#### Abstract

A new series of (5-pregnen-20-on-3 $\alpha$-yl)-substituted-benzoate analogues (10-13), (5-pregnene-20-on-3 $\alpha$-yl)-3-(substituted)acrylate derivatives (17-19) as well as the (17-(2-acetoxyacetyl)pregen- $3 \alpha$-yl)-3,4,5-trihydroxybenzoate (21) were synthesized from the $\beta$ pregenenolone scaffolds, by applying Mitsunobu reaction. All new compounds were characterized by ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}$ and 2D NMR spectroscopy. The inversion in configuration at $\mathrm{C}-3$ during the formation of $\alpha$-ester analogues was confirmed by NOESY NMR spectroscopy. The new compounds were evaluated for their in vitro antiviral activity against the replication of HIV-1 and HIV-2 in MT-4 cells. Compounds 18 showed an $\mathrm{EC}_{50}$ value of $>1.95 \mathrm{mg} / \mathrm{mL}$. In addition, preliminary structure-activity relationship and molecular modeling of compound 18 has been studied.

## 1. Introduction

Steroidal compounds display a variety of biological [1-3] functions and play a very important role in life [4-6], and attracted profound attention for development of potent pharmacological agents for treatments of various diseases [7] including: cardiovascular disease [8], adrenal insufficiencies [9], autoimmune disorders [10], fungal and microbial infections [11,12]. Furthermore, different steroidal derivatives have been considered as potent anti-cancer agents for the treatment of leukemia [7], breast cancer [13-15], prostate cancer [16] and brain tumors [17]. Furthermore, some steroids are promising pharmaceutical targets for important indications like epilepsy, anxiety disorders and dementia [18], while other steroid hormones have long been recognized to have sedative, anesthetic and anti-seizure properties in animals and humans [19-22]. Presence of different functional groups located around the rigid tetracyclic core leads to diversity in the biological actions as these serve as substrates for different targets.

Recently, several steroidal compounds have been synthesized and displayed a key role in a therapeutic strategy for treating advanced prostate cancer (PC) [23-25]. In 1996, Njar et al. $[20,26]$ reported the first steroidal inhibitors of

CYP17 bearing a heterocyclic moiety bound to C17 by a nitrogen atom, among which the imidazolyl derivative 1 was found to be the most promising [20-23,26-29]. Later, in 2005, the same group reported the synthesis of galeterone 2 and its $\Delta^{4}$-3-keto derivative [23-25,29-31], where compound 2 is currently undergoing Phase I/II clinical trials for the treatment of chemotherapy-naive CRPC [26,27,32-33]. However, patients suffering from CRPC can clearly benefit from the newly approved drug abiraterone acetate (Zytiga) 3 [28, 29,34,35]. This pregnenolone derivative was designed as an inhibitor of the enzyme $17 \alpha$-hydroxylase/C $\mathrm{C}_{17,20 \text {-lyase (CYP17A1) }[30,36]}$ which catalyzes two key reactions in steroid hormone biosynthesis. Much more recently, we have synthesized new series of pregnenolone having imino-benzothiazoles 4 at C-20, which showed remarkable inhibition of CYP17 hydroxylase activity, Figure 1 [37].

In continuation of our ongoing work on the synthesis of new pregnenolone analogues, we explore here a novel series of $\alpha$-ester derivatives of pregnenolone with inversion in configuration at C-3, by applying of Mitsunobu reaction [3840].

## 2. Experimental

### 2.1. Instrumentation

Melting points are uncorrected and were measured on a Büchi melting point apparatus B-545 (Büchi Labortechnik AG, Switzerland). NMR data were obtained on 400 and 600 MHz $\left({ }^{1} \mathrm{H}\right)$ and $150.91 \mathrm{MHz}\left({ }^{13} \mathrm{C}\right)$ spectrometers (Avance III, Bruker, Germany) with TMS as internal standard and on the $\delta$ scale in ppm. Heteronuclear assignments were verified by ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}$ HMBC and ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}$ HSQC NMR experiments. Microanalytical data were obtained with a Vario, Elemental analyzer (Shimadzu, Japan). Analytical silica gel TLC plates 60 F 254 were purchased from Merck. All reagents were obtained from commercial suppliers and were used without further purification.

