## 1. Chemistry

All reagents and solvents were commercially available and were used without further purification. IR spectra were recorded on a FTIR spectrophotometer Shimadzu 8201 PC and are reported in terms of frequency of absorption $\left(\mathrm{cm}^{-1}\right) .{ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on Bruker Supercon Magnet Avance DRX-300 or DPX 200 FT spectrometers using TMS as an internal reference and the samples were dissolved in suitable deuterated solvents (Chemical shifts ( $\delta$ ) are given in ppm relative to TMS and coupling constants (J) in Hz ). Electro Spray Ionisation Mass spectra (ESI-MS) were recorded by micromass quattro II instrument. HR-DART MS were recorded on JEOL, JMS T100LC Accu TOF. Purity of all tested compounds was ascertained on the basis of their elemental analysis and was carried out on Carlo-Erba-1108 instrument. Column chromatography purifications were performed in flash using 60-120 or 100-200 Mesh silica gel. Thin-layer chromatography (TLC) was carried out with silica gel plates (silica gel 60 F 254 ), that were visualized by exposure to ultraviolet light. The melting points were recorded on an electrically heated melting point apparatus and are uncorrected.

## General procedure for the preparation of Ethyl pyridin-4-ylmethylcarbamodithioate

 (4a):A mixture of 4-aminomethylpyridine ( $0.36 \mathrm{~mL}, 3.54 \mathrm{mmol}$ ), carbon disulfide ( $0.21 \mathrm{~mL}, 3.54$ mmol ) and ethyl iodide ( $0.18 \mathrm{~mL}, 1.77 \mathrm{mmol}$ ) in acetonitrile ( 4 mL ) was stirred magnetically at room temperature till the reaction mixture gets solidified. Reaction was completed (observed on TLC). Reaction mixture was concentrated under reduced pressure to provide crude product. The crude product was purified by column chromatography over silica-gel using $1 \%$ methanol/chloroform as eluent.Yield: $80 \%$; Light brown solid; mp $92-94^{\circ} \mathrm{C}$; HRMS: calc: $213.0520\left(\mathrm{MH}^{+}\right)$; Found: $213.0515\left(\mathrm{MH}^{+}\right)$; Anal. ## 2. Bioevaluation methods

In vitro antifungal assay

The in vitro antifungal activity of synthesized compound dithiocarbamates (4a-f) and rhodanine (6), (7a-o), (9a-e) were evaluated against pathogenic fungi, Candida albicans (Ca), Candida parapsilosis (Cp, ATCC22019), Sporothrix schenckii (Ss), Trichophyton mentagrophytes (Tm), Aspergillus fumigatus (Af), Cryptococcus neoformans (Cn), C. albicians ATCC10231, C. albicians ATCC14053, C. albicians CDRI, C. albicians Patient, C. albicians Amphotericin B resistant, ${ }^{1}$ C. albicians MTCC183, C. tropicalis ATCC750 and C. glabrata ATCC-MYA 2950, by broth micro-dilution technique as per guidelines of Clinical and laboratory Standard Institute (CLSI) ${ }^{2}$ using RPMI 1640 Medium buffered with MOPS [3-(N-morpholino) propanesulphonic acid] in microtitre plates. The starting concentration of compound in first well was $50 \mu \mathrm{~g} / \mathrm{ml}$ and its 2 fold dilutions as follows 25 , $12.5,6.25,3.12,1.56,0.78,0.39$ and so on. Inoculua of test culture were maintained using by McFarland standard and $1-5 \times 10^{3}$ cells were inoculated in each well. Microtitre plates were incubated for 24-48 h (yeasts) and $72-96 \mathrm{~h}$ (mycelial fungi) at $35^{\circ} \mathrm{C}$. After incubation minimal inhibitory concentrations (MIC) were determined by visual observation as well as on a spectrophotometer (Molecular Devices, USA) at 492nm. Clotrimazole and fluconazole were used as reference antifungal agents. ${ }^{3}$

## 3. In vitro Cytotoxicity evaluation assay

The cytotoxicity effect of the lead compounds dithiocarbamates and rhodanine analogues was evaluated against mammalian cells, mouse fibroblast cell line L929. Stock solutions (1 $\mathrm{mg} / \mathrm{ml}$ ) of the test compounds were prepared in DMSO. The cell line L929 was grown in RPMI 1640 medium supplemented with $10 \%$ FBS and 1 X antimycotic and antibacterial solution (sigma USA) at $37^{\circ} \mathrm{C}$ in humidified atmosphere having $5 \% \mathrm{CO}_{2}$. One hundred ml ( $1 \mathrm{X} 10^{3}$ cells in RPMI 1640) of the confluent fibroblast stock suspension ( $1 \mathrm{X} 10^{5} \mathrm{cells} / \mathrm{ml}$ ) was dispensed in 96 -well tissue culture plate. The original medium from the wells was replaced with 100 ml serum free RPMI 1640 when the cells reached $90 \%$ confluency after 5 h
incubation in a $\mathrm{CO}_{2}$ incubator. Various concentrations of the test compounds $(25,12.5,6.25$, 3.12, $1.56,0.78,0.39 \mu \mathrm{~g} / \mathrm{ml}$ ) were added to the growing cells and incubated for 24 h . Response of L929 cells to the test compounds was determined spectrophotometrically at 570 and 630 nm . The difference between absorbance at 570 and 630 nm was used as an index of the cell viability.

$$

The morphology of the cells was observed under Phase contrast microscope as follows. After fixation of the cells in the wells of 96 -well tissue culture plate, Giemsa stain was added to each well and incubated for 30 min at $37^{\circ} \mathrm{C}$. The culture plates were washed thoroughly with PBS, air dried and observed under a phase contrast microscope.

## 4. Molecular Docking

## Materials and methods

Homology model was developed for Candida albicans Cyp51, ${ }^{5}$ using crystal structure of Human cyp51 (31d6) with the help of Modeller 9v9. ${ }^{6}$ 3D structure of compounds were generated and minimized by Powell gradient method implemented in Sybyl7.1. ${ }^{7}$ Autodock3 ${ }^{8}$ was used to get optimal docking solution of selected compounds. Grid box was centered on Heme group and Lamarckian genetic algorithm was used for calculation of 50 docking pose after 250000 evaluations. Docking protocol was validated by docking the Fluconazole (Extracted from Crystal structure of Trypansoma cruzi Cyp51; 3khm ${ }^{9}$ ) to modeled Candida albicans cyp51. For molecular visualization UCSF Chimera1. $6^{10}$ was used.
