## DO FEMALE OFFENDERS DIFFER?

**Abstract**

In view of earlier research, female offenders have not received as much attention as male perpetrators. Thus, the research aimed to gain insight into the types of offences committed by serious violent female offenders (n = 206; those who had committed grievous bodily harm, attempted murder, or homicide) and to explore differences with control female perpetrators (n = 447); control offenders were matched according to age and year of offence of the serious violent offenders. The purpose was to therefore gather an understanding of female offenders, and to determine if the serious violent perpetrators differed from the control sample. A UK police force provided data of offences committed between April 2001 and April 2011. Descriptive information was analysed, with comparisons being made using Mann-Whitney U tests and Chi-Square analysis. 72.3% (n = 149) of serious violent offenders had one or more recorded convictions, and were significantly more likely to have committed a previous violent offence, than the control sample. On the other hand, control perpetrators had a higher likelihood of having previously committed a theft-related offence, when compared to serious violent females. Therefore, the findings indicate the types of offences committed by female offenders and highlight the differences between serious violent perpetrators and offenders in the control sample. The implications, limitations and suggestions for future research are discussed.

## DO FEMALE OFFENDERS DIFFER?

**1. Introduction**

Criminal literature has, for many decades, concentrated on male perpetrators, with female offenders receiving little attention (Campbell, 1993; Thornton, Graham-Kevan, & Archer, 2012). Limitations relating to female offending links to the topic of gender differences; there are current arguments for a gender-neutral perspective to crime (Andrews & Dowden, 2006; Nicholls & Petrila, 2005), with a lack of empirical support for innovative gendered methods stated in literature (e.g. Havens, Ford, Grasso & Marr, 2012; Heilbrun, DeMatteo, Marczyk, & Goldstein, 2008) despite counterclaims that females may have different trajectories to offending (e.g. Leschied, 2011). Although criminal practices that have been developed on male samples are argued to be applicable to females (e.g. Heilbrun et al., 2008; Murphy, Brecht, Huang, & Herbeck, 2012; van Voorhis, Wright, Salisbury, & Bauman, 2010), if male and female offenders do differ, employing poorly informed practices to females would not result in effective outcomes (Dvoskin, Skeem, Novaco, & Douglas, 2011).

Furthermore, there is a need to explore the differences, and similarities, between serious violent (SV) offenders. While literature has investigated perpetrators of homicide and other violent perpetrators (Soothill, Francis, Ackerley, & Fligelstone, 2002), homicide and attempted murder criminals (Ganpat, Liem, van der Leun, & Nieuwbeerta, 2014), and homicide and aggravated assault offenders (Smit, Bijleveld, Brouwers, Loeber, & Nieuwbeerta, 2003), there is a scarcity in comparing various types of SV offenders. Ganpat and colleagues (2014) underlined their research as the first comparison of particular SV criminals and their criminal history, to their knowledge, with research urging for further explorations of SV offenders (Polaschek, 2006). In light of the arguments relating to the impact of gender differences on serious violence, research must determine to what extent SV offenders are a homogenous, or heterogeneous, set of perpetrators

There are reports of an increase in violent female criminality (e.g. Nicholls, Cruise, Greig, & Hinz, 2015); a higher proportion of female offenders were arrested for violence against the person in 2015/16 (females: 38%; males: 34%; Ministry of Justice [MoJ], 2016). However, Thornton and colleagues (2012) highlighted the likelihood that statistics of violent crimes committed by female perpetrators are not an accurate reflection of actual rates of offending. Researchers (e.g. George, 1999, 2003; Simmons, Lehmann, Cobb, & Fowler, 2005) proposed an explanation for this, as it is argued that more men faced immediate custody (83%) than women (68%), with fines being more likely to be issued to females (82%) than males (65%; MoJ, 2016). Furthermore, Kong and AuCoin (2008) noted how female offending could be somewhat undetected, due to the focus being drawn to the much larger male offender

## DO FEMALE OFFENDERS DIFFER?

1  
2  
3 population.

4 Yet, Trägårdh, Nilsson, Granath and Sturup (2016) stated, “less is known about female  
5 homicide offenders” (p.126). Thus, while there has been an increase in focus on female  
6 perpetrators over the past few years (Rettinger & Andrews, 2010), many attempts to explore  
7 female criminality have focused on specific variables (Loucks & Zamble, 1999), such as  
8 psychopathy, mental health and intimate partner violence (IPV). Yet, for a group of offenders  
9 referred to as a “unique and rapidly expanding population” (Nicholls et al., 2015, p.79), it is  
10 evident further explorations are necessary. When attention has turned to female perpetrators  
11 and investigated whether there are risk factors specific to the gender of the offender,  
12 empirical findings are consistently limited by small samples (Tracy, Wolfgang, & Figlio,  
13 1990). Not only is research into female offenders necessary to support the development of  
14 practitioner risk tools, it is also of importance to public welfare (Nicholls et al., 2015).  
15 Further research into risk factors of SV females would inform investigative practices, in  
16 addition to aiding in decision-making within court proceedings (West, Hatters, Friedman, &  
17 Kim, 2011).

