# Internal Azomethine Ylide Cycloaddition Methodology for Access to the Substitution Pattern of Aziridinomitosene A 

Drew R. Bobeck, Don L. Warner, and Edwin Vedejs<br>Chemistry Department, University of Michigan, Ann Arbor Michigan, 48109

#### Abstract

 

Highly substituted, tethered alkyne dipolarophiles participate in the internal $2+3$ cycloaddition with azomethine ylides generated by treatment of oxazolium salts with cyanide ion. Starting from oxazole 26, a sequence of $N$-methylation, cyanide addition, and electrocyclic ring opening of a 4 -oxazoline intermediate affords the indoloquinone $\mathbf{3 1}$ in a one-pot process. A similar reaction from the protected alkynol derivative 25 affords the sensitive, but isolable enone 32, and subsequent oxidation affords 31 and the deprotected quinine alcohol 34. Related azomethine cycloaddition methodology via intramolecular oxazolium salt formation from $\mathbf{4 3}$ or $\mathbf{4 6}$ is also demonstrated, and allows the synthesis of quinone $\mathbf{4 5}$ and derived structures having the substitution pattern of aziridinomitosene A. Removal of the $N$-trityl protecting group could not be achieved without aziridine cleavage.

## Introduction

Enantiocontrolled synthesis of aziridinomitosenes has been a challenging problem over many years. ${ }^{1-7}$ Prior reports from our laboratory describe a potential solution, illustrated by the synthesis of non-racemic quinones $\mathbf{1 - 3}$ related to aziridinomitosene $A(4)$, but lacking the $C$ (7) methoxy group (Scheme 1). ${ }^{5 \mathrm{c}}$ The approach uses an intramolecular azomethine ylide cycloaddition to assemble the tetracyclic aziridinomitosene core in a sequence that begins with conversion of an oxazole 5 into the oxazolium salt $\mathbf{6}$. Cyanide addition then forms a labile 4oxazoline intermediate 7 and electrocyclic ring opening occurs to generate the transient azomethine ylide $\mathbf{8}$. Intramolecular cycloaddition to 9 proceeds with yields of ca. $60 \%$ or better when $R^{1}=H$ or Me and $R^{2}=$ trityl, but becomes less efficient when $R^{2}=\mathrm{Me}(30-40 \%$ yield). Our continuing efforts to prepare aziridinomitosene A (4) using similar methodology have therefore focused on the $N$-trityl series to learn whether a late stage detritylation may be possible in the highly sensitive environment. Although detritylation could not be accomplished without aziridine cleavage, the studies described below demonstrate access to relevant methoxysubstituted indoloquinones and reveal reaction pathways not encountered previously. The total synthesis of racemic $\mathbf{4}$ by Jiminez and Dong in 1999 remains the only route to the fully functionalized molecule. ${ }^{8}$

[^0]
## Methods and Results

Our azomethine ylide cycloaddition approach to 4 requires a 2,5 -disubstituted oxazole intermediate $\mathbf{1 0}(\mathrm{Y}, \mathrm{Z}=\mathrm{O}, \mathrm{H}$ or $\mathrm{Y}=\mathrm{Z}=\mathrm{O})$. Introduction of the acetylenic dipolarophile subunit via alkynyl anion addition to the aldehyde $\mathbf{1 1}$ borrows from prior work, but the current route features a more direct method for sidechain assembly from 12 based on lithiation at the oxazole $\mathrm{C}(5)$ position, metal exchange via 13, and palladium catalyzed coupling with enol triflate 14$E$. The latter was easily prepared by deprotonation of the $\beta$-keto ester $15^{9}$ with various bases and enolate quenching with $N$-phenylbistriflimide (Table 1). ${ }^{10}$ As expected, the $E: Z$ ratio of 14 increased with the coordinating ability of the enolate counterion ( $\mathrm{Li}>\mathrm{Na}<\mathrm{K}$, entries $1-3$ ), but enolate reactivity decreased markedly. The best compromise of yield and $E: Z$ ratio was obtained using LiH as the base (entry $6 ; 65 \%$ yield, $93: 7 \mathrm{E}: \mathrm{Z}$ ), although the reaction was very slow and required seven days at rt for good conversion. The isomers were assigned from the methyl ${ }^{1} \mathrm{H}$ NMR chemical shifts, assuming a greater downfield shift for $\mathbf{1 4 - Z}(\delta=2.36 \mathrm{ppm})$ compared to $14-E(\delta=2.18 \mathrm{ppm})$ due to proximity of the methyl and ester groups. ${ }^{11}$

With access to the enol triflate $14-E$ established, the oxazole coupling and azomethine ylide cycloaddition were investigated in a model system (Scheme 2). Metallated oxazoles were obtained from 2-phenyloxazole $\mathbf{1 6}^{12}$ via deprotonation ( $\left.\mathrm{BuLi} / \mathrm{TMEDA}\right)^{13}$ or from the 5bromo derivative $\mathbf{1 7}^{14}$ by lithium halogen exchange. The intermediate lithiooxazole $\mathbf{1 8}$ was then quenched with $\mathrm{Bu}_{3} \mathrm{SnCl}$ to afford the stannane $\mathbf{1 9}\left(84 \%\right.$ isolated),${ }^{15}$ or with anhydrous $\mathrm{ZnCl}_{2}$ to generate 20 in situ. Starting from 16, a preliminary test of the Negishi coupling ${ }^{16}$ of 20 was performed using $\mathrm{Pd}_{2}(\mathrm{dba})_{3} / \mathrm{PPh}_{3}$ with 1.1 equiv of a $1: 1$ mixture of the enol triflates 14- $E$ and 14-Z. After 15 h at rt , the enoate 21 was obtained in a modest $36 \%$ overall yield, but with a promising 9:1 ratio of $E: Z$ isomers suggesting higher reactivity for the $E$-isomer. Enoate 21 was also prepared by Stille coupling. ${ }^{17}$ Thus, 20 was heated at $65^{\circ} \mathrm{C}$ with 1.1 equiv of $14\left(57: 43 \mathrm{E}: Z \mathrm{Z}\right.$ mixture) in the presence of $\mathrm{Pd}_{2}(\mathrm{dba})_{3}$ and trifurylphosphine. ${ }^{18}$ This gave 21 in $84 \%$ yield, but with a lower $\mathrm{E}: \mathrm{Z}$ ratio (3:1). On the other hand, when enriched $14-E$ (>95:5 $E: Z, 1.3$ equiv) was used, the desired enoate $\mathbf{2 1}$ was obtained in $>95 \%$ yield as the sole product.

Next, the tethered alkyne required for the cycloaddition was installed. Enoate 21 was converted to the enal $\mathbf{2 3}$ ( $71 \%$ overall) by DIBAL reduction to the allylic alcohol 22 and oxidation with TPAP-NMO. ${ }^{19}$ Installation of the alkyne dipolarophile was then accomplished by addition of $\mathrm{LiC} \equiv \mathrm{CCH}_{2} \mathrm{OTBS}$ to give an intermediate alcohol 24 and protection afforded the TBS ether 25 ( $73 \%$ from 23). Alternatively, oxidation of 24 gave the ynone 26 ( $57 \%$ from 23).

With cycloaddition precursors $\mathbf{2 5}$ and 26 in hand, generation of the azomethine ylide and subsequent $[3+2]$ cycloaddition could be explored (Scheme 3 ). Enone 26 was studied first because the expected cycloadduct would be at the desired quinone oxidation state. Thus, the oxazole nitrogen of 26 was alkylated selectively with $\operatorname{MeOTf}\left(\mathrm{CH}_{3} \mathrm{CN}, 48 \mathrm{~h}\right)$. The resulting oxazolium salt 27 was added to excess $\mathrm{BnMe}_{3} \mathrm{~N}^{+} \mathrm{CN}^{-}$at $0^{\circ} \mathrm{C}$ to form the transient 4-oxazoline 28, followed by electrocyclic ring opening to the azomethine ylide 29 and subsequent [ $3+2$ ] cycloaddition to $30 .{ }^{5 \mathrm{a}, 5 \mathrm{c}, 15}$ Spontaneous elimination of HCN then produced the indoloquinone 31, isolated in $40 \%$ overall yield from the oxazole 26.

Focus then turned to the protected diol oxazole $\mathbf{2 5}$ as the cycloaddition precursor (Scheme 3). Alkylation of $\mathbf{2 5}$ with MeOTf as before and the usual treatment with cyanide ion initiated the cycloaddition sequence. Despite initial concerns about the stability of the desired cycloadduct 32, the substance could be purified by chromatography on silica gel ( $47 \%$ yield), although some decomposition was noted. Structure $\mathbf{3 2}$ was confirmed, and the aromatic tautomer 33 was ruled out by ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR evidence, including the characteristic enone ${ }^{13} \mathrm{C}$ signal at $\delta 179.5 \mathrm{ppm}$.

Oxidation of 32 proceeded smoothly using 2,3-dichloro-5,6-dicyanobenzoquinone (DDQ), 15 and allowed conversion of the crude cycloaddition product to the more stable quinone oxidation state. Partial deprotection occurred as well, and the product was obtained as a 7:1 mixture of $\mathbf{3 1 : 3 4}$ ( $95 \%$ combined from oxazole 25 without purification of 32). Several other oxidations ${ }^{20}$ were also effective (Table 2), although partial deprotection of the primary OTBS ether occurred in entries $1-3$. On the other hand, the combination of various oxidants with stronger bases for the oxidation step ${ }^{5 \mathrm{c}}$ resulted in conversion to the protected quinone 31, although in somewhat lower yield. Presumably, these reactions proceed via the phenoxide anion derived from 33.

As shown in Scheme 3, the methoxy enone substitution pattern corresponding to the aziridinomitosene A quinone is fully compatible with the azomethine ylide cycloaddition step. Indeed, better yields were obtained from $\mathbf{2 5}$ and from $\mathbf{2 6}$ compared to related cycloadditions studied previously in our laboratory. Furthermore, the potentially troublesome non-aromatized intermediate $\mathbf{3 2}$ could be handled with minimal complications using the in situ oxidation approach. With these encouraging results in hand, we sought to apply similar methodology to the synthesis of aziridinomitosene A (4) according to the retrosynthesis shown in Scheme 1.

The aziridinyl oxazole $\mathbf{1 2}$ was prepared starting with the addition of lithiated oxazole borane $35^{21}$ to N -trityl- O -allylserinal $36^{5 \mathrm{c}}$ (Scheme 4). This gave 37 as an inseparable 6:1 diastereomer mixture ( $84 \%$ ), but the major isomer could be purified after aziridine formation under Mitsunobu conditions. Based on the vicinal coupling constant $J=6.1 \mathrm{~Hz}$ for the aziridine methine protons, the major aziridine ( $65 \%$ ) was assigned the cis stereochemistry $\mathbf{3 8}$. This result was expected from previous studies using 5 -substituted oxazoles, 5 c and provides the basis for assigning the stereochemistry of $\mathbf{3 7}$. Allyl deprotection using zirconocene generated in $s i t u^{22}$ followed by iodide formation following a modified Mitsunobu procedure ${ }^{23}$ then gave the desired $\mathbf{1 2}$.

Compared to the lithiation of oxazole 16 used in the model system (Scheme 2), the corresponding reaction of $\mathbf{1 2}$ must contend with the potentially sensitive iodomethylaziridine subunit. Although lithium-iodine exchange or oligomerization of $\mathbf{1 6}$ were potential concerns, it was anticipated that steric shielding in the cis-fused, trityl substituted aziridine would discourage intermolecular events involving either the primary iodide or the aziridine moieties, and that $\mathrm{sp}^{2}$ hybridization and adjacent heteroatoms would favor the lithiated oxazole. Fortunately, $\mathbf{1 2}$ was deprotonated cleanly with LDA/TMEDA ${ }^{13}$ at $-78{ }^{\circ} \mathrm{C}$ (Scheme 4 ) without any additional precautions compared to the model system. The resulting anion $\mathbf{1 3}$ was stirred with freshly fused $\mathrm{ZnCl}_{2}$ to generate 39 , followed by Negishi coupling ${ }^{16}$ with triflate $\mathbf{1 4}$ (1.1 equiv of $E-14$ ) to give ester 40 in $70 \%$ overall yield from oxazole 12. The corresponding Stille coupling ${ }^{17}$ was investigated briefly, but 40 was obtained in a lower $56 \%$ yield from 12.

To install the alkyne necessary for [ $3+2]$ cycloaddition, ester 40 was converted to aldehyde 11 by the usual two-step reduction/oxidation procedure via alcohol 41 ( $65 \%$ ). Addition of $\mathrm{LiC} \equiv \mathrm{CCH}_{2} \mathrm{OTBS}$ to $\mathbf{1 1}$ then gave an intermediate alcohol $\mathbf{4 2}$ that was oxidized to ketone $\mathbf{4 3}$ in $70 \%$ overall yield.

The key $[3+2]$ cycloaddition could now be explored starting with ketone 43 . This approach is the most direct route to the tetracyclic aziridinomitosene core, and it is also the safest route because it avoids the hydroquinone oxidation state corresponding to solvolytically reactive leucoaziridino-mitosenes. Best results were obtained using the crystallized benzene complex of $\mathrm{AgOTf}^{24}$ for iodine activation and intramolecular $N$-alkylation. Conversion of 43 to the oxazolium salt $\mathbf{4 4}$ was monitored by ${ }^{1} \mathrm{H}$ NMR spectroscopy in $\mathrm{C}_{6} \mathrm{D}_{6}$ and was complete after 3 h . Subsequent azomethine ylide generation was then performed by addition of 44 to excess $\mathrm{BnMe}_{3} \mathrm{~N}^{+} \mathrm{CN}^{-}$in $\mathrm{CH}_{3} \mathrm{CN}$ at rt , the same procedure used in the model study. A transient yellow
color was observed that faded within seconds, presumably due to the formation and subsequent reactions of the azomethine ylide. After 2 h at rt , the desired tetracyclic aziridinomitosene $\mathbf{4 5}$ was indeed isolated. A single experiment gave $\mathbf{4 5}$ in $33 \%$ yield, but this result was never reproduced despite much effort. The crucial variables could not be identified and yields in the $10-27 \%$ range were more typical, and unknown byproducts were formed that could not be isolated.

Because the cycloaddition from ketone $\mathbf{4 3}$ was too unpredictable for scaleup, an alternative route from alcohol 42 was explored after protection as the TBS ether $\mathbf{4 6}$ ( $78 \%$ over the two steps from 11; Scheme 5). Intramolecular alkylation and ylide generation were then performed as before using the purified AgOTf-benzene complex. ${ }^{24}$ Following the same procedure used in Scheme 4 and in prior studies, the intermediate oxazolium salt 47 was added to $\mathrm{BnMe}_{3} \mathrm{~N}^{+}$ $\mathrm{CN}^{-}$(4 equiv) in $\mathrm{CH}_{3} \mathrm{CN}$ at rt and the transient color of ylide $\mathbf{4 8}$ appeared as usual. However, the isolated product proved to be $\mathbf{5 0}(33 \%, 2: 1 \mathrm{dr})$ and not the expected enone $\mathbf{4 9}$. The formula of $\mathbf{5 0}$ was deduced using ESMS $(m / z=49+\mathrm{HCN})$, and the connectivity was established by NMR spectroscopy. Furthermore, the ${ }^{13} \mathrm{C}$ NMR spectrum showed CN peaks at $\delta=117.0$ and 117.1 ppm for the two diastereomers and the ${ }^{1} \mathrm{H}$ NMR spectrum contained two signals for the $\mathrm{C}(6)$ methine hydrogens at $\delta=3.30 \mathrm{ppm}$ and $\delta=3.26 \mathrm{ppm}$ as quartets, consistent with structure 50. Analogous cyanide adducts were not observed starting from the ketone 44, nor in the model study from either $\mathbf{2 5}$ or $\mathbf{2 6}$. Furthermore, nucleophilic addition at $C(7)$ in mitomycin-derived quinones is reported to follow an addition/elimination pathway. ${ }^{25}$ On the other hand, simple addition of cyanide to a vinylogous ester has been reported in an unrelated substrate. ${ }^{26}$

Even though the product was not the desired vinylogous ester 49, oxidation of the cycloaddition product mixture containing 50 was nonetheless attempted in the hope that elimination of HCN might generate 49 in situ and that enolization and subsequent oxidation would afford the desired quinone 45. However, treatment with KHMDS/NCS at $-78{ }^{\circ} \mathrm{C}$ gave $\mathbf{4 5}$ in a marginal $17 \%$ yield from 46.

