# Faber Polynomial Coefficient Estimates for a Subclass of Analytic Bi-univalent Functions 

Serap Bulut ${ }^{\text {a }}$<br>${ }^{a}$ Kocaeli University, Civil Aviation College, Arslanbey Campus, TR-41285 İzmit-Kocaeli, Turkey

#### Abstract

In this work, considering a general subclass of analytic bi-univalent functions, we determine estimates for the general Taylor-Maclaurin coefficients of the functions in this class. For this purpose, we use the Faber polynomial expansions. In certain cases, our estimates improve some of those existing coeffcient bounds.

## 1. Introduction

Let $\mathcal{A}$ denote the class of all functions of the form

$$
\begin{equation*}
f(z)=z+\sum_{n=2}^{\infty} a_{n} z^{n} \tag{1}
\end{equation*}
$$

which are analytic in the open unit disk

$$
\mathbb{U}=\{z: z \in \mathbb{C} \quad \text { and } \quad|z|<1\}
$$

We also denote by $\mathcal{S}$ the class of all functions in the normalized analytic function class $\mathcal{A}$ which are univalent in $\mathbb{U}$.

It is well known that every function $f \in \mathcal{S}$ has an inverse $f^{-1}$, which is defined by

$$
f^{-1}(f(z))=z \quad(z \in \mathbb{U})
$$

and

$$
f\left(f^{-1}(w)\right)=w \quad\left(|w|<r_{0}(f) ; r_{0}(f) \geq \frac{1}{4}\right)
$$

In fact, the inverse function $g=f^{-1}$ is given by

$$
\begin{align*}
g(w) & =f^{-1}(w) \\
& =w-a_{2} w^{2}+\left(2 a_{2}^{2}-a_{3}\right) w^{3}-\left(5 a_{2}^{3}-5 a_{2} a_{3}+a_{4}\right) w^{4}+\cdots \\
& =: w+\sum_{n=2}^{\infty} A_{n} w^{n} . \tag{2}
\end{align*}
$$

[^0]A function $f \in \mathcal{A}$ is said to be bi-univalent in $\mathbb{U}$ if both $f$ and $f^{-1}$ are univalent in $\mathbb{U}$. Let $\Sigma$ denote the class of bi-univalent functions in $\mathbb{U}$ given by (1). The class of analytic bi-univalent functions was first introduced and studied by Lewin [22], where it was proved that $\left|a_{2}\right|<1.51$. Brannan and Clunie [4] improved Lewin's result to $\left|a_{2}\right| \leq \sqrt{2}$ and later Netanyahu [24] proved that $\left|a_{2}\right| \leq 4 / 3$. Brannan and Taha [5] and Taha [31] also investigated certain subclasses of bi-univalent functions and found non-sharp estimates on the first two Taylor-Maclaurin coefficients $\left|a_{2}\right|$ and $\left|a_{3}\right|$. For a brief history and interesting examples of functions in the class $\Sigma$, see [29] (see also [5]). In fact, the aforecited work of Srivastava et al. [29] essentially revived the investigation of various subclasses of the bi-univalent function class $\Sigma$ in recent years; it was followed by such works as those by Frasin and Aouf [14], Xu et al. [33, 34], Hayami and Owa [19], and others (see, for example, [2, 6-9, 11, 15, 23, 25, 26, 28]).

Not much is known about the bounds on the general coefficient $\left|a_{n}\right|$ for $n>3$. This is because the bi-univalency requirement makes the behavior of the coefficients of the function $f$ and $f^{-1}$ unpredictable. Here, in this paper, we use the Faber polynomial expansions for a general subclass of analytic bi-univalent functions to determine estimates for the general coefficient bounds $\left|a_{n}\right|$.

The Faber polynomials introduced by Faber [13] play an important role in various areas of mathematical sciences, especially in geometric function theory. The recent publications [16] and [18] applying the Faber polynomial expansions to meromorphic bi-univalent functions motivated us to apply this technique to classes of analytic bi-univalent functions.

In the literature, there are only a few works determining the general coefficient bounds $\left|a_{n}\right|$ for the analytic bi-univalent functions given by (1) using Faber polynomial expansions, [10, 17, 20, 21, 30]. Hamidi and Jahangiri [17] considered the class of analytic bi-close-to-convex functions. Jahangiri and Hamidi [20] considered the class defined by Frasin and Aouf [14]. Bulut [10] generalized the results obtained in [20]. Jahangiri et al. [21] considered the class of analytic bi-univalent functions with positive real-part derivatives. In this work, we generalize the results obtained by Srivastava et al. [30].

