## Outline of the Technology

Layer	Thickness [nm]
GaN cap	5
AlGaN barrier	30 ... 40
GaN buffer	2000
AlN nucleation layer	30 ... 60

- Si doping of upper half of AlGaN barrier and GaN cap up to  $10^{18} \text{ cm}^{-3}$
- GaN buffer semi-insulating
- Sheet charge density:  $1.2 \times 10^{13} \text{ cm}^{-2}$
- Room temperature mobility:  $1400 \text{ cm}^2/\text{Vs}$

MBE growth of the heterostructure

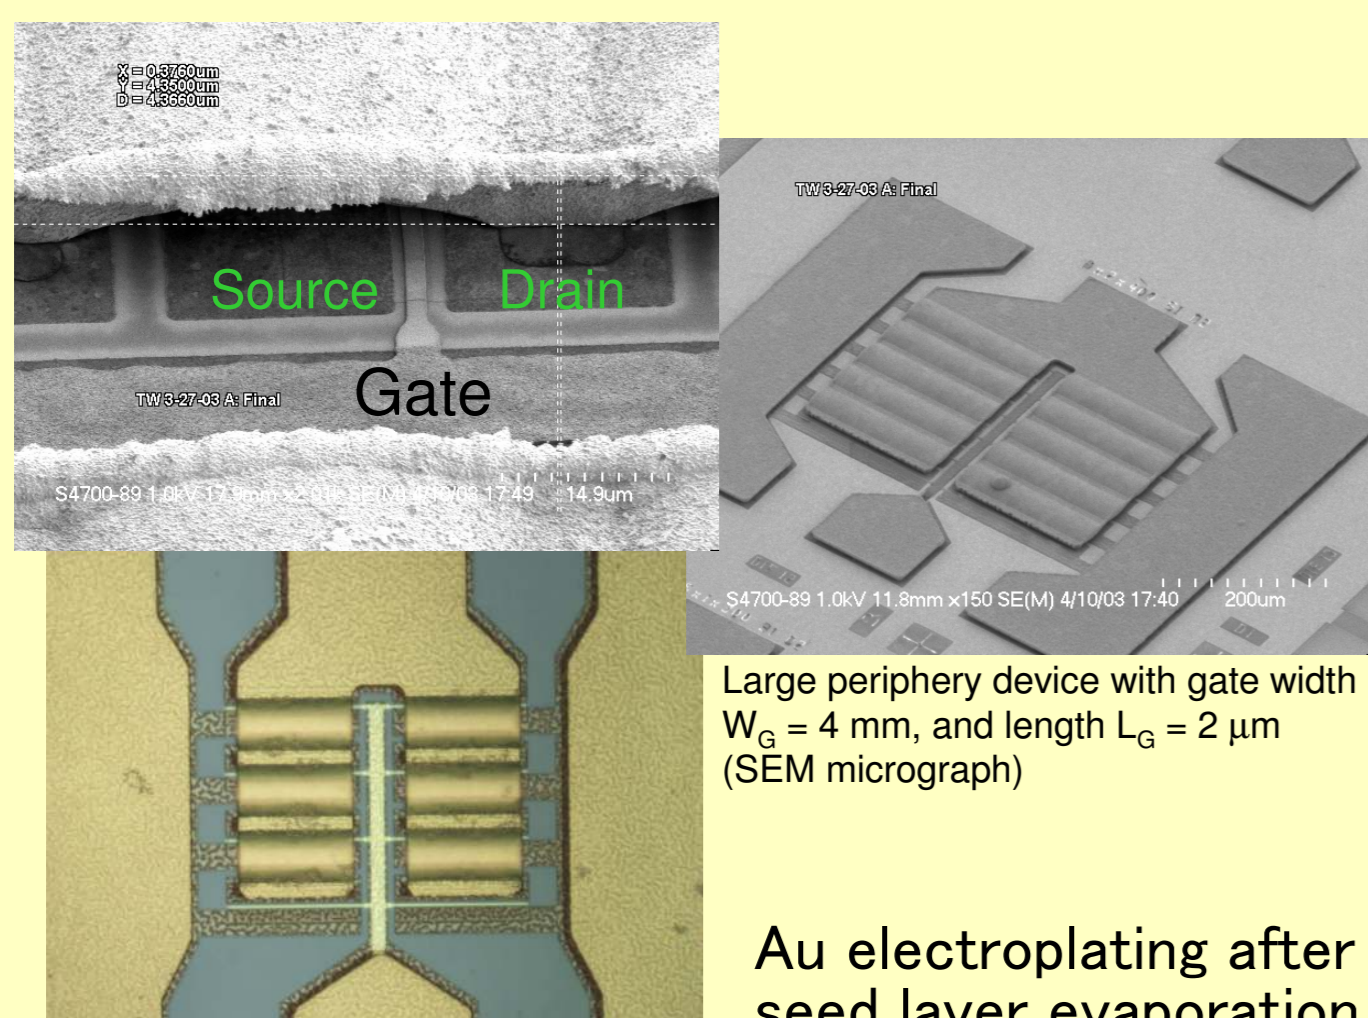

Mesa definition by ICP etching in  $\text{Cl}_2/\text{Ar}$  plasma

- Metal stack formed by 20 nm Ti, 100 nm Al, 55 nm Ni and 45 nm Au
- Rapid Thermal Annealing (RTA) in  $\text{N}_2$  atmosphere at  $780 \text{ }^\circ\text{C}$  to  $800 \text{ }^\circ\text{C}$  for 30 sec

Formation of the ohmic contacts

Large periphery device with gate width  $W_G = 4 \text{ mm}$ , and length  $L_G = 2 \text{ } \mu\text{m}$  (SEM micrograph)

Large periphery device with gate width  $W_G = 0.8 \text{ mm}$ , and length  $L_G = 2 \text{ } \mu\text{m}$  (optical micrograph)

Air bridge formation for drain interconnects of large periphery devices

Pillar definition

Goal: Connecting the drain contacts of the fishbone structure

Small periphery device with gate width  $W_G = 2 \times 25 \text{ } \mu\text{m}$ , and length  $L_G = 2 \text{ } \mu\text{m}$