In an attempt to prevent formation of the cyanide adduct 50, azomethine ylide generation was performed with 1.0 equiv of $\mathrm{BnMe}_{3} \mathrm{~N}^{+} \mathrm{CN}^{-}$instead of the excess used earlier (Scheme 6). This experiment gave a low yield ( $<10 \%$ ) of the quinone $\mathbf{4 5}$, but neither $\mathbf{4 9}$ nor $\mathbf{5 0}$ was detected by NMR. On the other hand, a mass corresponding to $\mathbf{5 0}(\mathrm{m} / z=\mathbf{4 9}+\mathrm{HCN})$ did appear in the electrospray mass spectrum of the crude product, suggesting that isomers of $\mathbf{5 0}$ had been formed. Structure 51 resulting from simple iodide-cyanide exchange was ruled out based on disappearance of the oxazole proton in the NMR spectrum, but further characterization of the sensitive product mixture was difficult. Eventually, partially enriched fractions of two new products were obtained by chromatography on $\mathrm{NEt}_{3}$ buffered silica gel that proved to be two diastereomers 53 resulting from the desired $[2+3]$ cycloaddition of azomethine ylide 52, but without the usual elimination of HCN. Varying amounts of decomposition products were also observed during attempts to purify $\mathbf{5 3}$ by chromatography, including a structure that is tentatively assigned as the expected adduct 49 from MS and NMR evidence. However, enriched samples of $\mathbf{4 9}$ were never obtained, nor could either isomer of $\mathbf{5 3}$ be isolated without contamination. Structure 53 is consistent with the upfield chemical shift of the aziridine protons ( $\delta=2.15,2.59 \mathrm{ppm}$ and $\delta=2.34,2.79 \mathrm{ppm}$ ) compared to $\delta=2.89$ and 3.03 ppm for the analogous protons of $\mathbf{4 5}$. However, decisive evidence for $\mathbf{5 3}$ proved elusive until yet another unexpected product was isolated during attempts to aromatize $\mathbf{5 3}$ to $\mathbf{4 5}$.

Oxidation of 53 using base/NCS, DDQ , or $\mathrm{TBAF} / \mathrm{Pd}-\mathrm{C} / \mathrm{O}_{2}$ gave extensive degradation along with traces of $\mathbf{4 5}$. However, treatment of crude 53 with HF-pyridine/ $\mathrm{O}_{2}{ }^{20}$ and added $\mathrm{NEt}_{3}$ to prevent aziridine cleavage produced a separable mixture of highly colored quinones (Scheme 6 ), including quinone alcohol 54 as well as the silyl ether $\mathbf{4 5}$. A deep red quinone was also isolated, and was assigned structure $\mathbf{5 5}$, corresponding to oxidation without HCN elimination.

The high field chemical shifts of the aziridine protons at $\delta=2.64$ and 2.96 ppm suggested the same sp ${ }^{3}$ environment at $\mathrm{C}(9 a)$ as seen in $\mathbf{5 3}$. With a mass corresponding to $\mathbf{5 4}+\mathrm{CN}+\mathrm{OH}$ and strong NMR evidence for the HO and $\mathrm{CH}_{2} \mathrm{OH}$ subunits (one exchangeable proton, singlet at $\delta=4.03 \mathrm{ppm}$; a second exchangeable proton at $\delta=4.65 \mathrm{ppm}$ as a doublet of doublets coupled to the $\mathrm{C}(10)$ methylene protons). Eventually, X-ray quality crystals were obtained and the structure was confirmed.

For preparative purposes, it was best to oxidize the crude cycloaddition mixture obtained from 46 by activation with AgOTf-benzene complex ${ }^{24}$ followed by 1.0 equiv of $\mathrm{BnMe}_{3} \mathrm{~N}^{+} \mathrm{CN}^{-}$. Without separation, the resulting mixture was treated with HF -pyridine $/ \mathrm{O}_{2}{ }^{20}$ and $\mathrm{NEt}_{3}$ to give $34 \%$ of $\mathbf{4 5}+\mathbf{5 4}$ combined, together with $14 \%$ of $\mathbf{5 5}$. Similar experiments with partially purified 53 were less efficient overall, but did provide evidence that only one of the two diastereomers of $\mathbf{5 3}$ undergoes elimination of HCN while the other oxidizes to $\mathbf{5 5}$. The combined $48 \%$ yield of tetracyclic adducts is not far from the range of yields obtained using simpler cycloaddition substrates, but the $34 \%$ recovery of useful quinones $(\mathbf{4 5}+\mathbf{5 4})$ was less than desired. Some solace was taken by considering the dramatic change in structure and the number of transformations to 45 in the one pot procedure starting from oxazole 46.

The last steps potentially leading to aziridinomitosene A require introduction of the carbamate and removal of the trityl protecting group. When tetracycle $\mathbf{4 5}$ was subjected to reductive detritylation conditions with $\mathrm{Et}_{3} \mathrm{SiH} / \mathrm{MsOH}$ at $-40^{\circ} \mathrm{C}$ desilylation to 54 proved faster than detritylation. ${ }^{27}$ The TBS ether in $\mathbf{4 5}$ was therefore removed with $\mathrm{NEt}_{3} / \mathrm{HF}$-pyr, and the alcohol 54 was converted to carbamates 56 and 57 using standard methods (Scheme 7). ${ }^{28}$ Treatment of 56 with $\mathrm{Et}_{3} \mathrm{SiH} / \mathrm{MsOH}$ at $0{ }^{\circ} \mathrm{C}$ followed by cleavage of the trichloroacyl group with $\mathrm{K}_{2} \mathrm{CO}_{3}$ afforded a product mixture having a major ESMS peak at $m / z=358$ amu corresponding to the ring opened amino alcohol $59+\mathrm{Na}$. Another peak at $m / z=275 \mathrm{amu}$ was assigned to the cation 60 resulting from heterolysis of the carbamate, identical to ESMS data reported previously for $59 .{ }^{29}$ A small peak at $m / z=340 \mathrm{amu}$, the mass expected for aziridinomitosene $\mathrm{A}(4)+\mathrm{Na}$, was also observed in samples of the crude product mixture. However, $\mathbf{4}$ was not detected by NMR comparison with a spectrum of authentic material, and was not present above the detection threshold level of ca. $2-3 \%$. Treatment of the carbamate 57 with $\mathrm{Et}_{3} \mathrm{SiH} / \mathrm{MsOH}$ also gave the amino alcohol 59 according to ESMS assay, although the mass corresponding to 4 was not detected in this case. ${ }^{29}$

In view of the above results, the reductive detritylation procedure was re-optimized in an attempt to lower the temperature threshold. Using the stronger acid TfOH together with the more potent hydride source triphenylsilane allowed detritylation of simpler model structures (for example, $(R)$-benzyl 1-tritylaziridine-2-carboxylate) as low as $-40^{\circ} \mathrm{C}$ with 1.0 equiv of each reagent over a time scale of $0.5-15 \mathrm{~h}$. However, when the new procedure ( 15 h at $-40^{\circ}$ C and workup with pH 10.3 buffer) was applied to $\mathbf{5 7}$, ESMS assay ( $\mathrm{m} / \mathrm{z}=600 \mathrm{amu}, \mathbf{5 8}+\mathrm{Na}$ ) indicated formation of the $N$-trityl amino alcohol 58 as the main component in a $3: 1$ mixture with the amino alcohol 59 . The $N$-trityl amino alcohol was not purified, but structure $\mathbf{5 8}$ is consistent with the ESMS data and ${ }^{1} \mathrm{H}$ NMR evidence for the intact $N$-trityl group, new C (6) methyl signals at $\delta=1.94$ and $\delta=1.90 \mathrm{ppm}$ in a $3: 1$ ratio, as well as new downfield methine signals. Tentatively, we interpret the methyl signals as evidence for diastereomeric amino alcohols from aziridine cleavage as reported for $\mathbf{5 9}$. When 2 equiv of TfOH and 2 equiv of $\mathrm{HSiPh}_{3}$ were used for the deprotection of 57 at $-40^{\circ} \mathrm{C}$, only the amino alcohol 59 was recovered (ca. 5:1 dr by NMR), and the structure was confirmed by comparison with literature MS and NMR data. ${ }^{29,30}$

The deprotection studies of 57 are consistent with rapid $\mathrm{C}(1)-\mathrm{N}$ heterolysis due to the activating effect of the indoloquinone nitrogen. This was no surprise given the long history of DNA alkylation involving similar events, and in particular, the studies by Kohn et al with
aziridinomitosenes B, C, and D. ${ }^{31}$ Nevertheless, there was reason to think that deprotection might be possible. Thus, earlier efforts in our laboratory had succeeded in the detritylation of 61 to 62 using $i \mathrm{Pr}_{3} \mathrm{SiH} / \mathrm{MsOH} .{ }^{27 \mathrm{~b}}$ Evidently, the vinylogous carbamate $\mathrm{C}=\mathrm{O}$ group of the ester substituent in 62 is an important stabilizing factor, but we had imagined (hoped) that the vinylogous amide (quinone) carbonyls of $\mathbf{5 7}$ would be at least as effective. This has proven not to be the case.

## Conclusions

Indoloquinone $\mathbf{3 1}$ was obtained in excellent yield using internal azomethine ylide cycloaddition methodology starting from the oxazole $\mathbf{2 5}$ when the sensitive intermediate cycloadduct $\mathbf{3 2}$ was oxidized without isolation. The ketone substrate $\mathbf{2 6}$ gave lower yields of $\mathbf{3 1}$ using the analogous oxazolium salt activation with cyanide ion. Similar routes to the tetracyclic quinone 45 encountered complications due to cyanide addition at the stage of the vinylogous ketone 49. Furthermore, two unexpectedly stable cycloadduct diastereomers 53 were encountered, and only one diastereomer could be converted into the desired quinone $\mathbf{4 5}$ after oxidation. The presence of a sensitive aziridine in all of the tetracyclic intermediates raises complications throughout the late stages of this sequence, but the challenge was met until the very last stage, the reductive $N$-trityl cleavage. This transformation has been achieved in a related system (61), but could not be demonstrated on a preparative scale with 57 due to aziridine ring opening.

We were well aware that $N$-trityl cleavage as the last step would be exceptionally challenging. This risk was accepted for two reasons. First, one of the goals of the study was to better define the limits of what chemistry is possible in the presence of the solvolytically sensitive aziridines. Second, the bulky $N$-trityl group is helpful at the stage of oxazolium salt formation using AgOTf. When smaller substituents are present at the aziridine nitrogen, activation of the iodide results in competing internal alkylation of oxazole nitrogen and intermolecular displacement by the same cyanide ion that is necessary to generate the azomethine ylide for the cycloaddition. At this point, it is clear that a different protecting group for aziridine nitrogen will be needed that is compatible with the internal oxazole alkylation/cyanide activation sequence.

## Experimental

(E)-Methyl 2-methoxy-3-(trifluoromethylsulfonyloxy)but-2-enoate (14)

To a suspension of $\mathrm{LiH}(81.0 \mathrm{mg}, 10.2 \mathrm{mmol})$ in THF $(28 \mathrm{~mL})$ at $-78^{\circ} \mathrm{C}$ was added a solution of $15^{9}$ in THF ( 1 mL ) dropwise over 5 min . After stirring at $-78^{\circ} \mathrm{C}$ for 1 h , a solution of N -phenyl-bis(trifluoromethanesulfonimide) $(2.43 \mathrm{~g}, 6.80 \mathrm{mmol})$ in THF ( 6 mL ) was added dropwise over 5 min . The resulting solution was stirred at $-78^{\circ} \mathrm{C}$ for 1 h then warmed to rt and stirred for 7 d . The yellow solution was poured into $\mathrm{H}_{2} \mathrm{O}(100 \mathrm{~mL})$ and extracted with $\mathrm{Et}_{2} \mathrm{O}$. The combined organic extracts were washed with a $10 \%$ citric acid solution, dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and solvents were removed (aspirator). The residue was purified by flash chromatography on silica gel ( $50 \mathrm{~mm} \times 15 \mathrm{~cm}, 10 \% \mathrm{Et}_{2} \mathrm{O} /$ hexanes, 50 mL fractions) to yield $1.23 \mathrm{~g}(65 \%)$ of triflate $\mathbf{1 4}$ as a volatile clear oil as an inseparable $93: 7$ ratio of $E: Z$ isomers $\left({ }^{1} \mathrm{H}\right.$ NMR analysis), analytical TLC on silica gel $60 \mathrm{~F} 254,10 \% \mathrm{Et}_{2} \mathrm{O} /$ hexanes, $\mathrm{Rf}=0.3$. Molecular ion $(\mathrm{M}+\mathrm{Na})$ calculated for $\mathrm{C}_{7} \mathrm{H}_{9} \mathrm{~F}_{3} \mathrm{NaO}_{6} \mathrm{~S}: 300.9970$; found $\mathrm{m} / \mathrm{z}=300.9963$, error $=2 \mathrm{ppm}$; IR (neat, $\left.\mathrm{cm}^{-1}\right) 1735, \mathrm{C}=\mathrm{O}, 1424 ; 500 \mathrm{MHz}^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right.$, ppm) major $E$-isomer: $\delta 3.87(3 \mathrm{H}, \mathrm{s}) 3.70(3 \mathrm{H}, \mathrm{s}) 2.18(3 \mathrm{H}, \mathrm{s})$. The presence of the minor $Z$-isomer was deduced from methyl integrals at $\delta 3.88\left(0.07 \mathrm{H}\right.$, s) $3.71\left(0.07 \mathrm{H}\right.$, s) $2.36(0.07 \mathrm{H}, \mathrm{s}) .{ }^{13} \mathrm{C} \mathrm{NMR}(125 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}, \mathrm{ppm}\right) E$-isomer $\delta 161.5,146.8,142.4,118.5(\mathrm{q}, 318 \mathrm{~Hz}), 60.5,52.5,15.8 . Z$-isomer $\delta$ 163.2, 147.1, 142.5, 118.5 (q, 318 Hz ), 60.4, 52.7, 17.2.

