime}\right\rangle$ is a tree obtained from a path $P_{n-1}=<\left\{v_{2, i .} i=2,3, \ldots, n\right\}>,(n \geq 2)$ by attaching $P_{3}$ at each of the vertices $\mathrm{V}_{22}, \mathrm{~V}_{23}, \mathrm{~V}_{25}, \ldots, \mathrm{~V}_{2, \mathrm{n}}$ and attaching a pendant edge at each of the vertices $\mathrm{V}_{24}, \mathrm{~V}_{26} \ldots, \mathrm{v}_{2, \mathrm{n}-1}$. Therefore D is a ctnd-set of G .
$\gamma_{\text {ctnd }}(\mathrm{G}) \leq|\mathrm{D}|=\left|\mathrm{V}(\mathrm{G})-\mathrm{D}^{\prime}\right|=4 \mathrm{n}-\left(\frac{5 \mathrm{n}-3}{2}\right)=\frac{3 \mathrm{n}+3}{2}$.
Hence $\gamma_{\text {ctnd }}(G) \leq \frac{3 n+3}{2}=\left\lfloor\frac{3 n+4}{2}\right\rfloor$.
Let $D^{\prime}$ be a $\gamma_{c t n d}$-set of $G$. Since $<V(G)-D^{\prime}>$ is not a dominating set, $D^{\prime}$ contains a vertex $u$ such that $\mathrm{N}(\mathrm{u}) \subseteq \mathrm{D} . \mathrm{u}$ is taken to be a vertex of minimum degree $\delta(\mathrm{G})=3$ in G. The blocks A, B are constructed as in case 1 .
$G$ is obtained by concatenating the blocks $A$ and $B^{\frac{n-1}{2}}$ as in case 1 . That is, $G \cong A B^{\frac{n-1}{2}}$. The vertices with the symbol $O$ in each of the blocks represent the vertices that are to be included in $\mathrm{D}^{\prime}$.

Therefore $\mathrm{D}^{\prime}$ contains 3 vertices from block A and atleast 3 vertices from each block $B$ of $B^{\frac{n-1}{2}}$.

Therefore $\gamma_{c t n d}(G)=\left|D^{\prime}\right| \geq 3+3\left(\frac{n-1}{2}\right)=\frac{3 n+3}{2}=\left\lfloor\frac{3 n+4}{2}\right\rfloor$.
Hence $\gamma_{c t n d}\left(C_{4} \times P_{n}\right)=\left\lfloor\frac{3 n+4}{2}\right\rfloor, n \geq 2$.

## Theorem 2.6:

$$
\text { If } G \cong C_{5} \times P_{n} \text {, then } \gamma_{\text {ctnd }}(G)=2 n+1, n \geq 3
$$

## Proof:

Let $G \cong C_{5} \times P_{n}$ and $V(G)=\bigcup_{i=1}^{n}\left\{V_{1 i}, V_{2 i}, V_{3 i}, V_{4 i}, V_{5 i}\right\}$ such that $<\left\{\mathrm{V}_{\mathrm{i} 1}, \mathrm{v}_{\mathrm{i} 2}, \ldots, \mathrm{v}_{\mathrm{in}}\right\}>\cong \mathrm{P}_{\mathrm{n}}^{\mathrm{i}}, \quad \mathrm{i}=1,2,3,4,5$ and $<\left\{\mathrm{v}_{1 \mathrm{j}}, \mathrm{v}_{2 \mathrm{j}}, \mathrm{v}_{3 \mathrm{j}}, \mathrm{v}_{4 \mathrm{j}}, \mathrm{v}_{5 \mathrm{j}}\right\}>\cong \mathrm{C}_{5}^{\mathrm{j}}$, $j=1,2, \ldots, n$, where $P_{n}^{i}$ is the $i^{\text {th }}$ copy of $P_{n}$ and $C_{5}^{j}$ is the $j^{\text {th }}$ copy of $C_{5}$ in $C_{5} \times P_{n}$. $|\mathrm{V}(\mathrm{G})|=5 \mathrm{n}$.
Case 1: n is odd
Let $D=\left\{\mathrm{V}_{21}, \mathrm{~V}_{12}, \mathrm{~V}_{32}\right\} \cup\left[\mathrm{U}_{\mathrm{i}=1}^{\frac{\mathrm{n}+1}{2}}\left\{\mathrm{v}_{1,2 \mathrm{i}-1}, \mathrm{~V}_{5,2 \mathrm{i}-1}\right\}\right] \cup\left[\mathrm{U}_{\mathrm{i}=2}^{\frac{\mathrm{n}-1}{2}}\left\{\mathrm{v}_{3,2 \mathrm{i},} \mathrm{V}_{4,2 \mathrm{i}}\right\}\right]$.
Then $|D|=3+2\left(\frac{n+1}{2}\right)+2\left(\frac{n-3}{2}\right)=2 n+1$.
Consider the blocks

