### **Experimental Details:**

**NMR measurements.** All 1H and 13C NMR spectra were acquired on Varian VXR (299.94 MHz for <sup>1</sup>H, 75.55 MHz for <sup>13</sup>C), UnityINOVA 400 (399.78 MHz for <sup>1</sup>H, 100.54 MHz for <sup>13</sup>C) equipped with Performa I single axis gradient Z amplifier and a Varian 5mm auto switchable Z gradient probe and variable temperature controller, or UnityINOVA 500 (499.76 MHz for <sup>1</sup>H, 125.68 MHz for <sup>13</sup>C) equipped with a Performa II single axis Z gradient amplifier and a Varian 5mm Triple Resonance Z gradient probe spectrometers. The <sup>1</sup>H chemical shifts are reported relative to that of TMS and referenced to either the internal HDO signal at 4.76 ppm, the singlet peak of 3-(trimethylsilyl)-1-propanesulfonic acid sodium salt (DSS) at 0 ppm, or DMSO-d6 signal at 2.5 ppm, as indicated for each spectrum. Variable temperature measurements were conducted on a sample of 1 dissolved in D<sub>2</sub>O and held at the specific temperature for 10 min prior to spectrum acquisition. Solution <sup>1</sup>H NMR measurements at variable pH were conducted at 296 K on a mixture prepared by mixing CoCl<sub>2</sub> (1 mmol, 0.066 M) and H-L1 (1.5 mmol, 0.1 M) in 15 mL of D<sub>2</sub>O (resulted pH = 6.63), stirred under aerobic conditions at 296 K for 1 h prior to pH adjustments. The pH is adjusted through incremental additions of either NaOD or D<sub>2</sub>SO<sub>4</sub>, as required, and the apparent solution pH values are reported. Measurements are made with Mettler Toledo EL02 pH meter calibrated with aqueous buffer solutions at 296 K.

**Spectrophotometric titration.** 15 solutions containing  $CoCl_2$  (20 mL, 2.5 mM, 0.05 mmol) and increasing amounts of H-L1 (0.01-0.15 mmol, 0.01 mmol increment) were prepared. The pH values for each solution were measured at different time intervals. The mixtures were incubated at 296 K for 24 h, under atmospheric conditions, before conducting absorbance measurements at 493 nm.

**Single-Crystal X-ray Diffraction.** X-ray diffraction data were collected using Bruker-AXS SMART-APEX CCD diffractometer equipped with Mo K $\alpha$  radiation source ( $\lambda = 0.71073$  Å) or SMART-APEX CCDII diffractometer equipped with Cu K $\alpha$  ( $\lambda = 1.54178$  Å) radiation source, as indicated. Indexing was performed using SMART v5.625.<sup>1</sup> Frames were integrated with SaintPlus 6.28A <sup>2</sup> software package. Absorption correction was performed by multi-scan method implemented in SADABS.<sup>3</sup> Crystal structures were solved using SHELXS-97 and refined using SHELXL-97 contained in SHELXTL v6.10 and WinGX v1.70.01 programs packages.<sup>4</sup> All non-disordered non-hydrogen atoms were refined with anisotropic displacement parameters. All H-atoms bonded to carbon atoms were placed in geometrically optimized positions and refined with an isotropic displacement parameter fixed at 1.2 times Uq. N bonded protons were localized via Fourier difference map inspection and refined isotropically with thermal parameters, based on the N atoms to which they are bonded.

Other Physical Measurements. Powder X-ray diffraction (XRPD) data were collected using Cu K $\alpha$  radiation ( $\lambda = 1.5406$ Å) on a Bruker AXS D8–Advance diffractometer. The MALDI–TOF MS spectrum was recorded on a Bruker Daltonics Autoflex III TOF/TOF mass spectrometer using  $\alpha$ -cyanohydroxy-cinnamic acid as the matrix. Solution UV–vis absorption spectra were collected on a PerkinElmer Lambda 900 spectrophotometer, with an attachment for solid samples and gaseous atmosphere. Stopped-flow kinetics data are collected on a Bio-Logic instrument (SFM300 mixer and MOS200M monochromator) and the data were fitted with Origin®.

