Kharagpur, India

KLUWER ACADEMIC PUBLISHERS
DORDRECHT / BOSTON / LONDON

CONTENTS

ıapter 1 **Continuous-time models and approaches** 1

by

G.P. Rao and N.K. Sinha

1. Introduction 1
2. Time discretization and the z-plane 5
3. Other viable alternatives 9
4. Identification of continuous-time models from sampled data 11
5. Scope of the book 12

References 14

ıapter 2 **Discrete-time modeling and identification of continuous-time systems: a general framework** 17

by

H. Van hamme, R. Pintelon and J. Schoukens

1. Introduction 17
2. Construction of a measurement setup 20
3. Controlling the approximation errors 34
4. Maximum likelihood off-line estimation for time-invariant systems 53
5. Simulation examples 63
6. Conclusions 75

References 76

ıapter 3 **The relationship between discrete time and continuous time linear estimation** 79

by

B.M. Ninness and G.C. Goodwin

1. Introduction 79
2. The delta operator 81
3. System estimation 95
4. Conclusion 120

References 121

Chapter 4 Transformation of discrete-time models
by
N.K. Sinha and G.J. Lastman

1. Introduction
2. Background
3. Evaluation of the natural logarithm of a square matrix
4. Choice of the sampling interval
5. Transformation of models obtained using the δ-operator
6. Conclusions

References

Chapter 5 Methods using Walsh functions
by
E.V. Bohn

1. Introduction
2. Integtral equation models
3. Walsh coefficients of *exp(sx)*
4. Sampled data Walsh coefficients
5. Evaluation of integral functions
6. Parameter identification
7. Walsh function inputs
8. Summary

References
Appendix A: Walsh coefficients of *exp(s(j)x)*
Appendix B: Operational matrices

Chapter 6 Use of the block-pulse operator
by
Shien-Yu Wang

1. Introduction
2. Definition of block-pulse operator
3. Operational rules of the BPO
4. Parameter identification of continuous nonlinear systems via BPO
5. Identification of distributed parameter systems via BPO
6. Optimal input design for identifying parameters in dynamic systems via BPO

References

apter 7 Recursive block pulse function method 205

by

Z.H. Jiang and W. Schaufelberger

1. Introduction 205
2. Block pulse function method 206
3. Block pulse difference equations 209
4. Recursive block pulse function method 211
5. Extensions of recursive block pulse function method 220
6. Conclusion 223

References 224

apter 8 Continuous model identification via orthogonal polynomials 227

by

K.B. Datta

1. Introduction 227
2. Orthogonal polynomials, integration operational matrix and two-dimensional orthogonal polynomials 230
3. One shot operational matrix for repeated integration 239
4. Sine-cosine functions 240
5. Lumped parameter system identification 243
6. Distributed parameter system identification 246
7. Transfer function matrix identification 252
8. Conclusion 255

References 255

apter 9 Use of numerical integration methods 259

by

H. Dai and N.K. Sinha

1. Introduction 259
2. Identification of single-input full state output systems 260
3. Identification of continuous-time system in diagonal form 269
4. Identification using Trapezoidal Pulse Functions 277
5. Effect of noise in the input-output data 284
6. Conclusions 287

References 288

Chapter 10 Application of digital filtering techniques 2
by
S. Sagara and Z.Y. Zhao

1. Introduction 2
2. Statement of the problem 2
3. Signal processing 2
4. Parameter estimation 3
5. On the choice of input signal 3
6. Conclusions 3
References 3

Chapter 11 The Poisson moment functional technique - Some New Results
by
D.C. Saha, V.N. Bapat and B.K. Roy

1. Introduction
2. Generalized Poisson moment functionals
3. Combined parameter and state estimation
4. GPMF based IV algorithm
5. Closed loop system identification
6. Discussion and conclusion
References

Chapter 12 Identification, estimation and control of continuous-time systems described by delta operator models
by
Peter C. Young, A. Chotai and Wlodek Tych

1. Introduction
2. The discrete differential (δ) operator TF model
3. Recursive identification and parameter estimation
4. Simulation and practical examples of SRIV modelling
5. True digital control and the PIP controller
6. Conclusions
Appendix I δ Operator models: Some brief observations
References

apter 13 **Identification of multivariable continuous-time systems** 419

by
E. Boje

1. Introduction 419
2. A canonical linear multivariable input-output model 420
3. Preparing input-output data for parameter identification by means of integral functionals 427
4. Solving the parameter estimation problem by linear least squares 432
5. Examples 434
6. Conclusions 437
7. Acknowledgement 437

References 438

Appendix 1 State space construction 439
Appendix 2 Controllability and observability 441
Appendix 3 Proof of the identity: $\det(\underline{M}p))\underline{I} = \mathrm{Adj}(\underline{M}(p))\underline{M}(p)$ 441

apter 14 **Use of pseudo-observability indices in identification of continuous-time multivariable models** 443

by
S. Bingulac and D.L. Cooper

1. Introduction 443
2. Pseudo-observable forms 444
3. Identification of discrete-time models 446
4. First-order-hold transformation 451
5. The Log of a square matrix 457
6. Illustrative examples 459
7. Conclusions 469

References 469

apter 15 **SVD-based subspace methods for multivariable continuous-time systems identification** 473

by
M. Moonen, B. de Moor and J. Vandewalle

1. Introduction 474
2. Preliminaries 475
3. An SVD based algorithm for the noise free case 479
4. A QSVD based algorithm for the colored noise case 481
5. Conclusions 486

References 486

Chapter 16 **Identification of continuous-time systems using multiharmonic test signals** 4

by

A. van den Bos

1. Introduction 4
2. Multiharmonic test signals 4
3. Estimation of Fourier coefficients 4
4. Properties of the residuals 4
5. Estimating the system parameters 4
6. The covariance matrices of the instrumental variable and the least squares estimators 5
7. Discussion and extensions 5

References 5

Chapter 17 **Adaptive model approaches** 5

by

H. Unbehauen

1. Model adaptation via gradient methods 5
2. Model adaptation using Liapunov's stability theory 5
3. Model adaptation using hyperstabilty theory 5

References 5

Chapter 18 **Nonparametric approaches to identification** 5

by

D. Matko

1. Introduction 5
2. Concepts of system and signal processing theory 5
3. Nonparametric identification methods 5
4. Realization of the methods with digital computers 5

References 5

Chapter 19 **From fine asymptotics to model selection** 5

by

L. Gerencsér and Zs. Vágó

1. Introduction and first results 5
2. Characterization of the process $\hat{\theta}_T - \theta^*$ 5
3. Stochastic complexity for continuous-time processes 5
4. Appendix 5

References 5

apter 20 **Real time issues in continuous system identification** 589
by
G.P. Rao, A. Patra and S. Mukhopadhyay

1. Introduction 589
2. The real-time identification environment 590
3. The plant and its model 592
4. Measurement system 597
5. Preprocessing of data 599
6. Digitally realizable forms for models of continuous-time (CT) systems 603
7. Algorithms 613
8. Post-processing 616
9. Applications and their specific demands 625
10. Hardware and software support 628
11. An example of implementation 630
12. Conclusions 633