Then $G \cong A B^{\frac{n-3}{2}} C$. Let $D$ be the set of vertices with the symbol $\bigcirc$ in each of the blocks A, $B^{\frac{n-3}{2}}$ and C. D contains 5 vertices from block $A$, and 4 vertices from each block $B$ of $B^{\frac{n-3}{2}}$ and 2 vertices from block $C$. Then $D$ is a dominating set of $G$ and the vertex $v_{11}$ is such that $\mathrm{N}\left(\mathrm{v}_{11}\right) \subseteq \mathrm{D}$ and $<\mathrm{V}(\mathrm{G})-\mathrm{D}>\xlongequal{\cong} \mathrm{T}$, where T is a tree constructed as below.

Let H be the graph obtained by subdividing each of the pendant edges of $\mathrm{P}_{\mathrm{n}-2}^{+}$exactly once and T be the tree obtained from H by attaching a pendant edge at one pendant vertex say $v$ of $P_{n-2}$ and then joining a vertex of degree 2 of $P_{4}$ by an edge to a pendant vertex at a distance 2 from $v$.

Therefore D is a ctnd-set of G.
$\gamma_{\text {ctnd }}(\mathrm{G}) \leq\left|\mathrm{D}^{\prime}\right|=2 \mathrm{n}+1$.
Let $D^{\prime}$ be a $\gamma_{\text {ctnd }}$-set of $G$. Since $\gamma^{\prime}\left(C_{5}\right)=2, D^{\prime}$ contains 2 vertices from each of n cycles and $\mathrm{D}^{\prime}$ contains one more vertex from a cycle $\mathrm{C}_{5}$ and hence $\mathrm{D}^{\prime}$ contains atleast $2 \mathrm{n}+1$ vertices. Therefore $\gamma_{\text {ctnd }}(G)=\left|D^{\prime}\right| \geq 2 n+1$.

Hence $\gamma_{\text {ctnd }}(G)=2 n+1, n \geq 2$
Case 2: n is even
Let $D=\left\{\mathrm{v}_{11}, \mathrm{~V}_{12}, \mathrm{~V}_{21}, \mathrm{v}_{32}, \mathrm{v}_{51}\right\} \cup\left[\mathrm{U}_{\mathrm{i}=2}^{\frac{\mathrm{n}}{2}}\left\{\mathrm{v}_{1,2 \mathrm{i}-1}, \mathrm{~V}_{3,2 \mathrm{i},} \mathrm{V}_{4,2 \mathrm{i},} \mathrm{v}_{5,2 \mathrm{i}-1}\right\}\right]$. Then $|\mathrm{D}|=5+4\left(\frac{\mathrm{n}-2}{2}\right)=2 \mathrm{n}+1$.
$G$ is obtained by concatenating the blocks $A, B^{\frac{n-2}{2}}$. That is $G \cong A B^{\frac{n-2}{2}}$. Let $D$ be the set of vertices with the symbol $\bigcirc$ in each of the blocks $A$ and $B^{\frac{n-2}{2}}$. D contains 5 vertices from block $A$, and 4 vertices from each block $B$ of $B^{\frac{n-2}{2}}$. Then $D$ is a dominating set of G and the vertex $\mathrm{v}_{11}$ is such that $\mathrm{N}\left(\mathrm{v}_{11}\right) \subseteq \mathrm{D}$ and $\langle\mathrm{V}(\mathrm{G})-\mathrm{D}\rangle \cong \mathrm{T}$, where T is a tree constructed as in case 1 .