**Computer Modelling.** The hydrated fragment  $[Co_2(L1)(H_2O)_8]^{3+}$ , with a +3 net charge and multiplicity of 7, was geometry optimized using the quantum chemistry code Gaussian 03.5 The minimized energy was calculated via Density Functional Theory (DFT) using the B3LYP hybrid exchange-correlation functional.<sup>6</sup> The unrestricted calculation employed the LANL2DZ basis set with an ECP applied to the cobalt atoms.<sup>7</sup>

#### Synthetic procedures for compounds 1(a-f) and 2-4:

 $[Co_8(C_{11}N_6H_{15})_{12}]Br_{12}\cdot 18H_2O, 1a. In a capped 25 mL scintillation vial, reaction of H-L1 (0.034 g, 0.15 mmol) and CoBr_2 \cdot 6H_2O (0.0325 g, 0.1 mmol) in a mixture of DMF and water, 1 mL each, at 115°C for 12 h resulted in red polyhedral crystals (0.051 g, 90 % yield based on CoBr_2) formulated as <math display="block">[Co_8(C_{11}N_6H_{15})_{12}]Br_{12}\cdot 18H_2O, \text{ from single-crystal X-ray diffraction.}$ 

 $[Co_8(C_{11}N_6H_{15})_1](SO_4)_6(DMF)\cdot31H_2O$ , 1b. In a capped 25 mL vial, reaction of H-L1 (0.034 g, 0.15 mmol) and Co(SO<sub>4</sub>)·6H<sub>2</sub>O (0.0263 g, 0.1 mmol) in a mixture of DMF and water, 1 mL each, at 115°C for 12 h resulted in red polyhedral crystals (0.023 g, 41.3% yield based on Co(SO<sub>4</sub>)) formulated as  $[Co_8(C_{11}N_6H_{15})_{12}](SO_4)_6(DMF)\cdot31H_2O$ , from single-crystal X-ray diffraction.

 $[Co_8(C_{11}N_6H_{15})_1][CoCl_4]_2Cl_8 \cdot 21H_2O$ , 1c. In a capped 25 mL scintillation vial, reaction of H-L1 (0.034 g, 0.15 mmol) and CoCl\_2 \cdot 6H\_2O (0.0237 g, 0.1 mmol) in a mixture of dimethylsulfoxide (DMSO) and water, 1 mL each, at 115°C for 24 h resulted in brown rectangular crystals (0.01 g, 23% yield based on CoCl\_2), formulated as  $[Co_8(C_{11}N_6H_{15})_{12}][CoCl_4]_2Cl_8 \cdot 21H_2O$ , from single crystal X-ray diffraction.

 $[Co_8(C_{11}N_6H_{15})_{12}](NO_3)_{12}\cdot 22H_2O$ , 1d. In an open 25 mL scintillation vial, a mixture of H-L1 (0.034 g, 0.15 mmol) and Co(NO\_3)\_2 \cdot 6H\_2O (0.1 mmol) in *N*,*N*'-diethylformamide (DEF) and water, 1 mL each, was prepared and left to stand at r.t. After seven days the reaction volume was reduced to almost 1 mL through evaporation and red crystals were collected (0.038 g, 70.2% yield based on Co(NO\_3)\_2), formulated as  $[Co_8(C_{11}N_6H_{15})_{12}](NO_3)_{12}\cdot 22H_2O$  from single crystal X-ray diffraction.

