Galactic Dynamics

SECOND EDITION

James Binney and Scott Tremaine

PRINCETON UNIVERSITY PRESS
PRINCETON AND OXFORD

Contents

Preface xiii

1 Introduction 1

1.1 An overview of the observations 5
• Stars 5 • The Galaxy 11 • Other galaxies 19 ▷ Elliptical galaxies 20 ▷ Spiral galaxies 25 ▷ Lenticular galaxies 28 ▷ Irregular galaxies 28 • Open and globular clusters 29 • Groups and clusters of galaxies 30 • Black holes 32

1.2 Collisionless systems and the relaxation time 33
• The relaxation time 34

1.3 The cosmological context 37
• Kinematics 38 • Geometry 39 • Dynamics 40 • The Big Bang and inflation 45 • The cosmic microwave background 48

Problems 52

2 Potential Theory 55

2.1 General results 56
▷ The potential-energy tensor 59

2.2 Spherical systems 60
• Newton's theorems 60 ▷ Potential energy of spherical systems 63 • Potentials of some simple systems 63 ▷ Point mass 63 ▷ Homogeneous sphere 63 ▷ Plummer model 65 ▷ Isochrone potential 65 ▷ Modified Hubble model 66 ▷ Power-law density model 68 ▷ Two-power density models 70

2.3 Potential-density pairs for flattened systems 72
• Kuzmin models and generalizations 72 • Logarithmic potentials 74 • Poisson's equation in very flattened systems 77

2.4 Multipole expansion 78

2.5 The potentials of spheroidal and ellipsoidal systems 83
• Potentials of spheroidal shells 84 • Potentials of spheroidal systems 87 • Potentials of ellipsoidal systems 94 ▷ Ferrers potentials 95 ▷ Potential-energy tensors of ellipsoidal systems 95

2.6 The potentials of disks 96
• Disk potentials from homoeoids 96 ▷ The Mestel disk 99 ▷ The exponential disk 100 ▷ Thick disks 102 • Disk potentials from Bessel functions 103 ▷ Application to axisymmetric disks 106 • Disk potentials from logarithmic spirals 107 • Disk potentials from oblate spheroidal coordinates 109

2.7 The potential of our Galaxy 110
▷ The bulge 111 ▷ The dark halo 112 ▷ The stellar disk 112 ▷ The interstellar medium 112 ▷ The bulge as a bar 117

2.8 Potentials from functional expansions 118
▷ Bi-orthonormal basis functions 120 ▷ Designer basis functions 120

2.9 Poisson solvers for N-body codes 122
• Direct summation 123 ▷ Softening 123 • Tree codes 125 ▷ Cartesian multipole expansion 127 • Particle-mesh codes 129 ▷ Periodic boundary conditions 131 ▷ Vacuum boundary conditions 132 ▷ Mesh refinement 135 ▷ P^3M codes 135 • Spherical-harmonic codes 136 • Simulations of planar systems 137

Problems 137

3 The Orbits of Stars 142

3.1 Orbits in static spherical potentials 143
▷ Spherical harmonic oscillator 147 ▷ Kepler potential 147 ▷ Isochrone potential 149 ▷ Hyperbolic encounters 153 • Constants and integrals of the motion 155

3.2 Orbits in axisymmetric potentials 159
• Motion in the meridional plane 159 • Surfaces of section 162 • Nearly circular orbits: epicycles and the velocity ellipsoid 164

3.3 Orbits in planar non-axisymmetric potentials 171
• Two-dimensional non-rotating potential 171 • Two-dimensional rotating potential 178 • Weak bars 188 ▷ Lindblad resonances 188 ▷ Orbits trapped at resonance 193

3.4 Numerical orbit integration 196
• Symplectic integrators 197 ▷ Modified Euler integrator 197 ▷ Leapfrog integrator 200 • Runge–Kutta and Bulirsch–Stoer integrators 201 • Multistep predictor-corrector integrators 202 • Multivalue integrators 203 • Adaptive timesteps 205 • Individual timesteps 206 • Regularization 208 ▷ Burdet–Heggie regularization 208 ▷ Kustaanheimo–Stiefel (KS) regularization 210

3.5 Angle-action variables 211
• Orbital tori 212 ▷ Time averages theorem 215 ▷ Action space 216 ▷ Hamilton–Jacobi equation 217 • Angle-action variables for spherical potentials 220 • Angle-action variables for flattened axisymmetric potentials 226 ▷ Stäckel potentials 226

▷ Epicycle approximation 231 • Angle-action variables for a non-rotating bar 234 • Summary 236

