## INTRODUCTION

As knowledge in any field grows, the tools that are to aid in making effective use of that knowledge and that are to stimulate further advances must be modernized. Among the most useful tools in the field of entomology are up-to-date catalogs of the various major groups of insects. They unlock the door to the vast store of published information pertaining to any particular species or form, and they clarify the relationships that species bear to one another. Such a modern catalog of the North American insects of the order Hymenoptera, which includes the sawflies, wood wasps, parasites of other insects that are used in biological control undertakings, bees, wasps, ants, gall wasps and related forms, has long been needed. The last regional catalog of this type was that by Cresson, published in 1887, although the North American species were included in the catalog of the known Hymenoptera of the world, by Dalla Torre, which was published in Germany in 10 volumes, between 1892 and 1902.

During the past 50 years several thousand new North American species have been described and named. Many more have been assigned to genera different from those in which they were originally described; numerous others have been found to be synonyms of previously described species; and still others have had to be renamed because of prior use of the same names for different species. Moreover, many species and genera, the names of which had been wrongly applied, have had to be redefined to correct misidentifications. New genera, too, have been established, and the classification not only of genera and species, but also of tribes, subfamilies, and families, has been appreciably altered. All this is the result of continued research which has grown increasingly critical and is continually adopting new approaches and applying new techniques.

The present contribution represents an attempt to bring together

that information in readily usable form. It had its inception in 1946 when three specialists in the Division of Insect Identification, U. S. Bureau of Entomology and Plant Quarantine, undertook to organize a cooperative effort in which participation by the foremost workers in the various groups of Hymenoptera was enlisted, and which had as its objective the preparation of a sound and authoritative synoptic catalog of the known insects belonging to this order that occur in America north of Mexico. At the outset it seemed doubtful that the efforts of more than 20 different and widely scattered taxonomists, all busily engaged with the work and problems of their respective positions, could be coordinated so as to insure completion of the projected catalog within a reasonable period. The cooperation on this undertaking, however, has been extraordinary; and when funds for publication became available, all individual contributions could be rather promptly completed and assembled and could be put into required form with a minimum of effort.

The specialists who participated in the development of this catalog and who are recorded as authors of the sections for which they were responsible are the following: W. G. Bodenstein, G. E. Bohart, R. M. Bohart, B. D. Burks, Howard E. Evans, Paul D. Hurd, Karl V. Krombein, E. Gorton Linsley, William R. M. Mason, C. D. Michener, W. W. Middlekauff, C. F. W. Muesebeck and Luella M. Walkley (joint contributions), W. D. Murray, Oswald Peck, D. T. Ries, Hugo G. Rodek, H. H. Ross, H. A. Scullen, M. R. Smith, L. J. Stannard, Henry K. and Marjorie Townes, and L. H. Weld. In addition invaluable assistance was given by a number of other specialists in Hymenoptera, notably A. B. Gahan and P. H. Timberlake.

## ARRANGEMENT SUPERSPECIFIC CLASSIFICATION

An attempt has been made to record all the forms, with their synonyms, described from, or known to occur in, the political divisions of the United States, Canada, Alaska, and Greenland. The arrangement is systematic for subgenera and higher groups in so far as our present knowledge and the limitations of a linear arrangement permit. The generic and subgeneric concepts represented in this arrangement rest upon what are believed to be correct genotype designations. In each instance the genotype is cited together with the authority for the selection. Where genotype designations have been found to be invalid under the International Rules of Zoological Nomenclature, new genotype designations, believed to be valid, are given in the catalog. Generic synonymy is included under the generic headings except where subgenera are recognized, in which cases such synonymy is given under the subgeneric names, and references to revisional papers are listed under the appropriate generic, tribal, subfamily, or family headings.

## TRIVIAL NAMES

Within the genera and subgenera the arrangement of species is alphabetical. Where subspecies are recognized the subspecific names are placed in alphabetical order under the species to which they belong; and varieties are listed under the species in which they occur except that varieties of subspecies are placed under the particular subspecies in

which they were described. In each case the specific, or other trivial, name is followed by an indication of the known distribution, and by brief statements showing hosts or prey or preferred habitats, where such information is available and significant. Much of the information on synonymy, distribution, hosts or prey preferences and habitats has hitherto been unpublished. The type localities are recorded for those forms that are known only from the localities where the type specimens were obtained. Otherwise the distribution is usually shown by states and provinces, or by the use of the faunal zones.