## Preparation of ( $E$ )-methyl 2-methoxy-3-(2-phenyloxazol-5-yl)but-2-enoate (21) by Negishi coupling between 17 and 14

5-Bromo-2-phenyloxazole ${ }^{14}(\mathbf{1 7})(151 \mathrm{mg}, 0.673 \mathrm{mmol})$ in THF ( 3 mL ) was cooled to $-78^{\circ}$ C and $n-\mathrm{BuLi}(1.67 \mathrm{M}$ solution in hexanes, $0.50 \mathrm{~mL}, 0.84 \mathrm{mmol}$ ) was added dropwise over 2 min . After stirring at $-78{ }^{\circ} \mathrm{C}$ for $10 \mathrm{~min}, \mathrm{ZnCl}_{2}$ ( 1.0 M solution in THF, $2.7 \mathrm{~mL}, 2.7 \mathrm{mmol}$ ) was added and the yellow solution was allowed to warm to rt over 25 min . In a separate flask, $\mathrm{Pd}_{2} \mathrm{dba}_{3}(60.0 \mathrm{mg}, 0.0655 \mathrm{mmol})$ and $\mathrm{PPh}_{3}(38.0 \mathrm{mg}, 0.0145 \mathrm{mmol})$ were dissolved in THF $(2 \mathrm{~mL})$ and stirred at rt 20 min . Triflate $14(205 \mathrm{mg}, 0.737 \mathrm{mmol}$ of a $1: 1$ ratio of $E / Z-14)$ in THF ( 1 mL ) was added dropwise at rt and the resulting green solution was stirred at rt for 10 min. The previously made organozinc was added via cannula dropwise over 5 min followed by a THF rinse ( 1 mL ). After stirring at rt for 15 h , the solution was poured into saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}(10 \mathrm{~mL})$ and extracted with $\mathrm{Et}_{2} \mathrm{O}$. The combined organic extracts were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and solvents were removed (aspirator). The yellow oil was purified by flash column chromatography on silica gel ( $30 \mathrm{~mm} \times 16 \mathrm{~cm}, 15 \% \mathrm{EtOAc} / \mathrm{hexanes}, 30 \mathrm{~mL}$ fractions) to yield $66 \mathrm{mg}(36 \%)$ of ester 21 as a light yellow oil in an inseparable $93: 7$ ratio of $E$ :Z isomers, analytical TLC on silica gel $60 \mathrm{~F} 254,15 \% \mathrm{EtOAc} /$ hexanes, $\mathrm{Rf}=0.2$. Molecular ion $(\mathrm{M}+\mathrm{H})$ calculated for $\mathrm{C}_{15} \mathrm{H}_{16} \mathrm{NO}_{4}: 274.1079$; found $\mathrm{m} / \mathrm{z}=274.1070$, error $=3 \mathrm{ppm}$; IR (neat, $\mathrm{cm}^{-1}$ ) 1729, $\mathrm{C}=\mathrm{O}, 1644$; for major $E-21: 400 \mathrm{MHz}{ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 8.01-7.95(2 \mathrm{H}, \mathrm{m})$ 7.48-7.43 (3H, m) $7.18(1 \mathrm{H}, \mathrm{s}) 3.82(3 \mathrm{H}, \mathrm{s}) 3.71(3 \mathrm{H}, \mathrm{s}) 2.10(3 \mathrm{H}, \mathrm{s})$. The presence of the minor Z-isomer was deduced from methyl integrals at $\delta 3.88(0.24 \mathrm{H}, \mathrm{s}) 3.72(0.24 \mathrm{H}$, s) $2.46(0.24 \mathrm{H}$, s). ${ }^{13} \mathrm{C}$ NMR of the major $E-21\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 165.1,161.2,149.1,144.6,130.6$, 129.0, 127.4, 127.0, 126.4, 112.9, 58.6, 52.6, 13.7.

## Preparation of 21 by Negishi coupling between 16 and 14

To a solution of 2-phenyloxazole $\mathbf{1 6}^{12}(32.0 \mathrm{mg}, 0.220 \mathrm{mmol})$ in THF $(1.5 \mathrm{~mL})$ at $-78{ }^{\circ} \mathrm{C}$ was added TMEDA ( $0.33 \mathrm{~mL}, 2.20 \mathrm{mmol}$, distilled over solid Na ) and $n-\mathrm{BuLi}(1.30 \mathrm{M}$ solution in hexanes, $0.19 \mathrm{~mL}, 0.242 \mathrm{mmol}$ ) dropwise over 5 min . After stirring at $-78^{\circ} \mathrm{C}$ for $1 \mathrm{~h}, \mathrm{ZnCl}_{2}$ ( 1.12 M in THF, $0.79 \mathrm{~mL}, 0.880 \mathrm{mmol}$ ) was added dropwise then the cooling bath was removed and the organozinc solution was allowed to warm to rt. In a separate flask, $\mathrm{Pd}_{2} \mathrm{dba}_{3}(20.1 \mathrm{mg}$, $0.0220 \mathrm{mmol})$ and $\mathrm{PPh}_{3}(23.0 \mathrm{mg}, 0.0880 \mathrm{mmol})$ was dissolved in THF $(0.5 \mathrm{~mL})$ and stirred at rt 20 min . Triflate $\mathbf{1 4}(71.1 \mathrm{mg}, 0.255 \mathrm{mmol}$ of a $>95: 5$ ratio of $E / Z-\mathbf{1 4})$ in THF $(0.5 \mathrm{~mL})$ was added dropwise and the resulting green solution was stirred at rt for 25 min . The previously made organozinc was added via cannula dropwise over 5 min followed by a THF rinse ( 0.5 mL ). After stirring at rt for 15 h , the solution was poured into saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ and extracted with $\mathrm{Et}_{2} \mathrm{O}$. The combined organic extracts were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and solvents were removed (aspirator). The yellow oil was purified by preparatory TLC on silica gel ( $20 \mathrm{~cm} \times$ $20 \mathrm{~cm} \times 1000 \mu \mathrm{~m}, 15 \% \mathrm{EtOAc} / \mathrm{hexanes}$ eluent) to give $28.3 \mathrm{mg}(47 \%)$ of 21 as a light yellow oil in a $>95: 5$ ratio of $E: Z$ isomers.

## Preparation of 21 by Stille coupling of 19 and 14

To a suspension of $\mathrm{Pd}_{2}(\mathrm{dba})_{3}(123 \mathrm{mg}, 0.134 \mathrm{mmol})$ and trifurylphosphine $(125 \mathrm{mg}, 0.537$ $\mathrm{mmol})$ in DMF $(4 \mathrm{~mL})$ that was stirred at rt 20 min was added a solution of triflate $\mathbf{1 4}$ (478 $\mathrm{mg}, 1.48 \mathrm{mmol}$ of a $>95: 5$ ratio of $E / Z-\mathbf{1 4}$ ) in DMF ( 4 mL , including cannula and flask washings) via cannula dropwise. The dark purple solution was allowed to stir at rt 20 min then a solution of stannane $\mathbf{1 9}^{15}(583 \mathrm{mg}, 1.34 \mathrm{mmol}$ ) in DMF ( 5 mL , including cannula and flask washings) was added via cannula dropwise. The reaction was heated to $65^{\circ} \mathrm{C}$ and stirred 15 h. After cooling to rt, the green solution was poured into saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}(30 \mathrm{~mL})$ and extracted with $\mathrm{Et}_{2} \mathrm{O}$. The combined organic extracts were washed with $\mathrm{H}_{2} \mathrm{O}$ and brine, dried $\left(\mathrm{MgSO}_{4}\right)$, and the solvents were removed (aspirator). The yellow oil was purified by flash column chromatography on silica gel ( $40 \mathrm{~mm} \times 15 \mathrm{~cm}, 15 \% \mathrm{EtOAc} / \mathrm{hexanes}, 40 \mathrm{~mL}$
fractions) to yield $0.367 \mathrm{~g}(>99 \%)$ of ester 21 as a light yellow oil in a $>95: 5$ ratio of $E: Z$ isomers identical to previously made material.

## (E)-2-Methoxy-3-(2-phenyloxazol-5-yl)but-2-en-1-ol (22)

To a solution of ester $21(158 \mathrm{mg}, 0.578 \mathrm{mmol})$ in toluene $(6 \mathrm{~mL})$ at $-78^{\circ} \mathrm{C}$ was added DIBAL$\mathrm{H}(20 \mathrm{wt} \%$ solution in toluene, $1.80 \mathrm{~mL}, 2.17 \mathrm{mmol}$ ) dropwise over 5 min . After stirring at $-78^{\circ} \mathrm{C}$ for 2 h , the cooling bath was removed and $6 \mathrm{~mL}^{\circ} \mathrm{Et}_{2} \mathrm{O}$ was added followed by 6 mL of saturated aqueous sodium potassium tartrate (Rochelle's Salt). The biphasic solution was vigorously stirred at rt for 1 h , then the mixture was extracted with $\mathrm{Et}_{2} \mathrm{O}$. The combined organic extracts were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and solvents were removed (aspirator). The off white solid was purified by flash column chromatography on silica gel ( $20 \mathrm{~mm} \times 15 \mathrm{~cm}, 3: 1 \mathrm{Et}_{2} \mathrm{O} /$ hexanes, 11 mL fractions) to yield $0.134 \mathrm{~g}(94 \%)$ of alcohol 22 as white solid, analytical TLC on silica gel $60 \mathrm{~F} 254,3: 1 \mathrm{Et}_{2} \mathrm{O}$ /hexanes, $\mathrm{Rf}=0.3$. Pure material was obtained by crystallization in EtOAc/hexanes as white rods, $\mathrm{mp}=97-99^{\circ} \mathrm{C}$. Molecular ion $(\mathrm{M}+\mathrm{H})$ calculated for $\mathrm{C}_{14} \mathrm{H}_{16} \mathrm{NO}_{3}: 246.1130$; found $m / z=246.1119$, error $=4 \mathrm{ppm}$; IR (neat, $\mathrm{cm}^{-1}$ ) $3263, \mathrm{OH}, 1642$; $400 \mathrm{MHz}{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.98-7.93(2 \mathrm{H}, \mathrm{m}) 7.44-7.41(3 \mathrm{H}, \mathrm{m}) 6.97(1 \mathrm{H}$, s) 4.59 $(2 \mathrm{H}, \mathrm{d}, J=5.9 \mathrm{~Hz}) 3.83(3 \mathrm{H}, \mathrm{s}) 2.93(1 \mathrm{H}, \mathrm{t}, J=5.9 \mathrm{~Hz}) 1.93(3 \mathrm{H}, \mathrm{s}) .{ }^{13} \mathrm{C}$ NMR ( 100 MHz , $\left.\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 160.8,153.5,151.1,130.4,129.0,127.3,126.2,125.3,107.8,58.3,56.9,13.4$.

## (E)-2-Methoxy-3-(2-phenyloxazol-5-yl)but-2-enal (23)

A solution of alcohol 22 ( $268 \mathrm{mg}, 1.09 \mathrm{mmol}$ ), $N$-methyl morpholine $N$-oxide (NMO) ( 269 $\mathrm{mg}, 2.30 \mathrm{mmol})$, and molecular sieves (activated powder, $4 \AA, 1.34 \mathrm{~g}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(14 \mathrm{~mL})$ was stirred at rt for 30 min . Tetrapropylammonium perruthenate (TPAP) $(77.0 \mathrm{mg}, 0.219 \mathrm{mmol})$ was then added and the resulting black solution was stirred at rt 1 h then filtered through a silica gel plug eluting with 250 mL of a 1:1 acetone/hexanes solution. Solvents were removed (aspirator) and the light yellow solid was purified by flash column chromatography on silica gel ( $30 \mathrm{~mm} \times 16 \mathrm{~cm}, 40 \% \mathrm{Et}_{2} \mathrm{O} /$ hexanes, 12 mL fractions) to yield 0.200 g ( $75 \%$ ) of aldehyde 23 as a light yellow solid, analytical TLC on silica gel $60 \mathrm{~F} 254,40 \% \mathrm{Et}_{2} \mathrm{O} /$ hexanes, $\mathrm{Rf}=0.3$. Pure material was obtained by crystallization in hexanes as light yellow needles, $\mathrm{mp}=77-80$ ${ }^{\circ} \mathrm{C}$. Molecular ion $(\mathrm{M}+\mathrm{H})$ calculated for $\mathrm{C}_{14} \mathrm{H}_{14} \mathrm{NO}_{3}$ : 244.0974; found $m / z=244.0966$, error $=3 \mathrm{ppm} ; \operatorname{IR}\left(\right.$ neat, $\left.\mathrm{cm}^{-1}\right) 1665 \mathrm{C}=\mathrm{O} ; 500 \mathrm{MHz}^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 10.19(1 \mathrm{H}, \mathrm{s}) 8.06-8.02$ $(2 \mathrm{H}, \mathrm{m}) 7.52-7.47(3 \mathrm{H}, \mathrm{m}) 7.34(1 \mathrm{H}, \mathrm{s}) 3.83(3 \mathrm{H}, \mathrm{s}) 2.29(3 \mathrm{H}, \mathrm{s}) .{ }^{13} \mathrm{C}$ NMR ( 125 MHz , $\left.\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 187.1,163.6,151.9,148.2,131.4,131.3,129.4,129.2,126.9,126.8,60.3,13.4$.

## (E)-7-(tert-Butyldimethylsilyloxy)-3-methoxy-2-(2-phenyloxazol-5-yl)hept-2-en-5-yn-4-one (26)

To a solution of tert-butyldimethylsilyl propargyl ether ${ }^{32}(33.0 \mathrm{mg}, 0.193 \mathrm{mmol})$ in THF ( 1.0 $\mathrm{mL})$ at $-40^{\circ} \mathrm{C}$ was added $n-\mathrm{BuLi}(0.374 \mathrm{M}$ solution in hexanes, $0.52 \mathrm{~mL}, 0.193 \mathrm{mmol})$ dropwise over 5 min . After stirring at $-42^{\circ} \mathrm{C}$ for 1 h , a solution of aldehyde $\mathbf{2 3}(26.0 \mathrm{mg}, 0.107$ mmol ) in THF ( 1.0 mL , including cannula and flask washings) was added dropwise via cannula and the reaction was stirred an additional 2 h at $-42^{\circ} \mathrm{C}$ then the cooling bath was removed and 2 mL of saturated aqueous sodium bicarbonate was added. After stirring at rt 10 min , the solution was poured into brine and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The combined organic extracts were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and solvents were removed (aspirator). To the crude alcohol from above in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \mathrm{~mL})$ was added NMO ( $26.0 \mathrm{mg}, 0.225 \mathrm{mmol}$ ) and molecular sieves (activated powder, $4 \AA, 120 \mathrm{mg}$ ) and the mixture was stirred at rt 20 min . TPAP ( $8.0 \mathrm{mg}, 0.021$ mmol ) was added in one portion and the black solution was stirred an additional 1 h at rt then filtered through a silica gel plug ( $2 \mathrm{~cm} \times 5 \mathrm{~cm}$ ) and eluted with 50 mL of a 1:1 hexanes/acetone solution. Solvents were removed (aspirator) and the yellow foam was purified by preparatory TLC on silica gel ( $20 \mathrm{~cm} \times 20 \mathrm{~cm} \times 1000 \mu \mathrm{~m}, 20 \% \mathrm{EtOAc} / \mathrm{hexanes}$ eluent) to give 25.0 mg (57\%) of 26 as a yellow foam, analytical TLC on silica gel $60 \mathrm{~F} 254,20 \% \mathrm{EtOAc} / \mathrm{hexanes}, \mathrm{Rf}$
$=0.3$. Molecular ion $(\mathrm{M}+\mathrm{H})$ calculated for $\mathrm{C}_{23} \mathrm{H}_{30} \mathrm{NO}_{4} \mathrm{Si}: 412.1944$; found $\mathrm{m} / \mathrm{z}=412.1935$, error $=2 \mathrm{ppm}$; IR $\left(\right.$ neat, $\left.\mathrm{cm}^{-1}\right) 1640 \mathrm{C}=\mathrm{O} ; 500 \mathrm{MHz}{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta$ 8.05-8.01 $(2 \mathrm{H}$, m) $7.49(1 \mathrm{H}, \mathrm{s}) 7.47-7.44(3 \mathrm{H}, \mathrm{m}) 4.33(2 \mathrm{H}, \mathrm{s}) 3.75(3 \mathrm{H}, \mathrm{s}) 2.22(3 \mathrm{H}, \mathrm{s}) 0.84(9 \mathrm{H}, \mathrm{s}) 0.03(6 \mathrm{H}$, s). ${ }^{13} \mathrm{C}$ NMR $\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 174.8,162.1,151.0,148.4,130.9,130.5,129.1,127.2$, 126.8, 120.3, 92.4, 84.3, 59.9, 51.7, 25.9, 18.4, 15.4, -5.2.