Therefore D is a ctnd-set of G and $\gamma_{\mathrm{ctnd}}(\mathrm{G}) \leq|\mathrm{D}|=2 \mathrm{n}+1$.
Let $D^{\prime}$ be a $\gamma_{\text {ctnd }}$-set of $G$. Since $\gamma\left(C_{5}\right)=2, D^{\prime}$ contains 2 vertices from each of $n$ cycles and since $V(G)-D$ is not a dominating set of $G, D^{\prime}$ contains one more vertex from a cycle $C_{5}$ and hence $D^{\prime}$ contains atleast $2 n+1$ vertices. Therefore $\gamma_{\text {ctnd }}(G)=\left|D^{\prime}\right| \geq$ $2 n+1$.

$$
\text { Hence } \gamma_{\text {ctnd }}(G)=2 \mathrm{n}+1, \mathrm{n} \geq 2 .
$$

## Theorem 2.7:

If $G \cong \mathrm{C}_{5} \times \mathrm{P}_{2}$, then $\gamma_{\text {ctnd }}(\mathrm{G})=5$.

## Proof:

Let $G \cong C_{5} \times P_{2}$ and $V(G)=\bigcup_{i=1}^{n}\left\{v_{1 i}, V_{2 i}, V_{3 i}, V_{4 i}, V_{5 i}\right\}$ such that $<\left\{\mathrm{V}_{\mathrm{i} 1}, \mathrm{v}_{\mathrm{i} 2}\right\}>\cong \mathrm{P}_{\mathrm{n}}^{\mathrm{i}}, \mathrm{i}=1,2,3,4,5$ and $<\left\{\mathrm{v}_{1 \mathrm{j}}, \mathrm{V}_{2 \mathrm{j}}, \mathrm{v}_{3 \mathrm{j}}, \mathrm{v}_{4 \mathrm{j}}, \mathrm{V}_{5 \mathrm{j}}\right\}>\cong \mathrm{C}_{5}^{\mathrm{j}}, \mathrm{j}=1,2$, where $P_{n}^{i}$ is the $i^{\text {th }}$ copy of $P_{n}$ and $C_{5}^{j}$ is the $j^{\text {th }}$ copy of $C_{5}$ in $C_{5} \times P_{2}$.

Let $\mathrm{D}=\left\{\mathrm{V}_{11}, \mathrm{~V}_{21}, \mathrm{~V}_{31}, \mathrm{v}_{41}, \mathrm{~V}_{12}\right\}$. Then $\mathrm{N}\left(\mathrm{V}_{11}\right) \subseteq \mathrm{D}$ and D is a dominating set of $G$ Also $V(G)-D=\left\{V_{31}, V_{22}, V_{33}, V_{44}, V_{52}\right\}$ and $<V(G)-D>$ is a graph obtained from $P_{3}$ by attaching 2 pendant edges at a pendant vertex of $P_{3}$. Therefore $D$ is a ctnd-set of $G$.
$\gamma_{\text {ctnd }}(\mathrm{G}) \leq|\mathrm{D}|=5$.
Let $\mathrm{D}^{\prime}$ be a $\gamma_{\text {ctnd }}$-set of $\mathrm{G} . \mathrm{D}^{\prime}$ contains 4 vertices from $\mathrm{C}_{5}^{1}$ and atleast one vertex from $C_{5}^{2}$.
Therefore $D^{\prime}$ contains atleast 5 vertices. $\gamma_{\text {ctnd }}(G)=\left|D^{\prime}\right| \geq 5$.
Hence $\gamma_{\text {ctnd }}(G)=5$.