## 2. The Class $\mathcal{N}_{\Sigma}(\alpha, \lambda, \delta)$

Firstly, we introduce a general class of analytic bi-univalent functions as follows.
Definition 1. For $\lambda \geq 1$ and $\delta \geq 0$, a function $f \in \sum$ given by (1) is said to be in the class $\mathcal{N}_{\Sigma}(\alpha, \lambda, \delta)$ if the following conditions are satisfied:

$$
\begin{equation*}
\operatorname{Re}\left((1-\lambda) \frac{f(z)}{z}+\lambda f^{\prime}(z)+\delta z f^{\prime \prime}(z)\right)>\alpha \tag{3}
\end{equation*}
$$

and

$$
\begin{equation*}
\operatorname{Re}\left((1-\lambda) \frac{g(w)}{w}+\lambda g^{\prime}(w)+\delta w g^{\prime \prime}(w)\right)>\alpha \tag{4}
\end{equation*}
$$

where $0 \leq \alpha<1$ and $z, w \in \mathbb{U}$ and $g=f^{-1}$ is defined by (2).
Remark 1. In the following special cases of Definition 1, we show how the class of analytic bi-univalent functions $\mathcal{N}_{\Sigma}(\alpha, \lambda, \delta)$ for suitable choices of $\lambda$ and $\delta$ lead to certain new as well as known classes of analytic bi-univalent functions studied earlier in the literature.
(i) For $\delta=0$, we obtain the bi-univalent function class

$$
\mathcal{N}_{\Sigma}(\alpha, \lambda, 0)=\mathcal{B}_{\Sigma}(\alpha, \lambda)
$$

introduced by Frasin and Aouf [14]. This class consists of functions $f \in \Sigma$ satisfying

$$
\operatorname{Re}\left((1-\lambda) \frac{f(z)}{z}+\lambda f^{\prime}(z)\right)>\alpha
$$

and

$$
\operatorname{Re}\left((1-\lambda) \frac{g(w)}{w}+\lambda g^{\prime}(w)\right)>\alpha
$$

where $0 \leq \alpha<1$ and $z, w \in \mathbb{U}$ and $g=f^{-1}$ is defined by (2).
(ii) For $\delta=0$ and $\lambda=1$, we have the bi-univalent function class

$$
\mathcal{N}_{\Sigma}(\alpha, 1,0)=\mathcal{H}_{\Sigma}(\alpha)
$$

introduced by Srivastava et al. [29]. This class consists of functions $f \in \Sigma$ satisfying

$$
\operatorname{Re}\left(f^{\prime}(z)\right)>\alpha
$$

and

$$
\operatorname{Re}\left(g^{\prime}(w)\right)>\alpha
$$

where $0 \leq \alpha<1$ and $z, w \in \mathbb{U}$ and $g=f^{-1}$ is defined by (2).
(iii) For $\lambda=1$, we get the bi-univalent function class

$$
\mathcal{N}_{\Sigma}(\alpha, 1, \delta)=\mathcal{N}_{\Sigma}^{(\alpha, \delta)}
$$

introduced by Srivastava et al. [30]. This class consists of functions $f \in \Sigma$ satisfying

$$
\operatorname{Re}\left(f^{\prime}(z)+\delta z f^{\prime \prime}(z)\right)>\alpha
$$

and

$$
\operatorname{Re}\left(g^{\prime}(w)+\delta w g^{\prime \prime}(w)\right)>\alpha
$$

where $0 \leq \alpha<1$ and $z, w \in \mathbb{U}$ and $g=f^{-1}$ is defined by (2).