## (E)-5-(4,7-Bis(tert-butyldimethylsilyloxy)-3-methoxyhept-2-en-5-yn-2-yl)-2-phenyloxazole

 (25)To a solution of tert-butyldimethylsilyl propargyl ether ${ }^{32}(252 \mathrm{mg}, 1.48 \mathrm{mmol})$ in THF ( 1.5 mL ) at $-78^{\circ} \mathrm{C}$ was added $n$ - $\mathrm{BuLi}(1.47 \mathrm{M}$ solution in hexanes, $1.01 \mathrm{~mL}, 1.48 \mathrm{mmol}$ ) dropwise over 5 min . The solution was allowed to stir at $-78^{\circ} \mathrm{C}$ for 1 h then a solution of aldehyde 23 ( $200 \mathrm{mg}, 0.822 \mathrm{mmol}$ ) in THF ( 0.5 mL , including cannula and flask washings) was added dropwise via cannula and the reaction was allowed to slowly warm to $-42^{\circ} \mathrm{C}$ over 20 minutes. The light yellow solution was stirred at $-42^{\circ} \mathrm{C}$ for 2 h then the cooling bath was removed and 2 mL of saturated aqueous sodium bicarbonate was added. After stirring at rt 10 min , the solution was poured into brine and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The combined organic extracts were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and solvents were removed (aspirator). The crude alcohol from above was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \mathrm{~mL})$ and tert-butyldimethylsilyl chloride ( $151 \mathrm{mg}, 1.00 \mathrm{mmol}$ ) was added followed by imidazole ( $84.0 \mathrm{mg}, 1.23 \mathrm{mmol}$ ). The suspension was stirred for 15 h at rt and then poured into brine and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The combined organic extracts were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and solvents were removed (aspirator). The clear oil was purified by flash column chromatography on silica gel ( $40 \mathrm{~mm} \times 15 \mathrm{~cm}, 20 \% \mathrm{Et}_{2} \mathrm{O} /$ hexanes, 15 mL fractions) to yield $0.318 \mathrm{~g}(73 \%)$ of oxazole 23 as a clear oil, analytical TLC on silica gel 60 $\mathrm{F} 254,20 \% \mathrm{Et}_{2} \mathrm{O} /$ hexanes, $\mathrm{Rf}=0.5$. Molecular ion $(\mathrm{M}+\mathrm{Na})$ calcd for $\mathrm{C}_{29} \mathrm{H}_{45} \mathrm{NNaO}_{4} \mathrm{Si}_{2}$ : 550.2785 ; found $m / z=550.2777$, error $=1 \mathrm{ppm}$; IR (neat, $\mathrm{cm}^{-1}$ ) $1638 ; 400 \mathrm{MHz}{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 8.09-8.02(2 \mathrm{H}, \mathrm{m}) 7.49-7.42(3 \mathrm{H}, \mathrm{m}) 7.07(1 \mathrm{H}, \mathrm{s}) 5.80(1 \mathrm{H}, \mathrm{t}, J=1.8 \mathrm{~Hz}) 4.38$ $(2 \mathrm{H}, \mathrm{d}, J=1.8 \mathrm{~Hz}) 3.99(3 \mathrm{H}, \mathrm{s}) 2.03(3 \mathrm{H}, \mathrm{s}) 0.89(9 \mathrm{H}, \mathrm{s}) 0.88(9 \mathrm{H}, \mathrm{s}) 0.11(6 \mathrm{H}, \mathrm{s}) 0.09(3 \mathrm{H}, \mathrm{s})$ $0.05(3 \mathrm{H}, \mathrm{s}) .{ }^{13} \mathrm{C}$ NMR ( $\left.100 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 161.2,152.7,150.6,130.4,129.0,127.7$, $126.4,126.3,107.5,84.3,83.8,61.2,59.9,52.0,26.0,25.9,18.4,14.1,-4.6,-4.8,-5.0$.

## Azomethine ylide cycloaddition to form 4-(tert-butyldimethylsilyloxy)-3-((tert-butyldimethylsilyloxy)methyl)-5-methoxy-1,6-dimethyl-2-phenyl-1H-indol-7(4H)-one (31)

To a solution of ynone oxazole $26(10.0 \mathrm{mg}, 0.0243 \mathrm{mmol})$ in freshly distilled $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CN}$ ( 0.5 ml , stirred over activated $4 \AA$ molecular sieves, distilled over $\mathrm{CaH}_{2}$, and distilled again over $\mathrm{P}_{2} \mathrm{O}_{5}$ ) and molecular sieves (activated $4 \AA, 7$ beads) was added MeOTf ( $4 \mu \mathrm{~L}, 0.0365$ $\mathrm{mmol})$. The clear solution was allowed to stir at rt 15 h . MeOTf ( $4 \mu \mathrm{~L}, 0.0592 \mathrm{mmol}$ ) was added and the light brown solution was stirred an additional 15 h at rt . Salt formation was indicated by TLC analysis of reaction mixture, $\mathrm{Rf}=0.0$ and by mass spectroscopy with molecular ion (M+) calculated for $\mathrm{C}_{24} \mathrm{H}_{32} \mathrm{NO}_{4} \mathrm{Si}$ : 426 , found $m / z=426$. The oxazolium salt was transferred to a solution of $\mathrm{BnMe}_{3} \mathrm{~N}^{+} \mathrm{CN}^{-}(9.0 \mathrm{mg}, 0.054 \mathrm{mmol})$ in freshly distilled $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CN}(2.0 \mathrm{~mL}$, including cannula and flask washings, stirred over activated $4 \AA$ molecular sieves, distilled over $\mathrm{CaH}_{2}$, and distilled again over $\mathrm{P}_{2} \mathrm{O}_{5}$ ) at $0{ }^{\circ} \mathrm{C}$ via cannula dropwise over 5 minutes. The reaction was stirred at $0^{\circ} \mathrm{C}$ for 10 min then the cooling bath was removed and the light orange solution was stirred at rt for 15 h . The orange solution was poured into brine and extracted with $\mathrm{Et}_{2} \mathrm{O}$. The combined organic extracts were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and solvents were removed (aspirator) to yield a light orange oil. The orange oil was purified by preparative TLC on silica gel ( $20 \mathrm{~cm} \times 20 \mathrm{~cm} \times 1000 \mu \mathrm{~m}, 15 \% \mathrm{EtOAc} /$ hexanes eluent) to give $4.0 \mathrm{mg}(40 \%)$ of $\mathbf{3 1}$ as an orange oil. Molecular ion ( $\mathrm{M}+\mathrm{Na}$ ) calculated for $\mathrm{C}_{24} \mathrm{H}_{31} \mathrm{NNaO}_{4} \mathrm{Si}: 448.1920$; found $m / z=448.1922$, error $=1 \mathrm{ppm}$; IR (neat, $\mathrm{cm}^{-1}$ ) $1661 \mathrm{C}=\mathrm{O}$, $1640 \mathrm{C}=\mathrm{O}, 1609$; UV $\left(\mathrm{CH}_{3} \mathrm{OH}, \mathrm{nm}\right) 266$ ( $\varepsilon 33000$ ), 347 ( $\varepsilon 8500$ ), $448(\varepsilon 4400) .500 \mathrm{MHz}{ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.50-7.42(5 \mathrm{H}, \mathrm{m}) 4.67(2 \mathrm{H}, \mathrm{s}) 4.00(3 \mathrm{H}, \mathrm{s}) 3.80(3 \mathrm{H}, \mathrm{s}) 2.00(3 \mathrm{H}, \mathrm{s})$
$0.86(9 \mathrm{H}, \mathrm{s}) 0.05(3 \mathrm{H}, \mathrm{s}) .{ }^{13} \mathrm{C}$ NMR ( $\left.125 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 179.9,179.6,156.9,141.9$, $130.8,129.4,129.3,129.3,129.3,128.7,122.5,121.9,61.3,55.6,34.4,26.2,18.8,9.0,-5.1$.

## Cycloaddition from protected akynol 25 to pyrroloenone 32

A solution of oxazole $\mathbf{2 5}(48.0 \mathrm{mg}, 0.0909 \mathrm{mmol})$ and molecular sieves (activated $4 \AA, 200$ mg ) in $\mathrm{CH}_{3} \mathrm{CN}\left(2 \mathrm{~mL}\right.$, stirred over activated $4 \AA$ molecular sieves, distilled over $\mathrm{CaH}_{2}$, and distilled again over $\mathrm{P}_{2} \mathrm{O}_{5}$ ) was stirred at rt for 15 min . MeOTf $(15 \mu \mathrm{~L}, 0.136 \mathrm{mmol})$ was added and the solution was allowed to stir at rt for 15 h . MeOTf $(15 \mu \mathrm{~L}, 0.136 \mathrm{mmol})$ again was added and the solution stirred at rt an addition 15 h . Salt formation was indicated by TLC analysis of reaction mixture, $\mathrm{Rf}=0.0$, and by mass spectroscopy with molecular ion ( $\mathrm{M}+$ ) calculated for $\mathrm{C}_{30} \mathrm{H}_{48} \mathrm{NO}_{4} \mathrm{Si}_{2}$ : 542 , found $m / z=542$. The newly formed oxazolium salt was added to a solution of $\mathrm{BnMe}_{3} \mathrm{~N}^{+} \mathrm{CN}^{-}(35.0 \mathrm{mg}, 0.200 \mathrm{mmol})$ in $\mathrm{CH}_{3} \mathrm{CN}(2 \mathrm{~mL}$, including cannula and flask washings), stirred over activated $4 \AA$ molecular sieves, distilled over $\mathrm{CaH}_{2}$, and distilled again over $\mathrm{P}_{2} \mathrm{O}_{5}$ ) at $0^{\circ} \mathrm{C}$ via cannula dropwise over 5 min . The reaction was stirred at $0{ }^{\circ} \mathrm{C}$ for 10 min then warmed to rt and stirred for 2 h . The orange solution was poured into pH 5.8 buffer $(15 \mathrm{~mL})$ and extracted with $\mathrm{Et}_{2} \mathrm{O}$. The combined organic extracts were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and solvents were removed (aspirator). The orange oil was purified by preparative TLC on silica gel ( $20 \mathrm{~cm} \times 20 \mathrm{~cm} \times 1000 \mu \mathrm{~m}, 20 \% \mathrm{EtOAc} /$ hexanes eluent ) to give $23.0 \mathrm{mg}(47 \%)$ of 32 as a white solid, analytical TLC on silica gel $60 \mathrm{~F} 254,20 \% \mathrm{EtOAc} / \mathrm{hexanes}, \mathrm{Rf}=0.6$. Pure material was obtained by crystallization in hexanes as off-white rods, $\mathrm{mp}=72-74{ }^{\circ} \mathrm{C}$. Molecular ion $(\mathrm{M}+\mathrm{Na})$ calculated for $\mathrm{C}_{30} \mathrm{H}_{47} \mathrm{NNaO}_{4} \mathrm{Si}_{2}$ : 564.2941; found $m / z=564.2939$, error $=0 \mathrm{ppm}$; IR (neat, $\left.\mathrm{cm}^{-1}\right) 1638 ; 500 \mathrm{MHz}{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.48-7.40(3 \mathrm{H}, \mathrm{m})$ $7.38-7.36(2 \mathrm{H}, \mathrm{m}) 5.81(1 \mathrm{H}, \mathrm{s}) 4.86(1 \mathrm{H}, \mathrm{AB}, J=11.2 \mathrm{~Hz}) 4.26(1 \mathrm{H}, \mathrm{AB}, J=11.2 \mathrm{~Hz}) 4.08(3 \mathrm{H}$, s) $3.84(3 \mathrm{H}, \mathrm{s}) 1.86(3 \mathrm{H}, \mathrm{s}) 0.90(9 \mathrm{H}, \mathrm{s}) 0.86(9 \mathrm{H}, \mathrm{s}) 0.05(3 \mathrm{H}, \mathrm{s}) 0.04(3 \mathrm{H}, \mathrm{s})-0.08(3 \mathrm{H}, \mathrm{s})$ $-0.46(3 \mathrm{H}, \mathrm{s}) .{ }^{13} \mathrm{C}$ NMR ( $\left.125 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 179.5,165.9,139.7,130.7,130.5,128.7$, $128.6,128.5,125.3,120.4,116.1,61.7,56.9,56.4,33.9,26.2,25.9,18.7,18.5,7.9,-4.0,-4.1$, $-5.1,-5.2$.

## Preparation of 31 and 3-(hydroxymethyl)-5-methoxy-1,6-dimethyl-2-phenyl-1H-indole-4,7dione (34) from 25

To a solution of oxazole $25(25.0 \mathrm{mg}, 0.0474 \mathrm{mmol})$ in $\mathrm{CH}_{3} \mathrm{CN}(0.6 \mathrm{ml}$, stirred over activated $4 \AA$ molecular sieves, distilled over $\mathrm{CaH}_{2}$, and distilled again over $\mathrm{P}_{2} \mathrm{O}_{5}$ ) and molecular sieves (activated $4 \AA, 150 \mathrm{mg}$ ) was added MeOTf ( $14 \mu \mathrm{~L}, 0.0592 \mathrm{mmol}$ ). The clear solution was allowed to stir at rt 15 h . MeOTf ( $7 \mu \mathrm{~L}, 0.0592 \mathrm{mmol}$ ) was added and the light brown solution was stirred an additional 15 h at rt . The oxazolium salt was transferred to a solution of $B n M e_{3} \mathrm{~N}^{+} \mathrm{CN}^{-}(18.0 \mathrm{mg}, 0.104 \mathrm{mmol})$ in $\mathrm{CH}_{3} \mathrm{CN}(4.5 \mathrm{~mL}$, including cannula and flask washings, stirred over activated $4 \AA$ molecular sieves, distilled over $\mathrm{CaH}_{2}$, and distilled again over $\mathrm{P}_{2} \mathrm{O}_{5}$ ) at $0{ }^{\circ} \mathrm{C}$ via cannula dropwise over 5 minutes. The reaction was stirred at $0{ }^{\circ} \mathrm{C}$ for 10 min then the cooling bath was removed and the light orange solution was stirred at rt for 2 h. The orange solution was poured into pH 5.8 buffer $(15 \mathrm{~mL})$ and extracted with $\mathrm{Et}_{2} \mathrm{O}$. The combined organic extracts were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and solvents were removed (aspirator) to yield a light orange oil. The crude oil from above was dissolved in benzene ( 1.0 mL ) and DDQ ( $22.0 \mathrm{mg}, 0.0948 \mathrm{mmol}$ ) was added in one portion. The dark black solution was stirred at rt for 2 h then poured into $\mathrm{Et}_{2} \mathrm{O}: \mathrm{H}_{2} \mathrm{O}: 1 \mathrm{M} \mathrm{NaOH}(10 \mathrm{~mL}: 10 \mathrm{~mL}: 1 \mathrm{~mL})$ and extracted with $\mathrm{Et}_{2} \mathrm{O}$. The combined organic extracts were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and solvents were removed (aspirator). The orange oil was purified by preparative TLC on silica gel ( $20 \mathrm{~cm} \times 20 \mathrm{~cm} \times$ $1000 \mu \mathrm{~m}, 15 \% \mathrm{EtOAc} / \mathrm{hexanes}$ eluent) to give 16.8 mg of $\mathbf{3 1}$ as an orange oil and 1.7 mg of 34 as an orange solid ( $95 \%$ combined yield), analytical TLC on silica gel $60 \mathrm{~F} 254,15 \% \mathrm{EtOAc} /$ hexanes, $\mathrm{Rf}=0.5$ (silyl ether) and $\mathrm{Rf}=0.2$ (alcohol). For alcohol 34: Pure material was obtained by crystallization in EtOAc/hexanes as orange needles, $\mathrm{mp}=119-121^{\circ} \mathrm{C}$. Molecular ion (M +Na ) calculated for $\mathrm{C}_{18} \mathrm{H}_{17} \mathrm{NNaO}_{4}: 334.1055$; found $m / z=334.1055$, error $=0 \mathrm{ppm}$; IR (neat, $\left.\mathrm{cm}^{-1}\right) 3425 \mathrm{OH}, 1731 \mathrm{C}=\mathrm{O}, 1638 \mathrm{C}=\mathrm{O} ; 500 \mathrm{MHz}{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta$ 7.52-7.46 (3H,
m) 7.31-7.29 $(2 \mathrm{H}, \mathrm{m}) 4.51(2 \mathrm{H}, \mathrm{d}, J=7.1 \mathrm{~Hz}) 4.19(1 \mathrm{H}, \mathrm{t}, J=7.1 \mathrm{~Hz}) 4.03(3 \mathrm{H}, \mathrm{s}) 3.79(3 \mathrm{H}, \mathrm{s})$ $2.02(3 \mathrm{H}, \mathrm{s}) .{ }^{13} \mathrm{C}$ NMR ( $\left.125 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 181.2,179.5,156.6,139.5,130.7,130.2$, 129.9, 129.6, 129.1, 128.6, 124.1, 122.8, 61.4, 56.4, 34.3, 9.2.