### 2.2. Synthesis

### 2.2.1. General procedure for the synthesis of $3 \alpha$-substituted aryl ester derivatives of pregnenolone by applying Mitsunobu reaction (10-13)

To a solution of 5-pregnene-3 $\beta$-ol-20-one (5) (316 mg 1.00 mmol ) in acetonitrile ( 10 mL ) were added substituted benzoic acids 6-9 ( 1.00 mmol ), triphenylphosphine ( $\mathrm{Ph}_{3} \mathrm{P}$ ) ( 262 mg , 1.00 mmol ) and diethylazodicarboxylate (DEAD) ( 1.00 mmol , 0.13 mL ) and the mixture was heated under reflux for 8 h . The reaction was monterited by TLC ( $n$-hexane: ethyl acetate, 3:1, $v: v)$. After cooling, diethyl ether ( 15 mL ) was added and the mixture was partitioned with saturated aqueous solution of $\mathrm{NaHCO}_{3}(10 \mathrm{~mL})$, brine solution ( 10 mL ) and finally with water. The organic extract was dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and the filtrate was evaporated to dryness. The residue was poured onto a short column of silica gel ( 5 g ), using $n$-hexane-ethyl acetate (3:2, v:v) as eluent to give the desired ester (Scheme 1).
(5-Pregnen-20-on-3 $\alpha$-yl)-4-hydroxybenzoate (10): From 4hydroxybenzoic acid (6) (138 mg). Yield: 245 mg (56\%). M.p.: $142-144^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ( 600 MHz, DMSO- $\mathrm{d}_{6}, \delta, \mathrm{ppm}$ ): $7.79(\mathrm{~d}, 2 \mathrm{H}$, $\left.J_{2^{\prime}, 3^{\prime}}=8.6 \mathrm{~Hz}, \mathrm{H}_{\text {arom. }}-2^{\prime}+\mathrm{H}_{\text {arom. }}-6^{\prime}\right), 6.83\left(\mathrm{~d}, 2 \mathrm{H}, J_{5^{\prime}, 6^{\prime}}==8.6 \mathrm{~Hz}\right.$, $\mathrm{H}_{\text {arom. }} \mathrm{B}^{\prime}+\mathrm{H}_{\text {arom. }} \mathrm{F}^{\prime}$ ), $5.28\left(\mathrm{t}, 1 \mathrm{H}, \mathrm{J}_{6,7}=4.6 \mathrm{~Hz}, \mathrm{H}-6\right), 4.60(\mathrm{~s}, 1 \mathrm{H}$, OH ), 3.26 ( $\mathrm{m}, 1 \mathrm{H}, \mathrm{H}-3$ ), $2.58(\mathrm{~m}, 1 \mathrm{H}, \mathrm{H}-17), 2.18\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}-4\right)$, 2.07 (s, 3H, Me-21), $2.02(\mathrm{~m}, 1 \mathrm{H}, \mathrm{H}-16 \mathrm{a}), 2.00(\mathrm{~m}, 1 \mathrm{H}, \mathrm{H}-12 \mathrm{a})$, 1.90 (m, 1H, H-7a), 1.79 (m, 1H, H-1a), 1.72 (m, 1H, H-2a), 1.70 ( $\mathrm{m}, 1 \mathrm{H}, \mathrm{H}-15 \mathrm{a}$ ), $1.67(\mathrm{~m}, 1 \mathrm{H}, \mathrm{H}-11 \mathrm{a}), 1.61(\mathrm{~m}, 1 \mathrm{H}, \mathrm{H}-16 \mathrm{~b}), 1.60$ (m, 1H, H-7a), 1.44 (m, 1H, H-11b), 1.41 (m, 1H, H-12b), 1.38 (m, 2H, H-8 + H-2b), 1.20 (m, 2H, H-14 + H-15b), 1.04 (m, 1H, $\mathrm{H}-1 \mathrm{~b}$ ), 1.00 (m, 1H, H-9), 0.94 (s, 3H, Me-19), 0.54 (s, 3H, Me18). ${ }^{13} \mathrm{C}$ NMR ( 150.91 MHz , DMSO- $d_{6}, \delta, \mathrm{ppm}$ ): 209.1 (C-20), $167.7\left(\mathrm{CO}_{2}\right), 162.1$ (Carom. 4 '), 141.8 (C-5), 131.8 (Carom. $\mathrm{C}^{\prime}$ +

