## Contents

Foreword by Graziano Curti ..... page xii
Preface ..... xiv
Acknowledgments ..... xV
I Coordinate Transformation ..... 1
1.1 Homogeneous Coordinates ..... 1
1.2 Coordinate Transformation in Matrix Representation ..... 2
1.3 Rotation About an Axis ..... 6
1.4 Rotational and Translational $4 \times 4$ Matrices ..... 14
1.5 Examples of Coordinate Transformation ..... 15
1.6 Application to Derivation of Curves ..... 24
1.7 Application to Derivation of Surfaces ..... 28
2 Relative Velocity ..... 33
2.1 Vector Representation ..... 33
2.2 Matrix Representation ..... 39
2.3 Application of Skew-Symmetric Matrices ..... 41
3 Centrodes, Axodes, and Operating Pitch Surfaces ..... 44
3.1 The Concept of Centrodes ..... 44
3.2 Pitch Circle ..... 49
3.3 Operating Pitch Circles ..... 50
3.4 Axodes in Rotation Between Intersected Axes ..... 51
3.5 Axodes in Rotation Between Crossed Axes ..... 52
3.6 Operating Pitch Surfaces for Gears with Crossed Axes ..... 56
4 Planar Curves ..... 59
4.1 Parametric Representation ..... 59
4.2 Representation by Implicit Function ..... 60
4.3 Tangent and Normal to a Planar Curve ..... 60
4.4 Curvature of Planar Curves ..... 68
5 Surfaces ..... 78
5.1 Parametric Representation of Surfaces ..... 78
5.2 Curvilinear Coordinates ..... 78
5.3 Tangent Plane and Surface Normal ..... 79
5.4 Representation of a Surface by Implicit Function ..... 82
5.5 Examples of Surfaces ..... 82
6 Conjugated Surfaces and Curves ..... 97
6.1 Envelope to a Family of Surfaces: Necessary Conditions of Existence ..... 97
6.2 Basic Kinematic Relations ..... 102
6.3 Conditions of Nonundercutting ..... 103
6.4 Sufficient Conditions for Existence of an Envelope to a Family of Surfaces ..... 107
6.5 Contact Lines; Surface of Action ..... 110
6.6 Envelope to Family of Contact Lines on Generating Surface $\Sigma_{1}$ ..... 112
6.7 Formation of Branches of Envelope to Parametric Families of Surfaces and Curves ..... 114
6.8 Wildhaber's Concept of Limit Contact Normal ..... 118
6.9 Fillet Generation ..... 119
6.10 Two-Parameter Enveloping ..... 124
6.11 Axes of Meshing ..... 128
6.12 Knots of Meshing ..... 134
6.13 Problems ..... 137
7 Curvatures of Surfaces and Curves ..... 153
7.1 Introduction ..... 153
7.2 Spatial Curve in 3D-Space ..... 153
7.3 Surface Curves ..... 164
7.4 First and Second Fundamental Forms ..... 175
7.5 Principal Directions and Curvatures ..... 180
7.6 Euler's Equation ..... 188
7.7 Gaussian Curvature; Three Types of Surface Points ..... 189
7.8 Dupin's Indicatrix ..... 193
7.9 Geodesic Line; Surface Torsion ..... 194
8 Mating Surfaces: Curvature Relations, Contact Ellipse ..... 202
8.1 Introduction ..... 202
8.2 Basic Equations ..... 203
8.3 Planar Gearing: Relation Between Curvatures ..... 204
8.4 Direct Relations Between Principal Curvatures of Mating Surfaces ..... 218
8.5 Direct Relations Between Normal Curvatures of Mating Surfaces ..... 226
8.6 Diagonalization of Curvature Matrix ..... 231
8.7 Contact Ellipse ..... 234
9 Computerized Simulation of Meshing and Contact ..... 241
9.1 Introduction ..... 241
9.2 Predesign of a Parabolic Function of Transmission Errors ..... 242
9.3 Local Synthesis ..... 245
9.4 Tooth Contact Analysis ..... 249
9.5 Application of Finite Element Analysis for Design of Gear Drives ..... 257
9.6 Edge Contact ..... 260
10 Spur Involute Gears ..... 267
10.1 Introduction ..... 267
10.2 Geometry of Involute Curves ..... 268
10.3 Generation of Involute Curves by Tools ..... 273
10.4 Tooth Element Proportions ..... 278
10.5 Meshing of Involute Gear with Rack-Cutter ..... 280
10.6 Relations Between Tooth Thicknesses Measured on Various Circles ..... 285
10.7 Meshing of External Involute Gears ..... 287
10.8 Contact Ratio ..... 292
10.9 Nonstandard Gears ..... 294
II Internal Involute Gears ..... 304
11.1 Introduction ..... 304
11.2 Generation of Gear Fillet ..... 305
11.3 Conditions of Nonundercutting ..... 309
11.4 Interference by Assembly ..... 314
12 Noncircular Gears ..... 318
12.1 Introduction ..... 318
12.2 Centrodes of Noncircular Gears ..... 318
12.3 Closed Centrodes ..... 323
12.4 Elliptical and Modified Elliptical Gears ..... 326
12.5 Conditions of Centrode Convexity ..... 329
12.6 Conjugation of an Eccentric Circular Gear with a Noncircular Gear ..... 330
12.7 Identical Centrodes ..... 331
12.8 Design of Combined Noncircular Gear Mechanism ..... 333
12.9 Generation Based on Application of Noncircular Master-Gears ..... 335
12.10 Enveloping Method for Generation ..... 336
12.11 Evolute of Tooth Profiles ..... 341
12.12 Pressure Angle ..... 344
Appendix 12.A: Displacement Functions for Generation by Rack-Cutter ..... 345
Appendix 12.B: Displacement Functions for Generation by Shaper ..... 348
13 Cycloidal Gearing ..... 350
13.1 Introduction ..... 350
13.2 Generation of Cycloidal Curves ..... 350
13.3 Equations of Cycloidal Curves ..... 354
13.4 Camus' Theorem and Its Application ..... 355
13.5 External Pin Gearing ..... 359
13.6 Internal Pin Gearing ..... 365
13.7 Overcentrode Cycloidal Gearing ..... 367
13.8 Root's Blower ..... 369
14 Involute Helical Gears with Parallel Axes ..... 375
14.1 Introduction ..... 375
14.2 General Considerations ..... 375
14.3 Screw Involute Surface ..... 377
14.4 Meshing of a Helical Gear with a Rack ..... 382
14.5 Meshing of Mating Helical Gears ..... 392
14.6 Conditions of Nonundercutting ..... 396
14.7 Contact Ratio ..... 398
14.8 Force Transmission ..... 399
14.9 Results of Tooth Contact Analysis (TCA) ..... 402
14.10 Nomenclature ..... 403
15 Modified Involute Gears ..... 404
15.1 Introduction ..... 404
15.2 Axodes of Helical Gears and Rack-Cutters ..... 407
15.3 Profile-Crowned Pinion and Gear Tooth Surfaces ..... 411
15.4 Tooth Contact Analysis (TCA) of Profile-Crowned Pinion and Gear Tooth Surfaces ..... 414
15.5 Longitudinal Crowning of Pinion by a Plunging Disk ..... 419
15.6 Grinding of Double-Crowned Pinion by a Worm ..... 424
15.7 TCA of Gear Drive with Double-Crowned Pinion ..... 430
15.8 Undercutting and Pointing ..... 432
15.9 Stress Analysis ..... 435
16 Involute Helical Gears with Crossed Axes ..... 441
16.1 Introduction ..... 441
16.2 Analysis and Simulation of Meshing of Helical Gears ..... 443
16.3 Simulation of Meshing of Crossed Helical Gears ..... 452
16.4 Generation of Conjugated Tooth Surfaces of Crossed Helical Gears ..... 455
16.5 Design of Crossed Helical Gears ..... 458
16.6 Stress Analysis ..... 465
Appendix 16.A: Derivation of Shortest Center Distance for Canonical Design ..... 467
Appendix 16.B: Derivation of Equation of Canonical Design $f\left(\gamma_{o}, \alpha_{o n}, \lambda_{b 1}, \lambda_{b 2}\right)=0$ ..... 472
Appendix 16.C: Relations Between Parameters $\alpha_{p t}$ and $\alpha_{p n}$ ..... 473