### 30 **1.1 Theoretical Approaches to Female Criminality**

31 In view of gender in theories of crime, concerns have been noted surrounding how  
32 effective theories, which are characteristically dominated by male offenders, can explain  
33 female perpetrators (McRobbie & Garber, 2005; Steffensmeier & Allan, 1996; Vold,  
34 Bernard, & Snipes, 2002), due to the failure to factor in the gender gap in criminal behaviour  
35 (McRobbie & Garber, 2005; Nwalozie, 2015). There are arguments that support the  
36 application of criminal theory to females (Hartjen & Priyadarsini, 2003), such as claims  
37 surrounding the similarities in male and female offender’s backgrounds, including poor  
38 education, unemployment, low socioeconomic status and social control (e.g. Chesney-Lind &  
39 Shelden, 1992; Giordano, Cernkovich, & Pugh, 1986; Steffensmeier & Allan, 1995, 1996).  
40 Further, both males and females were more likely to engage in criminality when a romantic  
41 partner offended (Alarid, Burton, & Cullen, 2000), yet Benda (2005) argued there was a  
42 greater negative impact on females. In addition, peer encouragement to participate in  
43 criminality was more pertinent for males (Simons, Stewart, Gordon, Conger, & Elder, 2002)  
44 and deemed less influential to females (Mears, Ploeger, & Warr, 1998). Thus, it is evident  
45 that a deeper theoretical understanding of female offenders is required; Chesney-Lind and  
46 Pasko (2013) argued the application of theory to female offenders was problematic, with  
47 Smart (2013) claiming that the “knowledge of the nature of female criminality is still in its

2  
3 infancy” (p. 1). Although the current research does not investigate factors that provide the  
4 basis for theories of criminal behavior, such as peer groups, significant life events or  
5 socioeconomic status, it aims to conduct an exploratory analysis to obtain a clearer  
6 understanding of female offenders and thus make an initial effort to address this lack of  
7 understanding.  
8  
9  
10

**1.2 Research on Female Offenders: Age**

11  
12  
13 Descriptive research of female offenders is limited as, for example, investigation of  
14 violent female offenders appears to include another aspect, such as a focus on IPV (e.g.  
15 Caman et al., 2016; Thornton et al., 2012), sexual homicide (Chan & Frei, 2013), or  
16 psychotic disorders (e.g. Bennett, Ogloff, Mullen, & Thomas, 2012). In regards to the onset  
17 age of violence, research reports this to be earlier in female offenders (e.g. Moffitt, Caspi,  
18 Rutter, & Silva, 2001; Serbin & Karp, 2004); in comparison to nonviolent perpetrators,  
19 violent females were reported to be significantly younger (Goldstein & Higgins-  
20 D’Alessandro, 2001; Pollock, Mullings, & Crouch, 2006). Furthermore, Heidensohn and  
21 Silvestri (2012) highlighted that females typically peak in their offending in their mid-teens  
22 (Gelsthorpe, Sharpe, & Roberts, 2007; Home Office, 2003). Yet, there are mixed reports in  
23 literature relating to the age of violent females, as there have also been reports of late-  
24 twenties (e.g. Bonta, Pang, & Wallace-Capretta, 1995; Chan & Frei, 2013; Murdoch, Vess, &  
25 Ward, 2012; Thornton et al., 2012), with others reporting offenders to be in their thirties (e.g.  
26 Bennett et al., 2012; Pollock et al., 2006; Rettinger & Andrews, 2010). Thus, comparing the  
27 average age of females is problematic due to the inconsistencies within literature. For  
28 example, the average age was noted at different points (e.g. during incarceration), with other  
29 instances not specifying when the age referred to. Additionally, the offenders are argued to be  
30 from “unrepresentative subpopulations” (Loucks & Zamble, 1994, p. 22), thus making  
31 associations difficult.

