13. ABSTRACT *(Maximum 200 words)*
Air fluorescence models require accurate Franck-Condon factors and Einstein coefficients for analyzing the intensities of N_2, N_2^+, and O_2^+ emissions produced by electron bombardment of air, such as in the aurora, high-altitude nuclear explosions, and rocket-borne electron gun experiments. In our previous report, improved vibrational and rotational constants based on the latest available spectroscopic measurements for several excited and ionic states important in air fluorescence modeling were derived. These constants have been used in the present work to calculate band origins, Franck-Condon factors, and *r*-centroids for many band systems of nitrogen and oxygen. These results, together with electronic transition moments obtained from published papers or derived here from published emission data and measured upper-state lifetimes, have been used to compute Einstein coefficients by the *r*-centroid method. Einstein coefficients by integration of the product of the electronic transition moment function and vibrational wavefunctions have also been computed for comparison. For band systems involving "perturbed" electronic states, Einstein coefficients have been derived by simply normalizing published emission data to measured upper-state lifetimes. In this report, tables of band origin wavelengths and wavenumbers, Franck-Condon factors, *r*-cen-

troids, electronic transition moments, and Einstein coefficients are presented for 17 N_2, N_2^+, and O_2^+ band systems. Plots of most of the electronic transition moment functions used in these calculations are also given. In addition, tables of Franck-Condon factors only are presented for 16 other band systems of nitrogen and oxygen, and tables of band wavelengths and Einstein coefficients are presented for 3 band systems having "perturbed" upper states.

PREFACE

The authors are grateful to J. M. Ajello, D. J. Burns, L. A. Collins, P. C. Cosby, G. K. James, S. R. Langhoff, B. Liu, H. Partridge, and J.-Y. Roncin for helpful discussions and correspondence and for providing reprints used as reference material in this report.

SECTION 1
INTRODUCTION

Einstein coefficients (radiative transition probabilities) for molecular nitrogen and oxygen bands are useful for calculating the emission spectra produced by electron bombardment of air, such as occurs, for example, in the aurora (Meier, 1987), high-altitude nuclear explosions (Boquist and Snyder, 1967), and rocket-borne electron gun experiments (O'Neil *et al.*, 1978a; 1978b). Accurate values of these coefficients are required for predicting the intensities of N_2, N_2^+, and O_2^+ emissions, which dominate the air fluorescence spectrum. They are also useful for other applications, such as calculating the radiation from high-temperature air (Landshoff and Magee, 1969; Avilova *et al.*, 1969), and analyzing the emissions from gas discharges (Cramarossa *et al.*, 1974) and afterglows (Golde and Thrush, 1973).

It is possible to measure Einstein coefficients in the laboratory; however, because there are so many bands of interest, with wavelengths ranging from extreme ultraviolet to far infrared, it is impractical to measure them all individually. Instead, simplifying theoretical relations can be combined with limited experimental data to calculate Einstein coefficients for the large number of bands required. Such calculations are often based on the r-centroid approximation (e.g., Nicholls and Stewart, 1962). Einstein coefficients of different bands in a given band system are related to the vibrational overlap integrals, or Franck-Condon factors, and to the electronic transition moment, which can be approximated as a function of the expectation value of the internuclear distance, or r-centroid. The latter function can be derived from measured transition probabilities or band strengths of a few of the bands in the system. Franck-Condon factors are also useful for calculating the branching ratios for populating various vibrational levels when an electronic state is excited from the ground state by electron impact. This is based on the close relationship between transition probabilities in electron impact at high energies and radiation absorption for optically-allowed transitions (Lassettre, 1965; Lassettre *et al.*, 1965).

It is also possible to derive electronic transition moments from quantum-mechanical calculations, without use of band strength measurements. Such calculations are difficult, but have very recently attained an accuracy comparable to that of many band intensity measurements. They usually cover a wider range of internuclear distances than covered by the r-centroid method. Their accuracy can sometimes be

increased by multiplying the calculated transition moment by a constant correction factor based on a measurement of one band intensity or radiative lifetime.

Many Einstein coefficients, Franck-Condon factors, and r-centroids for nitrogen and oxygen band systems have been published previously. In a monograph on the spectrum of molecular oxygen, Krupenie (1972) compiled from various sources and tabulated many of these quantities for several oxygen band systems, including the A–X and b–a band systems of O_2^+, and several ionization systems of O_2. In a similar monograph on molecular nitrogen, Lofthus and Krupenie (1977) compiled and presented many of these quantities for several band systems of N_2 and N_2^+. More recently, Slanger (1986) tabulated Morse-potential Franck-Condon factors for the N_2 c_4'–a band system. James *et al.* (1988) tabulated Morse-potential Franck-Condon factors for the O_2^+ A–X band system and O_2^+ A–O_2 X ionization system. Green *et al.* (1988) tabulated RKR Franck-Condon factors and r-centroids for the N_2 B–A band system. Piper *et al.* (1989) tabulated Einstein coefficients for the N_2 B–A band system, which they calculated from their measured electronic transition moment function. Marinelli *et al.* (1988) tabulated Einstein coefficients for the N_2 a–X and a–a' band systems; however, later measurements of the a state lifetime by Marinelli *et al.* (1989) indicated that their a–X Einstein coefficients should be increased by about 35%. Ajello *et al.* (1989) tabulated Morse-potential Franck-Condon factors for the N_2 c_4'–X band system, and RKR Franck-Condon factors for several N_2 b'–X bands. Allen and Lin (1989) listed both RKR and Morse-potential Franck-Condon factors for a few N_2 c_4'–X bands. And finally, Allen *et al.* (1990) tabulated both RKR and Morse-potential Franck-Condon factors for the N_2 x–a', y–a', and y–w band systems.

However, the published literature falls far short of providing complete and accurate sets of radiative parameters for all of the band systems that contribute significantly to air fluorescence. In particular, values of Einstein coefficients and r-centroids are available for fewer than half of the band systems of interest. Moreover, many of the published values are based on older spectroscopic constants or radiative lifetimes that have been superseded by more recent measurements. In a previous report (Laher and Gilmore, 1991), the spectroscopic constants of the pertinent nitrogen and oxygen states were reviewed, and new constants for many of these states were derived. In the present work, these improved values have been employed to calculate new RKR potential curves and, thence, improved Franck-Condon factors and

r-centroids. Also, the available information on electronic transition moments has been examined, the best values determined or newly derived, and these used to calculate Einstein coefficients. The results from calculations employing both r-centroid and direct methods of computing Einstein coefficients are presented.

In addition, three band systems with "perturbed" upper electronic states are considered in this report. Einstein coefficients for these transitions cannot be calculated as simply as is possible for transitions involving unperturbed states. In these cases, the most practical alternative to a complex theoretical calculation is to derive Einstein coefficients from measured band intensities and radiative lifetimes. This is the approach that has been taken here.

