Network monitoring How monitoring is done today

We want to monitor the network.

Specifically, we want to allow administrators to *easily*:

- collect network usage statistics
- detect intrusions
- provide forensic evidence

Network monitoring How monitoring is done today

# Challenges

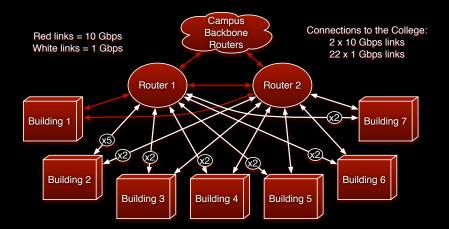

Middleboxes are commonly used, however, they present challenges...

- Speed
- 2 Cost
- 8 Flexibility
  - 1 Setup: rewire
  - 2 Change: rewire
  - 3 Add new middlebox: rewire

... making them ill suited for network monitoring.

Network monitoring How monitoring is done today

# Example: College of Engineering

Jeffrey R. Ballard, Ian Rae, Aditya Akella

Network monitoring How monitoring is done today

## How do people actually do it?

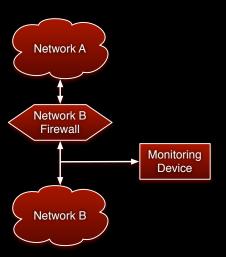

Mirror (or tap) an interesting network interface to another switch port, then listen to that port with something like Snort.

Advantage over a middlebox: monitoring has no impact on the production traffic and routes.

Disadvantages: the traffic can run you over, and it's still hard to add new detectors.

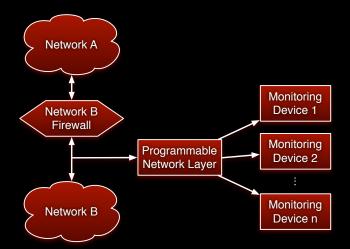

Network monitoring How monitoring is done today

#### What it looks like today

Network monitoring How monitoring is done today

#### What we want to do

Jeffrey R. Ballard, Ian Rae, Aditya Akella

OpenSAFE ALARMS Rule Aggregation Distribution

OpenSAFE uses a programmable network fabric to...

- Selectively match network flows
- Arbitrarily direct network flows to other switch ports at line rate
- Direct exceptions to a software component
- Enable the use of commodity network hardware

OpenSAFE ALARMS Rule Aggregation Distribution

# Why not implement it in software?

# We could use something like Click to dynamically manage detectors.

#### Major problem: software is not fast enough!

Jeffrey R. Ballard, Ian Rae, Aditya Akella Extensible and Scalable Network Monitoring Using OpenSAFE

OpenSAFE ALARMS Rule Aggregation Distribution

## Solution: Hardware!

#### Easiest: Custom ASICs

- Expensive
- 2 Non-standard
- 9 Potentially hard to configure

#### But we have something that can do this...

OpenSAFE ALARMS Rule Aggregation Distribution

#### W

## Programmable Network Fabric

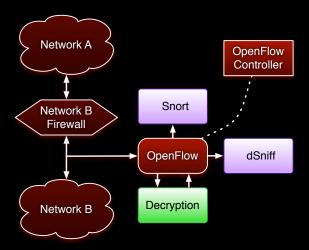

While OpenSAFE would be compatible with any programmable network fabric, we implemented OpenSAFE in OpenFlow since it is available today.

The key elements are:

- speed
- 2 heterogeneity
- 8 flexibility
- 4 cost

OpenSAFE ALARMS Rule Aggregation Distribution

# Example OpenSAFE Layout

Jeffrey R. Ballard, Ian Rae, Aditya Akella

OpenSAFE ALARMS Rule Aggregation Distribution

## ALARMS

ALARMS: A Language for Arbitrary Route Management for Security

Basic building blocks are **paths** of:

- Inputs: copy of traffic from a mirror switch port
- Selects: restricts the set of traffic for this rule
- Filters: pass the traffic through an application
- Sinks: where to finally direct the traffic

Combining these gives us a rich set of configurations.

OpenSAFE ALARMS Rule Aggregation Distribution

# Simple Example

We will use the following example over the next few slides:

Take all TCP port 80 traffic, send it to a counter, and then send it to a machine running tcpdump.

OpenSAFE ALARMS Rule Aggregation Distribution

#### Paths

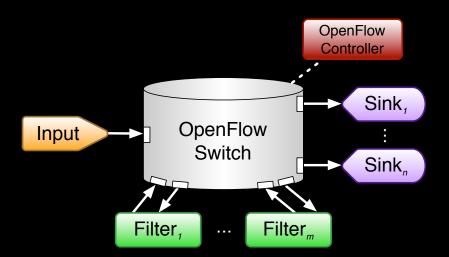

A path is:

- A source switch port with selection criteria
- ... which goes into zero or more filters
- ... then out to one or more sinks

OpenSAFE ALARMS Rule Aggregation Distribution

## **OpenSAFE** Schematic

Jeffrey R. Ballard, Ian Rae, Aditya Akella

OpenSAFE ALARMS Rule Aggregation Distribution

# Policy naming

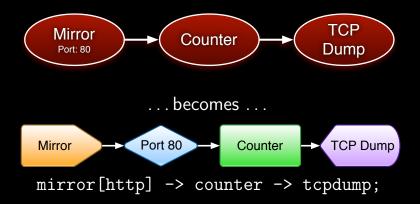

In OpenSAFE all switch ports are named.