**1.3 Research on Female Offenders: Criminal History**

48  
49 Women who have engaged in violence have been reported to have an offending history  
50 (Busch & Rosenberg, 2004; Moffitt et al., 2001). Statistics provided by MoJ (2016) reported  
51 that 16% of females, who were sentenced for an indictable offence, had no previous cautions  
52 or convictions, with 31% of female offenders having 15+ previous convictions or cautions,  
53 suggesting that a large proportion of female perpetrators do not have a substantial criminal  
54 history (Forsyth, Wooddell, & Evans, 2001; Rossegger et al., 2009; Yourstone, Lindholm, &  
55  
56  
57  
58  
59  
60

## DO FEMALE OFFENDERS DIFFER?

Kristiansson, 2008). However, it is important to highlight that the proportion of females, with 15+ previous convictions or cautions, has “risen to a greater extent” (p. 96) than males over the last decade (MoJ, 2016). In terms of the types of previous convictions, research conducted by Thornton and colleagues (2012) identified “all types of offending behaviour” (p. 1412) in a female sample, including IPV, general violence and other thefts (e.g. shoplifting). This is further evident in the prior offences committed by females in additional research, including crimes relating to public order (Alder & Worrall, 2004; McKeown, 2010), drugs, property, theft (e.g. McKeown, 2010) and general aggression (Moffitt et al., 2001). Pollock and colleagues (2006), in their assessment of violent and nonviolent female prisoners, stated that offenders, currently convicted of drug and property offences, had reported committing violent offences in the previous year. Self-report measures found that violent, in comparison to non-violent, offenders had a criminal history that included theft of vehicle, weapons, handling, gang membership, shoplifting and damaged property. Similarly, MoJ (2016) reported that violence against the person, theft and drug crimes were the most common offences for females to be convicted of.

### 1.4 Summary

Explorations between female SV and non-SV perpetrators are sparse in literature (e.g. Pollock et al., 2006). While female offenders are beginning to gain focus (Rettinger & Andrews, 2010), earlier research has been criticised for the lack of attention towards gender and criminality (Shaw, 1994; Soothill et al., 2002), with this stressing the need to explore violent, and nonviolent, reoffending in female perpetrators. Furthermore, there is still a requirement for an in-depth understanding of female offenders to assist in crime prevention strategies and to determine which offenders are at risk of reoffending (Kong & AuCoin, 2008); de Vogel and colleagues (2014) argued that empirical investigations of female-centered risk assessment are overshadowed by the magnitude of the perceived problem of male SV offending. Regardless, research into female offending reports mixed findings. Moreover, theories developed to explain female offending fail to explain the variety of all offences committed (e.g. assault or murder; Loucks & Zamble, 1999). Thus, the aim was to investigate factors of SV female offenders to achieve a further understanding of this offending group. In particular, this research aimed to determine if SV females differ to their non-SV counterparts (the control sample).

### 1.5 Aims of the Study

## DO FEMALE OFFENDERS DIFFER?

- i. To develop the existing understanding of female offenders by exploring descriptive and criminal history information;
- ii. To compare SV female offenders to a control group, of non-SV female perpetrators, to identify differences in the age at the first offence in the dataset, the frequency of offending and the presence of crime types in their criminal history.

## 2. Methodology

### 2.1 Sample: SV Female Offenders

In the current research, a SV offence was recorded as grievous bodily harm (GBH), attempted murder or homicide. The dataset provided by Devon and Cornwall Police Force ranged from April 2001 to March 2011. Therefore, SV offences were identified from a specified period of time (April 2005 to March 2011) to ensure that there would be a reasonable amount of time in the remaining dataset for previous offences to be traced. Between April 2005 and March 2011, in the Devon and Cornwall area, 206 SV female offenders were classified as committing a SV offence. Offending details known to the police were recorded, as was the age of offenders at the time of committing the target offence (attempted murder, GBH or homicide) and at the time of the first offence; it is crucial to note that this is the first offence that is recorded within the database (from April 2001) and therefore may not be the first offence committed by the offender. Nevertheless, there is a good follow-up period for all offenders, as this would be a minimum of 4 years; for example, for an offender who committed a SV offence in April 2005, their criminal history dating back to April 2001 would be available.

### 2.2 Sample: Control Offenders (Non-SV)

Soothill and colleagues (2002) stated the importance of determining the difference between serious and general criminals; in order to do this, a control group must be formed, with a suggestion that three controls per violent offender is appropriate. Additionally, Soothill et al. (2002) highlighted the need to include offenders who are still 'active'; therefore, offenders in the control group will have committed a non-SV offence within the same calendar year as SV offenders. The control sample was constructed to enable comparisons to be made with the SV sample; as the control group consisted of offenders with convictions for non-, or lesser-, violent crimes, it assisted in identifying instances of the heterogeneity, or homogeneity, of perpetrators. Therefore, an essential criterion for the

## DO FEMALE OFFENDERS DIFFER?

control sample was that members within this sample did not have any convictions for SV offences, between April 2001 and March 2011.

