Contents

Series Preface xiii

Preface xv

1 Introduction 1
- 1.1 Electron Transfer as a Ubiquitous Elementary Process in Chemistry and Biology 1
- 1.2 Electron Transfer in Relation to Other Electronic and Particle Transfer Processes 2
- 1.3 The Physical Scenario in the Simplest Chemical Process: Electron Transfer 6
- 1.4 Some Historical Observations 8

References 10

2 Some Theoretical Prerequisites 15
- 2.1 General 15
- 2.2 Classical and Quantum Mechanical Particle Motion 15
  - 2.2.1 The harmonic oscillator 17
  - 2.2.2 The Morse oscillator 19
- 2.3 Elements of Statistical Physics 20
  - 2.3.1 The partition function 21
  - 2.3.2 The energy 21
  - 2.3.3 The Gibbs distribution 21
  - 2.3.4 The density matrix 22
- 2.4 The Born–Oppenheimer Approximation and Potential Energy Surfaces 22
- 2.5 Elements of Quantum Mechanical Perturbation Theory and Fermi's Golden Rule 24
- 2.6 The Condon Approximation 28
- 2.7 The Physical Nature of the Perturbation and Some Concluding Observations 29

References 30

3 The Tunnel Effect in Physical, Chemical and Biological Processes 33
3.1 General 33
3.2 The Plane Wave and Rectangular Barriers 34
3.3 Tunnelling between Stationary Bound States 36
3.4 Resonance Tunnelling and Tunnelling through Spatially Fluctuating Barriers 39
3.4.1 Resonance tunnelling 40
3.4.2 Tunnelling in stationary, spatially randomly fluctuating barriers 41
3.5 Vibrationally Assisted Tunnelling 42
3.6 Tunnel Times 45
References 47

4 Elements of Dielectric Theory 49
4.1 General 49
4.2 Notes on Linear Medium Field Responses 49
4.3 Dielectric Materials 50
4.4 The Electric Field and the Electric Induction 51
4.5 The Dielectric Function in Vibrationally Dispersive Solvents 53
4.6 Non-local Dielectric Theory 57
4.7 Configurational Fluctuations in Dielectrics 60
4.7.1 Inertial and inertia-less environmental polarization 60
4.7.2 The fluctuation-dissipation theorem for dielectric polarization fluctuations 63
4.7.3 Fluctuations in local dielectrics 64
4.8 Notes on Molecular Approaches to Aqueous Dielectrics and Dielectric Fluctuations 65
4.9 A Few Concluding Notes 68
References 68

5 Charge Transfer in Solids 71
5.1 General 71
5.2 The Simplest Environmentally Localized Electronic System: The Polaron 72
5.2.1 The large polaron 74
5.2.2 The small polaron 75
5.3 Large and Small Polaron Dynamics 78
5.4 Electronic Transitions between Localized Centres in the Solid State 80
5.4.1 The quantum mechanical transition probability 81
5.4.2 The semi-classical Franck–Condon principle 82
5.5 Some Concluding Notes on Polaron Systems 84
5.5.1 Polaron formation in transition metal oxides and related materials 85
5.5.2 Conductivity in one-dimensional materials 85
5.5.3 Conductivity by soliton–defect mobility 86
References 87

6 The Simplest Chemical Process: Electron Transfer **91**
6.1 General 91
6.2 Notes on Transition State Theory 91
6.3 Features of the Molecular Electron Transfer Process 93
6.4 System Mode Specification 95
6.5 Phenomenological System Mode Specification: the Solvent 97
6.6 The Activation Energy and Gibbs Free Energy 100
6.7 The Symmetry Factor and the Activation Gibbs Free Energy 102
6.8 The Reorganization Energy 105
6.9 The Electronic Transmission Coefficient 108
6.10 The Diabatic Electron Transfer Rate Constant and the Transition State Theory Revisited 110
References 111