3.6 Slowly varying potentials 237
• Adiabatic invariance of actions 237 • Applications 238 ▷ Harmonic oscillator 238 ▷ Eccentric orbits in a disk 240 ▷ Transient perturbations 240 ▷ Slow growth of a central black hole 241

3.7 Perturbations and chaos 243
• Hamiltonian perturbation theory 243 • Trapping by resonances 246 ▷ Levitation 250 • From order to chaos 253 ▷ Irregular orbits 256 ▷ Frequency analysis 258 ▷ Liapunov exponents 260

3.8 Orbits in elliptical galaxies 262
• The perfect ellipsoid 263 • Dynamical effects of cusps 263 • Dynamical effects of black holes 266

Problems 268

4 Equilibria of Collisionless Systems 274

4.1 The collisionless Boltzmann equation 275
• Limitations of the collisionless Boltzmann equation 278 ▷ Finite stellar lifetimes 278 ▷ Correlations between stars 279 • Relation between the DF and observables 280 ▷ An example 282

4.2 Jeans theorems 283
• Choice of f and relations between moments 285 ▷ DF depending only on H 285 ▷ DF depending on H and L 286 ▷ DF depending on H and L_z 286

4.3 DFs for spherical systems 287
• Ergodic DFs for systems 288 ▷ Ergodic Hernquist, Jaffe and isochrone models 290 ▷ Differential energy distribution 292 • DFs for anisotropic spherical systems 293 ▷ Models with constant anisotropy 294 ▷ Osipkov–Merritt models 297 ▷ Other anisotropic models 298 ▷ Differential-energy distribution for anisotropic systems 299 • Spherical systems defined by the DF 299 ▷ Polytropes and the Plummer model 300 ▷ The isothermal sphere 302 ▷ Lowered isothermal models 307 ▷ Double-power models 311 ▷ Michie models 312

4.4 DFs for axisymmetric density distributions 312
• DF for a given axisymmetric system 312 • Axisymmetric systems specified by $f(H, L_z)$ 314 ▷ Fully analytic models 314 ▷ Rowley models 318 ▷ Rotation and flattening in spheroids 320 • The Schwarzschild DF 321

4.5 DFs for razor-thin disks 329
• Mestel disk 329 • Kalnajs disks 330

4.6 Using actions as arguments of the DF 333
• Adiabatic compression 335 ▷ Cusp around a black hole 336 ▷ Adiabatic deformation of dark matter 337

4.7 Particle-based and orbit-based models 338
• N-body modeling 339 ▷ Softening 341 ▷ Instability and chaos 341 • Schwarzschild models 344

4.8 The Jeans and virial equations 347
• Jeans equations for spherical systems 349 ▷ Effect of a central black hole on the observed velocity dispersion 350 • Jeans equations for axisymmetric systems 353 ▷ Asymmetric drift 354 ▷ Spheroidal components with isotropic velocity dispersion 356 • Virial equations 358 ▷ Scalar virial theorem 360 ▷ Spherical systems 361 ▷ The tensor virial theorem and observational data 362

4.9 Stellar kinematics as a mass detector 365
• Detecting black holes 366 • Extended mass distributions of elliptical galaxies 370 • Dynamics of the solar neighborhood 372

4.10 The choice of equilibrium 376
• The principle of maximum entropy 377 • Phase mixing and violent relaxation 379 ▷ Phase mixing 379 ▷ Violent relaxation 380 • Numerical simulation of the relaxation process 382

Problems 387

5 Stability of Collisionless Systems 394

5.1 Introduction 394
• Linear response theory 396 • Linearized equations for stellar and fluid systems 398

5.2 The response of homogeneous systems 401
• Physical basis of the Jeans instability 401 • Homogeneous systems and the Jeans swindle 401 • The response of a homogeneous fluid system 403 • The response of a homogeneous stellar system 406 ▷ Unstable solutions 410 ▷ Neutrally stable solutions 411 ▷ Damped solutions 412 • Discussion 416

5.3 General theory of the response of stellar systems 417
• The polarization function in angle-action variables 418 • The Kalnajs matrix method 419 • The response matrix 421

5.4 The energy principle and secular stability 423
• The energy principle for fluid systems 423 • The energy principle for stellar systems 427 • The relation between the stability of fluid and stellar systems 431

5.5 The response of spherical systems 432
• The stability of spherical systems with ergodic DFs 432 • The stability of anisotropic spherical systems 433 ▷ Physical basis of the radial-orbit instability 434 • Landau damping and resonances in spherical systems 437