Carom.-6'), 122.1 ( $\mathrm{Caram}_{\text {arom }}-1$ '), 120.8 (C-6), 115.6 ( $\mathrm{Caram}_{\text {arom }}-\mathrm{B}^{\prime}+\mathrm{C}_{\text {arom.- }}$ 5'), 70.5 (C-3), 63.1 (C-17), 60.9 (C-14), 50.0 (C-9), 43.8 (C-13), 42.7 (C-4), 38.5 (C-12), 37.4 (C-1), 36.6 (C-10), 31.9, 31.8 , 31.7 (C-2 + C-7 + C-8 + Me-21), 24.5 (C-15), 22.7 (C-16), 21.1 (C11), 19.6 (Me-19), 13.4 (Me) 18). ## 3. Results and discussion

### 3.1. Chemistry

Recently, we prepared in our laboratory the iminebenzothiadiazole analogues of pregnenolone molecule [37], aiming to evaluate their cytochrome CYP17 hydroxylase and HIV inhibition activity. In our present work, we have selected $\beta$-pregnenolone a starting material for the synthesis of a new series of $\alpha$-ester of pregnenolone analogues, with inversion in configuration at $\mathrm{C}-3$, by applying of Mitsunobu reaction. Thus, treatment of 5 with various substituted benzoic acids: $p$ -hydroxy-, 3,4-dihydroxy-(protocatechuic acid), 3,4,5-tri hydroxy (gallic acid) and 4-hydroxy-4-methoxy- (vanillic acid) benzoic acids (6-9), respectively, in THF in the presence of triphenylphosphine $\left(\mathrm{Ph}_{3} \mathrm{P}\right)$ and diethylazodicarboxylate (DEAD) at room temperature for 16 h , afforded after chromatographic purification, the new derivatives $\mathbf{1 0 - 1 3}$ in $56-66 \%$, yields (Scheme 1).

Next, our work focused on the synthesis of new pregnenolone analogues having unsaturated carboxylic ester moieties at $\alpha$-position of C-3, via Mitsunobu reaction, from cinnamic acid analogues having the potential phenolic groups. Thus, treatment of 5 with 3-(4-hydroxyphenyl)acrylic acid ( $p$ coumaric acid) 14, 3-(3,4-dihydroxyphenyl)acrylic acid (caffeic acid) 15, and 3-(4-hydroxy-3-methoxyphenyl)acrylic
acid (trans-ferulic acid) 16 in THF and $\mathrm{Ph}_{3} \mathrm{P}$ and DEAD as catalysts at room temperature for 16 h afforded, after chromatographic purification, the regioselective new $\alpha$-ester derivatives 17-19 in 63\% yield (Scheme 2).

