Contents

Preface XIX

I Introduction to Inversion Theory 1

1 Forward and inverse problems in geophysics 3
1.1 Formulation of forward and inverse problems for different geophysical fields . . . 3
1.1.1 Gravity field . . . 6
1.1.2 Magnetic field . . . 7
1.1.3 Electromagnetic field . . . 9
1.1.4 Seismic wavefield . . . 14
1.2 Existence and uniqueness of the inverse problem solutions . . . 16
1.2.1 Existence of the solution . . . 16
1.2.2 Uniqueness of the solution . . . 17
1.2.3 Practical uniqueness . . . 23
1.3 Instability of the inverse problem solution . . . 24

2 Ill-posed problems and the methods of their solution 29
2.1 Sensitivity and resolution of geophysical methods . . . 29
2.1.1 Formulation of the inverse problem in general mathematical spaces . . . 29
2.1.2 Sensitivity . . . 30
2.1.3 Resolution . . . 31
2.2 Formulation of well-posed and ill-posed problems . . . 32
2.2.1 Well-posed problems . . . 32
2.2.2 Conditionally well-posed problems . . . 33
2.2.3 Quasi-solution of the ill-posed problem . . . 34
2.3 Foundations of regularization methods of inverse problem solution . . . 36
2.3.1 Regularizing operators . . . 36
2.3.2 Stabilizing functionals . . . 39
2.3.3 Tikhonov parametric functional . . . 42

2.4 Family of stabilizing functionals 45
2.4.1 Stabilizing functionals revisited 45
2.4.2 Representation of a stabilizing functional in the form of a pseudo-quadratic functional 50
2.5 Definition of the regularization parameter 52
2.5.1 Optimal regularization parameter selection 52
2.5.2 L-curve method of regularization parameter selection 55

II Methods of the Solution of Inverse Problems 59

3 Linear discrete inverse problems 61
3.1 Linear least-squares inversion 61
3.1.1 The linear discrete inverse problem 61
3.1.2 Systems of linear equations and their general solutions 62
3.1.3 The data resolution matrix 64
3.2 Solution of the purely underdetermined problem 66
3.2.1 Underdetermined system of linear equations 66
3.2.2 The model resolution matrix 67
3.3 Weighted least-squares method 68
3.4 Applying the principles of probability theory to a linear inverse problem 69
3.4.1 Some formulae and notations from probability theory 69
3.4.2 Maximum likelihood method 71
3.4.3 Chi-square fitting 73
3.5 Regularization methods 74
3.5.1 The Tikhonov regularization method 74
3.5.2 Application of SLDM method in regularized linear inverse problem solution 75
3.5.3 Definition of the weighting matrices for the model parameters and data 77
3.5.4 Approximate regularized solution of the linear inverse problem 79
3.5.5 The Levenberg - Marquardt method 81
3.5.6 The maximum a posteriori estimation method (the Bayes estimation) 82
3.6 The Backus-Gilbert Method 84
3.6.1 The data resolution function 84
3.6.2 The spread function 86
3.6.3 Regularized solution in the Backus-Gilbert method 88

4 Iterative solutions of the linear inverse problem 91
4.1 Linear operator equations and their solution by iterative methods . . 91
4.1.1 Linear inverse problems and the Euler equation 91
4.1.2 The minimal residual method 93

4.1.3 Linear inverse problem solution using MRM 99
4.2 A generalized minimal residual method 101
4.2.1 The Krylov-subspace method 101
4.2.2 The Lanczos minimal residual method 103
4.2.3 The generalized minimal residual method 108
4.2.4 A linear inverse problem solution using generalized MRM . . . 112
4.3 The regularization method in a linear inverse problem solution 113
4.3.1 The Euler equation for the Tikhonov parametric functional . . 113
4.3.2 MRM solution of the Euler equation 115
4.3.3 Generalized MRM solutions of the Euler equation for the parametric functional 117