Therefore, offenders within this sample had not committed a SV offence between April 2001 and March 2011, as recorded by Devon and Cornwall police. The remaining cases were then matched according to age and year of the target offence of criminals in the SV group. Control offenders were only required for SV offenders with an offending history ( $n = 149$ ; Soothill et al., 2002), resulting in a comparison sample of 447 non-SV female offenders.

### 2.3 Design

The current research proposed to conduct a retrospective analysis, where the individuals within the sample are examined through the offender characteristic of age and criminal history information (offending frequency and crime types) to detect differences between female SV and control offenders. Age at the target offence was not investigated due to SV and control offenders being matched on this criterion.

### 2.4 Procedure

The age of female perpetrators and the criminal history of each offender were explored. Each offender was coded, in terms of age at the first recorded offence<sup>1</sup> in the dataset, the frequency of offending and the types of crimes committed by the offenders, according to four crime categorisation schemes. Almost 250 types of crime were recorded within the dataset; the offences from the police dataset were grouped according to a number of offence categorisation schemes. Criminal histories were examined according to four, eight, 15 and 24 crime categorisation schemes (see Table 1). The use of four categories was based on previous research (e.g. Harris, Smallbone, Dennison, & Knight, 2009), with eight categories drawn from the more general offence categories presented in the police data. As used by Harris and colleagues (2009), the present research used the current Australian and New Zealand Standard Offence Classification (ANZSOC; Pink, 2011); this identified 16 categories, however one category was not applicable to the UK dataset (Dangerous or negligent acts endangering persons) and therefore 15 categories remained. The 24 categories were identified from those used by the Home Office (2012), with consideration of the 38 offence groups used by Francis, Liu and Soothill (2008). It is important to highlight that there are categories present in the 15 (serious violent), and 24 (attempted murder, GBH, homicide), offence

---

<sup>1</sup> Since April 2001

## DO FEMALE OFFENDERS DIFFER?

categorisation schemes that are not applicable to the control sample, as offenders within the control sample, by definition, did not contain such offences in their criminal history.

## 2.5 Statistical Analyses

The variables of age at first offence within the database and the frequency of offending were assessed for normal distribution; each variable reported a significant Kolmogorov-Smirnov statistic, thus violating the assumption of normality. Moreover, the histograms depicted a skewed distribution. Therefore, Mann-Whitney U tests were utilised to explore the differences between the SV and control female samples. Descriptive analyses investigate the previous offending history of SV offenders to add to the existing, yet somewhat limited, understanding of SV females and the nature of their criminality. Statistical analyses explored whether there were differences in the SV and the control samples, in terms of:

- i. The age at the first offence in the dataset and the frequency of offending (Mann Whitney U analysis);
- ii. The presence of offence types (2x2 Chi-square analysis).

## 3. Results

### 3.1 Age

**3.1.1 SV offenders.** In terms of the age of offenders at the time of the first offence recorded within the database (i.e. post 2001), the ages ranged from nine to 53 years ( $n = 149$ ). The median age recorded was 19.00, with an average age of 22.92 years ( $SD = 10.01$ ). The age of offenders, at the time of committing the target offence, ranged from 13 to 62 years. The mean age of females was 27.00 years ( $SD = 10.38$ ), with a median of 24.00 years. When only females with previous convictions were included, the median was 24.00 years, with a range from 13 to 60 years ( $M = 27.07$ ,  $SD = 10.15$ ).

**3.1.2 Control offenders.** When the target offence was committed, the average age of the control group was 26.99 years old ( $SD = 9.94$ ) and the median age was 24.00 years, with the youngest offender recorded as 13 years and the oldest being 60 years old ( $n=447$ ). The mean age of female controls, at the time of the first offence that was recorded in the database, was 22.56 years ( $SD = 9.47$ ) and the median age was 20.00 years.

**3.1.3 A comparison of SV female and control offenders.** SV offenders with previous convictions ( $n = 149$ ) and control offenders ( $n = 447$ ) were compared in relation to the age at the time of committing the first offence; no significant differences were found ( $p > .05$ ).

## DO FEMALE OFFENDERS DIFFER?

**3.2 Frequency of Offending**

**3.2.1 SV offenders.** This section of the analysis considered only those offenders with previous convictions; 57 (27.7%) SV females had not previously been charged with an offence. Thus, 72.3% ( $n = 149$ ) of offenders had one or more recorded convictions. From the analysis of the 149 females, the number of previous convictions (post 2001) ranged from one to 50; the average number of prior offences was 5.81 ( $SD = 6.79$ ), with a median score of 4. The most common number of previous convictions was one ( $n = 40$ ), followed by two ( $n = 16$ ), three ( $n = 15$ ) and five offences ( $n = 14$ ), with one perpetrator being held responsible for 50 prior crimes.