## Aminoalcohol (37)

To a solution of the oxazole ( $1.74 \mathrm{~g}, 25.2 \mathrm{mmol}$ ) in 100 mL of anhydrous THF at rt was added $\mathrm{BH}_{3}$-THF ( 1.0 M solution in THF, Aldrich, fresh bottle, $26.5 \mathrm{~mL}, 26.5 \mathrm{mmol}$ ). After stirring at rt for 1 h , the colorless solution was cooled to $-78^{\circ} \mathrm{C}$, and $n \mathrm{BuLi}(1.52 \mathrm{M}$ solution in hexanes, $17.4 \mathrm{~mL}, 26.5 \mathrm{mmol}$ ) was added dropwise over 30 min . The colorless solution was stirred at $-78^{\circ} \mathrm{C}$ for 1.5 h , and then a solution of the aldehyde $\mathbf{3 6}{ }^{5 \mathrm{c}}(9.36 \mathrm{~g}, 25.2 \mathrm{mmol})$ in anhydrous THF ( 75 mL , including cannula and flask washings) was added via cannula dropwise over 30 min . The resulting pale yellow solution was stirred at $-78^{\circ} \mathrm{C}$ for 1.5 h , and then quenched with 200 mL of $5 \% \mathrm{AcOH}$ in EtOH . The cooling bath was removed, and the reaction mixture was allowed to warm to rt . After stirring at rt for 24 h , the colorless solution was concentrated by rotary evaporation, poured into ether, and washed with saturated aqueous $\mathrm{NaHCO}_{3}$. The aqueous layer was extracted with ether, all organic extracts were combined, dried ( $\mathrm{Na}_{2} \mathrm{SO}_{4}$ ), and concentrated by rotary evaporation. The crude material contained a $6: 1 \mathrm{dr}$ ratio, as determined by ${ }^{1} \mathrm{H}$ NMR assay. The residue was purified by flash chromatography on silica gel $(5.5 \times 20 \mathrm{~cm}, 900 \mathrm{~mL}$ of $1: 1$ hexane/ether then 900 mL of $2: 1$ hexane/acetone eluent, 20 mL fractions). Fractions 52-67 gave 9.21 g ( $84 \%$ ) of the alcohol 37 with 12:1 dr (NMR analysis) as a white foam, analytical TLC on silica gel $60 \mathrm{~F} 254,2: 1$ hexane/EtOAc, $\mathrm{Rf}=0.2$. Molecular ion $\left(\mathrm{M}+\mathrm{Na}^{+}\right)$calcd for $\mathrm{C}_{28} \mathrm{H}_{28} \mathrm{~N}_{2} \mathrm{NaO}_{3}: 463.19980$; found (electrospray) $m / z=463.2019$, error $=5 \mathrm{ppm}$; base peak $=243 \mathrm{amu}$; IR (neat, $\mathrm{cm}^{-1}$ ) 3342 , O-H; $1571 ; 400 \mathrm{MHz}$ NMR $\left(\mathrm{CDCl}_{3}, \mathrm{ppm}\right)$, major diastereomer, $\delta 7.62(1 \mathrm{H}, \mathrm{d}, J=0.7 \mathrm{~Hz}) 7.56-7.51(6 \mathrm{H}, \mathrm{m}) 7.30-7.24(6 \mathrm{H}$, m) 7.22-7.16 $(3 \mathrm{H}, \mathrm{m}) 7.07(1 \mathrm{H}, \mathrm{s}) 5.77-5.62(1 \mathrm{H}, \mathrm{m}) 5.16-5.03(2 \mathrm{H}, \mathrm{m}) 4.58(2 \mathrm{H}, \mathrm{d}, J=5.1$ $\mathrm{Hz}) 3.60-3.50(2 \mathrm{H}, \mathrm{m}) 3.36-3.29(1 \mathrm{H}, \mathrm{m}) 2.85(1 \mathrm{H}, \mathrm{dd}, J=9.5,2.9 \mathrm{~Hz}) 2.82-2.50(1 \mathrm{H}, \mathrm{s}) 2.41$ $(1 \mathrm{H}, \mathrm{dd}, J=9.5,6.6 \mathrm{~Hz})$. In addition, signals for the minor $(8 \%)$ diastereomer were resolved at $7.62-7.58(1 \mathrm{H}, \mathrm{m}) 6.99(1 \mathrm{H}, \mathrm{s}), 4.02(1 \mathrm{H}, \mathrm{dd}, J=8.8,3.7 \mathrm{~Hz}) 3.91(1 \mathrm{H}, \mathrm{d}, J=8.8 \mathrm{~Hz}) 3.68-3.65$ $(2 \mathrm{H}, \mathrm{m}) 3.26-3.19(1 \mathrm{H}, \mathrm{s}) 3.18(1 \mathrm{H}, \mathrm{dd}, J=9.5,2.6 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ), major diastereomer, $\delta 164.3,146.4,138.8,134.1,128.6,128.0,126.9,126.6,117.0,71.8,70.9$, 69.3, 69.1, 54.9.

## 2-[(2S,3R)-3-Allyloxymethyl-1-trityl-aziridin-2-yl] oxazole 38 from aminoalcohol 37

To a solution of alcohol $37(9.21 \mathrm{~g}, 20.9 \mathrm{mmol})$ and $\mathrm{Ph}_{3} \mathrm{P}(8.22 \mathrm{~g}, 31.3 \mathrm{mmol})$ in 150 mL of anhydrous THF was added diethyl azodicarboxylate ( $4.8 \mathrm{~mL}, 30.7 \mathrm{mmol}$ ) dropwise over 10 min . The cooling bath was removed and the reaction mixture was allowed to warm to rt. After stirring at rt for 14 h , the yellow solution was concentrated to approximately 10 mL by rotary evaporation and then passed through a $5 \times 10 \mathrm{~cm}^{2}$ plug of silica and the plug was washed with 1:1 hexane/EtOAc. The filtrate was concentrated by rotary evaporation and purified by flash chromatography on silica gel $\left(5 \times 20 \mathrm{~cm}, 2: 1\right.$ hexane $/ \mathrm{Et}_{2} \mathrm{O}$ eluent, $1 \times 300 \mathrm{~mL}$ then 20 mL fractions). Fractions 14-24 were concentrated to yield product. Fractions $25-63$ were concentrated by rotary evaporation and the residue was purified by another flash chromatography on silica gel under the same conditions. Fractions 18-36 were combined with the original 14-24 to give $5.7 \mathrm{~g}(65 \%)$ of $\mathbf{3 8}$ with $>95 \% \mathrm{dr}$ (NMR analysis) as a white foam, analytical TLC on silica gel $60 \mathrm{~F} 254,5: 1$ hexane/EtOAc, $\mathrm{Rf}=0.1$. Molecular ion ( $\mathrm{M}+\mathrm{Na}^{+}$) calcd for $\mathrm{C}_{28} \mathrm{H}_{26} \mathrm{~N}_{2} \mathrm{NaO}_{2}: 445.18920$; found $m / z=445.1880$, error $=3 \mathrm{ppm}$; base peak= 243 amu; IR (neat, $\left.\mathrm{cm}^{-1}\right) 1596 ; 1574 ; 300 \mathrm{MHz} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.66(1 \mathrm{H}, \mathrm{d}, J=0.8 \mathrm{~Hz})$ 7.56-7.48 (6H, m) 7.30-7.17 (9H, m) $7.15(1 \mathrm{H}, \mathrm{d}, J=0.8 \mathrm{~Hz}) 5.71(1 \mathrm{H}$, dddd, $J=17.0,10.4$, $5.5,5.5 \mathrm{~Hz}) 5.14-5.04(2 \mathrm{H}, \mathrm{m}) 4.01(1 \mathrm{H}, \mathrm{dd}, J=10.4,4.9 \mathrm{~Hz}) 3.78(2 \mathrm{H}$, ddd, $J=5.5,1.4,1.4$ $\mathrm{Hz}) 3.72(1 \mathrm{H}, \mathrm{dd}, J=10.4,7.1 \mathrm{~Hz}) 2.56(1 \mathrm{H}, \mathrm{d}, J=6.1 \mathrm{~Hz}) 1.98(1 \mathrm{H}, \mathrm{ddd}, J=7.1,6.0,4.9$ $\mathrm{Hz}) .{ }^{13} \mathrm{C}$ NMR ( $\left.100 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 161.7,143.5,138.6,134.4,129.4,127.7,127.5$, 126.9, 116.9, 75.0, 71.8, 68.1, 38.6, 32.2.

## Allyl ether cleavage from 38; (2S,3R)-2-(oxazol-2-yl)-3-hydroxymethyl-1-tritylaziridine

A solution of zirconocene dichloride (Aldrich, $2.63 \mathrm{~g}, 8.99 \mathrm{mmol}$ ) in 40 mL of anhydrous THF was cooled to $-78^{\circ} \mathrm{C}$, and $n \mathrm{BuLi}(1.56 \mathrm{M}$ solution in hexanes, $11.5 \mathrm{~mL}, 17.9 \mathrm{mmol})$ was added dropwise over 30 min . After the resulting yellow solution was stirred at $-78^{\circ} \mathrm{C}$ for 1 h , a solution of the allyl ether $38(2.48 \mathrm{~g}, 5.87 \mathrm{mmol})$ in anhydrous THF ( 30 mL , including cannula and flask washings) was added dropwise via cannula. The yellow solution was stirred at -78 ${ }^{\circ} \mathrm{C}$ for 5 min , the cooling bath was removed, and the reaction mixture was allowed to warm to rt . After 1 h at rt , the resulting dark brown solution was cooled to $0^{\circ} \mathrm{C}$, and 30 mL of saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ was added. The pale yellow suspension was stirred at rt for 3 h and then filtered through Celite ( $3 \square 5 \mathrm{~cm}$ ) with ether $(200 \mathrm{~mL})$. The filtrate was washed with brine, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, and concentrated by rotary evaporation. The residue was purified by flash chromatography on silica gel ( $5 \square 17 \mathrm{~cm}, 3: 2$ hexane/EtOAc eluent, 20 mL fractions). Fractions $16-46$ gave $2.22 \mathrm{~g}(98 \%)$ of the product as a colorless foam, analytical TLC on silica gel 60, 1:1 hexane/EtOAc, $\mathrm{Rf}=0.3$. Molecular ion $\left(\mathrm{M}+\mathrm{Na}^{+}\right)$calcd for $\mathrm{C}_{25} \mathrm{H}_{22} \mathrm{~N}_{2} \mathrm{NaO}_{2}$ : 405.15790; found $m / z=405.1582$, error $=1 \mathrm{ppm}$; IR (neat, $\mathrm{cm}^{-1}$ ) 3379 , O-H; $1574 ; 300 \mathrm{MHz}$ NMR $\left(\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.67(1 \mathrm{H}, \mathrm{d}, J=0.8 \mathrm{~Hz}) 7.58-7.51(6 \mathrm{H}, \mathrm{m}) 7.34-7.20(9 \mathrm{H}, \mathrm{m}) 7.15(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=$ $0.8 \mathrm{~Hz}) 4.13(1 \mathrm{H}, \mathrm{ddd}, J=12.1,6.3,4.1 \mathrm{~Hz}) 4.01-3.83(2 \mathrm{H}, \mathrm{m}) 2.38(1 \mathrm{H}, \mathrm{d}, J=6.0 \mathrm{~Hz}) 2.02-1.94$ $(1 \mathrm{H}, \mathrm{m}) .{ }^{13} \mathrm{C}$ NMR $\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 162.4,143.6,139.2,129.3,127.8,127.0,127.0$, 74.9, 61.1, 39.4, 31.6.

## (2S,3R)-2-(Oxazol-2-yl)-3-iodomethyl-1-tritylaziridine (12)

A solution of $\mathrm{Ph}_{3} \mathrm{P}(2.28 \mathrm{~g}, 8.7 \mathrm{mmol})$ in 40 mL of anhydrous toluene was cooled to $0{ }^{\circ} \mathrm{C}$, and diethyl azodicarboxylate (Aldrich, $1.3 \mathrm{~mL}, 8.12 \mathrm{mmol}$ ) was added, followed by a solution of the alcohol prepared above ( $2.22 \mathrm{~g}, 5.8 \mathrm{mmol}$ ) in anhydrous toluene ( 40 mL , including cannula and flask washings), followed by $\mathrm{MeI}(0.54 \mathrm{~mL}, 8.7 \mathrm{mmol})$. After stirring the resulting white suspension at $0^{\circ} \mathrm{C}$ for 5 min , the cooling bath was removed, and the reaction mixture was heated at $70^{\circ} \mathrm{C}$ for 2 h . The precipitate gradually dissolved forming a mixture of a pale yellow solution and a few drops of brown oil, which was concentrated by rotary evaporation. The residue was dissolved in 5 mL of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and purified by flash chromatography on silica gel $(4.5 \times 15 \mathrm{~cm}, 5: 1$ hexane/ethyl acetate, 20 mL fractions). Fractions $9-31$ were concentrated by rotary evaporation and purified by another flash chromatography on silica gel ( $4.5 \times 15 \mathrm{~cm}$, 10:1 hexane/ethyl acetate, 20 mL fractions). Fractions $9-22$ gave 2.78 g ( $97 \%, 95 \%$ for 2 steps) of the pure product as a colorless foam, analytical TLC on silica gel 60, 5:1 hexane/ethyl acetate eluent, $\mathrm{Rf}=0.3$. Molecular ion $\left(\mathrm{M}+\mathrm{Na}^{+}\right)$calcd for $\mathrm{C}_{25} \mathrm{H}_{21} \mathrm{IN}_{2} \mathrm{NaO}$ : 515.05990; found $\mathrm{m} / \mathrm{z}=$ 515.0600, error $=0 \mathrm{ppm}$; IR (neat, $\left.\mathrm{cm}^{-1}\right) 1574 ; 300 \mathrm{MHz} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.70(1 \mathrm{H}, \mathrm{d}$, $J=0.8 \mathrm{~Hz}) 7.55-7.48(6 \mathrm{H}, \mathrm{m}) 7.32-7.20(9 \mathrm{H}, \mathrm{m}) 7.19(1 \mathrm{H}, \mathrm{d}, J=0.8 \mathrm{~Hz}) 3.68(1 \mathrm{H}, \mathrm{dd}, J=9.9$, $4.7 \mathrm{~Hz}) 3.55(1 \mathrm{H}, \mathrm{dd}, J=9.9,9.4 \mathrm{~Hz}) 2.60(1 \mathrm{H}, \mathrm{d}, J=6.0 \mathrm{~Hz}) 2.11(1 \mathrm{H}, \mathrm{ddd}, J=9.4,6.0,4.7$ $\mathrm{Hz}) .{ }^{13} \mathrm{C}$ NMR ( $\left.100 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 160.5,143.3,139.0,129.2,127.8,127.8,127.1$, 75.4, 41.5, 34.9, 3.2.