 $[Co_8(C_{11}N_6H_{15})_{12}](BF_4)_{12}\cdot 2(DMF)\cdot 14H_2O, 1e. In a capped 25 mL scintillation vial, reaction of H-L1 (0.034 g, 0.15 mmol) and Co(BF_4)_2\cdot 6H_2O (0.1 mmol) in a mixture of DMF and water, 1 mL each, at115°C for 12 h resulted in red polyhedral crystals (0.04 g, 68.2% yield based on Co(BF_4)_2) formulated as <math display="block">[Co_8(C_{11}N_6H_{15})_{12}](BF_4)_{12}\cdot 2(DMF)\cdot 14H_2O, from single-crystal X-ray diffraction.$ 

 $[Co_8(C_{11}N_6H_{15})_1]Cl_{12}\cdot40H_2O$ , 1f. In a capped 25 mL scintillation vial, reaction of H-L1 (0.034 g, 0.15 mmol) and CoCl<sub>2</sub>·6H<sub>2</sub>O (0.1 mmol) in a mixture of hexamethylphosphoramide (HMPA) and water, 1 mL each, at115°C for 12 h resulted in red polyhedral crystals (0.035 g, 63.7% yield based on CoCl<sub>2</sub>) formulated as  $[Co_8(C_{11}N_6H_{15})_{12}]Cl_{12}\cdot40H_2O$  using single-crystal X-ray diffraction.

 $[Ni_4(C_{11}N_6H_{15})_4](NO_3)_4(DMF)_4$ , 2. In a capped 25 mL scintillation vial, reaction of H-L1 (0.023 g, 0.1 mmol) and Ni(NO<sub>3</sub>)<sub>2</sub>·6H<sub>2</sub>O (0.1 mmol) in 1 mL of DMF at room temperature for 12 h, resulted in green-blue polyhedral crystals (0.006 g, 14 % yield based on Ni(NO<sub>3</sub>)<sub>2</sub>) formulated as  $[Ni_4(C_{11}N_6H_{15})_4](NO_3)_4(DMF)_4$  using single crystal X-ray diffraction.

 $[Cd(C_{11}N_6H_{15})(NO_3)]_n$ , 3. In a capped 25 mL scintillation vial, reaction of H-L1 (0.023 g, 0.1 mmol) and  $Cd(NO_3)_2 \cdot 4H_2O$  (0.1 mmol) in 1 mL of DMF at 85°C for 12 h, resulted in colorless polyhedral crystals (0.017 g, 42 % yield based on  $Cd(NO_3)_2$ ) formulated as  $[Cd(C_{11}N_6H_{15})(NO_3)]_n$  using single crystal X-ray diffraction.

 $[In_8(C_{11}N_6H_{15})_{12}](NO_3)_{12}\cdot 4H_2O$ , 4. In a capped 25 mL scintillation vial, reaction of H-L1 (0.034 g, 0.15 mmol) and  $In(NO_3)_3\cdot 5H_2O$  (0.1 mmol) in DEF (5 mL) and ethanol (2 mL) at 85°C for 12 h, resulted in colorless polyhedral crystals (0.0225 g, 40% yield based on  $In(NO_3)_3$ ) formulated as  $[In_8(C_{11}N_6H_{15})_{12}](NO_3)_{12}\cdot 4H_2O$  using crystal X-ray diffraction.

#### Crystal structure description for compounds 1(a-f), and 2-4:

Single Crystal X-ray Structure Analysis of 1a,  $[Co_8(C_{11}N_6H_{15})_{12}]Br_{12}\cdot 18H_2O$ . In the crystal structure of 1a, the cationic MOCs crystallize in the monoclinic  $P2_1/n$  space group where the charge is balanced by twelve bromide counterions. Six bromide counterions decorate the faces of a MOC where hydrogen bond interactions between bromide ions and the pyrrole-type nitrogen atoms are present (N1`…Br distances of 3.0–3.394 Å), in a similar manner observed in 1. One bromide ion occupies the cavity inside the MOC and the remaining five bromide ions are geometrically disordered over several positions. The aliphatic carbon atoms C5` are geometrically disordered. The Co–N bond lengths, 1.916–1.986 Å (*thp*) and 1.841–1.907 Å (imidazolate), are similar to those observed in 1. On each of the six faces of a MOC, two parallel imidazolate rings are separated by centroid-to-centroid distances of 5.627–5.697 Å