## Coordinate Transformation

## I.I HOMOGENEOUS COORDINATES

A position vector in a three-dimensional space (Fig. 1.1.1) may be represented (i) in vector form as

$$
\begin{equation*}
\mathbf{r}_{m}=\overline{O_{m} M}=x_{m} \mathbf{i}_{m}+y_{m} \mathbf{j}_{m}+z_{m} \mathbf{k}_{m} \tag{1.1.1}
\end{equation*}
$$

where $\left(\mathbf{i}_{m}, \mathbf{j}_{m}, \mathbf{k}_{m}\right)$ are the unit vectors of coordinate axes, and (ii) by the column matrix

$$
\mathbf{r}_{m}=\left[\begin{array}{c}
x_{m}  \tag{1.1.2}\\
y_{m} \\
z_{m}
\end{array}\right] .
$$

The subscript " m " indicates that the position vector is represented in coordinate system $S_{m}\left(x_{m}, y_{m}, z_{m}\right)$. To save space while designating a vector, we will also represent the position vector by the row matrix,

$$
\mathbf{r}_{m}=\left[\begin{array}{lll}
x_{m} & y_{m} & z_{m} \tag{1.1.3}
\end{array}\right]^{\mathrm{T}} .
$$

The superscript " T " means that $\mathbf{r}_{m}^{\mathrm{T}}$ is a transpose matrix with respect to $\mathbf{r}_{m}$.
A point-the end of the position vector - is determined in Cartesian coordinates with three numbers: $x, y, z$. Generally, coordinate transformation in matrix operations needs mixed matrix operations where both multiplication and addition of matrices must be used. However, only multiplication of matrices is needed if position vectors are represented with homogeneous coordinates. Application of such coordinates for coordinate transformation in theory of mechanisms has been proposed by Denavit \& Hartenberg [1955] and by Litvin [1955]. Homogeneous coordinates of a point in a threedimensional space are determined by four numbers $\left(x^{*}, y^{*}, z^{*}, t^{*}\right)$ which are not equal to zero simultaneously and of which only three are independent. Assuming that $t^{*} \neq 0$, ordinary coordinates and homogeneous coordinates may be related as follows:

$$
\begin{equation*}
x=\frac{x^{*}}{t^{*}} \quad y=\frac{y^{*}}{t^{*}} \quad z=\frac{z^{*}}{t^{*}} . \tag{1.1.4}
\end{equation*}
$$

Figure I.I.I: Position vector in Cartesian coordinate system.