SECTION 2
METHODS OF CALCULATION

2.1 RKR INTERNUCLEAR POTENTIAL ENERGY FUNCTIONS.

In the Rydberg-Klein-Rees (RKR) method of determining potential energy curves for diatomic molecules (Rydberg, 1931; Klein, 1932; Rees, 1947), the classical turning points are computed from experimental vibrational and rotational spectroscopic term values through the equations:

$$f(v) = \frac{h}{2\pi\sqrt{2\mu}} \int_{-1/2}^{v} [G(v) - G(v')]^{-1/2}\, dv', \tag{1}$$

and

$$g(v) = \frac{2\pi\sqrt{2\mu}}{h} \int_{-1/2}^{v} B_{v'}\, [G(v) - G(v')]^{-1/2}\, dv', \tag{2}$$

with the internuclear distances of the inner and outer turning points given by:

$$r_{\text{inner}},\ r_{\text{outer}} = (f/g + f^2)^{1/2} \mp f. \tag{3}$$

In the above equations, h is Planck's constant, μ is the reduced mass of the molecule, and $G(v)$ and B_v are mathematical expressions involving tabulated spectroscopic constants which give the experimentally determined vibrational energy and rotational constant at each vibrational quantum number v. In order to maintain high accuracy and remove the singularity that occurs at $v' = v$, the above equations have been integrated using a 16 point Gauss-Jacobi quadrature (Stroud and Secrest, 1966), as detailed by Tellinghuisen (1972).

These integrations yield the turning points at the value of the potential energy function $U(r)$ corresponding to the energy $G(v)$. As a result, $U(r)$ is determined at unequally-spaced values of internuclear distance r. In order to use this potential to calculate wave functions, it is necessary to interpolate it to equally-spaced values of r. In addition, it may be necessary to extrapolate the potential beyond the region derived from experimental data. Frequently, the interpolation is done with a high-order Lagrange polynomial (Zare, 1964), which, although cumbersome and computationally expensive, is stable for interpolation. Functional forms for

the repulsive and attractive potential segments may then be smoothly joined to the experimentally determined curve in order to extrapolate the potential energy into regions where the wave function becomes small. Typically the wave functions derived from the potential are not very sensitive to the choice of extrapolation segments used.

In the present work, an interpolation and extrapolation method based upon a Morse-type function has been used. This method has been found to yield results in excellent agreement with those produced by a seventh-order Lagrange interpolating polynomial, with a reduction in computation time by a factor of 3. The Morse potential function is given by:

$$U(r) = D_e\{1 - \exp[-\beta(r - r_e)]\}^2, \tag{4}$$

where D_e is the dissociation energy, β is a constant, and r_e is the equilibrium internuclear distance. Equation (4) can be inverted to yield an expression for the exponent:

$$L(r) \equiv -\beta(r - r_e) = \ln\left[1 \pm \sqrt{U(r)/D_e}\right], \tag{5}$$

where the upper sign is for $r < r_e$ and the lower for $r > r_e$. Substitution of the RKR values of $U(r)$ in equation (5) yields a set of values for β and, hence, through equation (4), a set of Morse potentials, each of which passes through one of the RKR points and has the correct curve minimum and dissociation limit. If the entire RKR curve agreed with a Morse potential, these calculated Morse potentials would coincide, and $L(r)$ would be a linear function of r. Due to deviations from the Morse potential, the calculated $L(r)$ behavior is not exactly linear, but its variation is gradual enough that linear interpolation between successive RKR values provides excellent accuracy. Similarly, linear extrapolation of $L(r)$ provides reasonable extensions of the RKR potential to somewhat larger and smaller internuclear separations.

For the calculations presented in this report, the molecular constants tabulated by Laher and Gilmore (1991) were used to compute r_e, T_e, $G(v)$, and B_v. The dissociation energy, D_e, for each state was determined by subtracting T_e from the energy of the dissociation limit. For most of the states of N_2 and N_2^+, and all of the states of O_2^+, this limit energy was calculated by adding the T_0 and D^0 values listed by Lofthus and Krupenie (1977) and Krupenie (1972), respectively.

However, for two of the higher states of N_2 and one of N_2^+ the listed D^0 values correspond to the onset of predissociation due to the "avoided crossing" of another potential curve (see Herzberg, 1950, p. 296). In employing equation (5) to calculate a potential curve below the avoided crossing, it is better to use a D_e value based on the noninteracting "diabatic" curve that goes to a higher dissociation limit. The molecular orbital configurations of these three states (Lofthus and Krupenie, 1977) suggest that the appropriate limits and energies (in cm^{-1}) are: N_2 $C\ ^3\Pi_u$, $^4S^0 + 2s2p^4\ ^4P$, 166850; N_2 $E\ ^3\Sigma_g^+$, $^4S^0 + 3s\ ^4P$, 162054; N_2^+ $C\ ^2\Sigma_u^+$, $^4S^0 + 2p^3\ ^5S^0$, 242725. Similarly, for the N_2 $D\ ^3\Sigma_u^+$ state, whose dissociation energy is not listed by Lofthus and Krupenie, the appropriate limit is $^4S^0 + 3s\ ^4P$, 162054.

2.2 WAVE FUNCTIONS, *R*-CENTROIDS, AND FRANCK-CONDON FACTORS.

The RKR potential energy derived above was used in the radial Schrödinger equation to solve for the rotationless vibrational wavefunctions, $\psi(r)$, where r is the internuclear distance. The numerical method of solution of the radial Schrödinger equation has been described by Cooley (1961); it employs the Numerov (1933) method of integration. Cooley's procedure also uses an improved formula for the correction of trial eigenvalues, based upon the second-order iteration-variation method of Löwdin (1958). Since the accuracy of this predictor-corrector formula does not depend critically upon a small step size being used in the radial coordinate, relatively few potential energy steps (1024) were used in the integration. A brief description of the Cooley method as well as an assessment of its accuracy and numerical stability may be found in the work of Cashion (1963). Using the computed vibrational wavefunctions, the Franck-Condon factors, $q_{v'v''}$, and r-centroids, $\bar{r}_{v'v''}$, were then calculated from their defining integrals (Fraser, 1954; Nicholls and Stewart, 1962):

$$q_{v'v''} = \left[\int \psi_{v'}^* \psi_{v''} dr\right]^2 , \tag{6}$$

$$\bar{r}_{v'v''} = \int \psi_{v'}^* r \psi_{v''} dr \Big/ \int \psi_{v'}^* \psi_{v''} dr , \tag{7}$$

by Simpson's rule integration, where the primes and double primes denote upper and lower states, respectively. Equation (7) shows that $\bar{r}_{v'v''}$ is a weighted mean of the internuclear distance for the (v'-v'') band, with the weighting function $\psi_{v'}^* \psi_{v''}$. However, unlike conventional weighting functions, $\psi_{v'}^* \psi_{v''}$ can change sign over the

integration range. Consequently, the denominator of equation (7) can become very small even when the numerator is not so small, so that the r-centroid can become very large, lying beyond the range of r where the wavefunctions are appreciable. For similar reasons, the r-centroid can also go negative. However, such large or negative values occur only when the denominator is quite small. In such a situation, the Franck-Condon factor, which equals the square of the denominator, is very small, and the band is correspondingly very weak and usually of little practical importance. Moreover, in such cases, the Franck-Condon factor and intensity often vary significantly with rotational quantum number, a variation which is conventionally neglected.