## 3. Coefficient Estimates

Using the Faber polynomial expansion of functions $f \in \mathcal{A}$ of the form (1), the coefficients of its inverse $\operatorname{map} g=f^{-1}$ may be expressed as, [1]:

$$
\begin{equation*}
g(w)=f^{-1}(w)=w+\sum_{n=2}^{\infty} \frac{1}{n} K_{n-1}^{-n}\left(a_{2}, a_{3}, \ldots\right) w^{n}, \tag{5}
\end{equation*}
$$

where

$$
\begin{align*}
K_{n-1}^{-n}= & \frac{(-n)!}{(-2 n+1)!(n-1)!} a_{2}^{n-1} \\
& +\frac{(-n)!}{(2(-n+1))!(n-3))!} a_{2}^{n-3} a_{3} \\
& +\frac{(-n)!}{(-2 n+3)!(n-4)!} a_{2}^{n-4} a_{4}  \tag{6}\\
& +\frac{(-n)!}{(2(-n+2)!(n-5)!} a_{2}^{n-5}\left[a_{5}+(-n+2) a_{3}^{2}\right] \\
& +\frac{(-n)!}{(-2 n+5)!(n-6)!a_{2}^{n-6}\left[a_{6}+(-2 n+5) a_{3} a_{4}\right]} \\
& +\sum_{j \geq 7} a_{2}^{n-j} V_{j},
\end{align*}
$$

such that $V_{j}$ with $7 \leq j \leq n$ is a homogeneous polynomial in the variables $a_{2}, a_{3}, \ldots, a_{n}$, [3]. In particular, the first three terms of $K_{n-1}^{-n}$ are

$$
\begin{align*}
& K_{1}^{-2}=-2 a_{2} \\
& K_{2}^{-3}=3\left(2 a_{2}^{2}-a_{3}\right),  \tag{7}\\
& K_{3}^{-4}=-4\left(5 a_{2}^{3}-5 a_{2} a_{3}+a_{4}\right) .
\end{align*}
$$

In general, for any $p \in \mathbb{N}:=\{1,2,3, \ldots\}$, an expansion of $K_{n}^{p}$ is as, [1],

$$
\begin{align*}
K_{n}^{p}= & p a_{n}+\frac{p(p-1)}{2} D_{n}^{2}+\frac{p!}{(p-3)!3!} D_{n}^{3} \\
& +\cdots+\frac{p!}{(p-n)!n!} D_{n}^{n} \tag{8}
\end{align*}
$$

where

$$
D_{n}^{p}=D_{n}^{p}\left(a_{2}, a_{3}, \ldots\right),
$$

and by [32],

$$
D_{n}^{m}\left(a_{1}, a_{2}, \ldots, a_{n}\right)=\sum_{n=1}^{\infty} \frac{m!}{i_{1}!\ldots i_{n}!} a_{1}^{i_{1}} \ldots a_{n}^{i_{n}}
$$

while $a_{1}=1$, and the sum is taken over all non-negative integers $i_{1}, \ldots, i_{n}$ satisfying

$$
\begin{aligned}
i_{1}+i_{2}+\cdots+i_{n} & =m \\
i_{1}+2 i_{2}+\cdots+n i_{n} & =n
\end{aligned}
$$

It is clear that

$$
D_{n}^{n}\left(a_{1}, a_{2}, \ldots, a_{n}\right)=a_{1}^{n} .
$$

Consequently, for functions $f \in \mathcal{N}_{\Sigma}(\alpha, \lambda, \delta)$ of the form (1), we can write:

$$
\begin{equation*}
(1-\lambda) \frac{f(z)}{z}+\lambda f^{\prime}(z)+\delta z f^{\prime \prime}(z)=1+\sum_{n=2}^{\infty}[1+(n-1) \lambda+n(n-1) \delta] a_{n} z^{n-1} \tag{9}
\end{equation*}
$$

Our first theorem introduces an upper bound for the coefficients $\left|a_{n}\right|$ of analytic bi-univalent functions in the class $\mathcal{N}_{\Sigma}(\alpha, \lambda, \delta)$.

Theorem 2. For $\lambda \geq 1, \delta \geq 0$ and $0 \leq \alpha<1$, let the function $f \in \mathcal{N}_{\Sigma}(\alpha, \lambda, \delta)$ be given by (1). If $a_{k}=$ $0(2 \leq k \leq n-1)$, then

$$
\left|a_{n}\right| \leq \frac{2(1-\alpha)}{1+(n-1) \lambda+n(n-1) \delta} \quad(n \geq 4)
$$

Proof. For the function $f \in \mathcal{N}_{\Sigma}(\alpha, \lambda, \delta)$ of the form (1), we have the expansion (9) and for the inverse map $g=f^{-1}$, considering (2), we obtain

$$
\begin{equation*}
(1-\lambda) \frac{g(w)}{w}+\lambda g^{\prime}(w)+\delta w g^{\prime \prime}(w)=1+\sum_{n=2}^{\infty}[1+(n-1) \lambda+n(n-1) \delta] A_{n} w^{n-1} \tag{10}
\end{equation*}
$$

with

$$
\begin{equation*}
A_{n}=\frac{1}{n} K_{n-1}^{-n}\left(a_{2}, a_{3}, \ldots, a_{n}\right) . \tag{11}
\end{equation*}
$$