With $t^{*}=1$, a point may be specified by homogeneous coordinates such as $(x, y, z, 1)$, and a position vector may be represented by

$$
\begin{aligned}
& \mathbf{r}_{m}=\left[\begin{array}{c}
x_{m} \\
y_{m} \\
z_{m} \\
1
\end{array}\right] \text { or } \\
& \mathbf{r}_{m}=\left[\begin{array}{llll}
x_{m} & y_{m} & z_{m} & 1
\end{array}\right]^{\mathrm{T}} .
\end{aligned}
$$

## I.2 COORDINATE TRANSFORMATION IN MATRIX REPRESENTATION

Consider two coordinate systems $S_{m}\left(x_{m}, y_{m}, z_{m}\right)$ and $S_{n}\left(x_{n}, y_{n}, z_{n}\right)$ (Fig. 1.2.1). Point $M$ is represented in coordinate system $S_{m}$ by the position vector

$$
\mathbf{r}_{m}=\left[\begin{array}{llll}
x_{m} & y_{m} & z_{m} & 1 \tag{1.2.1}
\end{array}\right]^{\mathrm{T}} .
$$

The same point $M$ can be determined in coordinate system $S_{n}$ by the position vector

$$
\mathbf{r}_{n}=\left[\begin{array}{llll}
x_{n} & y_{n} & z_{n} & 1 \tag{1.2.2}
\end{array}\right]^{\mathrm{T}}
$$

with the matrix equation

$$
\begin{equation*}
\mathbf{r}_{n}=\mathbf{M}_{n m} \mathbf{r}_{m} \tag{1.2.3}
\end{equation*}
$$

Figure I.2.I: Derivation of coordinate transformation.

Matrix $\mathbf{M}_{n m}$ is represented by

$$
\begin{align*}
\mathbf{M}_{n m} & =\left[\begin{array}{cccc}
a_{11} & a_{12} & a_{13} & a_{14} \\
a_{21} & a_{22} & a_{23} & a_{24} \\
a_{31} & a_{32} & a_{33} & a_{34} \\
0 & 0 & 0 & 1
\end{array}\right] \\
& =\left[\begin{array}{cccc}
\left(\mathbf{i}_{n} \cdot \mathbf{i}_{m}\right) & \left(\mathbf{i}_{n} \cdot \mathbf{j}_{m}\right) & \left(\mathbf{i}_{n} \cdot \mathbf{k}_{m}\right) & \left(\widehat{O_{n} O_{m}} \cdot \mathbf{i}_{n}\right) \\
\left(\mathbf{j}_{n} \cdot \mathbf{i}_{m}\right) & \left(\mathbf{j}_{n} \cdot \mathbf{j}_{m}\right) & \left(\mathbf{j}_{n} \cdot \mathbf{k}_{m}\right) & \left(\widehat{O_{n} O_{m}} \cdot \mathbf{j}_{n}\right) \\
\left(\mathbf{k}_{n} \cdot \mathbf{i}_{m}\right) & \left(\mathbf{k}_{n} \cdot \mathbf{j}_{m}\right) & \left(\mathbf{k}_{n} \cdot \mathbf{k}_{m}\right) & \left(\widehat{O_{n} O_{m}} \cdot \mathbf{k}_{n}\right) \\
0 & 0 & 0 & 1
\end{array}\right] \\
& =\left[\begin{array}{cccc}
\cos \left(\widehat{x_{n}, x_{m}}\right) & \cos \left(\widehat{x_{n}, y_{m}}\right) & \cos \left(\widehat{\left.x_{n}, z_{m}\right)}\right. & x_{n}^{\left(\mathrm{O}_{m}\right)} \\
\cos \left(\widehat{y_{n}, x_{m}}\right) & \cos \left(\widehat{y_{n}, y_{m}}\right) & \cos \left(\widehat{\left.y_{n}, z_{m}\right)}\right. & y_{n}^{\left(\mathrm{O}_{m}\right)} \\
\cos \left(\widehat{\left.z_{n}, x_{m}\right)}\right) & \cos \left(\widehat{\left.z_{n}, y_{m}\right)}\right. & \cos \left(\widehat{\left.z_{n}, z_{m}\right)}\right. & z_{n}^{\left(\mathrm{O}_{m}\right)} \\
0 & 0 & 0 & 1
\end{array}\right] . \tag{1.2.4}
\end{align*}
$$

Here, $\left(\mathbf{i}_{n}, \mathbf{j}_{n}, \mathbf{k}_{n}\right)$ are the unit vectors of the axes of the "new" coordinate system; $\left(\mathbf{i}_{m}, \mathbf{j}_{m}, \mathbf{k}_{m}\right)$ are the unit vectors of the axes of the "old" coordinate system; $O_{n}$ and $O_{m}$ are the origins of the "new" and "old" coordinate systems; subscript "nm" in the designation $\mathbf{M}_{n m}$ indicates that the coordinate transformation is performed from $S_{m}$ to
$S_{n}$. The determination of elements $a_{l k}(k=1,2,3 ; l=1,2,3)$ of matrix $\mathbf{M}_{n m}$ is based on the following rules:
(i) Elements of the $3 \times 3$ submatrix

$$
\mathbf{L}_{n m}=\left[\begin{array}{lll}
a_{11} & a_{12} & a_{13}  \tag{1.2.5}\\
a_{21} & a_{22} & a_{23} \\
a_{31} & a_{32} & a_{33}
\end{array}\right]
$$

represent the direction cosines of the "old" unit vectors ( $\mathbf{i}_{m}, \mathbf{j}_{m}, \mathbf{k}_{m}$ ) in the "new" coordinate systems $S_{n}$. For instance, $a_{21}=\cos \left(\widehat{y_{n}, x_{m}}\right), a_{32}=\cos \left(z_{n}, \widehat{y}_{m}\right)$, and so on. The subscripts of elements $a_{k l}$ in matrix (1.2.5) indicate the number $l$ of the "old" coordinate axis and the number $k$ of the "new" coordinate axis. Axes $x, y, z$ are given numbers 1,2 , and 3 , respectively.
(ii) Elements $a_{14}, a_{24}$, and $a_{34}$ represent the "new" coordinates $x_{n}^{\left(\mathrm{O}_{m}\right)}, y_{n}^{\left(\mathrm{O}_{m}\right)}, z_{n}^{\left(\mathrm{O}_{m}\right)}$ of the "old" origin $\mathrm{O}_{m}$.