## Theorem 2.8:

$$
\text { If } \mathrm{G} \cong \mathrm{C}_{6} \times \mathrm{P}_{\mathrm{n}} \text {, then } \gamma_{\text {ctnd }}(\mathrm{G})=\left\lceil\frac{5 \mathrm{n}+1}{2}\right\rceil, \mathrm{n} \geq 3
$$

## Proof:

Let $G \cong C_{6} \times P_{n}$ and $V(G)=\bigcup_{i=1}^{n}\left\{v_{1 i}, v_{2 i}, v_{3 i}, v_{4 i}, v_{5 i}, v_{6 i}\right\}$ such that $<\left\{\mathrm{v}_{\mathrm{i} 1}, \mathrm{v}_{\mathrm{i} 2}, \ldots, \mathrm{v}_{\mathrm{in}}\right\}>\cong \mathrm{P}_{\mathrm{n}}^{\mathrm{i}}, \mathrm{i}=1,2,3,4,5,6$ and $<\left\{\mathrm{v}_{1 \mathrm{j}}, \mathrm{v}_{2 \mathrm{j}}, \mathrm{V}_{3 \mathrm{j}}, \mathrm{v}_{4 \mathrm{j}}, \mathrm{V}_{5 \mathrm{j}}, \mathrm{v}_{6 \mathrm{j}}\right\}>\cong \mathrm{C}_{6}^{\mathrm{j}}$, $j=1,2, \ldots, n$, where $P_{n}^{i}$ is the $i^{\text {th }}$ copy of $P_{n}$ and $C_{6}^{j}$ is the $j^{\text {th }}$ copy of $C_{6}$ in $C_{6} \times P_{n}$ and $|V(G)|$ $=6 \mathrm{n}$.
Case 1: n is odd.

$$
\begin{aligned}
& \operatorname{Let} D^{\prime}=\left\{v_{31}, v_{41}, V_{51}, v_{32}, v_{62}\right\} \cup\left[U_{i=1}^{\frac{n-1}{2}}\left\{v_{1,2 i+1}, v_{5,2 i+1}, v_{6,2 i+1}\right\}\right] \cup\left[U_{i=2}^{n}\left\{v_{2 i}\right\}\right] U \\
& {\left[U_{i=2}^{\frac{n-1}{2}}\left\{v_{3,2 i}, v_{4,2 i}\right\}\right] .} \\
& \quad \text { Then }\left|D^{\prime}\right|=5+3\left(\frac{n-1}{2}\right)+n-1+2\left(\frac{n-3}{2}\right)=\frac{7 n-1}{2} \text { and } D=V(G)-D^{\prime} . \text { Then }
\end{aligned}
$$ D is a dominating set of G and $\mathrm{N}\left(\mathrm{v}_{11}\right) \subseteq \mathrm{D}$. Also $\langle\mathrm{V}(\mathrm{G})-\mathrm{D}\rangle=\left\langle\mathrm{D}^{\prime}\right\rangle$ is a tree obtained from a path $P_{n-1}=<\left\{v_{2, i}, i=2,3, \ldots, n\right\}>,(n \geq 2)$ by attaching $P_{4}$ at each of the vertices $V_{23}, V_{25}, V_{27}, \ldots, V_{2, n}$ and attaching $P_{3}$ at each of the vertices $v_{24}, v_{26} \ldots, v_{2, n-1}$. Therefore $D$ is a ctnd-set of $G$.