**3.2.2 Control offenders.** Within this sample, the number of previous convictions stretched from 1 to 154, with a median score of 3 and an average of 7.22 ( $SD = 12.35$ ). It is important to note here that this sample was randomly selected from all appropriate matches that had been highlighted and so this is a fair representation of all non-SV offenders within the dataset.

**3.2.3 A comparison of SV female and control offenders: frequency of offending.** No significant differences were found between the sample of SV offenders, compared with the control sample, in terms of the number of previous convictions ( $p > 0.05$ ).

**3.3 Types of Previous Convictions**

**3.3.1 SV offenders.** Table 2 shows the types of previous convictions committed by SV offenders. Of the 149 perpetrators with prior offences, across each of the categorisation schemes, sexual offences were not recorded; in addition, no crimes of justice (15 categories) or abduction (24 categories) were noted. The largest proportions of female criminality were identified within the violent offences (four categories: 75.8% violent; eight categories: 74.5% violent; 15 categories: 65.8% cause injury; 24 categories: 53.0% ABH). Fewest SV offenders were reported to have previously committed burglary-related offences (8 categories: 9.4% burglary/robbery; 15 categories: 6.7% burglary, 4.0% robbery; 24 categories: 4.0% domestic burglary, 2.7% non-domestic burglary) and theft-related crimes (15 categories: 6.0% fraud; 24 categories: 6.0% fraud and forgery, 0.7% theft from vehicle, 0.7% vehicle interference), and were unlikely to have been charged for a weapons offence (15 categories: 3.4% weapons; 24 categories: 3.4% possession of weapon).

**3.3.2 Control offenders.** The types of previous convictions committed by the control sample are shown in Table 2. All females within the control sample had a previous conviction recorded. Other (4 categories: 76.7% other; 8 categories: 39.1% non-notifiable; 15

## DO FEMALE OFFENDERS DIFFER?

categories: 35.1% miscellaneous; 24 categories: 37.9% criminal damage), violent (4 categories: 64.3% violent; 8 categories: 63.7% violent; 15 categories: 51.6% cause injury; 24 categories: 39.2% ABH, 27.0% assault) and theft (4 categories: 52.3% property; 8 categories: 48.3% theft/handling; 15 categories: 48.6% theft; 24 categories: 43.5% other theft) crimes were frequently observed in the control sample. Within this sample, fewest offences were recorded in terms of sexual crimes (1.8% across all four crime categorisation schemes).

**3.3.3. A comparison of SV female and control offenders: types of crime.** Chi-square analyses were conducted to investigate the differences in the types of crimes committed in the criminal histories of female SV, compared to control offenders. When the four crimes categorisation scheme was applied, significant differences between the SV and control groups were observed (see Table 3); violent offences were twice as likely to appear in the criminal histories of SV females compared to their non-SV counterparts, with the control sample being at an increased likelihood of having previously committed a property offence.

In relation to the eight offences categorisation scheme (Table 4), SV female offenders were found to have double the probability of having a previous conviction for violence, whilst the control offenders had a significantly higher likelihood of committing theft/handling crimes.

When comparing offender criminal histories in regards to the 15 crimes categorisation scheme (see Table 5), SV females were three times more likely to previously commit public order offences, and almost twice as likely to have a previous conviction for cause injury, compared to the control sample. Yet, controls were more likely to have a prior offence of theft, when compared to female SV offenders.

In the comparison of offences within the 24 crimes categorisation scheme (see Table 6), SV females were more likely to have committed ABH or assault, than controls. On the other hand, those in the control sample had an increased likelihood of having previously committed other theft, when compared to their SV counterparts. No other statistically significant differences were detected ( $p > .05$ ). Small and medium effect sizes were reported.

#### 4. Discussion

Female offenders have been relatively ignored in previous research (e.g. Bonta et al., 1995; Loucks & Zamble, 1999; Nicholls et al., 2015; Soothill et al., 2002; Thornton et al., 2012). Thus, with the aim of developing the current awareness of female criminality, this study adopted a retrospective approach to explore such SV offenders and their criminal histories. The current research utilised data that ranged across a 10-year period to compare

## DO FEMALE OFFENDERS DIFFER?

1  
2  
3 the offending histories of 149 SV female offenders to 447 non-SV female offenders (the  
4 control sample). This enabled a comparison to be made, to determine if female SV offenders  
5 differed to non-SV perpetrators.  
6  
7

