Erratum to: Ecotoxicology DOI 10.1007/s10646-012-0927-y

In the original publication of the article, the conversion of imidacloprid concentrations from $\mu\text{g L}^{-1}$ into parts per billion (ppb) has been miscalculated in certain sections of the text. The authors would like to correct this error and provide the corrected conversions in the altered text below (correct ppb values given in italics).

- ...exposure to imidacloprid at an environmentally realistic level of $1 \mu\text{g L}^{-1}$ (=0.8 ppb)...
- ...oocytes were smaller in bees from microcolonies exposed to imidacloprid at $125 \mu\text{g L}^{-1}$ (98 ppb)...
- ...syrup dosed with imidacloprid at 1 ppb ($1.28 \mu\text{g L}^{-1}$)...

- ...the strongly detrimental effects of imidacloprid on fecundity at dosages of 39 ppb ($50 \mu\text{g L}^{-1}$)...
- Except at relatively high dosages (i.e. above 98 ppb)...
- ...the detrimental effects of imidacloprid on bumble bee fecundity at dosages below 98 ppb...
- ...dietary imidacloprid at levels up to approximately 39 ppb...
- ...bumble bee workers feeding on syrup at the highest dosage, 98 ppb...
- ...microcolonies feeding on syrups at dosages of 16 ppb ($20 \mu\text{g L}^{-1}$)...
- ...microcolonies exposed to an intermediate dosage of imidacloprid, 39 ppb...
- ...imidacloprid at 39 ppb may have disrupted social interactions.
