

ELECTRIC FIELD GRADIENTS IN METALS

R. Vianden

Helmholtz - Institut für Strahlen- und Kernphysik der Universität Bonn,
Nussallee 14-16, D-53115 BONN, Germany

The following table is a compilation of quadrupole interaction frequencies:

$$\nu_Q = \frac{e \cdot Q \cdot V_{zz}}{\hbar} \quad (1)$$

observed in pure metals and at the site of dilute impurities in metallic host lattices. In eq. (1) e is the positive elementary charge, Q the spectroscopic nuclear quadrupole moment and V_{zz} the principal component of the electric field gradient at the nuclear site. The axial asymmetry parameter η is given by:

$$\eta = \frac{V_{xx} - V_{yy}}{V_{zz}}$$

Data published up to June 1986 have been taken into account. All experimental values are expressed in terms of the quadrupole interaction frequency as defined by eq. (1). The entries are listed order of increasing atomic and mass number of the probe. Energy, spin, half-life and where available the quadrupole moment of the level are given for each probe. Where no reference is given the values for the quadrupole moments have been taken from ref. [310]. The columns of the table contain the following quantities:

1. Chemical symbol of the host lattice
2. Absolute value of the quadrupole interaction frequency in MHz. In all cases where the sign of v_Q has been determined it is given in the table.
3. Temperature of the host lattice in degrees K
4. Remarks, mainly designation of the applied method. The following abbreviations are used:

ME	Mößbauer effect
NMR	Nuclear magnetic resonance
β -NMR	NMR observed by resonant destruction of the asymmetry of β -radiation from polarized nuclei
NQR	Nuclear quadrupole resonance
NO	Nuclear orientation
TDPAD	Time differential perturbed angular distribution
SOPAD	Stroboscopic observation of perturbed angular distributions following nuclear reactions
IMPAC	Coulomb excitation recoil implantation perturbed angular correlation technique
IPAC	Integral perturbed angular correlation

TDPAC	Time differential perturbed angular correlation
β - γ TDPAC	β - γ Time differential perturbed angular correlation
e^- - γ TDPAC	e^- - γ Time differential perturbed angular correlation
(T)	Indicates that the temperature dependence has been measured
(P)	Indicates that the pressure dependence has been measured
M	in some cases the parent activity is given
S.Cry.	v_Q was measured in a single crystalline matrix. In all other cases a polycrystalline matrix was used.
Ded.	Deduced, using data given in the table

Dr. O. Klepper, Darmstadt, Dr. J.C. Soares, Lisbon and Dr. E.N. Kaufmann, Lawrence Livermore Laboratory have contributed to this compilation by making available their private data collection. Their help is very much appreciated.