Deposition of the Schottky gates: 30 nm Ni, 300 nm Au

## Results

### Small periphery devices:

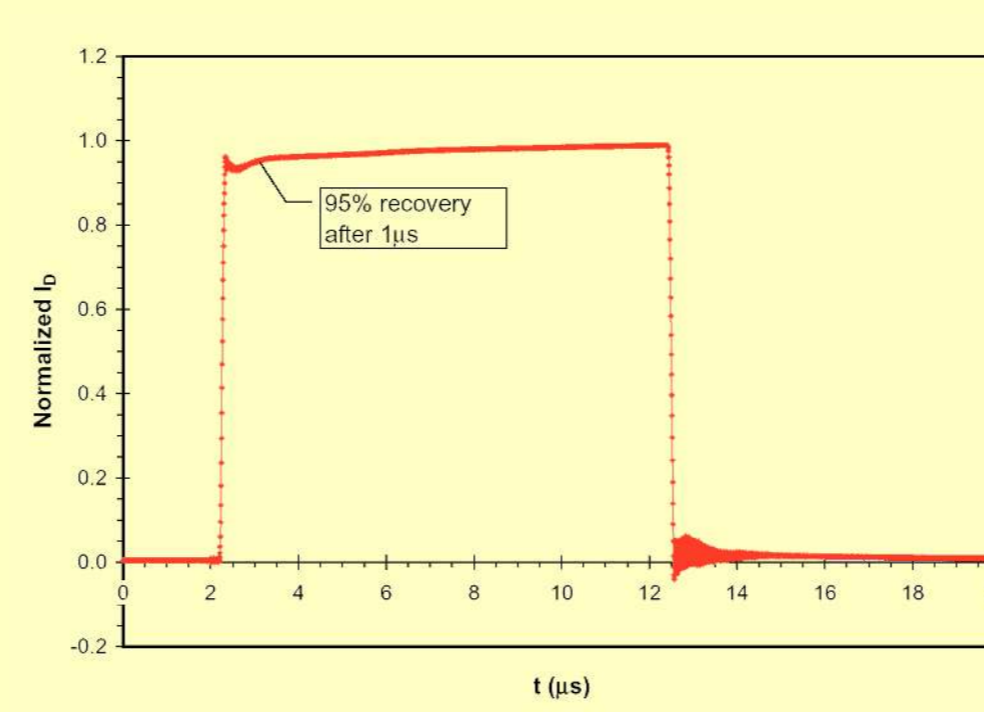

- Drain current  $I_D$  of up to 1100 mA/mm, and an average of 1000 mA/mm
- Transconductance  $g_m$  120 ... 140 mS/mm

$I_D$  vs.  $V_{DS}$  for device with gate length  $L_G = 2 \text{ } \mu\text{m}$ , a periphery of 150  $\mu\text{m}$  and a drain-source opening of 6  $\mu\text{m}$ . A maximum drain current of 1055 mA/mm has been measured.

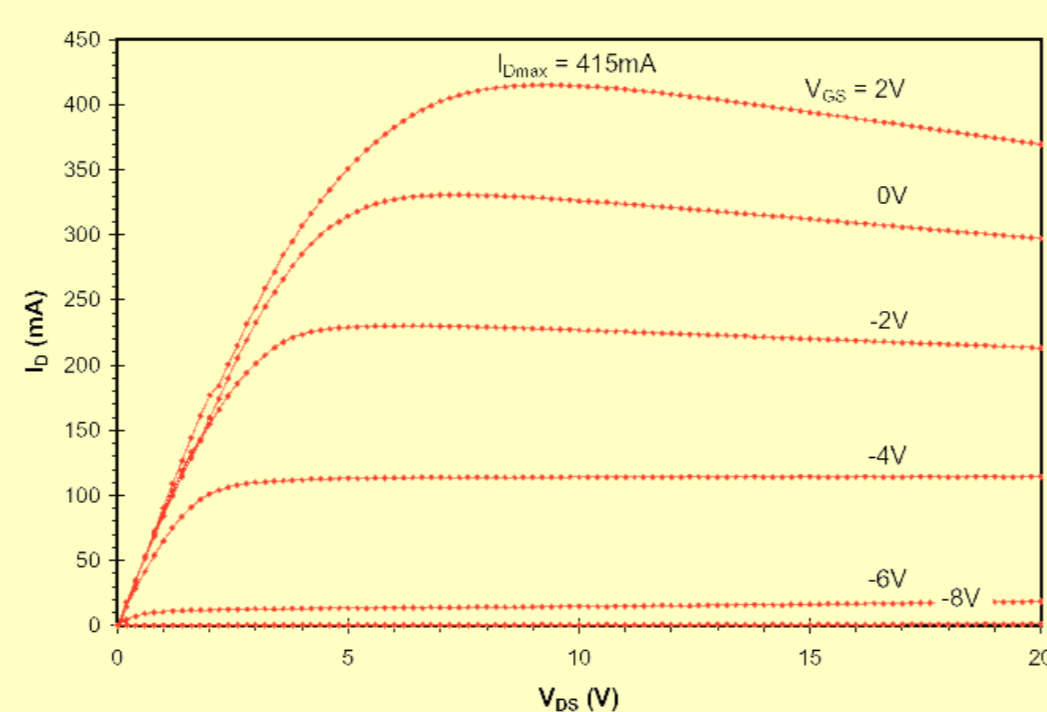

Transconductance for the same 150  $\mu\text{m}$  device, measured at a drain bias of 13 V.