Recall that nine elements of matrix $\mathbf{L}_{n m}$ are related by six equations that express the following:
(1) Elements of each row (or column) are direction cosines of a unit vector. Thus,

$$
\begin{equation*}
a_{11}^{2}+a_{12}^{2}+a_{13}^{2}=1, \quad a_{11}^{2}+a_{21}^{2}+a_{31}^{2}=1, \quad \cdots . \tag{1.2.6}
\end{equation*}
$$

(2) Due to orthogonality of unit vectors of coordinate axes, we have

$$
\begin{align*}
& {\left[\begin{array}{lll}
a_{11} & a_{12} & a_{13}
\end{array}\right]\left[\begin{array}{lll}
a_{21} & a_{22} & a_{23}
\end{array}\right]^{\mathrm{T}}=0} \\
& {\left[\begin{array}{lll}
a_{11} & a_{21} & a_{31}
\end{array}\right]\left[\begin{array}{lll}
a_{12} & a_{22} & a_{32}
\end{array}\right]^{\mathrm{T}}=0 .} \tag{1.2.7}
\end{align*}
$$

An element of matrix $\mathbf{L}_{n m}$ can be represented by a respective determinant of the second order [Strang, 1988]. For instance,

$$
a_{11}=\left|\begin{array}{ll}
a_{22} & a_{23}  \tag{1.2.8}\\
a_{32} & a_{33}
\end{array}\right|, \quad a_{23}=(-1)\left|\begin{array}{ll}
a_{11} & a_{12} \\
a_{31} & a_{32}
\end{array}\right| .
$$

To determine the new coordinates $\left(x_{n}, y_{n}, z_{n}, 1\right)$ of point $M$, we have to use the rule of multiplication of a square matrix $(4 \times 4)$ and a column matrix $(4 \times 1)$. (The number of rows in the column matrix is equal to the number of columns in matrix $\mathbf{M}_{n m}$.) Equation (1.2.3) yields

$$
\begin{align*}
& x_{n}=a_{11} x_{m}+a_{12} y_{m}+a_{13} z_{m}+a_{14} \\
& y_{n}=a_{21} x_{m}+a_{22} y_{m}+a_{23} z_{m}+a_{24}  \tag{1.2.9}\\
& z_{n}=a_{31} x_{m}+a_{32} y_{m}+a_{33} z_{m}+a_{34} .
\end{align*}
$$

The purpose of the inverse coordinate transformation is to determine the coordinates $\left(x_{m}, y_{m}, z_{m}\right)$, taking as given coordinates $\left(x_{n}, y_{n}, z_{n}\right)$. The inverse coordinate transformation is represented by

$$
\begin{equation*}
\mathbf{r}_{m}=\mathbf{M}_{m n} \mathbf{r}_{n} \tag{1.2.10}
\end{equation*}
$$

The inverse matrix $\mathbf{M}_{m n}$ indeed exists if the determinant of matrix $\mathbf{M}_{n m}$ differs from zero.

There is a simple rule that allows the elements of the inverse matrix to be determined in terms of elements of the direct matrix. Consider that matrix $\mathbf{M}_{n m}$ is given by

$$
\mathbf{M}_{n m}=\left[\begin{array}{cccc}
a_{11} & a_{12} & a_{13} & a_{14}  \tag{1.2.11}\\
a_{21} & a_{22} & a_{23} & a_{24} \\
a_{31} & a_{32} & a_{33} & a_{34} \\
0 & 0 & 0 & 1
\end{array}\right]
$$

It is necessary to determine the elements of matrix $\mathbf{M}_{m n}$ represented by

$$
\mathbf{M}_{m n}=\left[\begin{array}{cccc}
b_{11} & b_{12} & b_{13} & b_{14}  \tag{1.2.12}\\
b_{21} & b_{22} & b_{23} & b_{24} \\
b_{31} & b_{32} & b_{33} & b_{34} \\
0 & 0 & 0 & 1
\end{array}\right]
$$

Here,

$$
\mathbf{M}_{m n}=\mathbf{M}_{n m}^{-1}, \quad \mathbf{M}_{m n} \mathbf{M}_{n m}=\mathbf{I}
$$

where I is the identity matrix.
The submatrix $\mathbf{L}_{m n}$ of the order $(3 \times 3)$ is determined as follows:

$$
\mathbf{L}_{m n}=\left[\begin{array}{lll}
b_{11} & b_{12} & b_{13}  \tag{1.2.13}\\
b_{21} & b_{22} & b_{23} \\
b_{31} & b_{32} & b_{33}
\end{array}\right]=\left[\begin{array}{lll}
a_{11} & a_{21} & a_{31} \\
a_{12} & a_{22} & a_{32} \\
a_{13} & a_{23} & a_{33}
\end{array}\right]=\mathbf{L}_{n m}^{\mathrm{T}} .
$$

The remaining elements ( $b_{14}, b_{24}$, and $b_{34}$ ) are determined with the following equations:

$$
\begin{align*}
& b_{14}=-\left(a_{11} a_{14}+a_{21} a_{24}+a_{31} a_{34}\right) \Rightarrow-\left[\begin{array}{cccc}
: a_{11}: & a_{12} & a_{13} & : a_{14}: \\
: a_{21}: & a_{22} & a_{23} & : a_{24}: \\
: a_{31}: & a_{32} & a_{33} & : a_{34}: \\
: 0: & 0 & 0 & : 1:
\end{array}\right] \\
& b_{24}=-\left(a_{12} a_{14}+a_{22} a_{24}+a_{32} a_{34}\right) \Rightarrow-\left[\begin{array}{cccc}
a_{11} & : a_{12}: & a_{13} & : a_{14}: \\
a_{21} & : a_{22}: & a_{23} & : a_{24}: \\
a_{31} & : a_{32}: & a_{33} & : a_{34}: \\
0 & : 0: & 0 & : 1:
\end{array}\right] \\
& b_{34}=-\left(a_{13} a_{14}+a_{23} a_{24}+a_{33} a_{34}\right) \Rightarrow-\left[\begin{array}{cccc}
a_{11} & a_{12} & : a_{13}: & : a_{14}: \\
a_{21} & a_{22} & : a_{23}: & : a_{24}: \\
a_{31} & a_{32} & : a_{33}: & : a_{34}: \\
0 & 0 & : 0: & : 1:
\end{array}\right] . \tag{1.2.14}
\end{align*}
$$