5 Nonlinear inversion technique **121**
5.1 Gradient-type methods 121
5.1.1 Method of steepest descent 121
5.1.2 The Newton method 131
5.1.3 The conjugate gradient method 137
5.2 Regularized gradient-type methods in the solution of nonlinear inverse problems 143
5.2.1 Regularized steepest descent 143
5.2.2 The regularized Newton method 145
5.2.3 Approximate regularized solution of the nonlinear inverse problem 147
5.2.4 The regularized preconditioned steepest descent method . . . 147
5.2.5 The regularized conjugate gradient method 148
5.3 Regularized solution of a nonlinear discrete inverse problem 149
5.3.1 Nonlinear least-squares inversion 149
5.3.2 The steepest descent method for nonlinear regularized least-squares inversion 150
5.3.3 The Newton method for nonlinear regularized least-squares inversion 151
5.3.4 Numerical schemes of the Newton method for nonlinear regularized least-squares inversion 152
5.3.5 Nonlinear least-squares inversion by the conjugate gradient method 153
5.3.6 The numerical scheme of the regularized conjugate gradient method for nonlinear least-squares inversion 153
5.4 Conjugate gradient re-weighted optimization 155
5.4.1 The Tikhonov parametric functional with a pseudo-quadratic stabilizer 155
5.4.2 Re-weighted conjugate gradient method 157
5.4.3 Minimization in the space of weighted parameters 160

5.4.4 The re-weighted regularized conjugate gradient (RCG) method in the space of weighted parameters 161

III Geopotential Field Inversion 167

6 Integral representations in forward modeling of gravity and magnetic fields 169

6.1 Basic equations for gravity and magnetic fields 169
6.1.1 Gravity and magnetic fields in three dimensions 169
6.1.2 Two-dimensional models of gravity and magnetic fields 170
6.2 Integral representations of potential fields based on the theory of functions of a complex variable 171
6.2.1 Complex intensity of a plane potential field 171
6.2.2 Complex intensity of a gravity field 174
6.2.3 Complex intensity and potential of a magnetic field 175

7 Integral representations in inversion of gravity and magnetic data 177

7.1 Gradient methods of gravity inversion 177
7.1.1 Steepest ascent direction of the misfit functional for the gravity inverse problem 177
7.1.2 Application of the re-weighted conjugate gradient method . . 179
7.2 Gravity field migration 181
7.2.1 Physical interpretation of the adjoint gravity operator 181
7.2.2 Gravity field migration in the solution of the inverse problem . 184
7.2.3 Iterative gravity migration 186
7.3 Gradient methods of magnetic anomaly inversion 188
7.3.1 Magnetic potential inversion 188
7.3.2 Magnetic potential migration 189
7.4 Numerical methods in forward and inverse modeling 190
7.4.1 Discrete forms of 3-D gravity and magnetic forward modeling operators 190
7.4.2 Discrete form of 2-D forward modeling operator 193
7.4.3 Regularized inversion of gravity data 193

IV Electromagnetic Inversion 199

8 Foundations of electromagnetic theory 201

8.1 Electromagnetic field equations 201
8.1.1 Maxwell's equations 201
8.1.2 Field in homogeneous domains of a medium 202
8.1.3 Boundary conditions 203

8.1.4 Field equations in the frequency domain 204
8.1.5 Quasi-static (quasi-stationary) electromagnetic field 209
8.1.6 Field wave equations 210
8.1.7 Field equations allowing for magnetic currents and charges . . 211
8.1.8 Stationary electromagnetic field 212
8.1.9 Fields in two-dimensional inhomogeneous media and the concepts of E- and H-polarization 213
8.2 Electromagnetic energy flow 215
8.2.1 Radiation conditions 216
8.2.2 Poynting's theorem in the time domain 216
8.2.3 Energy inequality in the time domain 218
8.2.4 Poynting's theorem in the frequency domain 220
8.3 Uniqueness of the solution of electromagnetic field equations 222
8.3.1 Boundary-value problem 222
8.3.2 Uniqueness theorem for the unbounded domain 223
8.4 Electromagnetic Green's tensors 224
8.4.1 Green's tensors in the frequency domain 224
8.4.2 Lorentz lemma and reciprocity relations 225
8.4.3 Green's tensors in the time domain 227