7 Some Selected Experimental Data for Simple Electron Transfer Reactions **115**
7.1 General 115
7.2 Free Energy Relations 116
7.3 Inter-Reactant Work Terms 119
7.4 The Molecular and Solvent Reorganization Gibbs Free Energies 121
7.4.1 Simplest dependence on $\varepsilon_\infty^{-1} - \varepsilon_s^{-1}$ 123
7.4.2 A simple integrated approach to solvent ET parameters 123
7.4.3 Deconvolution of dynamic and stochastic solvent effects 124
7.5 The Electronic Transmission Coefficient 125
7.5.1 ET between molecules in frozen glassy media 127
7.5.2 Correlation between the electronic factor and low-lying excited state energy gaps 128
7.5.3 A comprehensive group of electron tunnel data in chemical and biological ET 129
7.6 Notes on Dissociative Charge Transfer 129
References 132

8 Towards More Precise Electron Transfer Theory **135**
8.1 Adiabatic and Diabatic Processes 135
8.2 A Note on the Nature of the Perturbation in Diabatic ET 138
8.3 Classical Nuclear Motion and Nuclear Tunnelling 140
8.4 Nuclear Tunnel Effects in Diabatic ET Reactions 141
8.4.1 Nuclear tunnelling in displaced one-dimensional oscillators 142
8.4.2 A combination scheme for high- and low-frequency nuclear motion 144
8.4.3 The inverted Gibbs free energy region 147
8.5 Nuclear Tunnel Effects in Vibrationally Dispersive Solvents 148
8.6 Low-Temperature Electron Transfer and Environmental Dispersion 152
8.7 Partially and Totally Adiabatic Reactions 154
8.8 Experimental Investigations of Chemical Processes at Low Temperatures and in the Inverted Gibbs Free Energy Region 154

8.8.1 Nuclear tunnelling in physical systems 154
8.8.2 Nuclear tunnelling in chemical systems at low temperatures and in the inverted Gibbs free energy region 154
References 156

9 Optical Charge Transfer in Allowed and Forbidden Transitions 159
9.1 General 159
9.2 Optical and Thermal Electronic Transitions 160
9.2.1 Quantization of the electromagnetic field 160
9.2.2 Modulation by a non-absorbing solvent 161
9.2.3 Field-molecule perturbations 162
9.2.4 Transition probabilities for light absorption and emission 162
9.2.5 Observables for optical transitions. Absorption 164
9.2.6 Observables for optical transitions. Spontaneous and stimulated emission 166
9.3 Optical Charge Transfer Bandshapes 166
9.3.1 The strong-coupling limit 168
9.3.2 The weak-coupling limit 170
9.3.3 Local mode reorganization 170
9.3.4 Transitions coupled to radiationless excited state decay. Broad Lorentzian and Voigtian bandshapes 171
9.4 Some Observations on Experimental Optical Bandshape Analysis 172
9.4.1 Weak-coupling systems 172
9.4.2 Strong-coupling systems 173
9.4.2.1 Solvatochromic band features of the betaines 173
9.4.2.2 Charge transfer in the $[Fe(CN)_6]^{4-} \cdot MV^{2+}$ ion pair 174
9.4.2.3 Photo-induced ET in the aqueous $[Fe(CN)_6]^{3-/4-}$ system at high concentration 174
9.5 Symmetry-Forbidden Transitions 175
9.5.1 Herzberg–Teller adiabatic separation schemes and orbitally symmetry-forbidden transitions 175
9.5.2 Some observations of temperature dependence in Herzberg–Teller transitions 178
9.6 Some Concluding Notes 178
References 179

10 Elements of Proton and Other Light-Atom Transfer Theory 183
10.1 General 183
10.2 Protons in Molecules 184
10.3 Interactions of the Bound Proton with the Molecular, Solvent and Conformational Environment 185
10.3.1 Local mode coupling 185
10.3.2 Coupling to a polar continuum 186
10.3.3 Proton coupling to a conformational macromolecular environment 186
10.3.4 Interactions between the proton donor and acceptor fragments 187