2.3 ELECTRONIC TRANSITION MOMENTS AND EINSTEIN COEFFICIENTS.

A diatomic electronic-vibrational transition may be expressed as

$$^{2S'+1}\Lambda'(v') \longrightarrow ^{2S''+1}\Lambda''(v''), \tag{8}$$

where S is the spin quantum number, and Λ is the electronic angular momentum quantum number (Λ values of 0, 1, 2, ... are indicated by the state symbols Σ, Π, Δ, ...).

In accordance with the definition established by Schadee (1978) and Whiting *et al.* (1980) for the electronic transition moment, the Einstein coefficient, $A_{v'v''}$ (in s^{-1}), for a transition in which $S' = S''$ is related to the electronic transition moment, $R_e(r)$ (in electric dipole moment atomic units), by

$$A_{v'v''} = (2.026 \times 10^{-6})\frac{(2 - \delta_{0,\Lambda'+\Lambda''})}{(2 - \delta_{0,\Lambda'})}\nu^3_{v'v''}\left[\int \psi^*_{v'} R_e(r)\psi_{v''}dr\right]^2, \tag{9}$$

where $\nu_{v'v''}$ is the band origin wavenumber (in cm^{-1}) and $\delta_{0,\Lambda}$ is the Kronecker delta, which equals 1 if $\Lambda = 0$ and equals 0 otherwise. For an electronic transition involving a change in spin, the corresponding relation is often more complicated, involving several independent transition moments (Whiting *et al.*, 1973). However, only one such spin-forbidden transition has been observed in air fluorescence, the N_2 $A\ ^3\Sigma^+_u$–$X\ ^1\Sigma^+_g$ Vegard-Kaplan band system. For this system the relation is simple; the fraction involving the Kronecker delta in equation (9) is just replaced by 2/3.

If the transition moment function, $R_e(r)$, for a band system is known from quantum-mechanical calculations, the Einstein coefficients for the bands can be calculated from equation (9). If, however, only experimental band strengths for some of the bands are known, equation (9) must first be inverted to solve for R_e in terms of the band strengths. The derived $R_e(r)$ can then be used to calculate the strengths or lifetimes of the other bands. The simplest method of performing this inversion is the r-centroid method (Fraser, 1954; Nicholls and Stewart, 1962). This method can be derived from a power series expansion of $R_e(r)$:

$$R_e(r) = a + br + cr^2 + \cdots. \tag{10}$$

The integral in equation (9) can then be written

$$\begin{aligned}\int \psi'_{v'} R_e(r) \psi_{v''} dr &= a \int \psi'_{v'} \psi_{v''} dr + b \int \psi'_{v'} r \psi_{v''} dr + c \int \psi'_{v'} r^2 \psi_{v''} dr + \cdots \\ &= q^{1/2}_{v'v''} \left[a + b\bar{r}_{v'v''} + c\bar{r}^2_{v'v''} Y^{(2)}_{v'v''} + \cdots \right], \end{aligned} \tag{11}$$

where

$$Y^{(2)}_{v'v''} = \frac{\int \psi'_{v'} r^2 \psi_{v''} dr / \int \psi'_{v'} \psi_{v''} dr}{\bar{r}^2_{v'v''}} = \frac{\overline{r^2_{v'v''}}}{\bar{r}^2_{v'v''}}. \tag{12}$$

For many band systems $R_e(r)$ can be well approximated by either a constant or a linear function of r, at least over the range of r important for the stronger bands. In this case the cr^2 term and higher terms in equation (10) can be dropped, and equation (11) becomes simply

$$\int \psi'_{v'} R_e(r) \psi_{v''} dr = q^{1/2}_{v'v''} R_e(\bar{r}_{v'v''}). \tag{13}$$

This is the r-centroid approximation.

Even when $R_e(r)$ is significantly nonlinear, equation (13) is a good approximation if the quantity $Y^{(2)}_{v'v''}$ in equations (11) and (12), and similar higher-order quantities, $Y^{(3)}_{v'v''} = \overline{r^3}/\bar{r}^3$, etc., are near unity. McCallum *et al.* (1972) have presented extensive tables of $Y^{(2)}_{v'v''}$ and $Y^{(3)}_{v'v''}$ for a number of N_2 band systems. For all except a small fraction of the bands, these quantities are within 10 percent of unity. Those bands having greater deviations from unity all have Franck-Condon factors less than 0.03, so they are relatively weak. However, there is a general tendency for the $Y^{(3)}_{v'v''}$ values to deviate more from unity than the $Y^{(2)}_{v'v''}$ values, so if still higher-order terms in the

power series representation of $R_e(r)$ are important the r-centroid approximation is likely to be less accurate.

A more direct method of determining the typical accuracy of the r-centroid approximation is to calculate both sides of equation (13) independently, for a number of bands and band systems, and compare the results. A small calculation of this type was made by Fraser (1954) for the N_2 B–A band system, assuming three different exponential-power-law variations in $R_e(r)$. However, he treated only $v' = 0$, $v'' = 0$–2, where the Franck-Condon factors are all greater than 0.16, so it is not surprising that he found that equation (13) was an excellent approximation.

In the course of the present work, we computed both sides of equation (13) for 15 band systems of N_2 and N_2^+ and 2 band systems of O_2^+, many with v', $v'' = 0$–21. Our results show that the r-centroid approximation is generally accurate for the stronger bands in a band system, which are usually the bands whose intensities can be most accurately measured experimentally. This justifies the standard r-centroid method of deducing $R_e(r)$ from band intensity measurements [e.g., Hartmann and Johnson (1978); Piper *et al.* (1989)]. Briefly, $R_e(r)$ is replaced by $R_e(\bar{r}_{v'v''})$ and equation (9) is rearranged to give

$$R_e(\bar{r}_{v'v''}) = \left[\frac{\text{const.} \times A_{v'v''}}{\nu^3_{v'v''} q_{v'v''}}\right]^{1/2}, \tag{14}$$

where the constant can be obtained from equation (9). Sometimes, absolute values of the Einstein coefficients, $A_{v'v''}$, can be obtained from band absorption measurements, utilizing the well-known relationship between absorption and emission coefficients, or from emission measurements, if the population of the emitting level can be determined by other means. More often, emission measurements give only relative values of $A_{v'v''}$ and, hence, of $R_e(\bar{r}_{v'v''})$. These relative values are placed on an absolute scale by a measurement of the radiative lifetime of one of the emitting levels. The resulting values then determine the function $R_e(\bar{r})$ with an accuracy that is usually limited only by the accuracy of the band intensity measurements and the number and range of the $\bar{r}_{v'v''}$ values covered, rather than by the accuracy of the r-centroid approximation. In the present work, this method of deriving transition moments has been utilized for a few band systems for which published results are either unavailable or have been superseded by better intensity measurements.