The structures of compounds $\mathbf{1 0 - 1 3}$ and $\mathbf{1 7 - 1 9}$ were identified by ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}$ NMR and mass spectral data, which showed similar patterns of aliphatic proton and carbon atoms, using the NMR spectrum of the starting material pregnenolone 5 as a reference. The doublets at $\delta 7.79\left(J_{2^{\prime}, 3^{\prime}}=8.6 \mathrm{~Hz}\right)$, and 7.59 ppm ( $J_{2}{ }^{\prime}, 6^{\prime}=8.6,3.4 \mathrm{~Hz}$ ) were assigned to the aromatic protons $\mathbf{H - 2 '}$ ' $\mathrm{H}-6$ ' of compounds 10 and 13, respectively, while the doublet at $\delta 6.83 \mathrm{ppm}$ was assigned to $\mathrm{H}-3^{\prime}$ and $\mathrm{H}-5^{\prime}$ of compound $10\left(J_{5^{\prime}, 6^{\prime}}==8.6 \mathrm{~Hz}\right)$. The multiplets at the regions $\delta$ 7.66-7.55 ppm were attributed to the aromatic protons $\mathrm{H}-2^{\prime}$ and H-6' of compounds 11, 12, 18 and 19 , while the same protons of compound 17 appeared as doublet of doublets at $\delta$ $7.65 \mathrm{ppm}\left(\mathrm{J}^{2 \prime}, 6^{\prime \prime}=2.0 \mathrm{~Hz}, J_{2^{\prime \prime}, 3^{\prime \prime}}=8.6 \mathrm{~Hz}\right)$. The doublet of doublets at $\delta 7.56 \mathrm{ppm}\left(J_{3 ", 5^{\prime \prime}}=2.0 \mathrm{~Hz}, J_{5^{\prime \prime}, 6^{\prime \prime}}=8.5 \mathrm{~Hz}\right)$ was assigned for the aromatic protons $\mathrm{H}-3^{\prime \prime}$ and $\mathrm{H}-5^{\prime \prime}$ of 17 , whereas the doublets at $\delta 7.08$ and $7.11 \mathrm{ppm}\left(J_{5^{\prime}, 6^{\prime}}=9.0\right.$ and 7.9 Hz$)$ were attributed to the aromatic protons $\mathrm{H}-5$ of 11 and 13 , respectively. The olefinic protons $\mathrm{H}-1^{\prime}$ and $\mathrm{H}-2^{\prime}$ of 17 were resonated at $\delta 7.62$ and 7.53 ppm as two doublets $\left(U_{1}, 2^{\prime}=10.0\right.$ Hz ), respectively, while the same protons of compounds 18 and 19 were overlapped with the aromatic protons $\mathrm{H}-2^{\prime \prime}, \mathrm{H}-5^{\prime \prime}$ and H-6" at the regions $\delta 7.66-7.55 \mathrm{ppm}$. The multiplets at the regions $\delta 1.80-1.76 \mathrm{ppm}$ and $\delta 1.04-1.00 \mathrm{ppm}$ were assigned to $\mathrm{H}-1 \mathrm{a}$ and $\mathrm{H}-1 \mathrm{~b}$, respectively, meanwhile the regions $\delta$ 1.1711.68 ppm and $\delta 1.38-1.35 \mathrm{ppm}$ were attributed to $\mathrm{H}-2 \mathrm{a}$ and $\mathrm{H}-$ 2 b , respectively. The resonances as multiplets at the regions $\delta$ 3.32-3.26 ppm were assigned to $\mathrm{H}-3$, whereas multiplets at $\delta$ 2.18-2.12 ppm were assigned to $\mathrm{CH}_{2}-4$. The triplets at $\delta 5.27$ ppm $(J=\sim 4.6-2.5 \mathrm{~Hz}$ ), was assigned to $\mathrm{H}-6$, while multiplets at the regions $\delta 1.94-1.91 \mathrm{ppm}$ and $1.55-1.50 \mathrm{ppm}$ were belonged to $\mathrm{H}-7 \mathrm{a}$ and $\mathrm{H}-7 \mathrm{~b}$, respectively. $\mathrm{H}-8$ and $\mathrm{H}-9$ were resonated as multiplets at the regions $\delta 1.42-1.39 \mathrm{ppm}$ and $1.00-0.97 \mathrm{ppm}$, respectively, whereas $\mathrm{H}-11 \mathrm{a}, \mathrm{H} 11 \mathrm{~b}$ and $\mathrm{H}-12 \mathrm{a}$ and $\mathrm{H}-12 \mathrm{~b}$ appeared as multiplets at the regions $\delta 1.60-1.42 \mathrm{ppm}$ and 2.00-1.40 ppm, respectively. The multiplets at the regions $\delta$ 1.20-1.16 ppm were assigned for $\mathrm{H}-14$ and $\mathrm{H}-15 \mathrm{a}$, while $\mathrm{H}-15 \mathrm{~b}$ appeared as multiplet at the regions $\delta 1.67-1.59 \mathrm{ppm} . \mathrm{H}-16 \mathrm{a}$, $\mathrm{H}-16 \mathrm{~b}$ and $\mathrm{H}-17$ were resonated as multiplets at the regions $\delta$ 2.06-1.55 and 2.59-2.54 ppm, respectively, whereas Me-18 and $\mathrm{M}-19$ appeared as singlets at the regions $\delta 0.54$ and 0.94 ppm , respectively. The broad singlets or signlets at the region $\delta$ 4.62-4.59 ppm were attributed to the hydroxyl groups of benzoic acid moieties of compound $\mathbf{1 0 - 1 9}$, except compound 18, where C 3 "-OH appeared as a singlet at $\delta 5.04 \mathrm{ppm}$. The methoxy groups of compounds 13 and 19 were resonated as singlets at $\delta 4.04$ and 4.03 ppm , respectively. In the ${ }^{13} \mathrm{C}$ NMR spectra of compound $\mathbf{1 0 - 1 9}$, the resonances at lower fields at the regions $\delta$ 209.1-208.9 ppm were assigned to $\mathrm{C}-20$, while the resonances at the regions $\delta$ 167.7-163.5 ppm were attributed to the carbonyl carbon atoms of ester groups. The signals at $\delta 70.5$ and 141.8 ppm were attributed to C-3 and C3 , respectively. C-1 appeared at the regions $\delta 38.5-37.5 \mathrm{ppm}$, while $\mathrm{C}-2, \mathrm{C}-7, \mathrm{C}-8$ and $\mathrm{Me}-21$ were appeared together at the regions $\delta 31.8,31.7$ and 31.6 ppm . The signals at $\delta 42.7$ and $\sim 120.8$ were assigned to $\mathrm{C}-4$ and C-6, respectively. The resonances at $\delta 50.0-49.1,36.6$ and 21.1 ppm were attributed to C-9, C-10 and C-11, respectively, whereas the signals at $\delta$ $38.5,43.8$ and $60.9-56.6 \mathrm{ppm}$ were assigned to $\mathrm{C}-12, \mathrm{C}-13$ and $\mathrm{C}-14$, respectively. $\mathrm{C}-15-\mathrm{C}-17$ were resonated at $\delta 25.5,22.7$ and 63.1 ppm , respectively, while $\mathrm{Me}-18$ and $\mathrm{Me}-19$ appeared at $\delta 13.4$ and 19.6 ppm , respectively. The olefinic carbon atoms C-1' of 17-19 appeared at $\delta 116.1,122.1$ and 123.1 ppm , meanwhile $\mathrm{C}_{\text {olefinic }}-2$ ' were resonated at $\delta 152.3,145.3$ and 154.0 ppm , respectively. The aromatic carbon atoms were fully analyzed (c.f. Experimental section).

