Publishing**

# Contents

Authors of Guest Boxes, xi  
Preface, xiii  
List of Symbols, xvi

## **PART I: INTRODUCTION**

### **1 Introduction, 3**

- 1.1 Genetics and conservation, 4
- 1.2 What should we conserve?, 5
- 1.3 How should we conserve biodiversity?, 10
- 1.4 Applications of genetics to conservation, 11
- Guest Box 1 by L. S. Mills and M. E. Soulé: The role of genetics in conservation, 13

### **2 Phenotypic Variation in Natural Populations, 15**

- 2.1 Color pattern, 18
- 2.2 Morphology, 20
- 2.3 Behavior, 23
- 2.4 Differences among populations, 26
- Guest Box 2 by C. J. Foote: Looks can be deceiving: countergradient variation in secondary sexual color in sympatric morphs of sockeye salmon, 29

### **3 Genetic Variation in Natural Populations: Chromosomes and Proteins, 33**

- 3.1 Chromosomes, 35
- 3.2 Protein electrophoresis, 47
- 3.3 Genetic variation within natural populations, 51
- 3.4 Genetic divergence among populations, 52
- 3.5 Strengths and limitations of protein electrophoresis, 54
- Guest Box 3 by A. Young and B. G. Murray: Management implications of polyploidy in a cytologically complex self-incompatible herb, 55

**4 Genetic Variation in Natural Populations: DNA, 63**

- 4.1 Mitochondrial and chloroplast DNA, 64
- 4.2 Single copy nuclear loci, 69
- 4.3 Multilocus techniques, 74
- 4.4 Sex-linked markers, 77
- 4.5 DNA sequences, 78
- 4.6 Additional techniques and the future, 78
- 4.7 Genetic variation in natural populations, 81
- Guest Box 4 by N. N. FitzSimmons: Multiple markers uncover marine turtle behavior, 82

**PART II: MECHANISMS OF EVOLUTIONARY CHANGE****5 Random Mating Populations: Hardy–Weinberg Principle, 93**

- 5.1 The Hardy–Weinberg principle, 94
- 5.2 Hardy–Weinberg proportions, 97
- 5.3 Testing for Hardy–Weinberg proportions, 99
- 5.4 Estimation of allele frequencies, 105
- 5.5 Sex-linked loci, 108
- 5.6 Estimation of genetic variation, 110
- Guest Box 5 by V. Castric and L. Bernatchez: Testing alternative explanations for deficiencies of heterozygotes in populations of brook trout in small lakes, 112

**6 Small Populations and Genetic Drift, 117**

- 6.1 Genetic drift, 118
- 6.2 Changes in allele frequency, 122
- 6.3 Loss of genetic variation: the inbreeding effect of small populations, 123
- 6.4 Loss of allelic diversity, 126
- 6.5 Founder effect, 129
- 6.6 Genotypic proportions in small populations, 136
- 6.7 Fitness effects of genetic drift, 138
- Guest Box 6 by P. L. Leberg and D. L. Rogowski: The inbreeding effect of small population size reduces population growth rate in mosquitofish, 141

**7 Effective Population Size, 147**

- 7.1 Concept of effective population size, 148
- 7.2 Unequal sex ratio, 151
- 7.3 Nonrandom number of progeny, 153
- 7.4 Fluctuating population size, 157
- 7.5 Overlapping generations, 158
- 7.6 Variance effective population size, 159
- 7.7 Cytoplasmic genes, 159
- 7.8 Gene genealogies and lineage sorting, 162
- 7.9 Limitations of effective population size, 163
- 7.10 Effective population size in natural populations, 166
- Guest Box 7 by C. R. Miller and L. P. Waits: Estimation of effective population size in Yellowstone grizzly bears, 167

## 8 Natural Selection, 171

- 8.1 Fitness, 173
  - 8.2 Single locus with two alleles, 174
  - 8.3 Multiple alleles, 179
  - 8.4 Frequency-dependent selection, 184
  - 8.5 Natural selection in small populations, 186
  - 8.6 Natural selection and conservation, 188
- Guest Box 8 by C. A. Stockwell and M. L. Collyer: Rapid adaptation and conservation, 192

## 9 Population Subdivision, 197

- 9.1  $F$ -statistics, 199
  - 9.2 Complete isolation, 204
  - 9.3 Gene flow, 205
  - 9.4 Gene flow and genetic drift, 206
  - 9.5 Cytoplasmic genes and sex-linked markers, 210
  - 9.6 Gene flow and natural selection, 214
  - 9.7 Limitations of  $F_{ST}$  and other measures of subdivision, 218
  - 9.8 Estimation of gene flow, 220
  - 9.9 Population subdivision and conservation, 226
- Guest Box 9 by C. S. Baker and F. B. Pichler: Hector's dolphin population structure and conservation, 227

## 10 Multiple Loci, 233

- 10.1 Gametic disequilibrium, 234
  - 10.2 Small population size, 239
  - 10.3 Natural selection, 240
  - 10.4 Population subdivision, 245
  - 10.5 Hybridization, 246
  - 10.6 Estimation of gametic disequilibrium, 250
- Guest Box 10 by S. H. Forbes: Dating hybrid populations using gametic disequilibrium, 252