5.6 The stability of uniformly rotating systems 439
• The uniformly rotating sheet 439 • Kalnajs disks 444 • Maclaurin spheroids and disks 449

Problems 450

6 Disk Dynamics and Spiral Structure 456

6.1 Fundamentals of spiral structure 458
• Images of spiral galaxies 460 • Spiral arms at other wavelengths 462 ▷ Dust 464 ▷ Relativistic electrons 465 ▷ Molecular gas 465 ▷ Neutral atomic gas 465 ▷ HII regions 467 • The geometry of spiral arms 468 ▷ The strength and number of arms 468 ▷ Leading and trailing arms 469 ▷ The pitch angle and the winding problem 471 ▷ The pattern speed 474 • The anti-spiral theorem 477 • Angular-momentum transport by spiral-arm torques 478

6.2 Wave mechanics of differentially rotating disks 481
• Preliminaries 481 ▷ Kinematic density waves 481 ▷ Resonances 484 • The dispersion relation for tightly wound spiral arms 485 ▷ The tight-winding approximation 485 ▷ Potential of a tightly wound spiral pattern 486 ▷ The dispersion relation for fluid disks 488 ▷ The dispersion relation for stellar disks 492 • Local stability of differentially rotating disks 494 • Long and short waves 497 • Group velocity 499 • Energy and angular momentum in spiral waves 503

6.3 Global stability of differentially rotating disks 505
• Numerical work on disk stability 505 • Swing amplifier and feedback loops 508 ▷ The swing amplifier 508 ▷ Feedback loops 512 ▷ Physical interpretation of the bar instability 513 • The maximum-disk hypothesis 515 • Summary 517

6.4 Damping and excitation of spiral structure 518
• Response of the interstellar gas to a density wave 518 • Response of a density wave to the interstellar gas 522 • Excitation of spiral structure 524 ▷ Excitation by companion galaxies 524 ▷ Excitation by bars 525 ▷ Stationary spiral structure 525 ▷ Excitation of intermediate-scale structure 526

6.5 Bars 528
• Observations 528 ▷ The pattern speed 531 • Dynamics of bars 533 ▷ Weak bars 534 ▷ Strong bars 535 ▷ The vertical structure of bars 536 ▷ Gas flow in bars 536 ▷ Slow evolution of bars 539

6.6 Warping and buckling of disks 539
• Warps 539 ▷ Kinematics of warps 540 ▷ Bending waves with self-gravity 542 ▷ The origin of warps 544 • Buckling instability 548

Problems 552

7 Kinetic Theory 554

7.1 Relaxation processes 555
▷ Relaxation 555 ▷ Equipartition 556 ▷ Escape 556 ▷ Inelastic

encounters 557 ▷ Binary formation by triple encounters 557 ▷ Interactions with primordial binaries 558

7.2 General results 559
• Virial theorem 559 • Liouville's theorem 561 • Reduced distribution functions 563 • Relation of Liouville's equation to the collisionless Boltzmann equation 565

7.3 The thermodynamics of self-gravitating systems 567
• Negative heat capacity 567 • The gravothermal catastrophe 568

7.4 The Fokker–Planck approximation 573
• The master equation 573 • Fokker–Planck equation 574 ▷ Weak encounters 574 ▷ Local encounters 576 ▷ Orbit-averaging 577 • Fluctuation-dissipation theorems 578 • Diffusion coefficients 580 ▷ Heating of the Galactic disk by MACHOs 583 • Relaxation time 586 • Numerical methods 588 ▷ Fluid models 588 ▷ Monte Carlo methods 592 ▷ Numerical solution of the Fokker–Planck equation 593 ▷ N-body integrations 594 ▷ Checks and comparisons 595

7.5 The evolution of spherical stellar systems 596
• Mass loss from stellar evolution 600 • Evaporation and ejection 602 ▷ The maximum lifetime of a stellar system 605 • Core collapse 606 • After core collapse 609 • Equipartition 612 • Tidal shocks and the survival of globular clusters 615 • Binary stars 616 ▷ Soft binaries 618 ▷ Hard binaries 620 ▷ Reaction rates 621 • Inelastic encounters 625 • Stellar systems with a central black hole 629 ▷ Consumption of stars by the black hole 629 ▷ The effect of a central black hole on the surrounding stellar system 631