## Preparation of (E)-methyl 3-(2-((2S,3R)-3-(iodomethyl)-1-tritylaziridin-2-yl)oxazol-5-yl)-2-methoxybut-2-enoate (40) from 12

To a solution of diisopropyl amine ( $153 \mu \mathrm{~L}, 1.09 \mathrm{mmol}$ ) in THF $(3 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$ was added $n$ $\mathrm{BuLi}(1.53 \mathrm{M}$ solution in hexanes, $0.69 \mathrm{~mL}, 1.04 \mathrm{mmol})$ dropwise over 5 min . After stirring at $0^{\circ} \mathrm{C}$ for 30 min , theLDA solution was transferred via cannula dropwise over 20 min to a stirred solution of oxazole $12(0.466 \mathrm{~g}, 0.946 \mathrm{mmol})$ and TMEDA ( $1.43 \mathrm{~mL}, 9.46 \mathrm{mmol}$, distilled over solid Na ) in THF ( 3 mL ) at $-78^{\circ} \mathrm{C}$. After stirring the resulting yellow solution at $-78^{\circ}$ C for $1 \mathrm{~h}, \mathrm{ZnCl}_{2}(1.5 \mathrm{M}$ in THF, $2.52 \mathrm{~mL}, 3.78 \mathrm{mmol})$ was added dropwise then the cooling bath was removed and the organozinc solution was allowed to warm to rt.

In a separate flask, $\mathrm{Pd}_{2} \mathrm{dba}_{3}(87.0 \mathrm{mg}, 0.0946 \mathrm{mmol})$ and $\mathrm{PPh}_{3}(99.0 \mathrm{mg}, 0.378 \mathrm{mmol})$ was dissolved in THF $(2.5 \mathrm{~mL})$ and stirred at rt 25 min . Triflate $\mathbf{1 4}(305 \mathrm{mg}, 1.10 \mathrm{mmol}$ of a $>95: 5$
ratio of $E / Z-14)$ in THF ( 2.5 mL ) was added dropwise and the resulting green solution was stirred at rt for 25 min . The previously made organozinc was added via cannula dropwise over 5 min . After stirring at rt for 15 h , the solution was poured into saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}(20$ $\mathrm{mL})$ and extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 40 \mathrm{~mL})$. The combined organic extracts were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and solvents were removed (aspirator). The yellow oil was purified by flash column chromatography on silica gel ( $40 \mathrm{~mm} \times 16 \mathrm{~cm}, 5: 1$ hexanes/EtOAc, 30 mL fractions) to yield $0.408 \mathrm{~g}(70 \%)$ of ester 40 as a colorless solid, analytical TLC on silica gel 60 F 254 , $5: 1 \mathrm{EtOAc} /$ hexanes, $\mathrm{Rf}=0.3$. Pure material was obtained by crystallization in $\mathrm{EtOAc} / \mathrm{hexanes}$ as clear rods, $\mathrm{mp}=125-127^{\circ} \mathrm{C}$. Molecular ion $(\mathrm{M}+\mathrm{Na})$ calculated for $\mathrm{C}_{31} \mathrm{H}_{29} \mathrm{IN}_{2} \mathrm{NaO}_{4}$ : 643.1070; found $m / z=643.1077$, error $=1 \mathrm{ppm}$; IR (neat, $\mathrm{cm}^{-1}$ ) $1729 \mathrm{C}=\mathrm{O} ; 400 \mathrm{MHz}{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.50-7.49(6 \mathrm{H}, \mathrm{m}) 7.30-7.21(9 \mathrm{H}, \mathrm{m}) 7.10(1 \mathrm{H}, \mathrm{s}) 3.75(3 \mathrm{H}, \mathrm{s}) 3.69(3 \mathrm{H}$, s) $3.70-3.66(1 \mathrm{H}, \mathrm{m}) 3.53(1 \mathrm{H}, \mathrm{dd}, J=9.9 \mathrm{~Hz}, 9.2 \mathrm{~Hz}) 2.53(1 \mathrm{H}, \mathrm{d}, J=5.9 \mathrm{~Hz}) 2.13-2.07(1 \mathrm{H}, \mathrm{m})$ $2.07(3 \mathrm{H}, \mathrm{s}) .{ }^{13} \mathrm{C}$ NMR ( $\left.125 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 165.0,160.0,149.7,144.6,143.5,129.5$, 128.0, 127.4, 126.2, 112.9, 75.6, 58.6, 52.6, 41.9, 35.3, 13.8, 3.3.

## (E)-3-(2-((2S,3R)-3-(lodomethyl)-1-tritylaziridin-2-yl)oxazol-5-yl)-2-methoxybut-2-enal (11)

To a solution of ester $40(0.958 \mathrm{~g}, 1.54 \mathrm{mmol})$ in toluene $(25 \mathrm{~mL})$ at $-78^{\circ} \mathrm{C}$ was added DIBALH ( $20 \%$ wt solution, $4.8 \mathrm{~mL}, 5.79 \mathrm{mmol}$ ) dropwise. After stirring the resulting yellow solution for 2 h at $-78^{\circ} \mathrm{C}$, the cooling bath was removed and 25 mL of $\mathrm{Et}_{2} \mathrm{O}$ was added followed by 25 mL of saturated aqueous sodium potassium tartrate (Rochelle's Salt). The mixture was vigorously stirred for 1 h , then the mixture was extracted with $\mathrm{Et}_{2} \mathrm{O}$. The combined organic extracts were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and solvents were removed (aspirator) to give 0.719 g $(79 \%)$ of 41 as a white foam that was sufficiently pure for the next reaction without further purification, analytical TLC on silica gel $60 \mathrm{~F} 254,30 \% \mathrm{EtOAc} /$ hexanes, $\mathrm{Rf}=0.2$. A solution of the alcohol from above $(185 \mathrm{mg}, 0.312 \mathrm{mmol}), N$-methyl morpholine $N$-oxide ( 77.0 mg , 0.655 mmol ), and molecular sieves (activated powder, $4 \AA, 360 \mathrm{mg}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{~mL})$ was stirred at rt . After stirring at $\mathrm{rt} 30 \mathrm{~min}, \operatorname{TPAP}(22.0 \mathrm{mg}, 0.0624 \mathrm{mmol})$ was added in one portion. After stirring at rt 1 h , the black solution was filtered through a silica gel plug eluting with 150 mL of a 1:1 acetone/hexanes solution. Solvents were removed (aspirator) and the light yellow solid was purified by flash column chromatography on silica gel ( $30 \mathrm{~mm} \times 15 \mathrm{~cm}, 2: 1$ hexanes/ $\mathrm{Et}_{2} \mathrm{O}, 20 \mathrm{~mL}$ fractions) to yield $0.150 \mathrm{~g}(82 \%)$ of aldehyde 11 as a light yellow foam, analytical TLC on silica gel $60 \mathrm{~F} 254,2: 1$ hexanes/ $\mathrm{Et}_{2} \mathrm{O}, \mathrm{Rf}=0.3$. Molecular ion $(\mathrm{M}+\mathrm{Na})$ calculated for $\mathrm{C}_{30} \mathrm{H}_{27} \mathrm{IN}_{2} \mathrm{NaO}_{3}$ : 613.0964; found $m / z=613.0959$, error $=1 \mathrm{ppm}$; IR (neat, $\mathrm{cm}^{-1}$ ) $1673 \mathrm{C}=\mathrm{O}$; $500 \mathrm{MHz}{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 9.99(1 \mathrm{H}, \mathrm{s}) 7.53-7.51(6 \mathrm{H}, \mathrm{m}) 7.30-7.27(6 \mathrm{H}, \mathrm{m}) 7.27$ $(1 \mathrm{H}, \mathrm{s}) 7.25-7.22(3 \mathrm{H}, \mathrm{m}) 3.80(3 \mathrm{H}, \mathrm{s}) 3.68(1 \mathrm{H}, \mathrm{dd}, J=9.8 \mathrm{~Hz}, 4.4 \mathrm{~Hz}) 3.50(1 \mathrm{H}, \mathrm{dd}, J=9.8 \mathrm{~Hz}$, $9.8 \mathrm{~Hz}) 2.57(1 \mathrm{H}, \mathrm{d}, J=5.9 \mathrm{~Hz}) 2.24(3 \mathrm{H}, \mathrm{s}) 2.19-2.15(1 \mathrm{H}, \mathrm{m}) .{ }^{13} \mathrm{C}$ NMR $\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right.$, ppm) $\delta 187.0,162.4,152.2,148.6,143.3,130.2,129.5,129.4,128.1,127.4,75.7,60.1,42.0$, 35.1, 15.3, 3.2.

## (E)-7-(tert-Butyldimethylsilyloxy)-2-(2-((2S,3R)-3-(iodomethyl)-1-tritylaziridin-2-yl)oxazol-5-yl)-3-methoxyhept-2-en-5-yn-4-one (43)

To a solution of tert-butyldimethylsilyl propargyl ether ${ }^{32}(213 \mathrm{mg}, 1.25 \mathrm{mmol})$ in THF ( 8 mL ) at $-78^{\circ} \mathrm{C}$ was added $n-\mathrm{BuLi}(1.53 \mathrm{M}$ solution in hexanes, $0.82 \mathrm{~mL}, 1.25 \mathrm{mmol})$ dropwise over 5 min . The clear solution was stirred for 1 h at $-78^{\circ} \mathrm{C}$, then a solution of aldehyde $\mathbf{1 1}$ ( 370 $\mathrm{mg}, 0.627 \mathrm{mmol}$ ) in THF ( 5 mL including flask and cannula washings) was added via cannula dropwise over 5 min . The resulting yellow solution was warmed to $-42^{\circ} \mathrm{C}$ and stirred for 2 h at $-42^{\circ} \mathrm{C}$. The cooling bath was then removed and 10 mL of saturated aqueous sodium bicarbonate was added. After stirring at rt 10 min , the solution was poured into $\mathrm{H}_{2} \mathrm{O}$ and extracted with $\mathrm{Et}_{2} \mathrm{O}$. The combined organic extracts were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and solvents were removed (aspirator).

The crude alcohol 42 from above, $N$-methyl morpholine $N$-oxide ( $154 \mathrm{mg}, 1.32 \mathrm{mmol}$ ), and molecular sieves (activated powder, $4 \AA, 1.40 \mathrm{~g}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(13 \mathrm{~mL})$ was stirred at rt for 30 $\min$. TPAP $(44.0 \mathrm{mg}, 0.125 \mathrm{mmol})$ was then added in one portion and the black solution was stirred at rt 1 h . The black solution was then filtered through a silica gel plug eluting with 100 mL of a 1:1 acetone/hexanes solution. Solvents were removed (aspirator) and the light yellow solid was purified by flash column chromatography on silica gel $(40 \mathrm{~mm} \times 17 \mathrm{~cm}, 20 \% \mathrm{EtOAc} /$ hexanes, 25 mL fractions) to yield 0.335 g ( $70 \%$ ) of ketone $\mathbf{4 3}$ as a light yellow foam, analytical TLC on silica gel $60 \mathrm{~F} 254,20 \% \mathrm{EtOAc} / \mathrm{hexanes}, \mathrm{Rf}=0.4$. ## Cycloaddition from ketone 43; isolation of 45

To a nitrogen flushed dry NMR tube was added AgOTf• $1 / 2$ benzene ${ }^{24}$ ( $10.0 \mathrm{mg}, 0.0343 \mathrm{mmol}$ ) and $\mathrm{C}_{6} \mathrm{D}_{6}(0.25 \mathrm{~mL})$ and then ketone $43(20.0 \mathrm{mg}, 0.0264 \mathrm{mmol})$ in $\mathrm{C}_{6} \mathrm{D}_{6}(0.2 \mathrm{~mL}$ including cannula and flask washings) via cannula and set in the dark. After $135 \mathrm{~min},{ }^{1} \mathrm{H}$ NMR showed no starting oxazole 43 and oxazolium salt formation was indicated by characteristic changes in the chemical shift of the oxazole hydrogen from $\delta=7.67 \mathrm{ppm}\left(\mathrm{C}_{6} \mathrm{D}_{6}\right)$ to $8.55 \mathrm{ppm}\left(\mathrm{C}_{6} \mathrm{D}_{6}\right)$, and this solution was transferred via syringe equipped with a syringe filter to a solution of $\mathrm{BnMe}_{3} \mathrm{~N}^{+} \mathrm{CN}^{-}(19.0 \mathrm{mg}, 0.106 \mathrm{mmol})$ in freshly distilled $\mathrm{CH}_{3} \mathrm{CN}(1.0 \mathrm{~mL}$ including NMR tube washings, stirred over activated $4 \AA$ molecular sieves, distilled over $\mathrm{CaH}_{2}$, and distilled again over $\mathrm{P}_{2} \mathrm{O}_{5}$ ) at rt over 5 min . The dark orange solution was stirred at rt for 2 h , then poured into $\mathrm{H}_{2} \mathrm{O}$ :brine and extracted with $\mathrm{Et}_{2} \mathrm{O}$. The combined organic extracts were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and solvents were removed (aspirator). The orange oil was purified by preparative TLC on silica gel ( $20 \mathrm{~cm} \times 20 \mathrm{~cm} \times 1000 \mu \mathrm{~m}$ pretreated with $\mathrm{NEt}_{3}$ vapor for 30 min , 5:1 hexanes/EtOAc with $2 \% \mathrm{NEt}_{3}$ eluent) to give 5.4 mg ( $33 \%$ ) of tetracycle 45 as an orange oil, analytical TLC on silica gel $60 \mathrm{~F} 254,40 \% \mathrm{EtOAc} /$ hexanes, $\mathrm{Rf}=0.7$; $[\alpha]_{\mathrm{D}}{ }^{23}-12.5$ (c 0.04, EtOAc). Molecular ion $(\mathrm{M}+\mathrm{Na})$ calculated for $\mathrm{C}_{39} \mathrm{H}_{42} \mathrm{~N}_{2} \mathrm{NaO}_{4} \mathrm{Si}$ : 653.2812; found $\mathrm{m} / \mathrm{z}=$ 653.2808, error $=1 \mathrm{ppm}$; IR (neat, $\left.\mathrm{cm}^{-1}\right) 1657 \mathrm{C}=\mathrm{O}, 1642 \mathrm{C}=\mathrm{O}$; UV $\left(\mathrm{CH}_{3} \mathrm{OH}, \mathrm{nm}\right) 286(\varepsilon$ 1100) $350(\varepsilon 600) 433(\varepsilon 450) .500 \mathrm{MHz}^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.45-7.44(6 \mathrm{H}, \mathrm{m}) 7.31-7.22$ $(9 \mathrm{H}, \mathrm{m}) 5.14(1 \mathrm{H}, \mathrm{AB}, J=14.2 \mathrm{~Hz}) 4.92(1 \mathrm{H}, \mathrm{AB}, J=14.2 \mathrm{~Hz}) 4.55(1 \mathrm{H}, \mathrm{d}, J=13.8 \mathrm{~Hz}) 4.10$ $(1 \mathrm{H}, \mathrm{dd}, J=13.8 \mathrm{~Hz}, 3.9 \mathrm{~Hz}) 4.00(3 \mathrm{H}, \mathrm{s}) 3.03(1 \mathrm{H}, \mathrm{d}, J=4.9 \mathrm{~Hz}) 2.89(1 \mathrm{H}, \mathrm{dd}, J=4.9 \mathrm{~Hz}, 3.9$ $\mathrm{Hz}) 1.97(3 \mathrm{H}, \mathrm{s}) 0.81(9 \mathrm{H}, \mathrm{s}) 0.01(3 \mathrm{H}, \mathrm{s})-0.05(3 \mathrm{H}, \mathrm{s}) .{ }^{13} \mathrm{C} \mathrm{NMR}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right)$ $\delta 179.9,179.0,157.4,141.7,129.4,128.4,128.1,128.0,127.3,127.2,123.0,120.3,74.4,61.4$, $58.9,50.2,41.9,35.4,26.3,18.7,8.7,-5.2,-5.2$.