The columns to be multiplied are marked.
To perform successive coordinate transformation, we need only to follow the product rule of matrix algebra. For instance, the matrix equation

$$
\begin{equation*}
\mathbf{r}_{p}=\mathbf{M}_{p(p-1)} \mathbf{M}_{(p-1)(p-2)} \cdots \mathbf{M}_{32} \mathbf{M}_{21} \mathbf{r}_{1} \tag{1.2.15}
\end{equation*}
$$

represents successive coordinate transformation from $S_{1}$ to $S_{2}$, from $S_{2}$ to $S_{3}, \ldots$, from $S_{p-1}$ to $S_{p}$.

To perform transformation of components of free vectors, we need only to apply $3 \times 3$ submatrices L, which may be obtained by eliminating the last row and the last column of the corresponding matrix $\mathbf{M}$. This results from the fact that the free-vector components (projections on coordinate axes) do not depend on the location of the origin of the coordinate system.

The transformation of vector components of a free vector A from system $S_{m}$ to $S_{n}$ is represented by the matrix equation

$$
\begin{equation*}
\mathbf{A}_{n}=\mathbf{L}_{n m} \mathbf{A}_{m} \tag{1.2.16}
\end{equation*}
$$

where

$$
\mathbf{A}_{n}=\left[\begin{array}{c}
A_{x n}  \tag{1.2.17}\\
A_{y n} \\
A_{z n}
\end{array}\right], \quad \mathbf{L}_{n m}=\left[\begin{array}{lll}
a_{11} & a_{12} & a_{13} \\
a_{21} & a_{22} & a_{23} \\
a_{31} & a_{32} & a_{33}
\end{array}\right], \quad \mathbf{A}_{m}=\left[\begin{array}{c}
A_{x m} \\
A_{y m} \\
A_{z m}
\end{array}\right] .
$$

A normal to the gear tooth surface is a sliding vector because it may be translated along its line of action. However, we may transform the surface normal as a free vector if the surface point where the surface normal is considered will be transferred simultaneously.

## I.3 ROTATION ABOUT AN AXIS

## Two Main Problems

We consider a general case in which the rotation is performed about an axis that does not coincide with any axis of the employed coordinate system. We designate the unit vector of the axis of rotation by $\mathbf{c}$ (Fig. 1.3.1) and assume that the rotation about $\mathbf{c}$ may be performed either counterclockwise or clockwise.

Henceforth we consider two coordinate systems: (i) the fixed one, $S_{a}$; and (ii) the movable one, $S_{b}$. There are two typical problems related to rotation about c . The first one can be formulated as follows.

Consider that a position vector is rigidly connected to the movable body. The initial position of the position vector is designated by $\overline{O A}=\rho$ (Fig. 1.3.1). After rotation through an angle $\phi$ about c , vector $\rho$ will take a new position designated by $\overline{O A}^{*}=\rho^{*}$. Both vectors, $\rho$ and $\rho^{*}$ (Fig. 1.3.1), are considered to be in the same coordinate system, say $S_{a}$. Our goal is to develop an equation that relates components of vectors $\rho_{a}$ and $\rho_{a}^{*}$. (The subscript " $a$ " indicates that the two vectors are represented in the same coordinate system $S_{a}$.) Matrix equation

$$
\begin{equation*}
\rho_{a}^{*}=\mathrm{L}_{a} \rho_{a} \tag{1.3.1}
\end{equation*}
$$

describes the relation between the components of vectors $\rho$ and $\rho^{*}$ that are represented in the same coordinate system $S_{a}$.

The other problem concerns representation of the same position vector in different coordinate systems. Our goal is to derive matrix $\mathbf{L}_{b a}$ in matrix equation

$$
\begin{equation*}
\rho_{b}=\mathbf{L}_{b a} \rho_{a} \tag{1.3.2}
\end{equation*}
$$

Figure I.3.I: Rigid body rotation.

The designations $\rho_{a}$ and $\rho_{b}$ indicate that the same position vector $\rho$ is represented in coordinate systems $S_{a}$ and $S_{b}$, respectively. Although the same position vector is considered, the components of $\rho$ in coordinate systems $S_{a}$ and $S_{b}$ are different and we designate them by

$$
\begin{equation*}
\rho_{a}=a_{1} \dot{\mathbf{i}}_{a}+a_{2} \dot{\mathbf{j}}_{a}+a_{3} \mathbf{k}_{a} \tag{1.3.3}
\end{equation*}
$$

and

$$
\begin{equation*}
\boldsymbol{\rho}_{b}=b_{1} \mathbf{i}_{b}+b_{2} \mathbf{j}_{b}+b_{3} \mathbf{k}_{b} . \tag{1.3.4}
\end{equation*}
$$

Matrix $\mathbf{L}_{b a}$ is an operator that transforms the components $\left[\begin{array}{lll}a_{1} & a_{2} & a_{3}\end{array}\right]^{\mathrm{T}}$ into $\left[\begin{array}{lll}b_{1} & b_{2} & b_{3}\end{array}\right]^{\mathrm{T}}$. It will be shown below that operators $\mathbf{L}_{a}$ and $\mathbf{L}_{b a}$ are related.

Problem I. Relations between components of vectors $\rho_{a}$ and $\rho_{a}^{*}$.
Recall that $\rho_{a}$ and $\rho_{a}^{*}$ are two position vectors that are represented in the same coordinate system $S_{a}$. Vector $\rho$ represents the initial position of the position vector, before rotation, and $\rho^{*}$ represents the position vector after rotation about c . The following derivations are based on the assumption that rotation about $\mathbf{c}$ is performed counterclockwise. The procedure of derivations (see also Suh \& Radcliffe, 1978, Shabana, 1989, and others) is as follows.

