Meningocele is a rare defect, which is the displacement of the structures of the brain or/and meninges through a congenital cavity in the cranium. A cranium bifidum with meningocele at the mid-parietal region was diagnosed in a three days old male lamb. General examination of lamb revealed fluctuated mass (6×8 cm) in the occipital region. Radiographic survey and ultrasonographic examination were carried out to confirm meningeal in the lamb.

Key Words - Cranium bifidum; lamb; meningocele; radiography; ultrasonographic
