Abstract

Induction motors are the most widespread rotating electric machines in industry due to their efficient and cost-effective performance. Induction motors are used to mainly operate at the constant speed since the rotor speed depends on the supply frequency. The development of power electronic devices and converter technologies has revolutionized the adjustable-speed induction motor drives. For most high-performance control methods, the effective motor control requires precise knowledge of the motor's parameters, which are usually obtained from manufacturers. However, the manufacturers describe these parameters under starting or full-loading condition only, instead of the normal operating conditions. It is well known that motor parameters are influenced by not only the load level but also environmental factors, such as temperature, humidity and lubricant viscosity.

The first part of the thesis describes the application of the sparse grid optimisation method in solving the induction motor parameter estimation problem. Kernel of the method is the efficient search in minimising the cost function on the grid created by using the Hyperbolic Cross Points (HCPs). The cost function quantifies the difference between simulation results and measurement results. Within model reference adaptive system (MRAS) framework, a global optimisation algorithm, HCP algorithm (HCPA), runs the motor model and finds the best parameters to minimise the value of the cost function. Since the proposed method requires only voltage and current signals, it is compatible with sensorless control methods, which have the benefits of increasing system reliability and reducing cost. The presented experimental validation shows that the relative errors of the estimated parameter values are less than 10% under various load levels. The estimated parameters can be further refined by applying local search method using global search result as a start point.

On the other hand, an induction motor failure results in severe damage not only to the motor itself but also to motor related equipment devices in an industrial plant. Consequently, motor condition monitoring and fault diagnosis are of great necessity to detect motor faults at the early stage in order to reduce unscheduled downtime, repair costs, and increase life span of machines. Emergence of a fault will cause a gradual drift

of fault-related characteristic model parameters. Therefore, a generic method to detect motor faults developed in this research is based on monitoring these parameters.

In the second part of this thesis, the proposed parameter estimation technique based on the sparse grid optimisation is utilised to detect stator short circuit faults by monitoring two characteristic parameters: fault level and fault location. Experimental results show that the proposed diagnosis method is capable of detecting stator short circuit fault levels and location under different load conditions. Compared to the genetic algorithm, the HCPA shows improved robustness in the case of unbalanced voltage supply. This non-invasive diagnosis method only needs a short length of voltage and current signals recorded at switch board without disrupting the machine's normal operation.

The third part of this thesis demonstrates a multi-motor condition monitoring scheme which can substantially reduce implementation cost for some industrial plants. The proposed multi-motor condition monitoring scheme builds on top of the technology implemented in modern Intelligent Electronic Devices (IEDs) for motor protection and control. The backbone of this scheme is the broadly accepted Ethernet technology and the IEC 61850 communication standard. Due to the widespread use of IEC 61850 in various industries, cost of the technology is significantly reduced while reliability has been improved. Based on the proposed systems, various applications can be developed to achieve remote condition monitoring of induction motors.

Statement of Originality

This work contains no material that has been accepted for the award of any other degree or diploma in any university or other tertiary institution and, to the best of my knowledge and belief, contains no material previously published or written by another person, except where due reference has been made in the text.

I give consent to this copy of the thesis, when deposited in the University Library, being available for loan, photocopying, and dissemination through the library digital thesis collection, subject to the provisions of the Copyright Act 1968.

I also give permission for the digital version of my thesis to be made available on the web, via the University's digital research repository, the Library catalogue, the Australasian Digital Thesis Program (ADTP) and also through web search engines, unless permission has been granted by the University to restrict access for a period of time.

Acknowledgments

I would like to express my sincere gratitude to my principle supervisor, Dr Rastko Živanović, for the immeasurable amount of support and guidance he has provided throughout this study. His advice on both research as well as on my career have been invaluable. I am indebted to my co-supervisor, Dr Said Al-Sarawi for his valuable suggestions and constructive advice. My sincere thanks goes to Assoc. Prof. Cheng-Chew Lim for his long term help, encouragement and advice. His professionalism and kindness have been always appreciated.

I must thank the office and workshop staff of the School of Electrical and Electronic Engineering, Mr Stephen Guest, Mrs Ivana Rebellato, Mrs Rose-Marie Descalzi, Ms Deborah Koch, Mr David Bowler, Mr Mark Innes, Mr Ryan King, Mr Anthony Schueller and Mr Ian Linke for their kind support throughout my PhD. They always ready to give their timely help whenever required.

Last but not least, I owe my deepest gratitude to my parents for the love and support they have provided through my entire life. A very special thank you to my husband Dr Longfang Zou for his unceasing support, encouragement and inspiration. I cannot present this work without expressing love to my daughter, Emily Chuanqi Zou, who enlightens my life with her sweet smile.

Typesetting

This thesis is typeset using the L^AT_EX2e software. WinEdt build 5.5 was used as an effective interface to L^AT_EX.

Referencing

Referencing and citation style in this thesis are based on the Institute of Electrical and Electronics Engineers (IEEE) Transaction style.

Units

The units used in this thesis are based on the International System of Units (SI units).

Prefixes

In this thesis, the commonly used numerical prefixes to the SI units are "p" (pico, 10^{-12}), "n" (nano, 10^{-9}), " μ " (micro, 10^{-6}), "m", (milli, 10^{-3}), "k" (kilo, 10^3), "M" (mega, 10^6), "G" (giga, 10^9), and "T" (tera, 10^{12}).

Spelling

The Australian English spelling is adopted in this thesis.