Step 1: We represent $\rho_{a}^{*}$ by the equation (Fig. 1.3.1)

$$
\begin{equation*}
\rho_{a}^{*}=\overline{O M}+\overline{M N}+\overline{N A^{*}} \tag{1.3.5}
\end{equation*}
$$

where

$$
\begin{equation*}
\overline{O M}=\left(\mathbf{c}_{a} \cdot \boldsymbol{\rho}_{a}\right) \mathbf{c}_{a}=\left(\mathbf{c}_{a} \cdot \boldsymbol{\rho}_{a}^{*}\right) \mathbf{c}_{a} \tag{1.3.6}
\end{equation*}
$$

and $\mathbf{c}_{a}$ is the unit vector of the axis of rotation that is represented in $S_{a}$.
Step 2: Vector $\rho_{a}$ is represented by the equation

$$
\begin{equation*}
\rho_{a}=\overline{O M}+\overline{M A}=\left(\mathbf{c}_{a} \cdot \boldsymbol{\rho}_{a}\right) \mathbf{c}_{a}+\overline{M A} \tag{1.3.7}
\end{equation*}
$$

that yields

$$
\begin{equation*}
\overline{M A}=\rho_{a}-\left(\mathbf{c}_{a} \cdot \rho_{a}\right) \mathbf{c}_{a} . \tag{1.3.8}
\end{equation*}
$$

We emphasize that a vector being rotated about c generates a cone with an apex angle $\alpha$. Thus, both vectors, $\rho$ and $\rho^{*}$, are the generatrices of the same cone, as shown in Fig. 1.3.1.

Step 3: Vector $\overline{M N}$ has the same direction as $\overline{M A}$ and this yields

$$
\begin{equation*}
|\overline{M N}|=\left|\overline{M A^{*}}\right| \cos \phi=|\overline{M A}| \cos \phi=\rho \sin \alpha \cos \phi \tag{1.3.9}
\end{equation*}
$$

where $\alpha$ is the apex angle of the generated cone, $|\overline{M A}|=\rho \sin \alpha$, and $\rho$ is the magnitude of $\rho$.

Equations (1.3.8) and (1.3.9) yield

$$
\begin{equation*}
\overline{M N}=|\overline{M N}| \frac{\overline{M A}}{|\overline{M A}|}=\left[\rho_{a}-\left(\mathbf{c}_{a} \cdot \rho_{a}\right) \mathbf{c}_{a}\right] \cos \phi \tag{1.3.10}
\end{equation*}
$$

Step 4: Vector $\overline{N A^{*}}$ has the same direction as $\left(\mathbf{c}_{a} \times \boldsymbol{\rho}_{a}\right)$ and may be represented by

$$
\begin{equation*}
\overline{N A^{*}}=\frac{\mathbf{c}_{a} \times \boldsymbol{\rho}_{a}}{\left|\mathbf{c}_{a} \times \boldsymbol{\rho}_{a}\right|}\left|\overline{N A^{*}}\right|=\sin \phi\left(\mathbf{c}_{a} \times \boldsymbol{\rho}_{a}\right) . \tag{1.3.11}
\end{equation*}
$$

Here,

$$
\left|\overline{N A^{*}}\right|=\left|\overline{M A^{*}}\right| \sin \phi=\rho \sin \alpha \sin \phi, \quad\left|\mathbf{c}_{a} \times \boldsymbol{\rho}_{a}\right|=\rho \sin \alpha .
$$

Step 5: Equations (1.3.5), (1.3.6), (1.3.10), and (1.3.11) yield

$$
\begin{equation*}
\rho_{a}^{*}=\rho_{a} \cos \phi+(1-\cos \phi)\left(\mathbf{c}_{a} \cdot \rho_{a}\right) \mathbf{c}_{a}+\sin \phi\left(\mathbf{c}_{a} \times \rho_{a}\right) . \tag{1.3.12}
\end{equation*}
$$

Step 6: It is easy to prove that

$$
\begin{equation*}
\left(\mathbf{c}_{a} \cdot \rho_{a}\right) \mathbf{c}_{a}=\mathbf{c}_{a} \times\left(\mathbf{c}_{a} \times \boldsymbol{\rho}_{a}\right)+\rho_{a} \tag{1.3.13}
\end{equation*}
$$

because

$$
\mathbf{c}_{a} \times\left(\mathbf{c}_{a} \times \rho_{a}\right)=\left(\mathbf{c}_{a} \cdot \rho_{a}\right) \mathbf{c}_{a}-\rho_{a}\left(\mathbf{c}_{a} \cdot \mathbf{c}_{a}\right) .
$$

Step 7: Equations (1.3.12) and (1.3.13) yield

$$
\begin{equation*}
\rho_{a}^{*}=\rho_{a}+(1-\cos \phi)\left[\mathbf{c}_{a} \times\left(\mathbf{c}_{a} \times \rho_{a}\right)\right]+\sin \phi\left(\mathbf{c}_{a} \times \rho_{a}\right) . \tag{1.3.14}
\end{equation*}
$$

Equation (1.3.14) is known as the Rodrigues formula. According to the investigation by Cheng \& Gupta [1989], this equation deserves to be called the Euler-Rodrigues, formula.

Step 8: Additional derivations are directed at representation of the Euler-Rodrigues formula in matrix form.