Compound 17 has been selected for further NMR experiment. The gradient-selected HMBC spectrum [41] of compound 17 revealed five ${ }^{1,2} \mathrm{~J}_{\mathrm{C}, \mathrm{H}}$ couplings: C-20 of the ester group at $\delta 208.9 \mathrm{ppm}$ coupled with $\mathrm{H}-17$ at $\delta 2.56 \mathrm{ppm}, \mathrm{CO}_{2}$ of the ester group at $\delta 165.9 \mathrm{ppm}$ with $\mathrm{H}_{\text {olefinic }}-1$ ' at $\delta 7.62 \mathrm{ppm}, \mathrm{C}$ $3^{\prime \prime}$ aromatic carbon atom at $\delta 114.8 \mathrm{ppm}$ with $\mathrm{H}-2$ " at $\delta 7.65$ ppm, C-2' at $\delta 129.2 \mathrm{ppm}$ with $\mathrm{H}_{\text {olefinic- }}{ }^{\prime}$ ' at $\delta 7.53 \mathrm{ppm}$, in addition to a ${ }^{1,2} J_{\text {Сн }}$ coupling between $C_{\text {olefinic }}-1$ ' at $\delta 116.1 \mathrm{ppm}$ and $\mathrm{H}_{\text {olefinic }}-2^{\prime}$ at $\delta 7.53 \mathrm{ppm}$. Further, the olefinic protons $\mathrm{H}-1^{\prime}$ at $\delta 7.62 \mathrm{ppm}$ showed a ${ }^{1,3} \mathrm{~J}_{\text {ch }}$ coupling with $\mathrm{CO}_{2}$ at $\delta 165.9$ ppm, while two ${ }^{1,3} J_{\mathrm{CH}}$ couplings between the aromatic proton H-6' at $\delta 7.65 \mathrm{ppm}$ and $\mathrm{C}-4^{\prime \prime}$ at $\delta 156.6 \mathrm{ppm}$ as well as Holefinic$1^{\prime}$ proton at $\delta 7.62 \mathrm{ppm}$ and $\mathrm{C}-1^{\prime \prime}$ at $\delta 133.7 \mathrm{ppm}$ were observed (Figure 2).