On the other hand, since $f \in \mathcal{N}_{\Sigma}(\alpha, \lambda, \delta)$ and $g=f^{-1} \in \mathcal{N}_{\Sigma}(\alpha, \lambda, \delta)$, by definition, there exist two positive real-part functions

$$
p(z)=1+\sum_{n=1}^{\infty} c_{n} z^{n} \in \mathcal{A}
$$

and

$$
q(w)=1+\sum_{n=1}^{\infty} d_{n} w^{n} \in \mathcal{A}
$$

where

$$
\operatorname{Re}(p(z))>0 \quad \text { and } \operatorname{Re}(q(w))>0
$$

in $\mathbb{U}$ so that

$$
\begin{equation*}
(1-\lambda) \frac{f(z)}{z}+\lambda f^{\prime}(z)+\delta z f^{\prime \prime}(z)=\alpha+(1-\alpha) p(z)=1+(1-\alpha) \sum_{n=1}^{\infty} K_{n}^{1}\left(c_{1}, c_{2}, \ldots, c_{n}\right) z^{n} \tag{12}
\end{equation*}
$$

and

$$
\begin{equation*}
(1-\lambda) \frac{g(w)}{w}+\lambda g^{\prime}(w)+\delta w g^{\prime \prime}(w)=\alpha+(1-\alpha) q(w)=1+(1-\alpha) \sum_{n=1}^{\infty} K_{n}^{1}\left(d_{1}, d_{2}, \ldots, d_{n}\right) w^{n} \tag{13}
\end{equation*}
$$

Note that, by the Caratheodory lemma (e.g., [12]),

$$
\left|c_{n}\right| \leq 2 \quad \text { and } \quad\left|d_{n}\right| \leq 2 \quad(n \in \mathbb{N})
$$

Comparing the corresponding coefficients of (9) and (12), for any $n \geq 2$, yields

$$
\begin{equation*}
[1+(n-1) \lambda+n(n-1) \delta] a_{n}=(1-\alpha) K_{n-1}^{1}\left(c_{1}, c_{2}, \ldots, c_{n-1}\right), \tag{14}
\end{equation*}
$$

and similarly, from (10) and (13) we find

$$
\begin{equation*}
[1+(n-1) \lambda+n(n-1) \delta] A_{n}=(1-\alpha) K_{n-1}^{1}\left(d_{1}, d_{2}, \ldots, d_{n-1}\right) \tag{15}
\end{equation*}
$$

Note that for $a_{k}=0(2 \leq k \leq n-1)$, we have

$$
A_{n}=-a_{n}
$$

and so

$$
\begin{aligned}
{[1+(n-1) \lambda+n(n-1) \delta] a_{n} } & =(1-\alpha) c_{n-1} \\
-[1+(n-1) \lambda+n(n-1) \delta] a_{n} & =(1-\alpha) d_{n-1} .
\end{aligned}
$$

Taking the absolute values of the above equalities, we obtain

$$
\left|a_{n}\right|=\frac{(1-\alpha)\left|c_{n-1}\right|}{1+(n-1) \lambda+n(n-1) \delta}=\frac{(1-\alpha)\left|d_{n-1}\right|}{1+(n-1) \lambda+n(n-1) \delta} \leq \frac{2(1-\alpha)}{1+(n-1) \lambda+n(n-1) \delta^{\prime}}
$$

which completes the proof of the Theorem 2.
The following corollaries are immediate consequences of the above theorem.
Corollary 3. [20, Theorem 1] For $\lambda \geq 1$ and $0 \leq \alpha<1$, let the function $f \in \mathcal{B}_{\Sigma}(\alpha, \lambda)$ be given by (1). If $a_{k}=0(2 \leq k \leq n-1)$, then

$$
\left|a_{n}\right| \leq \frac{2(1-\alpha)}{1+(n-1) \lambda} \quad(n \geq 4)
$$