## MAP OF FAUNAL ZONES

The map of faunal zones (frontispiece) is an adaptation by Arthur D. Cushman of the U. S. Biological Survey's Fourth Provisional Zone Map of North America, 1910, by C. Hart Merriam, Vernon Bailey, E. W. Nelson, and E. A. Preble. The only changes, other than those occasioned by the use of symbols instead of colors for the various zones, have been the addition of a small area of Tropical Zone at the extreme southern tip of Texas and a rezoning of Alaska on advice received from R. I. Sailer. It should be emphasized that with so great a reduction as used in the reproduction of this map, it has been necessary to represent narrow extensions and certain small isolated areas of some of the zones as more extensive than they actually are.

## ABBREVIATIONS AND SYMBOLS

The abbreviations and arrangement of titles of journals used in this work are essentially those recommended in United States Department Agriculture Miscellaneous Publication 377, 1939. Certain other abbreviations and symbols used in the catalog are explained as follows:

(!) = *lapsus* or misspelling of a scientific name.

"♂" = ♀ or "♀" = ♂ = incorrect sex determination.

♂ (♀ misdet.) or ♀ (♂ misdet.) = only one of sexes described belongs to the species catalogued.

emend. = emendation.

n. comb. = new combination; used after a specific or infraspecific heading to indicate a new generic assignment.

n. name = new name; used after a specific or infraspecific heading to indicate a new substitute name for a homonym; used after bibliographic citation to indicate a substitute name proposed earlier for a homonym.

n. status = new status; used where a form is here accorded a rank different from that which it had previously.

n. syn. = new synonymy; used after generic or specific bibliographic citations to indicate a new synonym.

preeoc. = preoccupied; used after a generic or specific citation to indicate a homonym.

The faunal zones and their divisions are also abbreviated wherever used. The abbreviations are explained as follows:

Bor. = Boreal

Canad. = Canadian

Huds. = Hudsonian

Transit. = Transition

Austr. = Austral  
 U. Austr. = Upper Austral  
 L. Austr. = Lower Austral  
 Austrorip. = Austroriparian  
 Carol. = Carolinian  
 Sonor. = Sonoran

## SCOPE

This catalog has been prepared with much care and it is thought to include all essential material published through 1949. It must be recognized, however, that in the field of taxonomy no contribution can long remain up-to-date. New forms are continually being discovered, and further research is constantly necessitating adjustments in concepts and in classifications. Within such unavoidable limitations it is hoped the catalog will be useful in many different entomological activities, and that it will stimulate young workers possessing an aptitude for taxonomy to take up the study of the fascinating and economically important insects that make up the order Hymenoptera.

<sup>1</sup> By Herbert H. Ross, Ill. Nat. Hist. Survey, Urbana, Ill.; except the Siricoidea, the Pamphiliidae, and the genus *Periclista*, for which D. T. Ries, Woodrow W. Middlekauf, and L. J. Stannard, respectively, are responsible.

larvae are either external leaf eaters, leaf miners, or stem borers, with the exception of the single family Orussidae, whose larvae are parasitic on wood-boring beetle larvae.

The following list of sawflies has many genera in which only a listing of specific names can be given, as these genera need to be revised. In certain other genera the extensive synonymy given is based on unpublished studies.

The literature contains many host records published at a time when specific diagnosis was different from that now in use. As a consequence many of them must be verified by a re-study of the reared adults before these records can be correlated with the present concepts of species. These concepts, new and old, differ not only in the occasional changing levels of evaluation of the same characters but more frequently in the complete change of characters on which identification is based. In view of this, many published host records have been omitted from this list. In order, however, that this literature on sawfly hosts may be known to the student, a bibliography of the more comprehensive papers is given here.

### Family PERGIDAE

#### Subfamily ACORDULECERINAE

##### Genus ACORDULECERA Say

*Acordulecera* Say, 1836. Boston Jour. Nat. Hist. 1: 209.  
 Type: *Acordulecera dorsalis* Say. Monob.  
*Acorduleceros* Konow, 1898. Ent. Nachr. 24: 250.