Behavior of the drain current when pulsed from pinch-off to  $V_{GS} = 0 \text{ V}$  for a similar device on the same wafer. After 1  $\mu\text{s}$ , the drain current has recovered to 95% of its DC value.

### Air bridged devices:

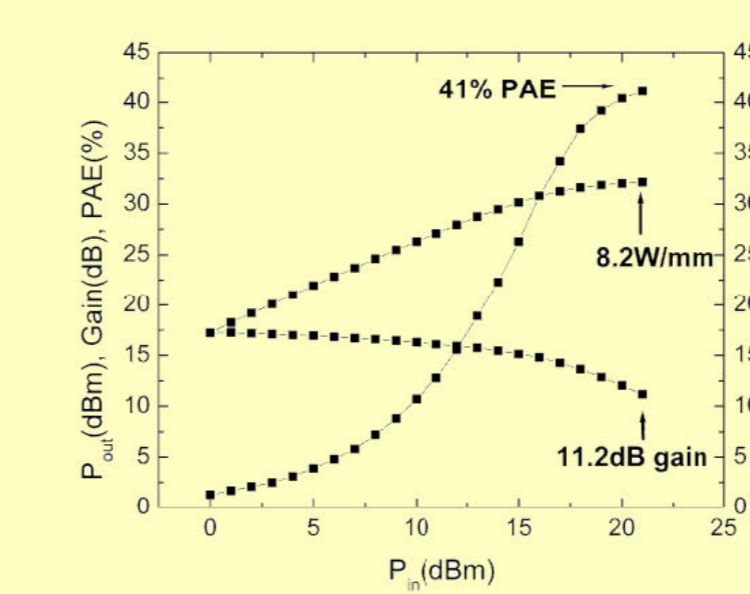

- Total gate length of up to 4 mm
- I-V characteristic scales well with periphery due to good heat dissipation by SiC substrate and Au air bridges

I-V characteristics of an air-bridged HEMT with a periphery of 0.4 mm and a gate length of 2  $\mu\text{m}$ . The transistor displays a maximum drain current of  $I_{Dmax} = 415 \text{ mA}$  and 1037 mA/mm, respectively.

### Load-pull data:

- HEMTs with gates of 1  $\mu\text{m}$  displayed an output power of more than 8 W/mm together with a power added efficiency (PAE) of 41% at 2 GHz.
- For submicron gates defined by electron beam lithography power values of 6.1 W/mm (7 GHz) as well as 3.16 W/mm (25 GHz) have been obtained.
- RF dispersion is remarkably low considering that no SiN passivation is used.

Load-pull data of a device measured at 2 GHz.  $V_{DS} = 45 \text{ V}$ ,  $V_{GS} = -4.7 \text{ V}$ ,  $L_G = 1 \text{ } \mu\text{m}$ ,  $W_G = 200 \text{ } \mu\text{m}$ . Source-Drain spacing: 5  $\mu\text{m}$ .

Load-pull data of a device measured at 2 GHz. The gate length is 2  $\mu\text{m}$ , with a total periphery of 200  $\mu\text{m}$  and a source-drain separation of 6  $\mu\text{m}$ .

Load-pull data at 7 GHz for a  $0.2 \times 200 \text{ } \mu\text{m}^2$  device. A power density of 6.1 W/mm along with 40% PAE and 4.6 dB gain compression has been measured.

Load-pull data at 25 GHz.  $V_{DS} = 20 \text{ V}$ ,  $V_{GS} = -7.3 \text{ V}$ ,  $L_G = 0.2 \text{ } \mu\text{m}$ ,  $W_G = 100 \text{ } \mu\text{m}$ . A linear gain of 6.5 dB together with a PAE of 30% and 1.8 dB compression has been obtained.

## Future directions and challenges

- Load-pull data on large periphery devices needed
- Control of parasitic buffer conduction in MBE growth on 4H-SiC substrates
- High breakdown fields needed for high power operation
- Better understanding of RF dispersion in MBE GaN/AlGaN/GaN HEMTs