2.4 TREATMENT OF TRANSITIONS INVOLVING "PERTURBED" ELECTRONIC STATES.

Significant fluorescent radiation is known to be emitted by some high-lying states of N_2 that have irregularly-spaced vibrational levels due to strong perturbations by nearby states of the same type (Herzberg, 1950). Typical effects of such perturbations on the vibrational and rotational levels of several high N_2 states are illustrated in a paper by Carroll *et al.* (1970). These perturbations also cause irregularities in the intensities of the various bands, as shown, for example, by the recent extensive measurements of Ajello *et al.* (1989) on the N_2 c_4'–X and b'–X bands.

When two or more nearby electronic states of the same type interact strongly, it is possible to treat the resulting vibrational and rotational levels as mixtures of two or more "deperturbed" or "diabatic" electronic states. This has been done by Stahel *et al.* (1983) for three $^1\Sigma_u^+$ and three $^1\Pi_u$ states of N_2 lying in the 12–14 eV region. In such situations, the proportions of the mixture vary with the vibrational level, so the conventional Born-Oppenheimer separation of electronic and nuclear motion is no longer valid. Consequently, the concept of an electronic transition moment as a function of internuclear distance is no longer applicable. It is still possible, in principle, to calculate the intensities of the bands in a band system using a coupled-state approach, as used by Stahel *et al.* However, the computations become quite complex even when just two or three coupled states are involved. The perturbed N_2 states of present interest lie in an energy region where, as one goes to higher vibrational levels, more and more coupled states must be included in the calculation.

In the present situation, the most practical method for deriving the Einstein coefficients of bands involving perturbed states is to use measured relative emission intensities, normalized by radiative lifetime measurements or absolute absorption measurements. This method has been applied here to the N_2 b–X, c_4'–X, and c_4'–a band systems. It should be noted, however, that the strength of a perturbation can change with the rotational level in a given vibrational level. Hence, the Einstein coefficients of the individual rotational lines in a perturbed band may differ. Consequently, the mean Einstein coefficient for a perturbed band may vary with temperature, since changing the temperature changes the relative contributions of the different rotational lines in a band.

SECTION 3

RESULTS FOR ELECTRONIC TRANSITION MOMENTS

Electronic transition moment functions for many of the N_2, N_2^+, and O_2^+ band systems considered in this report have been published or may be derived from published data using the method described in Section 2.3. Some of these band systems have been studied extensively, while for others little information is available. In the present work, an effort has been made to identify the most accurate electronic transition moments from the choices available; usually this involved selecting the most recent work. The recent advances in the quantum-mechanical calculation of diatomic dipole moments are demonstrated by the selection of such theoretical values as the best available values for eleven of the band systems treated, while values derived by the r-centroid method were selected for only four systems.

The best available $R_e(r)$ data for most of the band systems treated are plotted in Figures 1 through 13. Some of these figures also include, for comparison, other data not used in the subsequent calculations because they are known to be or appear to be less accurate than the data used. No figures are presented for two band systems for which similar figures in the original references are adequate, or for two band systems where no information on the variation of R_e with r is available.

As a convenience in making subsequent calculations of Einstein coefficients, we have derived mathematical fits to the preferred transition moments, of the form

$$R_e(r) = a + br + cr^2 + d\exp[-f(r-g)^2], \tag{15}$$

where a, ..., g are constant coefficients, $R_e(r)$ is in electric dipole moment atomic units, and r is in Å. These units are consistent with equation (9) for computing Einstein coefficients in units of s^{-1}. Our fits are indicated and plotted in Figures 1–13, and their coefficients are also listed in Table 1. The dipole moment functions for over half of the band systems treated could be satisfactorily fit with just a Gaussian term, i.e., the last term in equation (15). This expression has the advantage that it remains bounded everywhere and approaches zero for large values of r, which is known theoretically to be the correct behavior for most of the transitions considered. The dipole moment functions of the remaining band systems were fit with constant, linear, or quadratic expressions, corresponding to the first three terms on the right-hand side of equation (15), except for the O_2^+ A–X system, where a constant plus

a Gaussian term was found necessary to obtain a good fit. Generally, in the ranges of r of practical interest, all of the fits appear to be essentially as accurate as the basic data that they fit.

Figures 1–13 and Table 1 are generally self-explanatory, except for one N_2^+ and two O_2^+ band systems. For the N_2^+ A–X band system, Figure 9 shows two fairly recent quantum-mechanical results, and one semi-empirical curve deduced by Gattinger and Vallance Jones (1981) from measured relative band intensities, using the r-centroid method. The two theoretical $R_e(r)$ functions have similar shapes and agree within 10 percent. Probably the more recent one, from Langhoff *et al.* (1987), is more accurate. The semi-empirical curve was derived only over a limited range of r, and has a different shape, which gives unreasonable values of $R_e(r)$ if extrapolated very far. Gattinger and Vallance Jones' Figure 4 shows that this curve fits their data points quite well. However, when their data are corrected for the improved Franck-Condon factors calculated in the present work, and additional points are added from their tables and references, the data become more scattered, and do not fit their curve as well as they do the theoretical curves.

For the O_2^+ A–X and b–a band systems, the recent quantum-mechanical results of Blomberg and Liu (1988) for both systems, and of Langhoff *et al.* (1989) for the latter system, appear to be quite accurate. This conclusion is supported by the excellent agreement between the two calculations for the b–a system, as shown in Figure 13. Blomberg and Liu's results for the A–X system also agree reasonably well with the results of the somewhat more-approximate calculations of Wetmore *et al.* (1984) (see Figure 12). Accordingly, the most recent theoretical results have been fit as shown in Figures 12–13 and Table 1, for use in our subsequent calculations.

A semi-empirical A–X curve deduced by Erman and Larsson (1977) from their measured lifetimes for $A(v = 0\text{–}7)$ is also included in Figure 12. This curve differs significantly from the two theoretical curves, particularly at large internuclear separations, where the theoretical curves approach a linear variation, as expected theoretically for this transition. Moreover, using Erman and Larsson's curve, we calculated A-state lifetimes about 20 percent shorter than they measured. Erman and Larsson also presented a transition moment curve for the b–a system, based on their measured lifetimes for $b(v = 0\text{–}7)$. This curve has not been included in our Figure 13 because later measurements by Moseley *et al.* (1979) show that the

higher levels, $b(v > 3)$, have very short lifetimes due to predissociation, and all emissions observed by Erman and Larsson originated from $b(v = 0\text{–}3)$. This correction, combined with Erman and Larsson's listing of b-state lifetimes that increase by 22 percent from $v = 3$ to "$v = 7$," also indicates that their accuracy estimate of about ± 7 percent is overly optimistic.

In addition, we made an attempt to apply the r-centroid method to the recent relative intensity measurements on the O_2^+ A–X bands by Schappe *et al.* (1988). However, the relative $R_e(r)$ values derived from their published intensities were widely scattered. Further study suggested that they probably had a bigger problem with overlapping bands than they assumed. For example, the (0-6) and (4-8) bands are nearly coincident, and so are the (0-7) and (6-10) bands, but Schappe *et al.* attributed the measured intensities entirely to the first band of each pair.