The species of this genus are here treated in two lists. The first represents an evaluation of species units based primarily on saw characters; this part is taken from a manuscript key sent to me by the late O. Conde. The second represents species that Conde, because he had insufficient data, was unable to place reliably.

All species of the genus feed on oak, or hickory, or both, judging from known host data. The larvae are external leaf feeders.

### Family BRACONIDAE<sup>9</sup>

A large and important group of parasites, mostly primary, some internal, others external. The family is closely allied to the Ichneumonidae from which most species are immediately distinguished by the absence of the second recurrent vein.

Taxonomy: Ashmead, 1901 (1900). U. S. Natl. Mus. Proc. 23: 104-149.—Szépligeti, 1904. In Wytsman, Gen. Ins., fasc. 22 a-b, 253 pp.—Riegel, 1948. Ent. Soc. Amer. Ann. 4 (4): 439-448.

### Subfamily PAXYLOMMATINAE

Relatively rare insects whose host relations have not been satisfactorily established. They are found associated with ants and may be ant parasites although some records suggest parasitism of aphids.

#### Family ICHNEUMONIDAE<sup>13</sup>

Keys to genera: Ashmead, 1900. U. S. Natl. Mus. Proc. 23: 10-103.—Schmiedeknecht, 1902-1936. Opusc. Ichn., 5 vols. plus supplements.—Schmiedeknecht, 1930. Hymenoptera Nord und Mitteleuropas . . . , ed. 2, pp. 94-101, 260-337.—Berthoumieu, 1904. In Wytsman, Gen. Ins., fasc. 18, 87 pp. (Ichneumoninae).—Szépligeti, 1905. In Wytsman, Gen. Ins., fasc. 34, 71 pp. (part of Ophioninae).—Schmiedeknecht, 1907. In Wytsman, Gen. Ins., fasc. 62, 120 pp. (Pimplinae).—Schmiedeknecht, 1908. In Wytsman, Gen. Ins., fasc. 75, 165 pp. (Gelinae)—Szépligeti, 1911. In Wytsman, Gen. Ins., fasc. 114, 100 pp. (part of Ophioninae). Catalogue (Nearctic spp.): Townes, 1944 and 1945. Amer. Ent. Soc. Mem. 11: 1-925.

The above are the more useful general taxonomic references, but only Schmiedeknecht's *Opuscula Ichneumonologica* and his *Hymenoptera Nord und Mitteleuropas* contain keys that are reasonably reliable. Generic revisions of limited groups, as cited under the groups concerned, usually have more reliable keys.

Members of this family are all parasites. Hosts comprise larvae and pupae of holometabolous insects (including other Ichneumonidae), immature and adult spiders, and the egg sacs of spiders and pseudoscorpions. Host selection is sometimes quite restricted but more often includes a variety of species that may be exposed to parasitism in the habitat usually explored by the ovipositing female. Thus a given ichneumonid may parasitize mostly lepidopterous pupae under leaf mold, or exposed naked lepidopterous pupae, or exposed small cocoons, or caterpillars in buds, or caterpillars in leaf rolls, or larger hairy caterpillars, or leaf-feeding tenthredinid larvae, or larvae in nuts, galls, or fruit, or other classes of hosts.

The majority of the Nearctic species prefer habitats where there is frequent dew and considerable vegetation, such as river and stream bottoms, high altitudes, and the edges of woods. Only in such habitats

<sup>13</sup>By Henry and Marjorie Townes, North Carolina State College, Raleigh, N. C.

can many of them find drinking water frequently enough and protection from dessication until the next drink. Drier and warmer habitats have ichneumonids too, but these are stragglers from more favorable haunts or species specially adapted to the conditions. Common adaptations to the drier conditions include unusually heavy sclerotization, special ability to get nectar from flowers, or a life history in which adults are on the wing during periods of greater moisture, as in the spring and fall. Some species fly at night and escape the low humidity and high temperatures of the day by resting among thick vegetation. In many habitats species of various kinds are common from spring until a summer dry hot spell, after which only those specially adapted and stragglers of the more sensitive species may be found. This dependence on dew and protection from desiccation tends to make ichneumonids most common in areas of greater rainfall and of cooler climates.