$\gamma_{\text {ctnd }}(\mathrm{G}) \leq|\mathrm{D}|=\left|\mathrm{V}(\mathrm{G})-\mathrm{D}^{\prime}\right|=6 \mathrm{n}-\left(\frac{7 \mathrm{n}-1}{2}\right)=\frac{5 \mathrm{n}+1}{2}$.
Hence $\gamma_{\text {ctnd }}(G) \leq \frac{5 n+1}{2}$.
Let $\mathrm{D}^{\prime}$ be a $\gamma_{\text {ctnd }}$-set of $G$. Since $<V(G)-D^{\prime}>$ is not a dominating set.Therefore $\mathrm{D}^{\prime}$ contains a vertex of u such that $\mathrm{N}(\mathrm{u}) \subseteq \mathrm{D} . \mathrm{u}$ is taken to be a vertex of minimum degree $\delta(\mathrm{G})=3$ in G . The blocks A, B, C are constructed as given below.

Figure 5
$G$ is obtained by concatenating the blocks $A, B^{\frac{n-3}{2}}$ and $C$. That is, $G \cong A B^{\frac{n-3}{2}}$ C. The vertices with the symbol $\bigcirc$ in each of the blocks represent the vertices that are to be included in $\mathrm{D}^{\prime}$. Therefore $\mathrm{D}^{\prime}$ contains 6 vertices from block $A$ and atleast 5 vertices from each block $B$ of $B^{\frac{n-3}{2}}$ and 2 vertices from block $C$. Therefore $\gamma_{c t n d}(G)=\left|D^{\prime}\right| \geq 6+$ $5\left(\frac{\mathrm{n}-3}{2}\right)+2=\frac{5 \mathrm{n}+1}{2}$ and hence $\gamma_{\text {ctnd }}(G)=\frac{5 \mathrm{n}+1}{2}$.
Case 2: $n$ is even.

$$
\text { Let } D^{\prime}=\left\{\mathrm{V}_{31}, \mathrm{v}_{41}, \mathrm{~V}_{51}, \mathrm{v}_{32}, \mathrm{~V}_{62}\right\} \cup\left[\mathrm{U}_{\mathrm{i}=1}^{\frac{\mathrm{n}-2}{2}}\left\{\mathrm{v}_{1,2 \mathrm{i}+1}, \mathrm{v}_{5,2 \mathrm{i}+1}, \mathrm{v}_{6,2 \mathrm{i}+1}\right\}\right] \mathrm{U}
$$

$\left[U_{i=2}^{n}\left\{v_{2 i},\right\}\right] \cup\left[U_{i=2}^{\frac{n}{2}}\left\{v_{3,2 i}, v_{4,2 i}\right\}\right]$.
Then $\left|D^{\prime}\right|=5+3\left(\frac{n-2}{2}\right)+n-1+2\left(\frac{n-2}{2}\right)=\frac{7 n-2}{2}$ and $D=V(G)-D^{\prime}$. Then $D$ is a dominating set of G and $\mathrm{N}\left(\mathrm{v}_{11}\right) \subseteq \mathrm{D}$. Also $\langle\mathrm{V}(\mathrm{G})-\mathrm{D}\rangle=\left\langle\mathrm{D}^{\prime}\right\rangle$ is a tree obtained from a path $P_{n-1}=\left\langle\left\{v_{2, i,} i=2,3, \ldots, n\right\}\right\rangle,(n \geq 2)$ by attaching $P_{4}$ at each of the vertices $\mathrm{V}_{23}, \mathrm{~V}_{25}, \mathrm{~V}_{27}, \ldots, \mathrm{v}_{2, \mathrm{n}-1}$ and attaching $\mathrm{P}_{3}$ at each of the vertices $\mathrm{v}_{24}, \mathrm{~V}_{26} \ldots, \mathrm{v}_{2, \mathrm{n}}$. Therefore D is a ctnd-set of G .
$\gamma_{\text {ctnd }}(\mathrm{G}) \leq|\mathrm{D}|=\left|\mathrm{V}(\mathrm{G})-\mathrm{D}^{\prime}\right|=6 \mathrm{n}-\left(\frac{7 \mathrm{n}-2}{2}\right)=\frac{5 \mathrm{n}+2}{2}$.
Hence $\gamma_{\text {ctnd }}(G) \leq \frac{5 n+2}{2}$.
Let $D^{\prime}$ be a $\gamma_{c t n d}$-set of $G$. Since $<V(G)-D^{\prime}>$ is not a dominating set, $D^{\prime}$ contains a vertex of u such that $\mathrm{N}(\mathrm{u}) \subseteq \mathrm{D} . \mathrm{u}$ is taken to be a vertex of minimum degree $\delta(\mathrm{G})=3$ in G . The blocks A, B are constructed as in case 1 .
$G$ is obtained by concatenating the blocks $A$ and $B^{\frac{n-2}{2}}$. That is, $G \cong A B^{\frac{n-2}{2}}$. The vertices with the symbol $\bigcirc$ in each of the blocks represent the vertices that are to be included in $\mathrm{D}^{\prime}$.