Figure 2. JC,H correlations in the HMBC NMR spectrum of compound 17.
Treatment of 21-acetoxypregnenolone (5-pregnen-3 $\beta$,21-diol-20-one 21-acetate) (20) with compound 8 under Mitsunobu reaction conditions afforded, after chromatography, the $\alpha$-ester analogue 21 in $70 \%$ yield (Scheme 3).

The structure of compound 21 was elucidated from its ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra. In the ${ }^{1} \mathrm{H}$ NMR spectra of compound 21, the aromatic protons $\mathrm{H}-2$ ' and $\mathrm{H}-6$ ' appeared as multiplet at $\delta$ 7.56 ppm , while the protons of pregnene backbone were fully analyzed (c.f. Experimental section). CH2-21 resonated as a singlet at $\delta 5.82 \mathrm{ppm}$, while COMe protons appeared as a singlet at $\delta 2.09 \mathrm{ppm}$. The three hydroxyl groups of the aromatic ring appeared as $\delta 4.69$ and 4.04 ppm . In the ${ }^{13} \mathrm{C}$ NMR of compound 21, the resonance at the lower field $\delta 170.2 \mathrm{ppm}$ was assigned to the carbonyl carbon atom (OCOMe), while C$20(\mathrm{C}=0)$ appeared at $\delta 208.9 \mathrm{ppm}$. The methyl carbon atom (OCOMe) was resonated at $\delta 20.8 \mathrm{ppm}$, whereas the pregnene carbon atoms were fully identified ( $c f$ Experimental section). All the synthesized were confirmed also from their ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}$ HSQC NMR spectra [42].

The inversion in configuration at $\mathrm{C}-3$ during the formation of the $\alpha$-ester $\mathbf{1 0 - 1 9}$ was assigned from their NOESY ${ }^{1} \mathrm{H},{ }^{1} \mathrm{H}$ NMR spectroscopy [43]. Compound 11 has been selected for NOESY NMR correlation. Thus, $\mathrm{H}-3$ at $\delta=3.25 \mathrm{ppm}$ was correlated with $\mathrm{H}-2$ a at $\delta=1.71 \mathrm{ppm}, \mathrm{H}-1$ a at $\delta=1.80 \mathrm{ppm}$, as well as $\mathrm{H}-4$ a at $\delta=2.14 \mathrm{ppm}$, indicative for existence of $\mathrm{H}-3$ in an $\beta$ position and the ester in a $\alpha$ position (Figure 3 ).

Figure 3. NOESY ${ }^{1} \mathrm{H},{ }^{1} \mathrm{H}$ NMR correlation of the analogue 11.

### 3.2. In vitro anti-HIV activity

Compounds 10-14, 17-19 and 21 were tested for their in vitro anti-HIV-1 (strain $\mathrm{III}_{\mathrm{B}}$ ) and HIV-2 (strain ROD) activity in human T-lymphocyte (MT-4) cells based on an MTT assay [44]. The results are summarized in Table 1, in which the data for nevirapine (BOE/BIRG587) [45] and azidothymidine (DDN/AZT) [46] were included for comparison.