Statements of distribution are either lists of states and provinces, with occasional more definite localities, or generalizations when the extent and nature of the data seem to warrant them. Much new distributional information is included from specimens in the authors' collection and some from specimens in the U. S. National Museum. Many published records of uncertain validity have been omitted. New records are concentrated in the states and provinces where collectors have been unusually active and their catches have been available for study—J. G. Rempel in Saskatchewan, E. H. Strickland in Alberta, H. R. Foxlee in British Columbia, F. D. DeGant in Ohio, D. J. Borror and J. C. Bradley in Maine, R. M. Bohart and G. E. Bohart in California, and the authors in Quebec, New Hampshire, Rhode Island, New York, New Jersey, Pennsylvania, Ohio, Maryland, Virginia, North Carolina, South Carolina, Colorado, Arizona, Washington, Oregon, and California<sup>14</sup>. New host records are almost entirely from specimens reared and submitted to the Division of Insect Identification of the U. S. Bureau of Entomology and Plant Quarantine by workers in other Divisions of that Bureau and by various other public and private research workers. Published host records of doubtful accuracy have been omitted.

The names of supergeneric groups are based on those of the oldest included genera, which revives some well-known names like Ephialtini and Cteniscini and introduces some novelties like Pristiceratini, Banchinae, and Scolobatinae. The names of the subfamilies Ichneumoninae, Phaeogeninae, and Cryptinae are changed to Pimplinae, Ichneumoninae, and Gelinae, respectively, for the reasons given under the generic names *Ichneumon* and *Trachysphyrus*.

Type: *Cryptus kinbergi* Holmgren. Orig. desig.

This genus in the Holarctic Region has commonly gone under the name *Cryptus*. In the southern portion of South America is a large group of species similar to the Holarctic *Cryptus* but which, because of a peculiar metallic black or blue coloration, has gone under the generic name *Trachysphyrus*. A more natural grouping is to merge the two genera as one, and since the name *Cryptus* Fabricius 1804 is preoccupied, *Trachysphyrus* Haliday is the correct name for the resulting genus.

The name *Cryptus* is an invention of Jurine, who applied it to the sawflies that commonly go under the name *Arge* or *Hylotoma*. Jurine had an extensive work on the generic classification of the Hymenoptera that was long in manuscript form, and while it was in manuscript several workers learned of his new genera and used or discussed them. In 1801 Panzer as an anonymous naturalist (Intelligenzblatt der Litteratur-Zeitung, Erlangen. 1: 153-165) published a paper designed to call attention to

Jurine's unpublished work, for which he expressed great admiration. Included in this notice is an outline of Jurine's classification, in which the genera are listed and many of the new ones validated by characterization or by the inclusion of species. Panzer had received the outline from Jurine in correspondence. Here *Cryptus* appears as a genus of sawflies coextensive with the part of Fabricius' genus *Tenthredo* having the flagellum unsegmented (Argidae of modern classifications). In 1804 Panzer (*Faunae Insecta Germaniae*, h. 88, pl. 17) used the name *Cryptus* again, in the same sense, with *segmentarius* described and figured as a specific representative of the genus. Jurine's great work on the classification of the Hymenoptera was published in 1807. In this *Cryptus* is used in the same sense as in the preview of 1801 and in Panzer 1804, as applying to argid sawflies. In the meanwhile, however, Fabricius' classification of the Hymenoptera (*Systema Piezatorum*) had appeared in 1804. There is no evidence to show whether this publication preceded or followed Panzer's 1804 publication of *Cryptus*. Fabricius had learned of Jurine's work and pirated some of the new genera, in some cases using them without regard to Jurine's application. In the case of *Cryptus* he applied the name to a group of ichneumonids rather than to argids, and with his greater fame and prestige influenced most later authors to use the name in this sense.