SECTION 4
BAND-ARRAY RESULTS

In this section, tables of calculated radiative transition parameters are presented for the 38 band systems considered in this report. Tables 2 through 18 give a complete set of radiative transition parameters for 17 N_2, N_2^+, and O_2^+ band systems that are important in emission. With the exception of Tables 6, 11, and 12, these tables include seven quantities for each v'–v'' band; they are (as ordered in the tables):

1. Band origin wavelength, $\lambda_{v'v''}$ (μm);

2. Band origin wavenumber, $\nu_{v'v''}$ (cm^{-1});

3. Franck-Condon factor, $q_{v'v''}$;

4. R-centroid, $\bar{r}_{v'v''}$ (Å);

5. Electronic transition moment, $R_e(\bar{r}_{v'v''})$ (electric dipole moment atomic units);

6. Einstein coefficient, $A_{v'v''}$ (s^{-1}), calculated by the r-centroid method;

7. Einstein coefficient, $A_{v'v''}$ (s^{-1}), calculated by integrating $\int \psi_{v'}^* R_e(r) \psi_{v''} dr$.

The last two items are Einstein coefficients calculated by the r-centroid approximation and by direct integration. Since the latter is the more accurate of the two values, it is placed at the end of the list so that it can be read from the tables more easily.

In Tables 6, 11, and 12, item #6 has been omitted. This is because these three band systems have constant $R_e(r)$ functions, and, as shown in Section 2, the r-centroid approximation is exact for $R_e(r)$ functions that are constant or vary linearly with internuclear distance. Thus, the two different methods of calculating Einstein coefficients yield the same result for these cases, as we have verified numerically for many bands in these three systems, as well as for a test case involving a linear variation.

For more than half of the band systems in Tables 2–18, radiative transition parameters are presented for v', $v'' = 0$–21. The exceptions include the band systems that involve the N_2 $w\ ^1\Delta_u$, $C\ ^3\Pi_u$, $E\ ^3\Sigma_g^+$, and $D\ ^3\Sigma_u^+$ states, for which the available spectroscopic data are insufficient to permit reliable extrapolation to $v = 21$ (see Laher and Gilmore, 1991). In addition, results for the N_2^+ $B^2\Sigma_u^+$–$X^2\Sigma_g^+$ system are limited to $v' = 0$–10, since the unusual behavior of the energy levels and potential curve of the B state prevent an adequate fit by the usual spectroscopic power series beyond $v = 8$ or 10 (Laher and Gilmore, 1991). It would be possible to extend the present B–X calculations to higher vibrational levels by using a numerical RKR method, but since these levels are not significant in air fluorescence, this was not done.

For some of the bands in Tables 2–18, the wavelengths, wavenumbers, and Einstein coefficients have negative signs in front of their numerical values. This is to indicate that the transition is reversed. The N_2 B–A (0-8) band at 8.85 μm in Table 3 is an example. Since the A ($v'' = 8$) state is higher in energy than the B ($v' = 0$) state, the transition proceeds from the A state to the B state. Such cases are known as reverse bands.

The calculated strengths of bands with small Franck-Condon factors are often less accurate than those with larger Franck-Condon factors. Accordingly, in Tables 2–18, the Einstein coefficients calculated by direct integration are marked with asterisks if the corresponding Franck-Condon factors are less than 0.01. There are two situations in which small Franck-Condon factors arise. The first is when the wavefunctions of the upper and lower states overlap very little; in this case, the calculated band strength is usually quite accurate. The second is when the wavefunctions do overlap but, because of a near cancellation between similar contributions of positive and negative values of $\psi_v^* \cdot \psi_{v''}$, the resulting overlap integral is small. In this case, the overlap integral is sensitive to small variations in the potential energy curves, especially for high vibrational levels, and the resulting Franck-Condon factor may not be very accurate.

It is also interesting to note for which bands in the tables the Einstein coefficients calculated by the two methods disagree significantly. Accordingly, when the two values differ by more than 10%, the r-centroid value in the tables has been

enclosed in parentheses. Such disagreement tends to occur when $R_e(r)$ is significantly nonlinear and the Franck-Condon factor is small.

The radiative lifetimes of 14 N_2, N_2^+, and O_2^+ states have also been calculated and are presented in Table 19 as a function of vibrational level. These quantities were obtained by taking the inverse of the sum of the Einstein coefficients (calculated by direct integration) for transitions from a given upper level to all possible lower levels, which may include more than one electronic state. For example, the radiative lifetime for a given v' of the N_2 A state was found by summing over v'' all $A_{v'v''}$ values for the A-X and B–A-reverse band systems. The calculated lifetimes are generally in good agreement with the best available measurements, which can be verified by consulting the references given in Table 1. It should be noted, however, that radiative lifetimes for most of the levels listed in Table 19 have never been measured.

Tables 20 through 35 present tables of Franck-Condon factors for transitions between the upper states covered in the previous tables and the ground state, except for the N_2 A-X and a–X band systems, where Franck-Condon factors have already been presented in Tables 2 and 6. Eight of these tables cover N_2 band systems for which insufficient information is available to calculate accurate Einstein coefficients, generally because they are very weak ("forbidden") transitions. In addition, eight nitrogen and oxygen ionization systems are included for application to photoionization and electron-impact ionization problems. The Franck-Condon factors presented in these tables are generally more accurate than those in previously published work because the RKR potential energy curves used in the present calculations are based on spectroscopic constants that are valid to higher vibrational levels.

Tables 36 through 38 cover three N_2 band systems with perturbed upper states. As discussed in Section 2.4, perturbations involve mixing between electronic states, so the relations derived earlier for Franck-Condon factors, Einstein coefficients, etc., are no longer applicable. Consequently, Tables 36–38 simply list band origin or band head wavelengths derived from spectroscopic measurements, and Einstein coefficients derived from measurements of absolute absorption band intensities, relative emission band intensities and upper-state lifetimes. The sources and limitations of the basic data are indicated on the tables.

	$B'\ ^3\Sigma_u^-$-$B\ ^3\Pi_g$				0.208	1.40	0.90	Fit to geometric mean of theoretical values of Werner *et al.* (1984) and Rizzo *et al.* (1988) (see Fig. 3).
	$a\ ^1\Pi_g$-$X\ ^1\Sigma_g^+$	0.00588						R_e=constant from Shemansky (1969b), renormalized to give a $v = 0$ lifetime of 58 μs (Marinelli *et al.*, 1989). This includes a little contribution from electric quadrupole radiation; see Dahl and Oddershedde (1986).
	$a\ ^1\Pi_g$-$a'\ ^1\Sigma_u^-$				0.346	1.15	0.60	Fit to theoretical values of Yeager and McKoy (1977) (see Fig. 4).
	$w\ ^1\Delta_u$-$a\ ^1\Pi_g$				0.266	1.85	0.90	Fit to theoretical values of Yeager and McKoy (1977) (see Fig. 5).
	$C\ ^3\Pi_u$-$B\ ^3\Pi_g$				0.887	3.30	0.95	Fit to theoretical values of Werner *et al.* (1984) (see Fig. 6).

Table 1. Coefficients of analytic fits to the electronic transition moments of N_2, N_2^+, and O_2^+ band systems. – Continued

$R_e(r) = a + br + cr^2 + d\exp[-f(r-g)^2]$ (R_e is in electric dipole moment atomic units; r is in Å.)

