

## **Financial development and sectoral CO<sub>2</sub> emissions in Malaysia**

### **ABSTRACT**

The paper examines the impacts of financial development on sectoral carbon emissions (CO<sub>2</sub>) for environmental quality in Malaysia. Since the financial sector is considered as one of the sectors that will contribute to Malaysian economy to become a developed country by 2020, we utilize a cointegration method to investigate how financial development affects sectoral CO<sub>2</sub> emissions. The long-run results reveal that financial development increases CO<sub>2</sub> emissions from the transportation and oil and gas sector and reduces CO<sub>2</sub> emissions from manufacturing and construction sectors. However, the elasticity of financial development is not significant in explaining CO<sub>2</sub> emissions from the agricultural sector. The results for short-run elasticities were also consistent with the long-run results. We conclude that generally, financial development increases CO<sub>2</sub> emissions and reduces environmental quality in Malaysia.