Corollary 4. [30, Theorem 1] For $\delta \geq 0$ and $0 \leq \alpha<1$, let the function $f \in \mathcal{N}_{\Sigma}^{(\alpha, \delta)}$ be given by (1). If $a_{k}=$ $0(2 \leq k \leq n-1)$, then

$$
\left|a_{n}\right| \leq \frac{2(1-\alpha)}{n[1+(n-1) \delta]} \quad(n \geq 4)
$$

Theorem 5. For $\lambda \geq 1, \delta \geq 0$ and $0 \leq \alpha<1$, let the function $f \in \mathcal{N}_{\Sigma}(\alpha, \lambda, \delta)$ be given by (1). Then one has the following

$$
\begin{align*}
& \left|a_{2}\right| \leq\left\{\begin{array}{cc}
\sqrt{\frac{2(1-\alpha)}{1+2 \lambda+6 \delta}}, & 0 \leq \alpha<1-\frac{(1+\lambda+2 \delta)^{2}}{2(1+2 \lambda+6 \delta)} \\
\frac{2(1-\alpha)}{1+\lambda+2 \delta} & , 1-\frac{(1+\lambda+2 \delta)^{2}}{2(1+2 \lambda+6 \delta)} \leq \alpha<1
\end{array},\right.  \tag{16}\\
& \left|a_{3}\right| \leq \frac{2(1-\alpha)}{1+2 \lambda+6 \delta^{\prime}},  \tag{17}\\
& \left|a_{3}-2 a_{2}^{2}\right| \leq \frac{2(1-\alpha)}{1+2 \lambda+6 \delta} .
\end{align*}
$$

Proof. If we set $n=2$ and $n=3$ in (14) and (15), respectively, we get

$$
\begin{align*}
& (1+\lambda+2 \delta) a_{2}=(1-\alpha) c_{1}  \tag{18}\\
& (1+2 \lambda+6 \delta) a_{3}=(1-\alpha) c_{2}  \tag{19}\\
& -(1+\lambda+2 \delta) a_{2}=(1-\alpha) d_{1}  \tag{20}\\
& (1+2 \lambda+6 \delta)\left(2 a_{2}^{2}-a_{3}\right)=(1-\alpha) d_{2} \tag{21}
\end{align*}
$$

From (18) and (20), we find (by the Caratheodory lemma)

$$
\begin{equation*}
\left|a_{2}\right|=\frac{(1-\alpha)\left|c_{1}\right|}{1+\lambda+2 \delta}=\frac{(1-\alpha)\left|d_{1}\right|}{1+\lambda+2 \delta} \leq \frac{2(1-\alpha)}{1+\lambda+2 \delta} \tag{22}
\end{equation*}
$$

Also from (19) and (21), we obtain

$$
\begin{equation*}
2(1+2 \lambda+6 \delta) a_{2}^{2}=(1-\alpha)\left(c_{2}+d_{2}\right) \tag{23}
\end{equation*}
$$

Using the Caratheodory lemma, we get

$$
\left|a_{2}\right| \leq \sqrt{\frac{2(1-\alpha)}{1+2 \lambda+6 \delta}}
$$

and combining this with inequality (22), we obtain the desired estimate on the coefficient $\left|a_{2}\right|$ as asserted in (16).

Next, in order to find the bound on the coefficient $\left|a_{3}\right|$, we subtract (21) from (19). We thus get

$$
(1+2 \lambda+6 \delta)\left(-2 a_{2}^{2}+2 a_{3}\right)=(1-\alpha)\left(c_{2}-d_{2}\right)
$$

or

$$
\begin{equation*}
a_{3}=a_{2}^{2}+\frac{(1-\alpha)\left(c_{2}-d_{2}\right)}{2(1+2 \lambda+6 \delta)} \tag{24}
\end{equation*}
$$

Upon substituting the value of $a_{2}^{2}$ from (18) into (24), it follows that

$$
a_{3}=\frac{(1-\alpha)^{2} c_{1}^{2}}{(1+\lambda+2 \delta)^{2}}+\frac{(1-\alpha)\left(c_{2}-d_{2}\right)}{2(1+2 \lambda+6 \delta)}
$$

We thus find (by the Caratheodory lemma) that

$$
\begin{equation*}
\left|a_{3}\right| \leq \frac{4(1-\alpha)^{2}}{(1+\lambda+2 \delta)^{2}}+\frac{2(1-\alpha)}{1+2 \lambda+6 \delta} \tag{25}
\end{equation*}
$$