Band system		a	b	c	d	f	g	References
N_2	$E\ ^3\Sigma_g^+$–$A\ ^3\Sigma_u^+$				0.0173	106	1.25	Fit to relative $R_e(\bar{r})$ values derived from spectral measurements on the EXCEDE rocket-lofted electron-gun experiment (furnished by W. Reidy, private communication, 1986) (see Fig. 7); R_e=constant is assumed for the E–B and E–C transitions. Absolute normalization from E-state lifetime of 190 μs (Borst and Zipf, 1971) and relative radiation rates of the three band systems (Freund, 1969).
	$E\ ^3\Sigma_g^+$–$B\ ^3\Pi_g$	0.00185						
	$E\ ^3\Sigma_g^+$–$C\ ^3\Pi_u$	0.0414						
	$D\ ^3\Sigma_u^+$–$B\ ^3\Pi_g$				0.794	9.25	1.33	Fit to relative $R_e(\bar{r})$ values derived from emission data of Filippelli *et al.* (1984) (see Fig. 8); normalized to give a $v = 0$ lifetime of 14.1 ns (Kurzweg *et al.*, 1973).
N_2^+	$A\ ^2\Pi_u$–$X\ ^2\Sigma_g^+$				0.288	1.35	0.85	Fit to theoretical values of Langhoff *et al.* (1987) (see Fig. 9).
	$B\ ^2\Sigma_u^+$–$X\ ^2\Sigma_g^+$	1.051	0.2033	-0.4646				Fit to theoretical values of Langhoff and Bauschlicher (1988) (see Fig. 10). Calculation using this fit yields a $v = 0$ lifetime of 62.3 ns, which is within 2% of the measurement of Schmoranzer *et al.* (1989) (see Table 19).
	$C\ ^2\Sigma_u^+$–$X\ ^2\Sigma_g^+$				0.315	13.5	1.45	Fit to theoretical values of Langhoff and Bauschlicher (1988) (see Fig. 11).
O_2^+	$A\ ^2\Pi_u$–$X\ ^2\Pi_g$	0.120			1.72	1.26	2.83	Fit to theoretical values of Blomberg and Liu (1988) (see Fig. 12).
	$b\ ^4\Sigma_g^-$–$a\ ^4\Pi_u$				0.290	2.43	0.96	Fit to theoretical values of Blomberg and Liu (1988) and Langhoff *et al.* (1989) (see Fig. 13).

Table 2. Radiative transition parameters for N_2 $A\ ^3\Sigma_u^+ - X\ ^1\Sigma_g^+$. For each $v'-v''$ band, the listed quantities are $\lambda_{v'v''}$ (μm), $\nu_{v'v''}$ (cm^{-1}), $q_{v'v''}$, $\bar{r}_{v'v''}$ (Å), $R_e(\bar{r}_{v'v''})$ (electric dipole moment atomic units), $A_{v'v''}$ (s^{-1}) calculated by the r-centroid method, and $A_{v'v''}$ (s^{-1}) calculated by integrating $\int \psi_{v'}^* R_e(r) \psi_{v''} dr$.

Table 2. Radiative transition parameters for N_2 $A\ ^3\Sigma_u^+ - X\ ^1\Sigma_g^+$. For each v'–v'' band, the listed quantities are $\lambda_{v'v''}$ (μm), $\nu_{v'v''}$ (cm^{-1}), $q_{v'v''}$, $\bar{r}_{v'v''}$ (Å), $R_e(\bar{r}_{v'v''})$ (electric dipole moment atomic units), $A_{v'v''}$ (s^{-1}) calculated by the r-centroid method, and $A_{v'v''}$ (s^{-1}) calculated by integrating $\int \psi_{v'}^* R_e(r) \psi_{v''} dr$. – Continued

*The Einstein coefficients for this band may have limited accuracy, since the Franck-Condon factor is less than 0.01 (see text).

Table 3. Radiative transition parameters for N_2 $B\ ^3\Pi_g - A\ ^3\Sigma_u^+$. For each $v'-v''$ band, the listed quantities are $\lambda_{v'v''}$ (μm), $\nu_{v'v''}$ (cm^{-1}), $q_{v'v''}$, $\bar{r}_{v'v''}$ (Å), $R_e(\bar{r}_{v'v''})$ (electric dipole moment atomic units), $A_{v'v''}$ (s^{-1}) calculated by the r-centroid method, and $A_{v'v''}$ (s^{-1}) calculated by integrating $\int \psi_{v'}^* R_e(r) \psi_{v''} dr$.

Table 3. Radiative transition parameters for N_2 $B\ ^3\Pi_g$–$A\ ^3\Sigma_u^+$. For each v'–v'' band, the listed quantities are $\lambda_{v'v''}$ (μm), $\nu_{v'v''}$ (cm^{-1}), $q_{v'v''}$, $\bar{r}_{v'v''}$ (Å), $R_e(\bar{r}_{v'v''})$ (electric dipole moment atomic units), $A_{v'v''}$ (s^{-1}) calculated by the r-centroid method, and $A_{v'v''}$ (s^{-1}) calculated by integrating $\int \psi_{v'}^* R_e(r) \psi_{v''} dr$. – Continued

Table 4. Radiative transition parameters for N_2 $W\ ^3\Delta_u$–$B\ ^3\Pi_g$. For each v'–v'' band, the listed quantities are $\lambda_{v'v''}$ (μm), $\nu_{v'v''}$ (cm^{-1}), $q_{v'v''}$, $\bar{r}_{v'v''}$ (Å), $R_e(\bar{r}_{v'v''})$ (electric dipole moment atomic units), $A_{v'v''}$ (s^{-1}) calculated by the r-centroid method, and $A_{v'v''}$ (s^{-1}) calculated by integrating $\int \psi^*_{v'} R_e(r) \psi_{v''} dr$. – Continued

Table 4. Radiative transition parameters for N_2 $W\ ^3\Delta_u$–$B\ ^3\Pi_g$. For each v'–v'' band, the listed quantities are $\lambda_{v'v''}$ (μm), $\nu_{v'v''}$ (cm^{-1}), $q_{v'v''}$, $\bar{r}_{v'v''}$ (Å), $R_e(\bar{r}_{v'v''})$ (electric dipole moment atomic units), $A_{v'v''}$ (s^{-1}) calculated by the r-centroid method, and $A_{v'v''}$ (s^{-1}) calculated by integrating $\int \psi^*_{v'} R_e(r) \psi_{v''} dr$. – Continued

Table 5. Radiative transition parameters for N_2 $B'\ ^3\Sigma_u^- - B\ ^3\Pi_g$. For each v'–v'' band, the listed quantities are $\lambda_{v'v''}$ (μm), $\nu_{v'v''}$ (cm^{-1}), $q_{v'v''}$, $\bar{r}_{v'v''}$ (Å), $R_e(\bar{r}_{v'v''})$ (electric dipole moment atomic units), $A_{v'v''}$ (s^{-1}) calculated by the r-centroid method, and $A_{v'v''}$ (s^{-1}) calculated by integrating $\int \psi'_{v'} R_e(r) \psi_{v''} dr$. – Continued