Therefore $D^{\prime}$ contains 6 vertices from block $A$ and atleast 5 vertices from each block $B$ of $B^{\frac{n-2}{2}}$. Therefore $\gamma_{c t n d}(G)=\left|D^{\prime}\right| \geq 6+5\left(\frac{n-2}{2}\right)=\frac{5 n+2}{2}$ and hence $\gamma_{\mathrm{ctnd}}(\mathrm{G})=\frac{5 \mathrm{n}+2}{2}=\left\lceil\frac{5 n+1}{2}\right\rceil$.

$$
\text { Hence } \gamma_{\text {ctnd }}\left(C_{6} x P_{n}\right)=\left\lceil\frac{5 n+1}{2}\right\rceil, n \geq 2
$$

## Theorem 2.9:

If $G \cong C_{6} \times P_{2}$, then $\gamma_{\text {ctnd }}(G)=5$.

## Proof:

$G \cong C_{6} \quad x \quad P_{n}$ and $V(G)=\bigcup_{i=1}^{n}\left\{v_{1 i}, V_{2 i}, V_{3 i}, V_{4 i}, V_{5 i}, V_{6 i}\right\}$ such that $<\left\{v_{i 1}, v_{i 2}, \ldots, v_{i n}\right\}>\cong P_{n}^{i}, i=1,2,3,4,5,6$ and $<\left\{v_{1 j}, v_{2 j}, v_{3 j}, v_{4 j}, v_{5 j}, v_{6 j}\right\}>\cong C_{6}^{j}$, $j=1,2$, where $P_{n}^{i}$ is the $i^{\text {th }}$ copy of $P_{n}$ and $C_{6}^{j}$ is the $j{ }^{\text {th }}$ copy of $C_{6}$ in $C_{6} \times P_{2}$.

Let $\mathrm{D}=\left\{\mathrm{v}_{11}, \mathrm{v}_{21}, \mathrm{v}_{61}, \mathrm{v}_{12}, \mathrm{v}_{42},\right\}$. Then $\mathrm{N}\left(\mathrm{v}_{11}\right) \subseteq \mathrm{D}$ and D is a dominating set of G. Also $V(G)-D=\left\{V_{31}, v_{41}, V_{51}, V_{22}, V_{32}, V_{44}, V_{52}, v_{62}\right\}$ and $<V(G)-D>\cong P_{7}$. Therefore D is a ctnd-set of G. $\gamma_{\text {ctnd }}(G) \leq|D|=5$.

Let $D^{\prime}$ be a $\gamma_{\text {ctnd }}$-set of $G$. $D^{\prime}$ contains 3 vertices from $C_{6}^{1}$ and atleast 2 vertices from $\mathrm{C}_{6}^{2}$.
Therefore $D^{\prime}$ contains atleast 5 vertices. Therefore $\gamma_{\text {ctnd }}(G)=\left|D^{\prime}\right| \geq 5$.