To bolster the Fabrician usage of *Cryptus* and of certain other generic names of Hymenoptera, the International Commission on Zoological Nomenclature declared in 1939 (Opinion No. 135) that Panzer's first publication of Jurine's genera in 1801 should be regarded as unpublished. It is the authors' opinion that scientific nomenclature should rest on bibliographic and taxonomic facts rather than on the wishes of any organized or unorganized group. *Cryptus* should date from Jurine in Panzer, 1801, and should replace *Arge* Schrank, 1802, their genotypes being congeneric. Persons who wish to concur with the opinion of the International Commission on Zoological Nomenclature might date *Cryptus* from Panzer, 1804, or from Fabricius, 1804. Present information does not indicate which of these last two publications is prior, and disregarding the first appearance of the name *Cryptus* in literature would apply the name to either argids or ichneumonids according to which author is shown to be earlier, or according to some arbitrary decision.

This subject is also discussed by Morice and Durrant (1915, Ent. Soc. London Trans. 1915: 339-436) and by Bradley (1919, Ent. Soc. London Trans. 1919: 50-75). Dates of publication of Panzer's *Faunae Insecta Germaniae* are discussed by Sherborn (1923, Ann. Mag. Nat. Hist. (9) 11: 566-568) and the date of publication of Fabricius' *Systema Piezatorum* by Richards (1935, Ent. Soc. London Trans. 83: 144) and by Hedicke (1941, Deut. Ent. Gesell. Mitt. 10: 82-83).

Revision: Cresson, 1877. Amer. Ent. Soc. Trans. 6: 130-185.

Many authors (including the present ones) have believed that Latreille designated genotypes in his 1810 "Considerations général sur l'ordre naturel des crustacés, des arachnides, et des insectes." A recent examination of the literature has convinced the authors of this section of the catalog that in this work Latreille was only citing zoological generic examples and not nomenclatorial genotypes. The evidence in support of this view seems abundant and clear, whereas in support of the view that he was designating nomenclatorial genotypes there is only the word "type" in the title to Latreille's list: "Table des genres avec l'indication de l'espèce qui leur sert de type". Stebbing (1898, Natural Science 12: 239-244) has examined Latreille's so-called type designations in the cases of some of the Crustacea and shows that Latreille was often careful to show which section of a genus he considered the nomenclatorially typical section, but in his list of "types," was not concerned with selecting a species from the section of the genus designated as nomenclatorially typical. The list of cases Stebbing cites could be lengthened by examination of other groups. In his later works, when such a genus was subdivided, Latreille applied the original generic name to the section he had designated as typical rather than to the section containing the "type" of his list. In other words, Latreille's "types" of the 1810 list were to him only zoological examples of the genera and had no bearing on the application of the generic names.

This question has a bearing on the genotype and application of the name *Ichneumon*, and consequently on the subfamily names *Ichneumoninae* and *Pimplinae*—whether the subfamily names will be applied as traditionally or according to the "type" of *Ichneumon* (*Ichneumon manifestator*) in Latreille's 1810 list. For proof of Latreille's intention in this regard, consult the following references: Latreille, 1807. Genera Crustaceorum et Insectorum v. 3, p. 6-8.—Latreille, 1910. Considerations général sur l'ordre naturel des crustacés, des arachnides et des insectes, pp. 299-300; 436.—Latreille, 1825. Familles naturelles du règne animal, p. 445.—Latreille, 1829. Les crustacés, les arachnides, et les insectes v. 2, pp. 285-288.

The International Commission on Zoological Nomenclature has attempted in its "Opinions" to apply the names *Ichneumon*, *Pimpla*, *Ephialtes*, and *Cryptus* by edict. The methods of the Commission in these cases are admittedly not those of recognized nomenclatorial principles applied to bibliographic facts, and are therefore of a system foreign to that the authors have used throughout the family.

### Tribe PORIZONINI (= CAMPOPLEGINI)

This tribe includes many important parasites of economic pests. Most of the species attack lepidopterous larvae. Exceptions include those of the genus *Olesicampe* parasitic on Tenthredinidae and Diprionidae, of *Bathyplectes* and *Biolyisia* parasitic on Curculionidae, and of *Pyracmon* and perhaps of *Nemeritis* parasitic on wood-boring Coleoptera.