Single Crystal X-ray Structure Analysis of 1b,  $[Co_8(C_{11}N_6H_{15})_{12}](SO_4)_6(DMF)\cdot31H_2O$ . MOCs in 1b crystallize in the monoclinic,  $P2_1/n$  space group where each face of a MOC is decorated by a sulfate counterion, H-bonded to N1` atoms of *thp* rings. Each sulfate counterion is hydrogen bonded through two oxygen atoms to four N1` (N1`···O–S distances of 2.824–3.057 Å). Such multiple interactions between each sulfate ion and the N1` atoms appear to cause a noticeable decrease in the centroid-to-centroid distance (5.375–5.408 Å) between the two parallel imidazolate rings on each of the six faces of the MOC, shorter than those observed in 1 and 1a for chloride (5.505 Å) and bromide (5.627–5.697 Å) counterions, respectively. The Co–N bond lengths of 1.917–1.994 Å (*thp*), and 1.89–1.895 Å (imidazolate), closely matches those observed in 1 and 1a.

Single Crystal X-ray Structure Analysis of 1c,  $[Co_8(C_{11}N_6H_{15})_{12}][CoCl_4]_2Cl_8 \cdot 21H_2O$ . In 1c, discrete MOCs crystallize in the monoclinic *C2/m* space group. Each MOC cocrystallize with two  $[CoCl_4]^{2-}$  anions involved in hydrogen bond interactions to adjacent MOC (C-H···Cl distances of 2.608–2.935Å, normalized data). Charge balance is satisfied by eight chloride counterions. One chloride counterion occupies the cavity inside the MOC. The additional seven Cl<sup>-</sup> ions, geometrically disordered over multiple positions adjacent to the faces of the MOC, are H-bonded to the N1` atoms on each of the faces of the MOC (N···Cl distances of 3.21–3.615 Å). In the MOC, Co–N bond lengths of 1.945–1.953 Å (*thp*) and 1.88–1.901 Å (imidazolate) are in close agreement with those observed in compounds 1-1b. On each of the six faces of a MOC, two parallel imidazolate rings are separated by centroid-to-centroid distances of 5.569–5.58 Å.

Single Crystal X-ray Structure Analysis of 1d,  $[Co_8(C_{11}N_6H_{15})_{12}](NO_3)_{12}\cdot 22H_2O$ . The cationic MOCs in 1d crystallize in the  $P2_1/n$  space group and the charge is balanced by twelve disordered nitrate counterions. One nitrate ion occupies the cavity inside the MOC and is hydrogen bonded to the C2 hydrogen atoms of the imidazolate rings, (C···O distances of 2.268–2.901 Å). The remaining nitrates ions are hydrogen bonded to the N1` atoms of the ligand molecules, decorating the faces (N···O distances of 2.903–3.067 Å) and the edges (N···O distances of 2.894–2.981 Å) of the MOC. In the crystal structure of 1d, the MOCs are held together through bridging, hydrogen bonded, nitrate counterions. In the MOC, Co–N bond lengths of 1.932–1.95 Å (*thp*) and 1.899–1.921 Å (imidazolate) are in close agreement with those observed in compounds 1-1c. On each of the six faces of a MOC, two parallel imidazolate rings are separated by centroid-to-centroid distances of 5.623–5.69 Å.