10.4 The Born–Oppenheimer Approximation and the Franck–Condon Principle for Proton Transfer 187
10.4.1 The Born–Oppenheimer approximation for proton transfer 188
10.4.2 A generalized Franck–Condon principle 188
10.5 Proton Transfer between Spatially Fixed Molecular Fragments 189
10.5.1 The proton transfer rate constant 189
10.5.2 Specific limiting interactions 190
10.6 Some Important Proton Transfer Correlations: The Brønsted Relation and the Kinetic Deuterium Isotope Effect 192
10.6.1 The Brønsted relation 192
10.6.2 Temperature effects and the kinetic deuterium isotope effect 194
10.7 Fluctuational Barrier Preparation, Relaxation and Molecular Solvent Effects 197
10.7.1 Fluctuational barrier preparation and gated PT 197
10.7.2 Some relaxational solvent effects in fast chemical PT 199
10.7.3 Molecular solvent effects and PT 200
10.8 Some Notes on Untraditional Proton and Hydrogen Atom Transfer Systems 203
10.8.1 Low-temperature hydrogen atom transfer 203
10.8.2 Ultrafast PT of molecular systems in excited electronic states 204
10.8.3 Hydrogen and hydride transfer in transition metal complexes 204
10.8.4 'Vectorial' PT in biological systems 204
10.8.5 Proton conduction in solids 204
References 205

11 The Electrochemical Process 209
11.1 General 209
11.2 Bulk and Surface Properties of Pure Metals and Semiconductors 211
11.2.1 Bulk metals and semiconductors 211
11.2.2 Metal and semiconductor surfaces 212
11.3 The Metal Electrode–Electrolyte Interface 214
11.4 The Fundamental Electrochemical Process at Metal, Semimetal and Semiconductor Electrodes 217
11.4.1 Metal electrodes 220
11.4.2 Semimetal electrodes 222
11.4.3 Semiconductor electrodes 223
11.4.4 Some notes on experimental investigations of simple electrochemical ET reactions at metal and semiconductor electrodes 224
11.5 Features of the Electrochemical Electron Tunnel Factor 225
11.6 Electrochemical Processes via Surface Adsorbate States: An Element of Electrocatalysis 228
11.7 A Note on Adiabatic Electrochemical Electron Transfer 229
11.8 A Note on Perspectives and Outlooks in the Theory of the Fundamental Electrochemical Process 231
References 233

12 Elements of Long-Range and Multi-Level Electron Transfer 237
12.1 Multi-Level Electronic Processes in Chemistry and Biology 237
12.1.1 Multi-level physical electronic processes 237
12.1.2 Long-range and superexchange ET in chemical and biological systems 238
12.1.3 Coherent multi-step ET and dynamically populated intermediate states 240
12.2 ET Routes and Molecular Group Separation Schemes 240
12.2.1 Long-range ET and splitting of energy eigenvalues 241
12.2.2 Perturbation schemes and long-range ET as a scattering process 243
12.2.3 Notes on experimental investigations of long-range ET in homogeneous solution 244
12.3 Modulation of the Tunnel Factor and Self-Consistent Electronic–Vibrational Interactions in Long-Range ET 245
12.3.1 Environmental wave function modulation in the Condon approximation 246
12.4 Coherent Two-Step Electron Transfer 249
12.4.1 A note on three-level resonance electron tunnelling 250
12.4.2 The quasiclassical approximation to nuclear dynamics in three-level molecular ET 250
12.4.3 Intermediate state vibrational relaxation 252
12.4.4 Quantum mechanical approach to three-level ET 253
12.4.5 Some notes on the observation of coherent multi-step ET 254
12.5 A Few Observations on Relations between Thermal and Optical Multi-Level Electronic Transitions 257
12.6 Long-range ET in Non-traditional Interfacial Electrochemical ET Systems: *in situ* STM of Large Adsorbates and Continuous Phase Transitions in Two-dimensional Electrochemical Surface Layers 259
12.6.1 *In situ* STM of large adsorbate molecules 260
12.6.2 Continuous phase transitions in interfacial tunnel systems 263
References 265

