Dear Readers,

Yet another year serving our professional community! Health and Technology marks its 10th anniversary! We have a year ahead of us to celebrate and to strengthen Health and Technology's position and contribution to our profession and to the society.

We at Health and Technology decided to open the anniversary year with a collection of papers touching two of the hottest topics in our profession – the vision on biomedical engineering [1] and the internet of medical things in e-health.

Prof. Dr. Almir Badnjević and Prof. Dr. Ranko Škrbić compiled an excellent selection of extended papers related to the International Conference on Medical and Biological Engineering (CMBEBIH 2019), entitled CMBEBIH 2019: biomedical engineering - share the vision [1].

The second part of Health and Technology's first issue for 2020 is the topical collection Internet Of Medical Things In E-Health. Health and Technology presents this collection thanks to the efforts of the guest editors Prof. Dr. Hassan Fouad Mohamed- El-Sayed and Prof. Dr.M.Hemalatha.

The topical collection on Internet of Medical Things in e-Health has a significant contribution to the effective research and development of e-health systems. The guest editors have emphasized the importance of Ehealth for improving the fundamental concepts in traditional medicine, including the diagnostics and treatment processes. Various computational and research problems have been referred in terms of improvement of the scientific environment and provoking growth.

Magdalena Stoeva ms_stoeva@yahoo.com This topical collection is focused on a few main streams discussing the latest developments, trends and solutions for IoT in e-Health:

· Internet of medical things and models in E-health systems

Healthcare efficiency and improvement have always been a subject of discussion among professionals from various disciplines. Singh et al. [2] and Veningston et al. [3] have published their work in this field.

· Internet of medical things related security

The wide application of technology and internet driven solutions in healthcare inevitably brings the question on security. Ambika et al. [4] and Jeevitha et al. [5] have focused on steganography as a leading method to ensure security in MIoT.

• Cardio IoT in healthcare

Cardio applications have been pointed out as a special item by the guest editors, thus outlining the importance of cardio related disease and medical technology for our society. The work of Vijayashree et al. [6] on developing a cardio disease classification targets a reduction of the future risks in patient health.

• Internet of medical things in health monitoring

Health monitoring is a subject of 4 papers included in the topical collection. Two of the papers Sadek et al. [7] and Hayek et al. [8] are focused on solutions related to particular cases, while the other two papers present a global view on monitoring and activity data as an integral part of the healthcare system – Thirugnanam et al. [9] and Saripalle [10].

• Internet of medical things in data analysis for detection/ diagnostics

¹ Medical University of Plovdiv, Plovdiv, Bulgaria

The application of IoT in medical diagnostics has been widely covered in nearly 30% of the papers within this topical collection. Image analysis and classification are leading research topics while at the same time authors cover different modalities. Renuka et al. [11] focus on analyzing data originating from diagnostic methods using ionizing radiation, while Nitta et al. [12] and Virupakshappa et al. [13] have targeted MRI image analysis. Image processing with particular focus on organspecific diagnostics, including oncological applications is the main subject in the works presented by Dandu et al. [14], Magar et al. [15], Polepaka et al. [16] and Rose et al. [17].

 Internet of medical things in data analysis for prediction/ prevention of communicable disease

Special attention is paid on practical solutions for IoT implementation in the prediction and prevention of communicable diseases. The Dengue virus outbreak control framework, presented by Pravin et al. [18] has a wide potential for practical implementation in certain regions.

 Internet of medical things in data analysis for prediction/ prevention of non-communicable disease

Readers have already demonstrated high interest in the prostate cancer prediction framework developed by Shakeel et al. [19].

• Internet of medical things application in hybrid studies [20, 21]

Hybrid studies being one of the strongest contemporary methods for data collection and analysis have drawn the readers' attention. These methods are addressed by two -Jayashree et al. [20] present a complex computational algorithm for early prediction of diabetic disease, while Baskar et al. [21] draws our attention to the MIoT in neurology.

The editorial team of this topical collection have gathered research, educational, engineering and business ideas to form a set of thought-provoking articles covering the various aspects of IoT in e-Health. This topical collection has already attracted a lot of interest in its on-line version, gaining a good number of citations.

Contemporary healthcare is driven by the technology, while at the same time healthcare demands are among the main factors to support technology growth. I trust this vital selection of papers will turn into another valuable contribution this process.