On the other hand, upon substituting the value of $a_{2}^{2}$ from (23) into (24), it follows that

$$
a_{3}=\frac{(1-\alpha) c_{2}}{1+2 \lambda+6 \delta}
$$

Consequently (by the Caratheodory lemma), we have

$$
\begin{equation*}
\left|a_{3}\right| \leq \frac{2(1-\alpha)}{1+2 \lambda+6 \delta} \tag{26}
\end{equation*}
$$

Combining (25) and (26), we get the desired estimate on the coefficient $\left|a_{3}\right|$ as asserted in (17).
Finally, from (21), we deduce (by the Caratheodory lemma) that

$$
\left|a_{3}-2 a_{2}^{2}\right|=\frac{(1-\alpha)\left|d_{2}\right|}{1+2 \lambda+6 \delta} \leq \frac{2(1-\alpha)}{1+2 \lambda+6 \delta}
$$

This evidently completes the proof of Theorem 5.
Remark 2. The above estimates for $\left|a_{2}\right|$ and $\left|a_{3}\right|$ show that Theorem 5 is an improvement of the estimates obtained by Sivasubramanian et al. [27, Theorem 3.2].

By setting $\delta=0$ in Theorem 5, we obtain the following consequence.
Corollary 6. [20, Theorem 2] For $\lambda \geq 1$ and $0 \leq \alpha<1$, let the function $f \in \mathcal{B}_{\Sigma}(\alpha, \lambda)$ be given by (1). Then one has the following

$$
\begin{aligned}
& \left|a_{2}\right| \leq\left\{\begin{array}{cc}
\sqrt{\frac{2(1-\alpha)}{1+2 \lambda}}, & 0 \leq \alpha<\frac{1+2 \lambda-\lambda^{2}}{2(1+2 \lambda)} \\
\frac{2(1-\alpha)}{1+\lambda}, & \frac{1+2 \lambda-\lambda^{2}}{2(1+2 \lambda)} \leq \alpha<1
\end{array}\right. \\
& \left|a_{3}\right| \leq \frac{2(1-\alpha)}{1+2 \lambda} \\
& \left|a_{3}-2 a_{2}^{2}\right| \leq \frac{2(1-\alpha)}{1+2 \lambda}
\end{aligned}
$$

Remark 3. The above estimates for $\left|a_{2}\right|$ and $\left|a_{3}\right|$ show that Corollary 6 is an improvement of the estimates obtained by Frasin and Aouf [14, Theorem 3.2].

By setting $\delta=0$ and $\lambda=1$ in Theorem 5, we obtain the following consequence.
Corollary 7. For $0 \leq \alpha<1$, let the function $f \in \mathcal{H}_{\Sigma}(\alpha)$ be given by (1). Then one has the following

$$
\begin{aligned}
& \left|a_{2}\right| \leq\left\{\begin{array}{cc}
\sqrt{\frac{2(1-\alpha)}{3}}, & 0 \leq \alpha<\frac{1}{3} \\
1-\alpha & , \\
\frac{1}{3} \leq \alpha<1
\end{array}\right. \\
& \left|a_{3}\right| \leq \frac{2(1-\alpha)}{3}, \\
& \left|a_{3}-2 a_{2}^{2}\right| \leq \frac{2(1-\alpha)}{3}
\end{aligned}
$$

Remark 4. The above estimates for $\left|a_{2}\right|$ and $\left|a_{3}\right|$ show that Corollary 7 is an improvement of the estimates obtained by Srivastava et al. [29, Theorem 2].

By setting $\lambda=1$ in Theorem 5, we obtain the following consequence.
Corollary 8. [30, Theorem 2] For $\delta \geq 0$ and $0 \leq \alpha<1$, let the function $f \in \mathcal{N}_{\Sigma}^{(\alpha, \delta)}$ be given by (1). Then one has the following

$$
\begin{aligned}
& \left|a_{2}\right| \leq\left\{\begin{array}{cc}
\sqrt{\frac{2(1-\alpha)}{3(1+2 \delta)}} \quad, \quad 0 \leq \alpha<\frac{1+2 \delta-2 \delta^{2}}{3(1+2 \delta)} \\
\frac{1-\alpha}{1+\delta} & , \\
\frac{1+2 \delta-2 \delta^{2}}{3(1+2 \delta)} \leq \alpha<1
\end{array}\right. \\
& \left|a_{3}\right| \leq \frac{2(1-\alpha)}{3(1+2 \delta)} .
\end{aligned}
$$