Single Crystal X-ray Structure Analysis of 1e,  $[Co_8(C_{11}N_6H_{15})_{12}](BF_4)_{12}\cdot 2(DMF)\cdot 14H_2O$ . The cationic MOCs in 1e crystallize in the C2/c space group where the charge is balanced by twelve  $(BF_4)^-$  counterions. One disordered  $(BF_4)^-$  ion occupies the cavity inside the MOC while the remaining disordered  $(BF_4)^-$  ions are hydrogen bonded to the N1' atoms of the ligand molecules, decorating the faces and edges of the MOC. In the crystal structure of 1e, the MOCs are held together through bridging, hydrogen bonded,  $(BF_4)^-$  counterions. In the MOC, Co–N bond lengths of 1.937–1.940 Å (*thp*) and 1.896–1.918 Å (imidazolate) are in close agreement with those observed in compounds 1-1d. In 1e, each MOC cocrystallize with two DMF solvent molecules hydrogen bonded to two faces of the MOC, (N…O distances of 2.806–2.849 Å). On each of the six faces of a MOC, two parallel imidazolate rings are separated by centroid-to-centroid distances of 5.631–5.672 Å.

Single Crystal X-ray Structure Analysis of 1f,  $[Co_8(C_{11}N_6H_{15})_{12}]Cl_{12}\cdot40H_2O$ . The cationic MOCs in 1f crystallize in the *C*2/*c* space group where the charge is balanced by twelve chloride counterions. One chloride ion occupies the cavity inside the MOC. The remaining chloride ions are hydrogen bonded to the N1` atoms of the ligand molecules, decorating the faces (N···Cl distances of 3.139–3.231 Å) and the edges (N···Cl distances of 2.888–3.141 Å) of the MOC. In the crystal structure of 1f, the MOCs are held together through bridging, hydrogen bonded, water molecules. In the MOC, Co–N bond lengths of 1.937–1.956 Å (*thp*) and 1.895–1.909 Å (imidazolate) are in close agreement with those observed in compounds 1-1e. On each of the six faces of a MOC, two parallel imidazolate rings are separated by centroid-to-centroid distances of 5.641–5.661 Å.

Single Crystal X-ray Structure Analysis of 2,  $[Ni_4(C_{11}N_6H_{15})_4](NO_3)_4\cdot4(DMF)$ . In the crystal structure of 2, each Ni(II) ion is coordinated to one nitrate ion in bidentate fashion and two ligands L1, *cis*-MN<sub>4</sub>O<sub>2</sub>. Each neutral molecular square crystallizes with four DMF solvent molecules. The four ligand molecules, forming molecular squares, are hydrogen bonded through N1` atoms to four DMF molecules (N···O distances of 2.897–2.99 Å). Intramolecular H-bonds between the two *thp* rings of the molecular square are present (N–H···N distances of 2.279–2.289 Å). Ni–N bond lengths are in the range of 2.033–2.073 Å (*thp*) and 2.023–2.045 Å (imidazolate).

Single Crystal X-ray Structure Analysis of 3,  $[Cd(C_{11}N_6H_{15})(NO_3)]_n$ . The extended structure, chain, in 3 result from coordination of mono-deprotonated L1 and Cd(II) ions, distorted octahedral *cis*-MN<sub>4</sub>O<sub>2</sub>. Each ligand in the chains is H-bonded to one DMF molecule and to a nitrate ion from the adjacent chain. Furthermore, intramolecular H-bonds exist between the sp<sup>3</sup>-type N1` atoms (N-H…N distances of 2.377–2.610 Å). In 3, Cd– N bond lengths of 2.231–2.269 Å (*thp*) and 2.311–2.374 Å (imidazolate) are observed.

Single Crystal X-ray Structure Analysis of 4,  $[In_8(C_{11}N_6H_{15})_{12}](NO_3)_{12}\cdot 4H_2O$ . The cationic MOCs in 4 crystallize in the *R*-3 space group where the charge is balanced by twelve nitrate counterions. One nitrate ion occupies the cavity inside the MOC. Six nitrates ions are hydrogen bonded to the N1` atoms of the ligand molecules on the faces of the MOC (N···O distances of 2.706–3.032 Å). The other five nitrate ions are geometrically disordered over several positions. In the MOC, the In–N bond lengths are in the range of 2.176–2.25 Å (*thp*) and 2.203–2.223 Å (imidazolate). On each of the six faces of a MOC, the centroid-to-centroid distance between two parallel imidazolate rings is 6.465 Å.