8 Offenders from both samples were compared on age at the first offence that was recorded  
9 in the database; no significant differences were detected between SV and control females.  
10 Nonetheless, the descriptive data adds to the sparse literature of SV female perpetrators  
11 (Nicholls et al., 2015). While it is difficult to make comparisons with existing research, due  
12 to the differences in when the age of the offender was recorded (e.g. Rettinger & Andrews  
13 [2010] recorded the age of the offenders at the time the survey was completed, while the  
14 offender was incarcerated) or the specificity of offences (e.g. intimate partner homicide,  
15 Caman et al., 2016), this research will assist in painting a clearer picture of SV female  
16 offenders. SV female offenders, in the current research, generally reflected the ages reported  
17 for SV perpetrators in previous literature, in terms of both the age at the first offence and the  
18 age at the time of committing the SV crime (e.g. Murdoch et al., 2012; Thornton et al., 2012).  
19 In regards to previous convictions, 72.3% of the SV sample ( $n = 149$ ) had one or more  
20 offences recorded in their criminal history, comparable to the 68.2% of Rettinger and  
21 Andrews (2010) violent female sample. The remaining 27.7% of the SV female offenders had  
22 not been held responsible for a prior crime, during the given time frame. The frequency of  
23 offending did not differ significantly between the SV and control samples.  
24  
25  
26  
27  
28  
29  
30  
31  
32  
33  
34

35 Across the four crime categorisation schemes, SV females were more likely to have a  
36 prior conviction for violent offences, compared with perpetrators in the control sample, thus  
37 lending support to previous literature that has stated the presence of general violence and  
38 aggression in violent female offender's criminal histories (e.g. Moffitt et al., 2001; Pollock et  
39 al., 2006; Thornton et al., 2012). Moreover, robbery has been argued to be less likely to  
40 appear in the prior offences of females (Pollock et al., 2006), with the current research  
41 reporting 3.4% of the SV sample having committed robbery. Whereas, theft-related crimes  
42 have been identified in the offending history of violent female perpetrators (e.g. Pollock et  
43 al., 2006), yet the current research identified such offences to be more likely associated with  
44 females in the control sample. This highlights the dissimilarities apparent between SV and  
45 non-SV female offenders. Further, earlier research reported criminal damage was likely to  
46 appear in the criminal histories of SV offenders (Howard & Dixon, 2013; Pollock et al.,  
47 2006; Thornton et al., 2012); yet, although not significantly different, a higher proportion of  
48 non-SV females had convictions for criminal damage

## DO FEMALE OFFENDERS DIFFER?

1  
2  
3 Interestingly, the offence of kidnapping was not recorded in the SV or control groups; in  
4 research by Soothill and colleagues (2002), kidnapping was found in male offenders who  
5 went on to commit murder. Liu, Francis and Soothill (2008) delved into this topic of  
6 research, in consideration of gender, and found that 282 offenders in the sample, of which 14  
7 were females, had a conviction of kidnapping. Yet again, other research did not record any  
8 offences of abduction in the sample (Rossegger et al., 2009). Consequently, the findings are  
9 mixed and would benefit from further insight.  
10  
11  
12

14

#### 15 16 17 **4.1 Implications**

18 Within the general area of forensic psychology, a number of significant relationships have  
19 emerged between researchers and practitioners; this has developed into a strong partnership  
20 that benefits both parties, resulting in a demand for evidence-based research, with outcomes  
21 that may have a subsequent impact on operational practice in the community (Taylor, Snook,  
22 Bennell, & Porter, 2015). For example, Wermink and colleagues (2016) highlighted the use  
23 of empirical research to inform the sentencing of offenders, in addition to other judicial and  
24 practical decisions, such as the type of action, treatment, community management and  
25 supervision needs (Craig, Beech, & Cortoni, 2013; Hilton, Harris, & Rice, 2010; Soothill,  
26 Francis, & Liu, 2008). What is more, Zagar, Grove and Busch (2013) reported the need for  
27 policies to review violence due to the impact this has, in terms of the costs to society and  
28 increasing demands on the prison system. As a result of the recent economic crisis and cuts to  
29 the police force in the UK, it is necessary to adapt, develop and implement cost-effective  
30 approaches. In addition, the assessment of risk by practitioners is essential (Hollin, 2009), as  
31 a practitioner must make decisions about offenders that may lead to the public being at risk if  
32 the practitioner was to make the wrong decision. Furthermore, the predictors for further  
33 criminality may differ according to the offender and the crime that they commit, as if  
34 offenders are not a homogenous group they would require different risk assessment tools  
35 (Hollin, 2009). There are practical implications of differentiating between violent and  
36 nonviolent offenders; the presence of differences between these perpetrators would suggest  
37 the allocation of resources should therefore differ according to the type of offender and the  
38 subsequent risk of harm to society (Lai, Zeng, & Chu, 2015). Thus, the current findings lend  
39 insight into SV female offenders and their criminal histories, and how they may – or may not  
40 – differ from non-SV female perpetrators.