# Logically, ALARMS articulates paths of named switch ports.

Jeffrey R. Ballard, Ian Rae, Aditya Akella Extensible and Scalable Network Monitoring Using OpenSAFE

OpenSAFE ALARMS Rule Aggregation Distribution

#### Revisiting our example

Jeffrey R. Ballard, Ian Rae, Aditya Akella

OpenSAFE ALARMS Rule Aggregation Distribution

#### Let's get some more paths

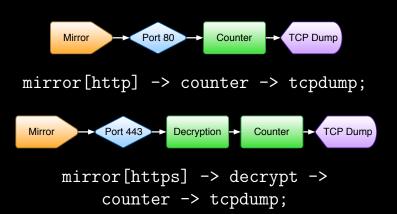

#### mirror[http] -> counter -> tcpdump;

Jeffrey R. Ballard, Ian Rae, Aditya Akella Extensible and Scalable Network Monitoring Using OpenSAFE

OpenSAFE ALARMS Rule Aggregation Distribution

#### Let's get some more paths

Jeffrey R. Ballard, Ian Rae, Aditya Akella

OpenSAFE ALARMS **Rule Aggregation** Distribution

# Waypoints

As more rules are added, often the rules follow the same paths making rule management difficult.

Solution:

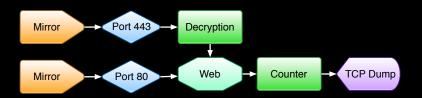

#### Waypoints are virtual destinations for paths.

Jeffrey R. Ballard, Ian Rae, Aditya Akella

OpenSAFE ALARMS Rule Aggregation Distribution

## Waypoint example

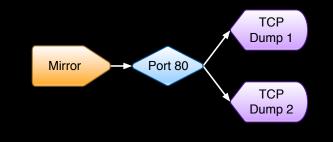

#### mirror[https] -> decrypt -> web; mirror[http] -> web; <u>web -</u>> counter -> tcpdump;

Jeffrey R. Ballard, Ian Rae, Aditya Akella

OpenSAFE ALARMS Rule Aggregation Distribution

## Multiple Destinations

mirror[http] -> {ALL, tcpdump1, tcpdump2};

Jeffrey R. Ballard, Ian Rae, Aditya Akella

OpenSAFE ALARMS Rule Aggregation Distribution

#### Distribution rules

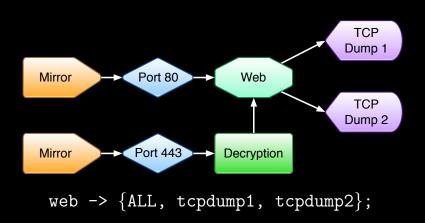

When parallel filters or sinks are used, distribution rules describe how **traffic flows** should be spread.

Rules include:

Any	Randomly pick a switch port
All	Replicate packet to all switch ports
Round Robin	Cycle through the switch ports
Hash	Apply a hash function

OpenSAFE ALARMS Rule Aggregation Distribution

### Multiple Destinations

Jeffrey R. Ballard, Ian Rae, Aditya Akella

Mapping to OpenFlow Switch Example

# Mapping the language into OpenFlow

We want to handle lots of traffic, so need high performance.

Hardware is fast. Software is slow.

Install as many precomputed flow entries as possible.

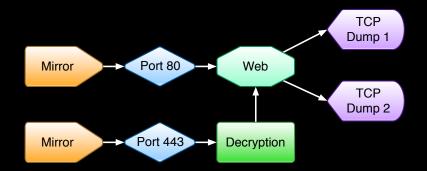

However, when the hardware does not support functions we must go to software. In OpenFlow this includes Any, Round Robin, and Hash distribution rules.

Mapping to OpenFlow Switch Example

## How it works under the hood

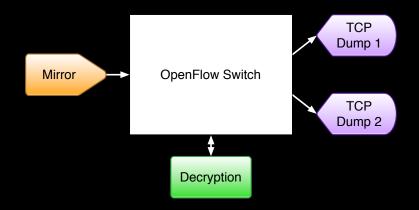

Starting with the last path diagram we had before...

Related Work Future Work Conclusion

# Related Work: Ethane

The focus here is to insert a tool just at the border, optimized for the border.

Related Work Future Work Conclusion

# Related Work: Policy-aware switching

*Policy-aware switching*, proposed by Joseph et al. is somewhat similar to Ethane.

It removes the centralized controller, and has each switch determine the next hop.

Also, the policy specification language, like Ethane, is centered around deciding appropriate paths for a flow.

Related Work Future Work Conclusion

### What next?

In the future, we'd like to expand our system by exploring:

- incorporating dynamic feedback from filters and sinks
- precomputing more dynamic distribution rules

Related Work Future Work Conclusion

OpenSAFE greatly simplifies high-speed network monitoring.

- It is also:
  - Cost effective by using commodity hardware
  - Flexible and easy to modify
  - Capable of operating at high line rates