The traditional name of the tribe is Campoplegini, and the name Porizonini has been applied to a tribe properly known as the Tersilochini. The original description of the genus *Porizon* (Fallén, 1813. Spec. Nov. Hym. Disp. Method., p. 18) applies to campoplegines rather than to tersilochines, and the only species originally referred to the genus by

name is *Ophion moderator* Fabricius (= *Ichneumon moderator* Linnaeus). This, the genotype of *Porizon*, is a member of the present tribe, related to the genus *Horogenes*. Since *Porizon* is the oldest generic name included in the tribe, the name selected for it is *Porizonini*.

Revision of Canadian species: Viereck, 1925 and 1926. Canad. Ent. 57: 176-181, 198-204, 223-228, 296-303; 58: 2-8, 30-38, 71-78, 122-130, 143-149, 176-182, 196-201, 219-225, 257-260, 276-283. Although Viereck here gives keys to genera and species, artificiality and inaccuracy vitiate their value.

#### Subfamily CYNIPINAE

Plant-inhabiting species, either as gall makers or inquilines in galls. The species of *Neuroterus*, and of all the genera following that genus in the present treatment, produce galls on oak.

The symbol "0" is used when the original description included a description of the gall.

The type locality has been placed immediately after the specific heading and the host from which the species was described is usually mentioned first.

To avoid confusion caused by recent changes in the botanical names of certain oaks the following usage is here adopted: *Quercus rubra* for the northern red oak; *Q. falcata* for the Spanish oak; *Q. cinerea* for the blue-jack oak; *Q. catesbeiae* for the turkey oak; *Q. prinus* for the rock chestnut oak; *Q. michauxii* for the basket oak.

To conserve space the following short titles will be used for three papers:

"Genus Cynips" for Kinsey, 1930. The Gall Wasp Genus Cynips, Ind. Univ. Studies 16, Nos. 84, 85, 86: 1-577 (June, Sept., Dec. 1929). (Waterman Inst. Sci. Res. Pub. 42; Contrib. Dept. Zool. Ind. Univ. No. 220, Ent. Ser. No. 7.)

"Higher Categories" for Kinsey, 1936. The Origin of Higher Categories in Cynips, Ind. Univ. Pubs., Sci. Ser. No. 4: 1-334. (Contrib. Dept. Zool. Ind. Univ. No. 242, Ent. Ser. No. 10.)

"Genera Gallenbew. Cynip." (the title of the more familiar separate) for Mayr, 1881. 20 Jahressber. Comm.-Oberrealsch. I. Bez. Wien, pp. 1-38.

Some of the early American describers of gall makers (e. g., Fitch 1859) prefixed *quercus* (with a hyphen) before the specific name (e. g., *Cynips quercus-globulus*) to indicate the plant on which the gall was formed. This *quercus-globulus* must be regarded as a compound specific name and retained.

Osten Sacken (1861, 1862, 1863), Bassett (1863, 1864, 1881) and Ashmead (1881) in their descriptions either omitted the hyphen or abbreviated the *quercus* to *q.* By strict interpretation of the International Rules such names are trinomial and not available, although it is obvious these authors did not regard them as trinomial and sometimes listed the species without the *quercus* or *q.* in the same year and volume. (Dalla Torre and Kieffer in Das Tierreich, 1910, had no authority for supplying a hyphen in these cases thus making binomials of them.)

Osten Sacken in 1865 and Ashmead in 1885 listed the then known American species as binomials and in each instance cited the previous description but credited the species to the original author. But under the Rules the species dates from the first publication in such a list and is to be credited to the author of the list although the original description was by another author at an earlier date. This is a manifest injustice for these authors had no idea their names were not valid. The Cresson Synopsis of 1887 and later authors dropped the *quercus* "in conformity with usage." Binomials in the following lists, lacking citations, are not valid: Packard, 1881, U. S. Ent. Comm. Bul. 7: 56-57; Bassett, 1882, Amer. Nat. 16: 246, 329; Mayr, 1881, Genera Gallenbew. Cynip., p. 28, 29, 30, 36, 37. (*Mammula* Mayr is valid for it is the only species and the genotype of his new genus *Loxaulus*.)

To conform to the Rules will change the long-familiar authority for a species in some 35 cases. As treated here, under each of these species names are listed (1) the reference to the original description followed by "Tri." to indicate the name was trinomial in form and not available, (2) early binomials (if any) not available because they are *nomina nuda*, (3) the first valid binomial, (4) synonyms (if any).