53  
54  
55

56 **4.1.1 Theoretical implications.** Explorations into female offenders is limited, with a  
57 failure to agree if theories of crime can be applied to both sexes (e.g. Alarid et al., 2000;  
58  
59  
60

## DO FEMALE OFFENDERS DIFFER?

1  
2  
3 Benda, 2005; Giordano, Cernkovich, & Holland, 2003; Kruttschnitt, Uggem, & Shelton,  
4 2000). While further details (e.g. peers, relationships, motivations) would be necessary to  
5 comment on specific theories of crime, the current research suggests that theory must  
6 consider both the gender of the offender and the type of crimes they commit, and thus should  
7 not treat perpetrators as a homogenous group.  
8  
9

10  
11 **4.1.2 Practical implications.** As noted, in terms of differences between violent and  
12 nonviolent criminals, this has implications for the criminal justice system, such as allocating  
13 resources appropriately to those at most risk of harm to society (Lai et al., 2015).  
14 Additionally, Soothill and colleagues (2002) stressed the value of understanding criminal  
15 careers for those within the criminal justice system; in particular, offender characteristics,  
16 criminal history and the severity of the crime have been argued to have an impact on this  
17 decision-making (Spohn, 2000; Wermink et al., 2016). Violent offending was recorded in this  
18 female sample, with differences found between women in the SV and control samples; this  
19 enhances the current claims for more attention to be turned to females in research (e.g.  
20 Nicholls et al., 2015). Moreover, as established earlier, decisions relating to the likes of  
21 sentencing and parole are often influenced by the defendant's gender (e.g. Tillyer, Hartley, &  
22 Ward, 2015); thus, the current findings go some way in informing and demonstrating the  
23 criminality displayed by females (e.g. West et al., 2011).  
24  
25

26  
27 In consideration of the crime categorisation schemes, applying each set of crime  
28 categories detected differences and relationships within the data. Thus, this questions whether  
29 specific offence categories would be beneficial to research and practitioners, as utilising  
30 broader crime categories risks hiding important details. Harris and colleagues (2009)  
31 recommended using fewer offence categories arguing it may be more advantageous in terms  
32 of methodology. Yet this could be argued to be undesirable due to the risk of grouping  
33 offenders who would otherwise be categorised differently, if more specific crime types were  
34 used. Similarly, Youngs, Ioannou and Eagles (2016) considered the limitations of using broad  
35 crime categories, warning that a perpetrator's criminality could be oversimplified and thus  
36 not give an accurate representation of their offending. On the other hand, a limitation of using  
37 too many categories is the inclusion of minor crime categories, such as traffic offences,  
38 which do not demonstrate serious offences (Horning, Salfati, & Crawford, 2010) and could  
39 therefore be argued to be meaningless; similarly, Brame, Mulvey, Piquero and Schubert  
40 (2014) questioned the use of 'other' and 'miscellaneous' categories. Adding support for the  
41 need for consistency amongst research, Nieuwebeerta, Blokland, Piquero and Sweeten (2011)  
42 noted difficulties in making comparisons amongst research as a result of the different

## DO FEMALE OFFENDERS DIFFER?

categories used. What is more, considering the use of categories has importance implications to practitioners (e.g. Loeber & Ahonen, 2014).

#### 4.2 Limitations

Access to police data is valuable to research; the use of such data provides researchers with a way to investigate a variety of forensic topics (Alison, Snook, & Stein, 2001). However, police data is not without its limitations. The information documented was for police investigations (Alison et al., 2001), where the goal is to achieve a conviction of the guilty offender(s), as opposed to research purposes (Almond, McManus, & Ward, 2013; Canter & Alison, 2003) and as such the research design and methodology was not a primary consideration (i.e. other details not considered to be relevant to conviction might have been overlooked). Moreover, archival data may differ, depending on the differences in “record-keeping policies and practices” (Arthur et al., 2001, p. 9), which would be applicable both on an individual basis (individual differences in recording details from one case to another) and also as a police force (Alison et al., 2001). Further, an additional limitation of this data is, of course, that the data were provided by a single police force; thus, the offenders may be representative of that area only (Devon and Cornwall) and may not, therefore, reflect offenders in other areas. This is not unusual, however; for example, Cook, Ludwig and Braga (2005) faced similar restrictions. The location of the police force must also be considered; the present data were from a force based in a rural area and so the findings may differ from those using samples drawn from urban locations