$$
\text { Hence } \gamma_{\text {ctnd }}(G)=5
$$

## Remark 2.2:

In view of Theorem 2.4,Theorem 2.5, Theorem 2.6, and Theorem 2.8,

1. $\gamma_{\text {ctnd }}\left(C_{3} \times C_{n}\right)=n+3, n \geq 3$.
2. $\gamma_{\text {ctnd }}\left(C_{4} \times C_{n}\right)=\left\lceil\frac{3 n+6}{2}\right\rceil, n \geq 3$.
3. $\gamma_{\text {ctnd }}\left(C_{5} \times C_{n}\right)=2 n+3, n \geq 3$.
4. $\gamma_{c t n d}\left(C_{6} \times C_{n}\right)=3 n, n \geq 3$.

## Remark 2.3:

1. If $\mathrm{G}_{1} \cong \mathrm{~K}_{\mathrm{m}}$ and $\mathrm{G}_{2} \cong \mathrm{~K}_{\mathrm{n}}$, then $\gamma_{\text {ctnd }}\left(\mathrm{G}_{1}+\mathrm{G}_{2}\right)=\mathrm{m}+\mathrm{n}$.
2. If $\mathrm{G}_{1}$ and $\mathrm{G}_{2}$ are any two non-complete connected graphs of order m and n respectively, with minimum degree atleast two, then $\gamma_{c t n d}\left(G_{1}+G_{2}\right) \leq m+n-1$. Equality holds, if $\mathrm{G}_{1} \xlongequal{\cong} \mathrm{~K}_{\mathrm{m}}-\mathrm{e}, \mathrm{G}_{2} \cong \mathrm{~K}_{\mathrm{n}}-\mathrm{e}$.
3. For any two connected graphs $\mathrm{G}_{1}$ and $\mathrm{G}_{2}$ of order m and n respectively, $\gamma_{\text {ctnd }}\left(\mathrm{G}_{1}{ }^{a} \mathrm{G}_{2}\right) \leq \mathrm{m}+\mathrm{n}-1$. Equality holds, if $\mathrm{G}_{1} \cong \mathrm{P}_{2}$ and $\mathrm{G}_{2} \cong \mathrm{nK}_{1}$.
4. For any two nontrivial connected graphs $G_{1}$ and $G_{2}$ with the of order $m$ and $n$ respectively, $\gamma_{\mathrm{ctnd}}\left(\mathrm{G}_{1}{ }^{a} \mathrm{G}_{2}\right) \leq \mathrm{m}+\mathrm{n}-2$. Equality holds, if $\mathrm{G}_{1} \cong \mathrm{P}_{2}$ and $\mathrm{G}_{2} \cong \mathrm{C}_{3}$.

## Authors' Profile:

S. Muthammai received the M.Sc. and M.Phil degree in Mathematics from Madurai Kamaraj University, Madurai in 1982 and 1983 respectively and received the Ph.D. degree in Mathematics from Bharathidasan University, Tiruchirappalli in 2006. From $16^{\text {th }}$ September 1985 to $12^{\text {th }}$ October 2016, she has been with the Government Arts College for Women (Autonomous), Pudukkottai, Tamilnadu and she is currently the Principal(Retd.) for Alagappa Government Arts College, Karaikudi, Tamilnadu. Her main area of research is domination in Graph Theory.

Ananthavalli .G was born in Aranthangi, India, in 1976. She received the B.Sc. degree in Mathematics from Madurai Kamaraj University, Madurai, India, in 1996, the M.Sc. degree in Applied Mathematics from Bharathidasan University, Tiruchirappalli, India, in 2000, the M.Phil. degree in Mathematics from Madurai Kamaraj University, Madurai, India, in 2002, the B.Ed, degree from IGNOU, New Delhi, India, in 2007 and the M.Ed. degree from PRIST University, Thanjavur, India, in 2010. She was cleared SET in 2016. She has nearly 12 years of teaching experience in various schools and colleges. She is pursuing research in the department of Mathematics at Government Arts College for Women (Autonomous), Pudukkottai, India. Her main area of research is domination in Graph Theory.
