# Extremely Useful Insight No.1 (Gutman'04)

- used to prune the set of edges Dijkstra has to look at
- two metrics: one determines what shortest paths are, the other what in the middle means
- extensively exploited e.g. in papers by Gutman, Goldberg et al. or Sanders/Schultes (the latter also use network contraction for increased efficiency)
- yields shortest path queries in the order of *milliseconds* on the US roadmap (after preprocessing)
- ► any sensible reason to aim for faster query times ? ⇒YES! Web services, traffic simulations, logistics ...

Introduction	Transit Node Routing 00	Grid-based TN Routing	HH-based TN routing	Conclusions 00
Our Contribution				

### First Contribution: Extremely Useful Insight No.2

Imagine you aim to travel 'far' – let's say more than 50 miles –

how many different routes would you potentially use to leave your local neighborhood ?

Introduction	Transit Node Routing 00	Grid-based TN Routing	HH-based TN routing	Conclusions 00

Our Contribution				

Based on our new insight we propose **Transit Node Routing**, a highly efficient scheme which allows for

 reduction of shortest path distance queries to a constant number of table-lookups

Introduction	Transit Node Routing 00	Grid-based TN Routing	HH-based TN routing	Conclusions
Our Contribution				

Based on our new insight we propose **Transit Node Routing**, a highly efficient scheme which allows for

- reduction of shortest path distance queries to a constant number of table-lookups
- various trade-offs between space and query-/preprocessing times:
  - avg. query times between  $5\mu s$  and  $63\mu s$  (on the US road map)
  - preprocessing times between 1h and 20h
  - a per node space overhead of 21 to 244 bytes

Introduction	Transit Node Routing 00	Grid-based TN Routing	HH-based TN routing	Conclusions
Our Contribution				

Based on our new insight we propose **Transit Node Routing**, a highly efficient scheme which allows for

- reduction of shortest path distance queries to a constant number of table-lookups
- various trade-offs between space and query-/preprocessing times:
  - avg. query times between  $5\mu s$  and  $63\mu s$  (on the US road map)
  - preprocessing times between 1h and 20h
  - a per node space overhead of 21 to 244 bytes
- ► ⇒ Query times orders of magnitudes better than previously reported results

### Milliseconds $(10^{-3})$ vs. Microseconds $(10^{-6})!$

	Transit Node Routing	Grid-based TN Routing	HH-based TN routing	Conclusions 00
Formalization				

## Transit Nodes: Formalization

Consider the set  $\Pi$  of all 'long' shortest paths within the network. We want to find a set of *Transit Nodes*  $\mathcal{T}$  such that

	Transit Node Routing	Grid-based TN Routing	HH-based TN routing	Conclusions
Formalization				

### Transit Nodes: Formalization

Consider the set  $\Pi$  of all 'long' shortest paths within the network. We want to find a set of *Transit Nodes*  $\mathcal{T}$  such that

• every  $\pi \in \Pi$  contains a node from  $\mathcal{T}$  (global hitting set)

	Transit Node Routing	Grid-based TN Routing	HH-based TN routing	Conclusions
Formalization				

### Transit Nodes: Formalization

Consider the set  $\Pi$  of all 'long' shortest paths within the network. We want to find a set of *Transit Nodes*  $\mathcal{T}$  such that

• every  $\pi \in \Pi$  contains a node from  $\mathcal{T}$  (global hitting set)

$$\blacktriangleright |\mathcal{T}| = O(\sqrt{|V|})$$
	Transit Node Routing	Grid-based TN Routing	HH-based TN routing	Conclusions 00
Formalization

In Transit to Constant Time Shortest-Path Queries in Road Networks

Bast, Funke, Matijevic, Sanders, Schultes 12/19

# Highway Hierarchies [Sanders/Schultes ESA'05/'06]

- Gutman's insight with 2nd metric = Dijkstra rank
- complete search within a local area
- identify highway network = minimal subgraph that preserves all 'long' shortest paths
- contract network
- iterate  $\Rightarrow$  highway hierarchy

	Transit Node Routing 00	Grid-based TN Routing	HH-based TN routing ○●○○○	Conclusions
Implementation				

# HH-based Transit Node Routing

Second attempt – a more sophisticated realization of the transit node routing idea.

• Long paths have to use higher levels in the HH  $\Rightarrow$  high level in HH canonical choice for transit nodes T

	Transit Node Routing 00	Grid-based TN Routing	HH-based TN routing ○●○○○	Conclusions
Implementation				

# HH-based Transit Node Routing

Second attempt – a more sophisticated realization of the transit node routing idea.