The cross product $\left(\mathbf{c}_{a} \times \boldsymbol{\rho}_{a}\right)$ may be represented in matrix form by

$$
\begin{equation*}
\mathrm{c}_{a} \times \rho_{a}=\mathrm{C}^{s} \rho_{a} \tag{1.3.15}
\end{equation*}
$$

where $\mathbf{C}^{s}$ is the skew-symmetric matrix represented by

$$
\mathbf{C}^{s}=\left[\begin{array}{ccc}
0 & -c_{3} & c_{2}  \tag{1.3.16}\\
c_{3} & 0 & -c_{1} \\
-c_{2} & c_{1} & 0
\end{array}\right]
$$

Vector $\mathbf{c}_{a}$ is represented by

$$
\begin{equation*}
\mathbf{c}_{a}=c_{1} \mathbf{i}_{a}+c_{2} \dot{\mathbf{j}}_{a}+c_{3} \mathbf{k}_{a} . \tag{1.3.17}
\end{equation*}
$$

Step 9: Equations (1.3.14), (1.3.15), and (1.3.16) yield the following matrix representation of the Euler-Rodrigues formula:

$$
\begin{equation*}
\boldsymbol{\rho}_{a}^{*}=\left[\mathbf{I}+(1-\cos \phi)\left(\mathbf{C}^{s}\right)^{2}+\sin \phi \mathbf{C}^{s}\right] \boldsymbol{\rho}_{a}=\mathbf{L}_{a} \boldsymbol{\rho}_{a} \tag{1.3.18}
\end{equation*}
$$

where I is the $3 \times 3$ identity matrix. While deriving Eqs. (1.3.14) and (1.3.18), we assumed that the rotation is performed counterclockwise. For the case of clockwise rotation, it is necessary to change the sign preceding $\sin \phi$ to its opposite. The expression for matrix $\mathrm{L}_{a}$ that will cover two directions of rotation is

$$
\begin{equation*}
\mathbf{L}_{a}=\mathbf{I}+(1-\cos \phi)\left(\mathbf{C}^{s}\right)^{2} \pm \sin \phi \mathbf{C}^{s} . \tag{1.3.19}
\end{equation*}
$$

The upper sign preceding $\sin \phi$ corresponds to counterclockwise rotation and the lower sign corresponds to rotation in a clockwise direction. In both cases the unit vector c must be expressed by the same Eq. (1.3.17) that determines the orientation of $\mathbf{c}$ but not the direction of rotation. The direction of rotation is identified with the proper sign preceding $\sin \phi$ in Eq. (1.3.19).

Problem 2. Recall that our goal is to derive the operator $\mathbf{L}_{b a}$ in matrix equation (1.3.2) that transforms components of the same vector (see Eqs. (1.3.3) and (1.3.4)). It will be shown below that the sought-for operator is represented as

$$
\begin{equation*}
\mathbf{L}_{b a}=\mathbf{L}_{a}^{\mathrm{T}}=\mathbf{I}+(1-\cos \phi)\left(\mathbf{C}^{s}\right)^{2} \mp \sin \phi \mathbf{C}^{s} . \tag{1.3.20}
\end{equation*}
$$

Operator $\mathbf{L}_{b a}$ can be obtained from operator $\mathbf{L}_{a}$ given by Eq. (1.3.19) by changing the sign of the angle of rotation, $\phi$. The upper and lower signs preceding $\sin \phi$ in Eq. (1.3.20) correspond to the cases where $S_{a}$ will coincide with $S_{b}$ by rotation counterclockwise and clockwise, respectively. The proof is based on the determination of components of the same vector, say vector $\overline{O A}$ shown in Fig. 1.3.1, in coordinate systems $S_{a}$ and $S_{b}$.

Step 1: We consider initially that vector $\overline{O A}$ is represented in $S_{a}$ as

$$
\rho_{a}=\left[\begin{array}{lll}
a_{1} & a_{2} & a_{3} \tag{1.3.21}
\end{array}\right]^{\mathrm{T}}
$$

Step 2: To determine components of vector $\overline{O A}$ in $S_{b}$ we consider first that coordinate system $S_{b}$ and the previously mentioned position vector are rotated as one rigid body
about $\mathbf{c}$. After rotation through angle $\phi$, position vector $\overline{O A}$ will take the position $\overline{O A}^{*}$ and can be represented in $S_{b}$ as

$$
\begin{equation*}
\overline{\mathrm{OA}}^{*}=a_{1} \mathbf{i}_{b}+a_{2} \dot{\mathbf{j}}_{b}+a_{3} \mathbf{k}_{b} \tag{1.3.22}
\end{equation*}
$$

It is obvious that vector $\overline{O A}^{*}$ has in $S_{b}$ the same components as vector $\overline{O A}$ has in $S_{a}$.
Step 3: We consider now in $S_{b}$ two vectors $\overline{O A}^{*}$ and $\overline{O A}$. Vector $\overline{O A}^{*}$ will coincide with $\overline{O A}$ after clockwise rotation about $\mathbf{c}$. The components of vectors $\overline{O A}^{*}$ and $\overline{O A}$ in $S_{b}$ are related by an equation that is similar to Eq. (1.3.19). The difference is that we now have to consider that the rotation from $\overline{O A}^{*}$ to $\overline{O A}$ is performed clockwise. Then we obtain

$$
\begin{equation*}
(\overline{\mathrm{OA}})_{b}=\mathbf{L}_{b}\left(\overline{\mathrm{OA}}^{*}\right)_{b}=\left[\mathbf{I}+(1-\cos \phi)\left(\mathbf{C}^{s}\right)^{2}-\sin \phi \mathbf{C}^{s}\right]\left(\overline{\mathrm{OA}}^{*}\right)_{b} . \tag{1.3.23}
\end{equation*}
$$