9 Integral representations in electromagnetic forward modeling 231
9.1 Integral equation method 231
9.1.1 Background (normal) and anomalous parts of the electromagnetic field 231
9.1.2 Poynting's theorem and energy inequality for an anomalous field 233
9.1.3 Integral equation method in two dimensions 234
9.1.4 Calculation of the first variation (Fréchet derivative) of the electromagnetic field for 2-D models 237
9.1.5 Integral equation method in three dimensions 239
9.1.6 Calculation of the first variation (Fréchet derivative) of the electromagnetic field for 3-D models 240
9.1.7 Fréchet derivative calculation using the differential method . . 243
9.2 Family of linear and nonlinear integral approximations of the electromagnetic field 245
9.2.1 Born and extended Born approximations 246
9.2.2 Quasi-linear approximation and tensor quasi-linear equation . 247
9.2.3 Quasi-analytical solutions for a 3-D electromagnetic field . . . 248
9.2.4 Quasi-analytical solutions for 2-D electromagnetic field 251
9.2.5 Localized nonlinear approximation 252
9.2.6 Localized quasi-linear approximation 253
9.3 Linear and non-linear approximations of higher orders 256
9.3.1 Born series 256

9.3.2 Modified Green's operator 257
9.3.3 Modified Born series 259
9.3.4 Quasi-linear approximation of the modified Green's operator . 261
9.3.5 QL series 263
9.3.6 Accuracy estimation of the QL approximation of the first and higher orders 263
9.3.7 QA series 266
9.4 Integral representations in numerical dressing 267
9.4.1 Discretization of the model parameters 267
9.4.2 Galerkin method for electromagnetic field discretization 269
9.4.3 Discrete form of electromagnetic integral equations based on boxcar basis functions 271
9.4.4 Contraction integral equation method 275
9.4.5 Contraction integral equation as the preconditioned conventional integral equation 276
9.4.6 Matrix form of Born approximation 278
9.4.7 Matrix form of quasi-linear approximation 278
9.4.8 Matrix form of quasi-analytical approximation 280
9.4.9 The diagonalized quasi-analytical (DQA) approximation . . . 281

10 Integral representations in electromagnetic inversion 287
10.1 Linear inversion methods 288
10.1.1 Excess (anomalous) current inversion 288
10.1.2 Born inversion 290
10.1.3 Conductivity imaging by the Born approximation 292
10.1.4 Iterative Born inversions 296
10.2 Nonlinear inversion 297
10.2.1 Formulation of the nonlinear inverse problem 297
10.2.2 Fréchet derivative calculation 298
10.3 Quasi-linear inversion 300
10.3.1 Principles of quasi-linear inversion 300
10.3.2 Quasi-linear inversion in matrix notations 301
10.3.3 Localized quasi-linear inversion 306
10.4 Quasi-analytical inversion 311
10.4.1 Fréchet derivative calculation 311
10.4.2 Inversion based on the quasi-analytical method 312
10.5 Magnetotelluric (MT) data inversion 314
10.5.1 Iterative Born inversion of magnetotelluric data 315
10.5.2 DQA approximation in magnetotelluric inverse problem 317
10.5.3 Fréchet derivative matrix with respect to the logarithm of the total conductivity 319
10.5.4 Regularized smooth and focusing inversion of MT data 320

10.5.5 Example of synthetic 3-D MT data inversion 321
10.5.6 Case study: inversion of the Minamikayabe area data 324

11 Electromagnetic migration imaging 331
11.1 Electromagnetic migration in the frequency domain 332
11.1.1 Formulation of the electromagnetic inverse problem as a minimization of the energy flow functional 332
11.1.2 Integral representations for electromagnetic migration field . . 335
11.1.3 Gradient direction of the energy flow functional 336
11.1.4 Migration imaging in the frequency domain 338
11.1.5 Iterative migration 343
11.2 Electromagnetic migration in the time domain 344
11.2.1 Time domain electromagnetic migration as the solution of the boundary value problem 345
11.2.2 Minimization of the residual electromagnetic field energy flow 351
11.2.3 Gradient direction of the energy flow functional in the time domain 353
11.2.4 Migration imaging in the time domain 354
11.2.5 Iterative migration in the time domain 357