Table 5. Radiative transition parameters for N_2 $B'\ ^3\Sigma_u^- - B\ ^3\Pi_g$. For each v'–v'' band, the listed quantities are $\lambda_{v'v''}$ (μm), $\nu_{v'v''}$ (cm^{-1}), $q_{v'v''}$, $\bar{r}_{v'v''}$ (Å), $R_e(\bar{r}_{v'v''})$ (electric dipole moment atomic units), $A_{v'v''}$ (s^{-1}) calculated by the r-centroid method, and $A_{v'v''}$ (s^{-1}) calculated by integrating $\int \psi'_{v'} R_e(r) \psi_{v''} dr$. – Continued

Table 7. Radiative transition parameters for N_2 $a\ ^1\Pi_g$–$a'\ ^1\Sigma_u^-$. For each v'–v'' band, the listed quantities are $\lambda_{v'v''}$ (μm), $\nu_{v'v''}$ (cm^{-1}), $q_{v'v''}$, $\bar{r}_{v'v''}$ (Å), $R_e(\bar{r}_{v'v''})$ (electric dipole moment atomic units), $A_{v'v''}$ (s^{-1}) calculated by the r-centroid method, and $A_{v'v''}$ (s^{-1}) calculated by integrating $\int \psi'_{v'} R_e(r) \psi_{v''} dr$. – Continued

Table 7. Radiative transition parameters for N_2 $a\ ^1\Pi_g$-$a'\ ^1\Sigma_u^-$. For each v'–v'' band, the listed quantities are $\lambda_{v'v''}$ (μm), $\nu_{v'v''}$ (cm^{-1}), $q_{v'v''}$, $\bar{r}_{v'v''}$ (Å), $R_e(\bar{r}_{v'v''})$ (electric dipole moment atomic units), $A_{v'v''}$ (s^{-1}) calculated by the r-centroid method, and $A_{v'v''}$ (s^{-1}) calculated by integrating $\int \psi_{v'}^* R_e(r) \psi_{v''} dr$. – Continued

Table 8. Radiative transition parameters for N_2 $w\ ^1\Delta_u$–$a\ ^1\Pi_g$. For each v'–v'' band, the listed quantities are $\lambda_{v'v''}$ (μm), $\nu_{v'v''}$ (cm^{-1}), $q_{v'v''}$, $\bar{r}_{v'v''}$ (Å), $R_e(\bar{r}_{v'v''})$ (electric dipole moment atomic units), $A_{v'v''}$ (s^{-1}) calculated by the r-centroid method, and $A_{v'v''}$ (s^{-1}) calculated by integrating $\int \psi_{v'}^{*} R_e(r) \psi_{v''} dr$. – Continued

Table 8. Radiative transition parameters for N_2 $w\ ^1\Delta_u$–$a\ ^1\Pi_g$. For each v'–v'' band, the listed quantities are $\lambda_{v'v''}$ (μm), $\nu_{v'v''}$ (cm^{-1}), $q_{v'v''}$, $\bar{r}_{v'v''}$ (Å), $R_e(\bar{r}_{v'v''})$ (electric dipole moment atomic units), $A_{v'v''}$ (s^{-1}) calculated by the r-centroid method, and $A_{v'v''}$ (s^{-1}) calculated by integrating $\int \psi^*_{v'} R_e(r) \psi_{v''} dr$. – Continued

Table 9. Radiative transition parameters for N_2 $C\ ^3\Pi_u$–$B\ ^3\Pi_g$. For each v'–v'' band, the listed quantities are $\lambda_{v'v''}$ (μm), $\nu_{v'v''}$ (cm^{-1}), $q_{v'v''}$, $\bar{r}_{v'v''}$ (Å), $R_e(\bar{r}_{v'v''})$ (electric dipole moment atomic units), $A_{v'v''}$ (s^{-1}) calculated by the r-centroid method, and $A_{v'v''}$ (s^{-1}) calculated by integrating $\int \psi_{v'}^* R_e(r) \psi_{v''} dr$.

*The Einstein coefficients for this band may have limited accuracy, since the Franck-Condon factor is less than 0.01 (see text).

Table 9. Radiative transition parameters for N_2 $C\ ^3\Pi_u$–$B\ ^3\Pi_g$. For each v'–v'' band, the listed quantities are $\lambda_{v'v''}$ (μm), $\nu_{v'v''}$ (cm^{-1}), $q_{v'v''}$, $\bar{r}_{v'v''}$ (Å), $R_e(\bar{r}_{v'v''})$ (electric dipole moment atomic units), $A_{v'v''}$ (s^{-1}) calculated by the r-centroid method, and $A_{v'v''}$ (s^{-1}) calculated by integrating $\int \psi^*_{v'} R_e(r) \psi_{v''} dr$. – Continued

*The Einstein coefficients for this band may have limited accuracy, since the Franck-Condon factor is less than 0.01 (see text).

Table 14. Radiative transition parameters for N_2^+ $A\ ^2\Pi_u$–$X\ ^2\Sigma_g^+$. For each v'–v'' band, the listed quantities are $\lambda_{v'v''}$ (μm), $\nu_{v'v''}$ (cm^{-1}), $q_{v'v''}$, $\bar{r}_{v'v''}$ (Å), $R_e(\bar{r}_{v'v''})$ (electric dipole moment atomic units), $A_{v'v''}$ (s^{-1}) calculated by the r-centroid method, and $A_{v'v''}$ (s^{-1}) calculated by integrating $\int \psi_{v'}^* R_e(r) \psi_{v''} dr$.

Table 14. Radiative transition parameters for N_2^+ $A\ ^2\Pi_u$–$X\ ^2\Sigma_g^+$. For each v'–v'' band, the listed quantities are $\lambda_{v'v''}$ (μm), $\nu_{v'v''}$ (cm^{-1}), $q_{v'v''}$, $\bar{r}_{v'v''}$ (Å), $R_e(\bar{r}_{v'v''})$ (electric dipole moment atomic units), $A_{v'v''}$ (s^{-1}) calculated by the r-centroid method, and $A_{v'v''}$ (s^{-1}) calculated by integrating $\int \psi_{v'}^* R_e(r) \psi_{v''} dr$. – Continued

Table 15. Radiative transition parameters for N_2^+ $B\ ^2\Sigma_u^+ - X\ ^2\Sigma_g^+$. For each $v'-v''$ band, the listed quantities are $\lambda_{v'v''}$ (μm), $\nu_{v'v''}$ (cm^{-1}), $q_{v'v''}$, $\bar{r}_{v'v''}$ (Å), $R_e(\bar{r}_{v'v''})$ (electric dipole moment atomic units), $A_{v'v''}$ (s^{-1}) calculated by the r-centroid method, and $A_{v'v''}$ (s^{-1}) calculated by integrating $\int \psi_{v'}^* R_e(r) \psi_{v''} dr$. –Continued