## 5-((E)-4,7-Bis(tert-butyldimethylsilyloxy)-3-methoxyhept-2-en-5-yn-2-yl)-2-((2S,3R)-3-(iodomethyl)-1-tritylaziridin-2-yl)oxazole (46)

To a solution of tert-butyldimethylsilyl propargyl ether ${ }^{32}$ ( $251 \mathrm{mg}, 1.47 \mathrm{mmol}$ ) in THF ( 10 $\mathrm{mL})$ at $-78^{\circ} \mathrm{C}$ was added $n-\mathrm{BuLi}(1.47 \mathrm{M}$ solution in hexanes, $1.0 \mathrm{~mL}, 1.47 \mathrm{mmol})$ dropwise over 5 min . After stirring the clear solution for 1 h at $-78^{\circ} \mathrm{C}$, a solution of aldehyde $\mathbf{1 1}$ (435 $\mathrm{mg}, 0.737 \mathrm{mmol}$ ) in THF ( 5 mL including cannula washings) was added via cannula dropwise over 5 min . The resulting yellow solution was warmed to $-42^{\circ} \mathrm{C}$ and stirred for 2 h . The cooling bath was then removed and 10 mL of saturated aqueous sodium bicarbonate was added and stirred at rt 10 min . The resulting light yellow solution was poured into brine and extracted with $\mathrm{Et}_{2} \mathrm{O}$. The combined organic extracts were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and solvents were removed (aspirator). The crude alcohol from above was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( 15 mL ) and tert-butyldimethylsilyl chloride ( $222 \mathrm{mg}, 1.47 \mathrm{mmol}$ ) was added followed by imidazole ( 125
$\mathrm{mg}, 1.84 \mathrm{mmol})$. After stirring for 15 h at rt , the reaction was poured into $\mathrm{H}_{2} \mathrm{O}(20 \mathrm{~mL})$ and extracted wth $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 30 \mathrm{~mL})$. The combined organic extracts were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and solvents were removed (aspirator). The clear oil was purified by flash column chromatography on silica gel ( $50 \mathrm{~mm} \times 16 \mathrm{~cm}, 10 \% \mathrm{EtOAc} /$ hexanes, 40 mL fractions) to yield $0.500 \mathrm{~g}(78 \%)$ of oxazole 46 as an inseparable $1: 1$ mixture of diastereomers as a white foam, analytical TLC on silica gel $60 \mathrm{~F} 254,10 \% \mathrm{EtOAc} /$ hexanes, $\mathrm{Rf}=0.2$. ## Cyanide adduct 50 via azomethine ylide generation from 46

To a solution of AgOTf $\cdot 1 / 2$ benzene ${ }^{24}(8.0 \mathrm{mg}, 0.026 \mathrm{mmol})$ in $\mathrm{C}_{6} \mathrm{D}_{6}(0.2 \mathrm{~mL})$ in a dry, nitrogen flushed NMR tube was added a solution of oxazole 46 ( $24 \mathrm{mg}, 0.027 \mathrm{mmol}$ ) in $\mathrm{C}_{6} \mathrm{D}_{6}$ ( 0.4 mL including cannula and flask washings) via cannula. After sitting in the dark for 3.5 h at $\mathrm{rt},{ }^{1} \mathrm{H}$ NMR showed no starting oxazole 46 and oxazolium salt formation was indicated by characteristic changes in the chemical shift of the oxazole hydrogens from $\delta=7.01 \mathrm{ppm}$ and $6.99 \mathrm{ppm}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right)$ to 7.77 ppm and $7.73 \mathrm{ppm}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right)$, and the brown solution was transferred via syringe equipped with a syringe filter to a solution of $\mathrm{BnMe}_{3} \mathrm{~N}^{+} \mathrm{CN}^{-}(19 \mathrm{mg}$, $0.11 \mathrm{mmol})$ in freshly distilled $\mathrm{CH}_{3} \mathrm{CN}(1.0 \mathrm{~mL}$ including NMR tube washings, stirred over activated $4 \AA$ molecular sieves, distilled over $\mathrm{CaH}_{2}$, and distilled again over $\mathrm{P}_{2} \mathrm{O}_{5}$ ) at $0{ }^{\circ} \mathrm{C}$ over 5 min . After stirring the orange solution at $0^{\circ} \mathrm{C}$ for 30 min the reaction was warmed to rt over 10 minutes and stirred for an additional 30 min . The dark solution was poured into $\mathrm{H}_{2} \mathrm{O}$ :brine and extracted with EtOAc. The combined organic extracts were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and solvents were removed (aspirator). The brown oil was purified by preparative TLC on silica gel $\left(20 \mathrm{~cm} \times 20 \mathrm{~cm} \times 1000 \mu \mathrm{~m}\right.$ pretreated with $\mathrm{NEt}_{3}$ vapor for $30 \mathrm{~min}, 5: 1$ hexanes/EtOAc with $2 \% \mathrm{NEt}_{3}$ eluent) to give $6.9 \mathrm{mg}(33 \%)$ of tetracycle $\mathbf{5 0}$ as a white solid in a 3:2 mixture ( ${ }^{1} \mathrm{H}$ NMR analysis) of inseparable diastereomers, analytical TLC on silica gel 60 F254 pretreated with $\mathrm{NEt}_{3}$ vapor, $5: 1$ hexanes/EtOAc with $2 \% \mathrm{NEt}_{3}, \mathrm{Rf}=0.6$. Molecular ion (M +Na ) calculated for $\mathrm{C}_{46} \mathrm{H}_{59} \mathrm{~N}_{3} \mathrm{NaO}_{4} \mathrm{Si}_{2}$ : 796.3942; found $m / z=796.3962$, error $=3 \mathrm{ppm}$; IR (neat, $\left.\mathrm{cm}^{-1}\right) 1659 \mathrm{C}=\mathrm{O} ; 500 \mathrm{MHz}{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, \mathrm{ppm}\right)$ overlapping diastereomer signals given as a sum of individual isomer values, $\delta 7.48-7.44(10 \mathrm{H}, \mathrm{m}) 7.30-7.21(15 \mathrm{H}, \mathrm{m}) 5.36(1 \mathrm{H}$, s) $5.36(0.6 \mathrm{H}$, s) $4.77(1 \mathrm{H}, \mathrm{AB}, J=12.0 \mathrm{~Hz}) 4.74(0.6 \mathrm{H}, \mathrm{AB}, J=12.5 \mathrm{~Hz}) 4.68(0.6 \mathrm{H}, \mathrm{AB}, J=12.5$ $\mathrm{Hz}) 4.64(1 \mathrm{H}, \mathrm{AB}, J=12.0 \mathrm{~Hz}) 4.63(0.6 \mathrm{H}, \mathrm{d}, J=13.2 \mathrm{~Hz}) 4.56(1 \mathrm{H}, \mathrm{d}, J=13.2 \mathrm{~Hz}) 4.18-4.13$ $(1.6 \mathrm{H}, \mathrm{m}) 3.59(3 \mathrm{H}$, s) $3.57(2 \mathrm{H}$, s) $3.30(0.6 \mathrm{H}, \mathrm{q}, J=7.1 \mathrm{~Hz}) 3.26(1 \mathrm{H}, \mathrm{q}, J=6.8 \mathrm{~Hz}) 2.91-2.88$ $(2.6 \mathrm{H}, \mathrm{m}) 2.81(0.6 \mathrm{H}, \mathrm{d}, J=4.9 \mathrm{~Hz}) 1.44(3 \mathrm{H}, \mathrm{d}, J=6.8 \mathrm{~Hz}) 1.42(2 \mathrm{H}, \mathrm{d}, J=7.1 \mathrm{~Hz}) 0.89(6 \mathrm{H}, \mathrm{s})$ $0.86(9 \mathrm{H}, \mathrm{s}) 0.84(6 \mathrm{H}, \mathrm{s}) 0.80(9 \mathrm{H}, \mathrm{s}) 0.25(1.8 \mathrm{H}, \mathrm{s}) 0.17(3 \mathrm{H}, \mathrm{s}) 0.06(1.8 \mathrm{H}, \mathrm{s}) 0.05(3 \mathrm{H}, \mathrm{s})$ $-0.01(1.8 \mathrm{H}, \mathrm{s})-0.05(1.8 \mathrm{H}, \mathrm{s})-0.06(3 \mathrm{H}, \mathrm{s})-0.16(3 \mathrm{H}, \mathrm{s}) .{ }^{13} \mathrm{C} \mathrm{NMR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right)$ $\delta 184.6,184.5,144.1,143.9,132.3,132.3,129.4,129.3,128.0,127.3,127.3,123.8,123.3$, $117.1,117.0,116.3,116.3,83.9,83.8,77.4,74.5,74.2,63.0,62.7,57.5,56.9,53.1,50.8,50.6$, $45.1,45.0,43.1,41.9,35.1,34.7,29.9,29.9,26.2,26.1,25.7,25.7,18.5,18.4,8.9,8.8,-4.2$, $-4.3,-4.7,-4.8,-5.0,-5.1,-5.2,-5.4$.

## NCS oxidation of 50 to indoloquinone 45

To a solution of AgOTf $\cdot 1 / 2$ benzene ${ }^{24}(23.0 \mathrm{mg}, 0.0778 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.25 \mathrm{~mL})$ in a dry, nitrogen flushed NMR tube was added a solution of oxazole 46 ( $34.0 \mathrm{mg}, 0.0389 \mathrm{mmol}$ ) in $\mathrm{CD}_{2} \mathrm{Cl}_{2}$ ( 0.45 mL including cannula and flask washings) via cannula. After 1 h at rt , shielded from light, ${ }^{1} \mathrm{H}$ NMR showed no starting oxazole 46 and the brown solution was transferred via syringe equipped with a syringe filter to a solution of $\mathrm{BnMe}_{3} \mathrm{~N}^{+} \mathrm{CN}^{-}(27.0 \mathrm{mg}, 0.156 \mathrm{mmol})$ in $\mathrm{CD}_{3} \mathrm{CN}$ ( 2.0 mL including NMR tube washings) at $0^{\circ} \mathrm{C}$ over 5 min . The orange solution was warmed to rt over 5 min then stirred an addition 1 h at rt . The dark solution was poured into $\mathrm{H}_{2} \mathrm{O}$ :brine ( $20 \mathrm{~mL}, 1: 1 \mathrm{v}: \mathrm{v}$ ) and extracted with $\mathrm{EtOAc}(3 \times 15 \mathrm{~mL})$. The combined organic extracts were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and solvents were removed (aspirator). To the crude product obtained above in THF $(0.6 \mathrm{~mL})$ at $-78^{\circ} \mathrm{C}$ was added KHMDS $(0.30 \mathrm{~mL}$ of a 0.258 M solution in THF, 0.0778 mmol ) and stirred at $-78^{\circ} \mathrm{C}$ for 30 min . NCS $(0.34 \mathrm{~mL}$ of a 0.232 M solution in THF, 0.0778 mmol ) was added and stirred an additional 25 min at $-78^{\circ} \mathrm{C}$. After warming to rt over 15 min , the orange solution was poured into $\mathrm{H}_{2} \mathrm{O}$ and extracted with EtOAc . The combined organic extracts were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and solvents were removed. The orange oil was purified by preparative TLC on silica gel $(20 \mathrm{~cm} \times 20 \mathrm{~cm} \times 1000 \mu \mathrm{~m}$ pretreated with $\mathrm{NEt}_{3}$ vapor for 30 min , 5:1 hexanes/EtOAc with $2 \% \mathrm{NEt}_{3}$ eluent) to give 4.1 mg ( $17 \%$ over 2 steps) of tetracycle $\mathbf{4 5}$ as an orange oil identical to the material described above by ${ }^{1} \mathrm{H}$ NMR.