Designating components of $(\overline{O A})_{b}$ by $\left[\begin{array}{lll}b_{1} & b_{2} & b_{3}\end{array}\right]^{\mathrm{T}}$, we receive

$$
\left[\begin{array}{lll}
b_{1} & b_{2} & b_{3}
\end{array}\right]^{\mathrm{T}}=\left[\mathbf{I}+(1-\cos \phi)\left(\mathbf{C}^{s}\right)^{2}-\sin \phi \mathbf{C}^{s}\right]\left[\begin{array}{lll}
a_{1} & a_{2} & a_{3} \tag{1.3.24}
\end{array}\right]^{\mathrm{T}} .
$$

Step 4: We have now obtained components of the same vector $\overline{O A}$ in coordinate systems $S_{a}$ and $S_{b}$, respectively. The matrix equation that describes transformation of components of $\overline{O A}$ is

$$
\begin{equation*}
(\overline{\mathrm{OA}})_{b}=\mathrm{L}_{b a}(\overline{\mathrm{OA}})_{a} \tag{1.3.25}
\end{equation*}
$$

For the case in which rotation from $S_{a}$ to $S_{b}$ is performed counterclockwise we have obtained that

$$
\begin{equation*}
\mathbf{L}_{b a}=\mathbf{I}+(1-\cos \phi)\left(\mathbf{C}^{s}\right)^{2}-\sin \phi \mathbf{C}^{s} \tag{1.3.26}
\end{equation*}
$$

Similarly, for the case in which rotation from $S_{a}$ to $S_{b}$ is performed clockwise, we obtain

$$
\begin{equation*}
\mathbf{L}_{b a}=\mathbf{I}+(1-\cos \phi)\left(\mathbf{C}^{s}\right)^{2}+\sin \phi \mathbf{C}^{s} \tag{1.3.27}
\end{equation*}
$$

The general description of operator $\mathbf{L}_{b a}$ and the respective coordinate transformation are as follows:

$$
\begin{equation*}
\rho_{b}=\mathbf{L}_{b a} \boldsymbol{\rho}_{a}=\left[\mathbf{I}+(1-\cos \phi)\left(\mathbf{C}^{s}\right)^{2} \mp \sin \phi \mathbf{C}^{s}\right] \rho_{a} . \tag{1.3.28}
\end{equation*}
$$

The upper and lower signs preceding $\sin \phi$ correspond to the cases in which rotation from $S_{a}$ to $S_{b}$ is performed counterclockwise and clockwise, respectively.

In our identification of coordinate systems $S_{a}$ and $S_{b}$ we do not use the terms fixed and movable. We just consider that $S_{a}$ is the previous coordinate system and $S_{b}$ is the new one, and we take into account how the rotation from $S_{a}$ to $S_{b}$ is performed: counterclockwise or clockwise.

## Matrix $L_{b a}$

Using Eqs. (1.3.26) and (1.3.27), we may represent elements of matrix $\mathbf{L}_{b a}$ in terms of components of unit vector c of the axis of rotation and the angle of rotation $\phi$. Thus,

Figure I.3.2: Derivation of coordinate transformation by rotation.

we obtain

$$
\mathbf{L}_{b a}=\left[\begin{array}{lll}
a_{11} & a_{12} & a_{13}  \tag{1.3.29}\\
a_{21} & a_{22} & a_{23} \\
a_{31} & a_{32} & a_{33}
\end{array}\right]
$$

Here,

$$
\begin{align*}
& a_{11}=\cos \phi\left(1-c_{1}^{2}\right)+c_{1}^{2} \\
& a_{12}=(1-\cos \phi) c_{1} c_{2} \pm \sin \phi c_{3} \\
& a_{13}=(1-\cos \phi) c_{1} c_{3} \mp \sin \phi c_{2} \\
& a_{21}=(1-\cos \phi) c_{1} c_{2} \mp \sin \phi c_{3} \\
& a_{22}=\cos \phi\left(1-c_{2}^{2}\right)+c_{2}^{2}  \tag{1.3.30}\\
& a_{23}=(1-\cos \phi) c_{2} c_{3} \pm \sin \phi c_{1} \\
& a_{31}=(1-\cos \phi) c_{1} c_{3} \pm \sin \phi c_{2} \\
& a_{32}=(1-\cos \phi) c_{2} c_{3} \mp \sin \phi c_{1} \\
& a_{33}=\cos \phi\left(1-c_{3}^{2}\right)+c_{3}^{2} .
\end{align*}
$$

When the axis of rotation coincides with a coordinate axis of $S_{a}$, we have to make two components of unit vector $\mathbf{c}_{a}$ equal to zero in Eqs. (1.3.30). For instance, in the case in which rotation is performed about the $z_{a}$ axis (Fig. 1.3.2), we have

$$
\mathbf{c}_{a}=\mathbf{k}_{a}=\left[\begin{array}{lll}
0 & 0 & 1 \tag{1.3.31}
\end{array}\right]^{\mathrm{T}} .
$$

We emphasize again that in all cases of coordinate transformation only elements (1.3.30) of matrix $\mathrm{L}_{b a}$, and not the components of $\mathrm{c}_{a}$, depend on the direction of rotation. The unit vector c can be represented in either of the two coordinate systems, $S_{a}$ and $S_{b}$, by the equations

$$
\begin{equation*}
\mathbf{c}=c_{1} \mathbf{i}_{a}+c_{2} \dot{\mathbf{j}}_{a}+c_{3} \mathbf{k}_{a}=c_{1} \mathbf{i}_{b}+c_{2} \dot{\mathbf{j}}_{b}+c_{3} \mathbf{k}_{b} \tag{1.3.32}
\end{equation*}
$$

This means that the unit vector c of the axis of rotation has the same components in both coordinate systems, $S_{a}$ and $S_{b}$. It is easily verified that

$$
\left[\begin{array}{lll}
c_{1} & c_{2} & c_{3}
\end{array}\right]^{\mathrm{T}}=\mathbf{L}_{b a}\left[\begin{array}{lll}
c_{1} & c_{2} & c_{3} \tag{1.3.33}
\end{array}\right]^{\mathrm{T}}
$$