Table 16. Radiative transition parameters for N_2^+ $C\ ^2\Sigma_u^+ - X\ ^2\Sigma_g^+$. For each $v'-v''$ band, the listed quantities are $\lambda_{v'v''}$ (μm), $\nu_{v'v''}$ (cm^{-1}), $q_{v'v''}$, $\bar{r}_{v'v''}$ (Å), $R_e(\bar{r}_{v'v''})$ (electric dipole moment atomic units), $A_{v'v''}$ (s^{-1}) calculated by the r-centroid method, and $A_{v'v''}$ (s^{-1}) calculated by integrating $\int \psi_{v'}^* R_e(r) \psi_{v''} dr$. – Continued

Table 17. Radiative transition parameters for O_2^+ $A\ ^2\Pi_u$–$X\ ^2\Pi_g$. For each v'–v'' band, the listed quantities are $\lambda_{v'v''}$ (μm), $\nu_{v'v''}$ (cm^{-1}), $q_{v'v''}$, $\bar{r}_{v'v''}$ (Å), $R_e(\bar{r}_{v'v''})$ (electric dipole moment atomic units), $A_{v'v''}$ (s^{-1}) calculated by the r-centroid method, and $A_{v'v''}$ (s^{-1}) calculated by integrating $\int \psi_{v'}^* R_e(r) \psi_{v''} dr$. – Continued

Table 17. Radiative transition parameters for O_2^+ $A\ ^2\Pi_u$–$X\ ^2\Pi_g$. For each v'–v'' band, the listed quantities are $\lambda_{v'v''}$ (μm), $\nu_{v'v''}$ (cm^{-1}), $q_{v'v''}$, $\bar{r}_{v'v''}$ (Å), $R_e(\bar{r}_{v'v''})$ (electric dipole moment atomic units), $A_{v'v''}$ (s^{-1}) calculated by the r-centroid method, and $A_{v'v''}$ (s^{-1}) calculated by integrating $\int \psi'_{v'} R_e(r) \psi_{v''} dr$. – Continued

*The Einstein coefficients for this band may have limited accuracy, since the Franck-Condon factor is less than 0.01 (see text).

Table 18. Radiative transition parameters for O_2^+ $b\ ^4\Sigma_g^- - a\ ^4\Pi_u$. For each $v'-v''$ band, the listed quantities are $\lambda_{v'v''}$ (μm), $\nu_{v'v''}$ (cm^{-1}), $q_{v'v''}$, $\bar{r}_{v'v''}$ (Å), $R_e(\bar{r}_{v'v''})$ (electric dipole moment atomic units), $A_{v'v''}$ (s^{-1}) calculated by the r-centroid method, and $A_{v'v''}$ (s^{-1}) calculated by integrating $\int \psi_{v'}^* R_e(r) \psi_{v''} dr$.

Table 18. Radiative transition parameters for O_2^+ $b\ ^4\Sigma_g^- - a\ ^4\Pi_u$. For each $v'-v''$ band, the listed quantities are $\lambda_{v'v''}$ (μm), $\nu_{v'v''}$ (cm^{-1}), $q_{v'v''}$, $\bar{r}_{v'v''}$ (Å), $R_e(\bar{r}_{v'v''})$ (electric dipole moment atomic units), $A_{v'v''}$ (s^{-1}) calculated by the r-centroid method, and $A_{v'v''}$ (s^{-1}) calculated by integrating $\int \psi_{v'}^* R_e(r) \psi_{v''} dr$. – Continued

*Read as 1.13×10^{-5}.

†Value depends considerably on the spin component and rotational level, and also on the unknown (but slow) rate of radiative decay to the ground state.

‡Actual lifetime shorter due to predissociation.

§Value may be significantly too large due to omission of transitions to high vibrational levels of lower electronic states.

Table 36. Band origin wavelengths and Einstein coefficients for N_2 $b\ ^1\Pi_u$–$X\ ^1\Sigma_g^+$. For each v'–v'' band, the listed quantities are $\lambda_{v'v''}$ (μm) and $A_{v'v''}$ (s^{-1}). Band origins from Carroll and Collins (1969) and Roncin *et al.* (1987). Einstein coefficients calculated by normalizing relative band intensities measured by James *et al.* (1990) to the $v' = 1$ lifetime of 1.75 ns measured by Oertel *et al.* (1981), corrected to a radiative lifetime of 1.96 ns by allowing for 10.5% predissociation as determined by James *et al.* The other levels of the $b\ ^1\Pi_u$ state are strongly predissociated and give little emission.

$v' \setminus v''$	0	1	2	3	4	5	6	7	8	9	10	11	12
1	0.0986	0.1009	0.1033	0.1058	0.1083	0.1110	0.1138	0.1166	0.1196	0.1227	0.1259	0.1292	0.1326

*Read as 1.04×10^8.
†These bands were too weak to be measured by James *et al.* (1990).

Table 37. Band origin wavelengths and Einstein coefficients for N_2 $c_4'\ ^1\Sigma_u^+$–$X\ ^1\Sigma_g^+$. For each v'–v'' band, the listed quantities are $\lambda_{v'v''}$ (μm) and $A_{v'v''}$ (s^{-1}). Band origins from Yoshino and Tanaka (1977) and Roncin *et al.* (1987), or calculated from data therein. Einstein coefficients for $v'' = 0$ from Table VII of Ajello *et al.* (1989). Einstein coefficients for $v'' > 0$ from relative band intensities, $I_{v'v''}/I_{v'0}$, measured by Ajello *et al.* and James *et al.* (1990), except for $v' = 1$ and 2, where $A_{v'0}$ were too small to be measured, so $A_{2v''}$ were normalized to the $v' = 2$ radiative lifetime (0.65 ns) measured by Oertel *et al.* (1981), while $A_{1v''}$ were normalized to the average of the radiative lifetimes for $v' = 0$ (0.74 ns) deduced by Ajello *et al.* and $v' = 2$ measured by Oertel *et al.* Bands from $v' = 5$ are weak and their intensities have not been measured.

†Based on the upper limit value of the electron-impact emission cross section given in Table II of Ajello *et al.* (1989), less estimated contributions from overlapping features.

‡Based on a revised value of the electron-impact emission cross section, 0.55×10^{-19} cm^2 (Ajello, private communication, September 1990).

Table 38. Band head wavelengths and Einstein coefficients for N_2 $c_4'\ ^1\Sigma_u^+ - a\ ^1\Pi_g$. For each v'–v'' band, the listed quantities are $\lambda_{Hv'v''}$ (μm) and $A_{v'v''}$ (s^{-1}). Band heads from Lofthus and Krupenie (1977) (band origins not available). Einstein coefficients calculated from the electron-impact band intensities of Filippelli *et al.* (1984) relative to that of the c_4'–X 0-0 band of Ajello *et al.* (1989), normalized to the $A_{00}(c_4'$–$X)$ value of the latter.

$v' \setminus v''$	0	1	2	3	4	5
0	0.2827 1.98(6)*	0.2967 4.82(6)	0.3119 3.40(6)	0.3283 2.37(6)	0.3463 1.37(6)	0.3661 9.0(5)

*Read as 1.98×10^6.