7.6 Summary 633

Problems 634

8 Collisions and Encounters of Stellar Systems 639

8.1 Dynamical friction 643
▷ The validity of Chandrasekhar's formula 646 • Applications of dynamical friction 647 ▷ Decay of black-hole orbits 647 ▷ Galactic cannibalism 649 ▷ Orbital decay of the Magellanic Clouds 650 ▷ Dynamical friction on bars 651 ▷ Formation and evolution of binary black holes 652 ▷ Globular clusters 654

8.2 High-speed encounters 655
▷ Mass loss 657 ▷ Return to equilibrium 657 ▷ Adiabatic invariance 658 • The distant-tide approximation 658 • Disruption of stellar systems by high-speed encounters 661 ▷ The catastrophic regime 662 ▷ The diffusive regime 663 ▷ Disruption of open clusters 664 ▷ Disruption of binary stars 665 ▷ Dynamical constraints on MACHOs 668 ▷ Disk and bulge shocks 669 ▷ High-speed interactions in clusters of galaxies 672

8.3 Tides 674
• The restricted three-body problem 675 • The sheared-sheet or Hill's approximation 678 ▷ The epicycle approximation and Hill's approximation 679 ▷ The Jacobi radius in Hill's approximation 680 • Tidal tails and streamers 681

8.4 Encounters in stellar disks 685
• Scattering of disk stars by molecular clouds 687 • Scattering of disk stars by spiral arms 691 • Summary 695

8.5 Mergers 695
• Peculiar galaxies 696 • Grand-design spirals 698
• Ring galaxies 699 • Shells and other fine structure 701
• Starbursts 705 • The merger rate 708

Problems 710

9 Galaxy Formation 716

9.1 Linear structure formation 717
• Gaussian random fields 719 ▷ Filtering 720 ▷ The Harrison–Zeldovich power spectrum 721 • Gravitational instability in the expanding universe 722 ▷ Non-relativistic fluid 722 ▷ Relativistic fluid 726

9.2 Nonlinear structure formation 733
• Spherical collapse 733 • The cosmic web 735 • Press–Schechter theory 739 ▷ The mass function 744 ▷ The merger rate 746
• Collapse and virialization in the cosmic web 748

9.3 N-body simulations of clustering 751
• The mass function of halos 752 • Radial density profiles 753
• Internal dynamics of halos 756 ▷ The shapes of halos 756
▷ Rotation of halos 757 ▷ Dynamics of halo substructure 759

9.4 Star formation and feedback 760
▷ Reionization 760 ▷ Feedback 761 ▷ Mergers, starbursts and quiescent accretion 762 ▷ The role of central black holes 764
▷ Origin of the galaxy luminosity function 765

9.5 Conclusions 765

Problems 766

Appendices

A Useful numbers 770

B Mathematical background 771
• Vectors 771 • Curvilinear coordinate systems 773
• Vector calculus 775 • Fourier series and transforms 778
• Abel integral equation 780 • Schwarz's inequality 780
• Calculus of variations 781 • Poisson distribution 781
• Conditional probability and Bayes's theorem 782 • Central limit theorem 783

C **Special functions** 785
• Delta function and step function 785 • Factorial or gamma function 786 • Error function, Dawson's integral, and plasma dispersion function 786 • Elliptic integrals 787 • Legendre functions 788 • Spherical harmonics 789 • Bessel functions 790

D **Mechanics** 792
• Single particles 792 • Systems of particles 794 • Lagrangian dynamics 797 • Hamiltonian dynamics 797 ▷ Hamilton's equations 797 ▷ Poincaré invariants 799 ▷ Poisson brackets 800 ▷ Canonical coordinates and transformations 800 ▷ Extended phase space 803 ▷ Generating functions 803

E **Delaunay variables for Kepler orbits** 805

F **Fluid mechanics** 807
• Basic equations 807 ▷ Continuity equation 807 ▷ Euler's equation 808 ▷ Energy equation 810 ▷ Equation of state 811 • The ideal gas 812 • Sound waves 813 ▷ Energy and momentum in sound waves 814 • Group velocity 817

G **Discrete Fourier transforms** 818

H **The Antonov–Lebovitz theorem** 822

I **The Doremus–Feix–Baumann theorem** 823

J **Angular-momentum transport in disks** 825
• Transport in fluid and stellar systems 825 • Transport in a disk with stationary spiral structure 826 • Transport in perturbed axisymmetric disks 828 • Transport in the WKB approximation 829

K **Derivation of the reduction factor** 830

L **The diffusion coefficients** 833

M **The distribution of binary energies** 838
• The evolution of the energy distribution of binaries 838 • The two-body distribution function in thermal equilibrium 839 • The distribution of binary energies in thermal equilibrium 839 • The principle of detailed balance 841