Another limitation of the current data is that the follow-up period within the data were limited from April 2001; consequently, the data were likely to represent only a snapshot of the offender’s criminal history. Therefore, any offences recorded before this have not been included and it cannot be guaranteed that the first offence recorded in the dataset was an offender’s first crime in their criminal history for perpetrators in both the SV and control samples. This has implications for the age of the offender at the first offence, as it cannot be guaranteed that this is the offender’s first offence committed. Similarly, it cannot be ascertained whether SV offenders had committed additional, or more serious, SV crimes other than those recorded in the dataset. This has a number of implications; firstly, those SV offenders who have committed the same SV offence previously, and could thus be argued to be serial offenders, may differ from those who have committed an SV crime once (see DeLisi & Scherer, 2006; Wright, Pratt, & DeLisi, 2008). Nevertheless, perpetrators in Ganpat et al.’s (2014) attempted and completed murder samples held previous convictions for attempted

## DO FEMALE OFFENDERS DIFFER?

1  
2  
3 and/or complete murders; the researchers noted that the purpose of the research was to  
4 explore SV criminal histories, regardless of whether offenders had such prior offences.  
5 Ganpat et al. (2014) analysed the data containing those with SV previous offences and also  
6 without, concluding that this did not have any great differences in their findings. Similarly, it  
7 cannot be determined whether any offenders in the control sample had a SV crime in their  
8 criminal history prior to 2001. For the control sample, this would be problematic based on the  
9 criteria for their inclusion; yet, other research that has used matched-case controls cannot  
10 certify that the control sample did not contain offenders with SV previous convictions that  
11 were unknown to the police (e.g. Clarke et al., 2016; Soothill et al., 2002), and thus it is  
12 evident that this is a limitation associated with the type of data used.

53  
54  
55  
56  
57  
58  
59  
60  
There are also issues in relating the findings with literature; for example, some research  
considers the impact of additional factors, such as IPV (Thornton et al., 2012), with  
descriptive information (such as age) being recorded at different stages and varying samples  
being employed (e.g. prison vs. student population). Additionally, a weakness of the sample  
is the small proportion of SV female offenders with previous convictions ( $n=149$ ). However,  
research has generally noted the shortage of research on SV offences committed by female  
offenders, due to low murder arrest rates (Chan & Frei, 2013) and small proportions of SV  
females (e.g. Rossegger et al. [2009] used a sample of only six female homicide  
perpetrators). In comparison with previous research, this investigation has a relatively large  
sample size for a criminal female population; other research has utilised sample sizes that  
have varied from 16 to 55 to 202 female offenders (Rossegger et al., 2009; Bennett et al.,  
2012; Chan & Frei, 2013, respectively).

It can be noted also that the current research selected SV offenders of attempted murder,  
homicide and GBH, and is, therefore, restricted in its application to other SV offences (e.g.  
Ganpat et al., 2014). What is more, the findings may be confounded by the differing types of  
SV crime; research has reported differences in specific SV offences, such as interpersonal  
violence, filicide and accidental homicide, in terms of the motivations, offender  
characteristics and circumstances (e.g. Bourget & Bradford, 1990; Roberts, Zgoba, &  
Shahidullah, 2007; Straus, 2007). Moreover, as pointed out by Vaughn, DeLisi, Beaver and  
Howard (2008), there is a lack of standardisation in the definition of homicide used in  
research, as many group different types of homicides together. Thus, such different offenders  
are often categorised under one homogenous group.

However, the strengths of this research must also be noted. As the review of the existing  
literature shows, there have been limitations when making comparisons because of

## DO FEMALE OFFENDERS DIFFER?

1  
2  
3 inconsistencies in methodological practice. Firstly, findings that are produced without the use  
4 of a control sample limit the extent to which they can be claimed to be characteristics of those  
5 in the sample (e.g. Craissati & Sindall, 2009). Clearly the use of a matched-case control  
6 sample is an advantage to the present research. Additionally, Ganpat and colleagues (2014)  
7 reported the investigation of lethal and non-lethal violent offenders as the first to compare a  
8 sample of specifically SV offenders, focussing on the criminal history. The current  
9 exploration, therefore, greatly adds to this sparse area of empirical research, particularly in  
10 terms of female perpetrators.  
11  
12  
13  
14  
15  
16

**4.3 Conclusion**

17  
18  
19 This research explored the age and offending history information of 206 SV offenders  
20 ( $n=149$  with previous convictions), with a control sample of 447 perpetrators. The purpose of  
21 the research was to identify differences between females in the SV and control samples. As a  
22 result of using a suitable control sample, the findings assist in determining how SV offenders  
23 may differ from other offenders. Therefore, SV female offenders do demonstrate differences  
24 in the types of offences they commit, prior to committing an SV offence, when compared to  
25 non-SV offenders. This has potential implications for crime prevention strategies and the  
26 identification of those offenders who are at risk of future SV offending, as the findings add to  
27 the growing literature about the differences in female, particularly SV, perpetrators.