13 Stochastic Views in Chemical Rate Theory 269
13.1 Dynamic and Stochastic Approaches to Chemical Processes in Condensed Media 269
13.2 Diffusion and Stochastic Processes in External Potentials 271
13.3 Reactive One-Dimensional Diffusion across a Barrier Close to Equilibrium 273
13.4 A View of Diabatic and Adiabatic Electron Transfer with Relaxation and Diffusion in Multi-Dimensional Environmental Polarization Modes 276
13.4.1 Potential surfaces spanned by Gibbs free energy fluctuations 276
13.4.2 Implications of single-mode reactive energy diffusion 279
13.5 Solvent and Molecular Structural Features 281
13.5.1 The notion of time dependent friction 281
13.5.2 Molecular high-frequency nuclear motion 283

13.5.3 Solvent relaxation and local low-frequency nuclear motion in diabatic and adiabatic electron and proton transfer 283
13.5.4 Two-dimensional reactive diffusion 287
13.5.5 Concluding notes on non-stationary diffusion and a formal correlation between diffusion coefficients and solute–solvent interaction terms 289
13.6 Notes on Molecular Representations of Diffusion and Solvent Control 291
13.6.1 Notes on numerical approaches 291
13.6.2 Analytical formalism in the mean spherical approximation 292
13.7 Some Experimental Observations 295
13.7.1 Steady-state relaxation and viscosity patterns 296
13.7.2 Charge transfer cases in multi-time domains and molecular structural effects 296
References 298

14 Elements of Charge Transfer in Biological Systems 301
14.1 Biological Structures and Charge Transport Chains 301
14.2 Biological Charge Transfer Sites in Solvated Protein Environments and Biological Organization of Electron and Proton Tunnelling 304
14.2.1 Electronic–conformational interactions 304
14.2.2 Electrostatic and solvent interactions in anisotropic dielectric media 306
14.2.3 The electronic tunnel factor 307
14.3 Long-Range Electron Transfer in Selected Biological Systems 309
14.3.1 ET in individual metalloproteins 310
14.3.1.1 Intramolecular ET in single–haeme cytochromes and myoglobins 310
14.3.1.2 ET and molecular recognition of the blue copper proteins 312
14.3.1.3 The multi-centre ET haemoproteins cyt c_4 and cyt c_3 313
14.3.2 Organized ET in multi-centre redox enzymes and supramolecular protein complexes 314
14.3.2.1 The copper oxidases 314
14.3.2.2 A view on multi-ET in the nitrogenase enzyme complexes 315
14.3.2.3 ET in the bacterial photosynthetic reaction centres 317
14.4 Selected Biological Proton Transfer Systems 321
14.4.1 Large kinetic isotope effects in enzymatic proton and hydrogen transfer 322
14.4.2 Proton transfer and conformational dynamics in carboxypeptidase a catalysed peptide and ester hydrolysis 322
14.4.3 Fluctuational PT barrier preparation in chymotrypsin catalysis 323
14.4.4 Organized proton transfer: the proton pumps 325
References 328

15 Perspectives and Outlook **333**
15.1 Fundamentals of Charge Transfer Theory 333
15.1.1 Fundamentals of molecular approaches to charge transfer in condensed media 333
15.1.2 Interfacial electron transfer 334
15.1.3 New areas in the melting pot: ET near phase transitions and coherent multi-ET 335
15.2 Technological Perspectives for Charge Transfer Theory 335
15.2.1 Functional molecular materials 336
15.2.2 Functional supramolecular organization 336
15.2.3 Molecular and supramolecular function 336
15.2.3.1 Molecular electronic rectification and amplification 336
15.2.3.2 Quantum size effects and single-electron tunnelling (SET) 337
15.2.3.3 A working biological molecular electronic device: bacteriorhodopsin 338
References 339

Appendix A **341**
Derivation of the quantum mechanical rate constant, Equation (5.34) 341

Appendix B **343**
Derivation of Equation (8.24) 343

Appendix C **345**
Analysis of Equations (5.34) and (8.51) 345
C1. Strong electronic–vibrational coupling 345
C2. Weak electronic–vibrational coupling 346

Appendix D **349**
The Maxwellian velocity distribution at high friction 349