## 11 Quantitative Genetics, 257

- 11.1 Heritability, 258
  - 11.2 Selection on quantitative traits, 264
  - 11.3 Quantitative trait loci (QTLs), 269
  - 11.4 Genetic drift and bottlenecks, 274
  - 11.5 Divergence among populations ( $Q_{ST}$ ), 276
  - 11.6 Quantitative genetics and conservation, 278
- Guest Box 11 by D. W. Coltman: Response to trophy hunting in bighorn sheep, 282

## 12 Mutation, 285

- 12.1 Process of mutation, 286
- 12.2 Selectively neutral mutations, 291
- 12.3 Harmful mutations, 296
- 12.4 Advantageous mutations, 297

12.5 Recovery from a bottleneck, 297

Guest Box 12 by M. W. Nachman: Color evolution via different mutations in pocket mice, 299

## **PART III: GENETICS AND CONSERVATION**

### **13 Inbreeding Depression, 305**

13.1 Pedigree analysis, 307

13.2 Gene drop analysis, 310

13.3 Estimation of  $F$  and relatedness with molecular markers, 313

13.4 Causes of inbreeding depression, 315

13.5 Measurement of inbreeding depression, 317

13.6 Genetic load and purging, 323

Guest Box 13 by R. C. Lacy: Understanding inbreeding depression: 20 years of experiments with *Peromyscus* mice, 327

### **14 Demography and Extinction, 334**

14.1 Estimation of population size, 336

14.2 Inbreeding depression and extinction, 338

14.3 Population viability analysis, 342

14.4 Loss of phenotypic variation, 350

14.5 Loss of evolutionary potential, 355

14.6 Mitochondrial DNA, 355

14.7 Mutational meltdown, 357

14.8 Long-term persistence, 357

14.9 The 50/500 rule, 359

Guest Box 14 by A. C. Taylor: Noninvasive population size estimation in wombats, 360

### **15 Metapopulations and Fragmentation, 363**

15.1 The metapopulation concept, 364

15.2 Genetic variation in metapopulations, 365

15.3 Effective population size, 369

15.4 Population divergence and fragmentation, 371

15.5 Genetic rescue, 372

15.6 Long-term population viability, 374

Guest Box 15 by R. C. Vrijenhoek: Fitness loss and genetic rescue in stream-dwelling topminnows, 377

### **16 Units of Conservation, 380**

16.1 What should we try to protect?, 382

16.2 Systematics and taxonomy, 385

16.3 Phylogeny reconstruction, 387

16.4 Description of genetic relationships within species, 392

16.5 Units of conservation, 404

16.6 Integrating genetic, phenotypic, and environmental information, 415

Guest Box 16 by R. S. Waples: Identifying conservation units in Pacific salmon, 417

**17 Hybridization, 421**

- 17.1 Natural hybridization, 423
- 17.2 Anthropogenic hybridization, 428
- 17.3 Fitness consequences of hybridization, 429
- 17.4 Detecting and describing hybridization, 434
- 17.5 Hybridization and conservation, 443
- Guest Box 17 by L. H. Rieseberg: Hybridization and the conservation of plants, 446

**18 Conservation Breeding and Restoration, 449**

- 18.1 The role of conservation breeding, 452
- 18.2 Reproductive technologies and genome banking, 457
- 18.3 Founding populations for conservation breeding programs, 459
- 18.4 Genetic drift in captive populations, 461
- 18.5 Natural selection and adaptation to captivity, 464
- 18.6 Genetic management of conservation breeding programs, 466
- 18.7 Supportive breeding, 470
- 18.8 Reintroductions and translocations, 472
- Guest Box 18 by J. V. Briskie: Effects of population bottlenecks on introduced species of birds, 479

**19 Invasive Species, 482**

- 19.1 Why are invasive species so successful?, 484
- 19.2 Genetic analysis of introduced species, 487
- 19.3 Establishment and spread of invasive species, 491
- 19.4 Hybridization as a stimulus for invasiveness, 492
- 19.5 Eradication, management, and control, 494
- Guest Box 19 by J. L. Maron: Rapid adaptation of invasive populations of St John's Wort, 499

**20 Forensic and Management Applications of Genetic Identification, 502**

- 20.1 Species identification, 504
- 20.2 Individual identification and probability of identity, 509
- 20.3 Parentage testing, 513
- 20.4 Sex identification, 515
- 20.5 Population assignment, 515
- 20.6 Population composition analysis, 518
- Guest Box 20 by L. P. Waits: Microsatellite DNA genotyping identifies problem bear and cubs, 521

**Glossary, 526****Appendix: Probability and Statistics, 543**

- A1 Probability, 546
- A2 Statistical measures and distributions, 548
- A3 Frequentist hypothesis testing, statistical errors, and power, 557
- A4 Maximum likelihood, 561
- A5 Bayesian approaches and MCMC (Markov chain Monte Carlo), 562

- A6 Approximate Bayesian computation (ABC), 567
- A7 Parameter estimation, accuracy, and precision, 567
- A8 Performance testing, 569
- A9 The coalescent and genealogical information, 570
- Guest Box A by J. F. Crow: Is mathematics necessary?, 575