12 Differential methods in electromagnetic modeling and inversion 361
12.1 Electromagnetic modeling as a boundary-value problem 361
12.1.1 Field equations and boundary conditions 361
12.1.2 Electromagnetic potential equations and boundary conditions 365
12.2 Finite difference approximation of the boundary-value problem 366
12.2.1 Discretization of Maxwell's equations using a staggered grid . 367
12.2.2 Discretization of the second order differential equations using the balance method 371
12.2.3 Discretization of the electromagnetic potential differential equations 376
12.2.4 Application of the spectral Lanczos decomposition method (SLDM) for solving the linear system of equations for discrete electromagnetic fields 379
12.3 Finite element solution of boundary-value problems 380
12.3.1 Galerkin method 380
12.3.2 Exact element method 384
12.4 Inversion based on differential methods 385
12.4.1 Formulation of the inverse problem on the discrete grid 385
12.4.2 Fréchet derivative calculation using finite difference methods . 386

V Seismic Inversion 393

13 Wavefield equations 395

13.1 Basic equations of elastic waves 395
13.1.1 Deformation of an elastic body; deformation and stress tensors 395
13.1.2 Hooke's law 399
13.1.3 Dynamic equations of elasticity theory for a homogeneous isotropic medium 400
13.1.4 Compressional and shear waves 402
13.1.5 Acoustic waves and scalar wave equation 405
13.1.6 High frequency approximations in the solution of an acoustic wave equation 405
13.2 Green's functions for wavefield equations 407
13.2.1 Green's functions for the scalar wave equation and for the corresponding Helmholtz equation 407
13.2.2 High frequency (WKBJ) approximation for the Green's function 410
13.2.3 Green's tensor for vector wave equation 411
13.2.4 Green's tensor for the Lamé equation 413
13.3 Kirchhoff integral formula and its analogs 414
13.3.1 Kirchhoff integral formula 415
13.3.2 Generalized Kirchhoff integral formulae for the Lamé equation and the vector wave equation 417
13.4 Uniqueness of the solution of the wavefield equations 420
13.4.1 Initial-value problems 420
13.4.2 Energy conservation law 422
13.4.3 Uniqueness of the solution of initial-value problems 425
13.4.4 Sommerfeld radiation conditions 426
13.4.5 Uniqueness of the solution of the wave propagation problem based on radiation conditions 429
13.4.6 Kirchhoff formula for an unbounded domain 434
13.4.7 Radiation conditions for elastic waves 437

14 Integral representations in wavefield theory 443

14.1 Integral equation method in acoustic wavefield analysis 443
14.1.1 Separation of the acoustic wavefield into incident and scattered (background and anomalous) parts 443
14.1.2 Integral equation for the acoustic wavefield 445
14.1.3 Reciprocity theorem 447
14.1.4 Calculation of the first variation (Fréchet derivative) of the acoustic wavefield 448
14.2 Integral approximations of the acoustic wavefield 449
14.2.1 Born approximation 449

14.2.2 Quasi-linear approximation 450
14.2.3 Quasi-analytical approximation 451
14.2.4 Localized quasi-linear approximation 452
14.2.5 Kirchhoff approximation 453
14.3 Method of integral equations in vector wavefield analysis 456
14.3.1 Vector wavefield separation 456
14.3.2 Integral equation method for the vector wavefield 457
14.3.3 Calculation of the first variation (Fréchet derivative) of the vector wavefield 458
14.4 Integral approximations of the vector wavefield 460
14.4.1 Born type approximations 460
14.4.2 Quasi-linear approximation 461
14.4.3 Quasi-analytical solutions for the vector wavefield 461
14.4.4 Localized quasi-linear approximation 462