- ► Long paths have to use higher levels in the HH ⇒ high level in HH canonical choice for transit nodes T
- Using several levels from HH induce multi-layer solution in a very natural way

# HH-based Transit Node Routing

Second attempt – a more sophisticated realization of the transit node routing idea.

- ► Long paths have to use higher levels in the HH ⇒ high level in HH canonical choice for transit nodes T
- Using several levels from HH induce multi-layer solution in a very natural way
- Local queries can be handled very efficiently by HH ( grid-based approach)

	Transit Node Routing 00	Grid-based TN Routing	HH-based TN routing ○○●○○	Conclusions
Implementation				

## HH-based Transit Node Routing: What are 'long' paths?

Compute for each node v a radius r(v) such that a query (s, t) is non-local/the path is considered long, if respective disks with radii r(s) and r(t) do **not** overlap.

	Transit Node Routing 00	Grid-based TN Routing	HH-based TN routing ○○○●○	Conclusions
Implementation				

For the fastest variant in terms of query times, levels 4, 2, 1 of the HH are used as 3 layers

	Transit Node Routing 00	Grid-based TN Routing	HH-based TN routing ○○○●○	Conclusions
Implementation				

- For the fastest variant in terms of query times, levels 4, 2, 1 of the HH are used as 3 layers
- A more economical version in terms of storage space and preprocessing times uses levels 5 and 3 in a 2-layer structure

	Transit Node Routing 00	Grid-based TN Routing	HH-based TN routing ○○○●○	Conclusions
Implementation				

- For the fastest variant in terms of query times, levels 4, 2, 1 of the HH are used as 3 layers
- A more economical version in terms of storage space and preprocessing times uses levels 5 and 3 in a 2-layer structure
- Implemented and benchmarked also for directed graphs, e.g. roadmap of Europe, and *distances* instead of travel times

	Transit Node Routing 00	Grid-based TN Routing	HH-based TN routing	Conclusions

	Transit Node Routing 00	Grid-based TN Routing	HH-based TN routing	Conclusions ● ○
Conclusions				

new, extremely useful insight which improves avg. query times by orders of magnitude: Microseconds vs. Milliseconds!

	Transit Node Routing 00	Grid-based TN Routing	HH-based TN routing	Conclusions ● ○
Conclusions				

- new, extremely useful insight which improves avg. query times by orders of magnitude: Microseconds vs. Milliseconds!
- we presented two ways to exploit this insight:
  - simple, grid-based implementation tuned for space efficiency (63µs avg.query; 20h preprocessing; 21 bytes/node)
  - sophisticated, extremely fast implementation based on HH (5µs; < 4h; 244 bytes/node); fast for all types of queries</li>

	Transit Node Routing 00	Grid-based TN Routing	HH-based TN routing	Conclusions ● ○

- we presented two ways to exploit this insight:
  - simple, grid-based implementation tuned for space efficiency (63µs avg.query; 20h preprocessing; 21 bytes/node)
  - sophisticated, extremely fast implementation based on HH (5µs; < 4h; 244 bytes/node); fast for all types of queries</li>
- not mentioned: efficient ways to output actual paths

	Transit Node Routing 00	Grid-based TN Routing	HH-based TN routing	Conclusions ● ○
Conclusions				

- new, extremely useful insight which improves avg. query times by orders of magnitude: Microseconds vs. Milliseconds!
- we presented two ways to exploit this insight:
  - simple, grid-based implementation tuned for space efficiency (63µs avg.query; 20h preprocessing; 21 bytes/node)
  - sophisticated, extremely fast implementation based on HH (5µs; < 4h; 244 bytes/node); fast for all types of queries</li>
- not mentioned: efficient ways to output actual paths
- room for improvement in both realizations: grid-based in terms of query/preprocessing, HH-based in terms of space consumption

	Transit Node Routing 00	Grid-based TN Routing	HH-based TN routing	Conclusions ● ○
Conclusions				

- new, extremely useful insight which improves avg. query times by orders of magnitude: Microseconds vs. Milliseconds!
- we presented two ways to exploit this insight:
  - ▶ simple, grid-based implementation tuned for space efficiency (63µs avg.query; 20h preprocessing; 21 bytes/node)
  - sophisticated, extremely fast implementation based on HH (5µs; < 4h; 244 bytes/node); fast for all types of queries</li>
- not mentioned: efficient ways to output actual paths
- room for improvement in both realizations: grid-based in terms of query/preprocessing, HH-based in terms of space consumption
- One of the main challenges: deal with dynamics of real-world networks

	Transit Node Routing 00	Grid-based TN Routing	HH-based TN routing	Conclusions