Compounds-induced cytotoxicity was also measured in MT-4 cells parallel with the antiviral activity. All compounds are inactive except compound 18 which showed $\mathrm{EC}_{50}$ values of $>1.95 \mu \mathrm{~g} / \mathrm{mL}$, respectively, but no selectivity was observed (SI <1).

From the SAR analysis, we found that the olefin and dihydroxy group substituents at the olefinic benzoate group at $\mathrm{C}-3$ of the pregnenolone ring, e.g. compound 18 was well tolerated in the hydrophobic region of HIV RT and then showed higher activity than those of the other benzoate substituents at C-3 of the same ring. This might be explained in term of hydrophobic interaction of the double bond as well as aromatic ring as well as hydrogen bonds of the two hydroxyl groups at the benzoate group with the amino acids of the HIV1 RT.

## 4. Molecular modeling analysis

The molecular docking was performed using SYBYL-X 1.1 and the docking results were shown by PyMOL [47]. Our molecular docking analysis of the new analogues based on the modeling study which was performed to understand the binding mode of these analogues with the HIV-RT binding pocket (NNIBP) (PDB code: 3DLG, [48]).

Compound 18 has been selected for the docking modeling study, since its binding energy score -8.2 , indicating a selectivity of substituted olefinic benzoate in its binding to the enzyme pocket (Figure 4). As shown in Figure 4, the aromatic ring of compound 18 fitted into an aromatic rich subpocket surrounded by the aromatic side chains of Tyr179 as well as the existence of the hydrogen bond between the hydroxyl group of Tyr179 with those of the benzoate moiety. The pregnenolone backbone was located in the middle of the binding pocket, anchoring the carbonyl substituent at $\mathrm{C}-20$ in a favourable position for hydrogen bonding with the $\mathrm{NH}_{2}$ group of Lys101, in addition to a hydrogen bond between the oxygen atom of $\mathrm{CO}_{2}$ group at $\mathrm{C}-3$ with NH 2 of Pro132 of the RT enzyme. Overall, the combination of hydrophobic interaction and $\pi$-stacking appears to govern the binding of compound 18 with HIV RT.

Figure 4. Docked conformation of compound $\mathbf{1 8}$ showing three hydrogen bonding: Lys101 with $\mathrm{C}=0$ at $\mathrm{C}-20$ and Pro132 with oxygen atom of $\mathrm{CO}_{2}$ at C-3 of pregnenolone ring, in addition to Tyr179 with hydroxyl group of the benzoate moiety. It exhibited also hydrophobic interaction between phenyl group of the benzoate moiety and Tyr179 of reverse transcriptase (RT) enzyme residues.

## 5. Conclusion

In conclusion, synthesis of new $3 \alpha$-substituted aryl ester derivatives of pregnenolone 10-13 and (5-pregnen-20-on-3 $\alpha$ -yl)-3-substituted-phenyl acrylates 17-19 by applying Mitsunobu reaction has been described. All the compounds were assigned by their 2D NMR spectroscopy, where NOESY NMR spectra have confirmed the inversion in configuration at $\mathrm{C}-3$ during the formation of $\alpha$-ester analogues. All the new synthesized compounds have been evaluated for their activity against HIV-1 and 2. Compounds $\mathbf{1 8}$ showed potential activity against HIV-1, whereas the others analogues shown moderate to poor activity. Compound 18 have been selected for the
molecular modeling study showing its binding to the reverse transcriptase enzyme pocket through three hydrogen bonding and one hydrophobic interaction.

## Acknowledgement

We thank Prof. Christophe Pannecouque of Rega Institute for Medical Research, Katholieke Universiteit, Leuven, Belgium for the anti-HIV screening. Mr. Ulrich Haunz and Miss Anka Friemel of Chemistry Department, University of Konstanz, Germany are highly acknowledged for the NMR experiments.