15 Integral representations in wavefield inversion 467
15.1 Linear inversion methods 467
15.1.1 Born inversion of acoustic and vector wavefields 468
15.1.2 Wavefield imaging by the Born approximations 470
15.1.3 Iterative Born inversions of the wavefield 475
15.1.4 Bleistein inversion 475
15.1.5 Inversion based on the Kirchhoff approximation 491
15.1.6 Traveltime inverse problem 494
15.2 Quasi-linear inversion 496
15.2.1 Quasi-linear inversion of the acoustic wavefield 496
15.2.2 Localized quasi-linear inversion based on the Bleistein method 497
15.3 Nonlinear inversion 499
15.3.1 Formulation of the nonlinear wavefield inverse problem 499
15.3.2 Fréchet derivative operators for wavefield problems 500
15.4 Principles of wavefield migration 503
15.4.1 Geometrical model of migration transformation 503
15.4.2 Kirchhoff integral formula for reverse-time wave equation migration 507
15.4.3 Rayleigh integral 510
15.4.4 Migration in the spectral domain (Stolt's method) 514
15.4.5 Equivalence of the spectral and integral migration algorithms . 516
15.4.6 Inversion versus migration 517
15.5 Elastic field inversion 518
15.5.1 Formulation of the elastic field inverse problem 518
15.5.2 Fréchet derivative for the elastic forward modeling operator . . 520
15.5.3 Adjoint Fréchet derivative operator and back-propagating elastic field 522

A Functional spaces of geophysical models and data **531**
A.1 Euclidean Space . . . 531
A.1.1 Vector operations in Euclidean space . . . 531
A.1.2 Linear transformations (operators) in Euclidean space . . . 534
A.1.3 Norm of the operator . . . 534
A.1.4 Linear functionals . . . 536
A.1.5 Norm of the functional . . . 536
A.2 Metric space . . . 537
A.2.1 Definition of metric space . . . 537
A.2.2 Convergence, Cauchy sequences and completeness . . . 538
A.3 Linear vector spaces . . . 539
A.3.1 Vector operations . . . 539
A.3.2 Normed linear spaces . . . 540
A.4 Hilbert spaces . . . 541
A.4.1 Inner product . . . 541
A.4.2 Approximation problem in Hilbert space . . . 544
A.5 Complex Euclidean and Hilbert spaces . . . 546
A.5.1 Complex Euclidean space . . . 546
A.5.2 Complex Hilbert space . . . 547
A.6 Examples of linear vector spaces . . . 547

B Operators in the spaces of models and data **553**
B.1 Operators in functional spaces . . . 553
B.2 Linear operators . . . 555
B.3 Inverse operators . . . 556
B.4 Some approximation problems in the Hilbert spaces of geophysical data 557
B.5 Gram - Schmidt orthogonalization process . . . 559

C Functionals in the spaces of geophysical models **563**
C.1 Functionals and their norms . . . 563
C.2 Riesz representation theorem . . . 564
C.3 Functional representation of geophysical data and an inverse problem 565

D Linear operators and functionals revisited **569**
D.1 Adjoint operators . . . 569
D.2 Differentiation of operators and functionals . . . 571
D.3 Concepts from variational calculus . . . 573
D.3.1 Variational operator . . . 573
D.3.2 Extremum functional problems . . . 574

E Some formulae and rules from matrix algebra **577**
E.1 Some formulae and rules of operation on matrices 577
E.2 Eigenvalues and eigenvectors 578
E.3 Spectral decomposition of a symmetric matrix 579
E.4 Singular value decomposition (SVD) 580
E.5 The spectral Lanczos decomposition method 582
E.5.1 Functions of matrices 582
E.5.2 The Lanczos method 583

F Some formulae and rules from tensor calculus **589**
F.1 Some formulae and rules of operation on tensor functions 589
F.2 Tensor statements of the Gauss and Green's formulae 590
F.3 Green's tensor and vector formulae for Lamé and Laplace operators . 591

Bibliography **593**

Index **604**