## Azomethine ylide cycloaddition from bis-TBS protected diol 46; isolation of 54 and 55 and detection of 53

To a solution of AgOTf $\cdot 1 / 2$ benzene ${ }^{24}(13.5 \mathrm{mg}, 0.0457 \mathrm{mmol})$ in $\mathrm{CD}_{2} \mathrm{Cl}_{2}(0.2 \mathrm{~mL})$ in a dry, nitrogen flushed NMR tube was added a solution of oxazole $46(40.0 \mathrm{mg}, 0.0457 \mathrm{mmol})$ in $\mathrm{CD}_{2} \mathrm{Cl}_{2}$ ( 0.4 mL including cannula and flask washings) via cannula. After sitting in the dark for 1 h at $\mathrm{rt},{ }^{1} \mathrm{H}$ NMR showed no starting oxazole 46 and oxazolium salt formation was indicated by characteristic changes in the chemical shift of the oxazole hydrogens from $\delta=7.01 \mathrm{ppm}$ and $6.99 \mathrm{ppm}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right)$ to 7.77 ppm and $7.73 \mathrm{ppm}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right)$, and this solution was transferred via syringe equipped with a syringe filter to a solution of $\mathrm{BnMe}_{3} \mathrm{~N}^{+} \mathrm{CN}^{-}(8.0 \mathrm{mg}, 0.0457 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}\left(2.0 \mathrm{~mL}\right.$ including NMR tube washings) at $0^{\circ} \mathrm{C}$ over 5 min . After stirring the orange solution at $0^{\circ} \mathrm{C}$ for $1 \mathrm{~h}, \mathrm{H}_{2} \mathrm{O}(2 \mathrm{~mL})$ was added and the solution was poured into $\mathrm{H}_{2} \mathrm{O}$ and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The combined organic extracts were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and solvents were removed (aspirator) to yield crude 53 as a 1:1 ratio of diastereomers. In preparative work, this mixture was used without further purification to minimize decomposition, but chromatography allowed isolation of small amounts of partially purified material for spectroscopy. Preparative TLC on silica gel 60 F254, 5:1 hexanes/EtOAc $2 \%$ $\mathrm{NEt}_{3}, \mathrm{Rf}=0.4\left(20 \mathrm{~cm} \times 20 \mathrm{~cm} \times 1000 \mu \mathrm{~m}, 5: 1\right.$ hexanes/EtOAc $2 \% \mathrm{NEt}_{3}$ eluent) gave the less polar diastereomer of 53; ESMS molecular ion ( $\mathrm{M}+\mathrm{Na}$ ) calculated for $\mathrm{C}_{46} \mathrm{H}_{59} \mathrm{~N}_{3} \mathrm{NaO}_{4} \mathrm{Si}_{2}$ : 796.4; found $m / z=796.4$; partial $500 \mathrm{MHz}{ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.41-7.40(6 \mathrm{H}, \mathrm{m})$ and 7.31-7.20 $(9 \mathrm{H}, \mathrm{m})$ for the $N-\mathrm{Tr}$ group, $5.77(1 \mathrm{H}, \mathrm{s})$ for the CH -OTBS hydrogen, $4.60(1 \mathrm{H}, \mathrm{dd}$, $J=14.6 \mathrm{~Hz}, 2.0 \mathrm{~Hz})$ and $4.48(1 \mathrm{H}, \mathrm{dd}, J=14.6 \mathrm{~Hz}, 2.7 \mathrm{~Hz})$ for the $\mathrm{CH}_{2} \mathrm{OTBS}$ hydrogens, 3.98 $(3 \mathrm{H}, \mathrm{s})$ for the $\mathrm{OCH}_{3}$ hydrogens, $3.60(1 \mathrm{H}, \mathrm{d}, J=13.4 \mathrm{~Hz})$ and $3.49(1 \mathrm{H}, \mathrm{dd}, J=13.4 \mathrm{~Hz}, 2.2$
$\mathrm{Hz})$ for the $\mathrm{N}-\mathrm{CH}_{2}-\mathrm{CHNTr}$ hydrogens, $2.59(1 \mathrm{H}, \mathrm{d}, J=4.6 \mathrm{~Hz})$ and $2.15(1 \mathrm{H}, \mathrm{dd}, J=4.6 \mathrm{~Hz}, 2.2$ $\mathrm{Hz})$ for the aziridine hydrogens, $1.79(3 \mathrm{H}, \mathrm{s})$ for the $\mathrm{C}-6 \mathrm{CH}_{3}$ hydrogens. ${ }^{13} \mathrm{C}$ NMR $(125 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 117.4$ for the CN . For the more polar diastereomer, $\mathrm{Rf}=0.2$, partial purification by preparative TLC on buffered silica gel as above gave peaks in the $500 \mathrm{MHz}{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.59-7.57(6 \mathrm{H}, \mathrm{m})$ and $7.31-7.19(9 \mathrm{H}, \mathrm{m})$ for the $N-\mathrm{Tr}$ group, $5.31(1 \mathrm{H}, \mathrm{s})$ for the CH-OTBS hydrogen, $4.50(1 \mathrm{H}, \mathrm{d}, J=13.2 \mathrm{~Hz})$ and $4.38(1 \mathrm{H}, \mathrm{dd}, J=13.2 \mathrm{~Hz}, 2.2 \mathrm{~Hz})$ for the $\mathrm{CH}_{2} \mathrm{OTBS}$ hydrogens, $3.92(3 \mathrm{H}, \mathrm{s})$ for the $\mathrm{OCH}_{3}$ hydrogens, $2.79(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=5.4 \mathrm{~Hz})$ and 2.35 $(1 \mathrm{H}, \mathrm{dd}, J=5.4 \mathrm{~Hz}, 3.4 \mathrm{~Hz})$ for the aziridine hydrogens, $1.70\left(3 \mathrm{H}\right.$, s) for the $\mathrm{C}-6 \mathrm{CH}_{3}$ hydrogens. If the chromatography was attempted without $\mathrm{NEt}_{3}$ buffer in the eluent, then increased decomposition was observed, tentatively to give ca. $10 \%$ conversion to 49 according to ESMS
data $(m / z=747 \mathrm{amu} ; 49+\mathrm{H})$ and proton chemical shifts of $\delta 5.06$ (s, CH adjacent to OTBS), $4.83(\mathrm{AB} \mathrm{q}, J=11.9 \mathrm{~Hz})$ and $4.69(\mathrm{AB} \mathrm{q}, J=11.9 \mathrm{~Hz}$ for methylene adjacent to OTBS), 4.09 (s, $\mathrm{OMe}), 2.87(\mathrm{~d}, J=4.9 \mathrm{~Hz})$ and $2.83(\mathrm{dd}, J=4.9 \mathrm{~Hz}, 3.6 \mathrm{~Hz})$ for the aziridine protons, and 1.84 ( $\mathrm{s}, \mathrm{Me}$ ). For preparative purposes, $\mathrm{NEt}_{3}(0.16 \mathrm{~mL}, 1.14 \mathrm{mmol})$ was added to the crude cycloadduct from above in $\mathrm{CH}_{3} \mathrm{CN}(7 \mathrm{~mL})$ and the mixture was placed under an atmosphere of $\mathrm{O}_{2}$ (balloon). The reaction was stirred at rt 10 min and $\mathrm{HF}-\mathrm{pyr}(0.18 \mathrm{~mL}$ of a 3.9 M solution in $\mathrm{CH}_{3} \mathrm{CN}, 0.702 \mathrm{mmol}$ ) was then added. After stirring at rt 16 h under $\mathrm{O}_{2}$, the dark red solution was poured into $\mathrm{NaHCO}_{3}(20 \mathrm{~mL})$ and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 20 \mathrm{~mL})$. The combined organic extracts were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and solvents were removed (aspirator). The red oil was purified by preparative TLC on silica gel ( $20 \mathrm{~cm} \times 20 \mathrm{~cm} \times 1000 \mu \mathrm{~m}, 50 \% \mathrm{EtOAc} /$ hexanes eluent) to give 3.8 mg ( $16 \%$ ) of alcohol 54 as an orange solid, $5.2 \mathrm{mg}(18 \%)$ of $\mathbf{4 5}$ as an orange oil, and 3.5 mg ( $14 \%$ ) of 55 as a red solid (total of $48 \%$ cylclized material), analytical TLC on silica gel $60 \mathrm{~F} 254,40 \% \mathrm{EtOAc} / \mathrm{hexanes}$, for $54 \mathrm{Rf}=0.4$. Pure 54 obtained by crystallization in EtOAc/hexanes as orange needles, MP $=>200^{\circ} \mathrm{C}$ (decomposes). Molecular ion $\left(\mathrm{M}^{+}\right)$calculated for $\mathrm{C}_{33} \mathrm{H}_{28} \mathrm{~N}_{2} \mathrm{O}_{4}: 516.2049$; found $m / z=516.2051$, error $=0 \mathrm{ppm}$; IR (neat, $\left.\mathrm{cm}^{-1}\right) 3417 \mathrm{OH}, 1640 \mathrm{C}=\mathrm{O}, 1600 \mathrm{C}=\mathrm{O} ; 500 \mathrm{MHz}{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta$ 7.43-7.42 ( 6 H , m) 7.32-7.29 ( $6 \mathrm{H}, \mathrm{m}$ ) $7.27-7.24(3 \mathrm{H}, \mathrm{m}) 4.78(1 \mathrm{H}, \mathrm{dd}, J=13.9 \mathrm{~Hz}, 6.1 \mathrm{~Hz}) 4.61(1 \mathrm{H}, \mathrm{dd}, J=13.9$ $\mathrm{Hz}, 8.1 \mathrm{~Hz}) 4.54(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=13.9 \mathrm{~Hz}) 4.15(1 \mathrm{H}, \mathrm{dd}, 13.9 \mathrm{~Hz}, 3.9 \mathrm{~Hz}) 4.03(3 \mathrm{H}, \mathrm{s}) 3.90(1 \mathrm{H}$, dd, $J=8.1 \mathrm{~Hz}, 6.1 \mathrm{~Hz}) 2.89(1 \mathrm{H}, \mathrm{dd}, 4.9 \mathrm{~Hz}, 3.9 \mathrm{~Hz}) 2.84(1 \mathrm{H}, \mathrm{d}, J=4.9 \mathrm{~Hz}) 1.99(3 \mathrm{H}, \mathrm{s}) .{ }^{13} \mathrm{C}$ NMR $\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 180.9,178.9,157.5,144.1,140.8,129.3,129.1,128.3,128.1,127.5$, $125.0,119.5,74.5,61.5,56.7,50.5,42.6,33.9,8.9$. For 55, analytical TLC on silica gel 60 $\mathrm{F} 254,40 \% \mathrm{EtOAc} /$ hexanes $\mathrm{Rf}=0.2$. Pure 55 was obtained by crystallization in $\mathrm{EtOAc} /$ hexanes as fine red needles, $\mathrm{MP}=165-168^{\circ} \mathrm{C}$ (dec). Molecular ion (M+Na) calculated for $\mathrm{C}_{34} \mathrm{H}_{29} \mathrm{~N}_{3} \mathrm{NaO}_{5}$ : 582.2005; found $\mathrm{m} / \mathrm{z}=582.2007$, error $=0 \mathrm{ppm}$; IR $\left(\right.$ neat, $\left.\mathrm{cm}^{-1}\right) 3415 \mathrm{OH}$, $1650 \mathrm{C}=\mathrm{O}, 1574 \mathrm{C}=\mathrm{O} ; 500 \mathrm{MHz}{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.58-7.57(6 \mathrm{H}, \mathrm{m}) 7.33-7.30(6 \mathrm{H}$, m) 7.27-7.23 (3H, m) $4.65(1 \mathrm{H}, \mathrm{dd}, J=11.7 \mathrm{~Hz}, 2.4 \mathrm{~Hz}) 4.27(1 \mathrm{H}, \mathrm{dd}, J=11.7 \mathrm{~Hz}, 2.4 \mathrm{~Hz}) 4.12$ $(1 \mathrm{H}, \mathrm{d}, J=12.2 \mathrm{~Hz}) 4.05(3 \mathrm{H}, \mathrm{s}) 4.03(1 \mathrm{H}, \mathrm{s}) 3.84(1 \mathrm{H}, \mathrm{dd}, J=11.7 \mathrm{~Hz}, 11.7 \mathrm{~Hz}) 3.66(1 \mathrm{H}, \mathrm{dd}$, $J=12.2 \mathrm{~Hz}, 4.4 \mathrm{~Hz}) 2.96(1 \mathrm{H}, \mathrm{d}, J=5.4 \mathrm{~Hz}) 2.64\left(1 \mathrm{H}\right.$, broad dd, $J$ obsc) $1.89(3 \mathrm{H}, \mathrm{s}) .{ }^{13} \mathrm{C}$ NMR $\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 182.3,179.3,158.3,152.8,143.5,129.6,128.1,127.5,126.0,121.4$, 116.7, 82.8, 75.9, 64.3, 61.8, 52.7, 45.6, 41.1, 8.6.

## Preparation of (1S, 2,S)-9-hydroxymethyl-2,3-dihydro-7-methoxy-6-methyl-1,2-( $N$ -tritylaziridino)-1 H -pyrrolo[1,2-a]indole (54) from 45

To a solution of tetracycle $45(8.0 \mathrm{mg}, 0.013 \mathrm{mmol})$ in $\mathrm{CH}_{3} \mathrm{CN}(0.6 \mathrm{~mL})$ at rt was added $\mathrm{NEt}_{3}(11 \mu \mathrm{~L}, 0.076 \mathrm{mmol})$ dropwise. HF-pyr $\left(10 \mu \mathrm{~L}\right.$ of a 3.9 M solution in $\mathrm{CH}_{3} \mathrm{CN}, 0.039$ mmol ) was added dropwise and stirred at rt for 15 h . The dark orange solution was poured into brine $(20 \mathrm{~mL})$ and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 15 \mathrm{~mL})$. The combined organic extracts were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and solvents were removed (aspirator). The orange oil was was purified by preparative TLC on silica gel ( $20 \mathrm{~cm} \times 20 \mathrm{~cm} \times 1000 \mu \mathrm{~m}$ pretreated with $\mathrm{NEt}_{3}$ vapor for $30 \mathrm{~min}, 30 \% \mathrm{EtOAc} /$ hexanes with $2 \% \mathrm{NEt}_{3}$ eluent) to give $4.9 \mathrm{mg}(75 \%)$ of alcohol 54 as an orange solid identical to the material described above by ${ }^{1} \mathrm{H}$ NMR.

## Carbamoylation of 54 and analytical scale detritylation

To a solution of alcohol $54(3.8 \mathrm{mg}, 0.0074 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.5 \mathrm{~mL})$ cooled to $-78{ }^{\circ} \mathrm{C}$ was added trichloroacetyl isocyanate ( $18 \mu \mathrm{~L}$ of a 0.42 M solution in $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 0.0076 \mathrm{mmol}$ ) dropwise. After stirring at $-78^{\circ} \mathrm{C}$ for 1 h , the reaction was warmed to rt over 20 min and then stirred an additional 1 h . The orange solution was poured into $\mathrm{H}_{2} \mathrm{O}(8 \mathrm{~mL})$ and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 10 \mathrm{~mL})$. The combined organic extracts were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and solvents were removed (aspirator). The unstable orange oil was purified by preparative TLC on silica gel $\left(20 \mathrm{~cm} \times 20 \mathrm{~cm} \times 250 \mu \mathrm{~m}\right.$ pretreated with $\mathrm{NEt}_{3}$ vapor for $30 \mathrm{~min}, 100 \% \mathrm{EtOAc}$ with $2 \% \mathrm{NEt}_{3}$ eluent) to give $4.0 \mathrm{mg}(80 \%)$ of $\mathbf{5 6}$ as an orange oil that was quickly used in the following reaction to minimize decomposition; analytical TLC on silica gel 60 F 254 pretreated
with $\mathrm{NEt}_{3}$ vapor, $100 \% \mathrm{EtOAc}$ with $2 \% \mathrm{NEt}_{3}$ eluent, $\mathrm{Rf}=0.2$. Molecular ion $(\mathrm{M}+\mathrm{Na}) \mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{36} \mathrm{H}_{28} \mathrm{Cl}_{3} \mathrm{~N}_{3} \mathrm{NaO}_{6}$ : 726.1; found 726.1. Partial $500 \mathrm{MHz}{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right.$, $\mathrm{ppm}) \delta 7.44-7.43(6 \mathrm{H}, \mathrm{m})$ and $7.31-7.23(9 \mathrm{H}, \mathrm{m})$ for the $N-\operatorname{Tr}$ group, $5.47(2 \mathrm{H}, \mathrm{s})$ for the $\mathrm{CH}_{2}-\mathrm{O}$ hydrogens, $4.58(1 \mathrm{H}, \mathrm{d}, J=13.9 \mathrm{~Hz})$ and $4.15(1 \mathrm{H}, \mathrm{dd}, J=13.9 \mathrm{~Hz}, 3.9 \mathrm{~Hz})$ for the N-$\mathrm{CH}_{2}$-NTr hydrogens, $4.05(3 \mathrm{H}, \mathrm{s})$ for the $\mathrm{OCH}_{3}$ hydrogens, $3.14(1 \mathrm{H}, \mathrm{d}, J=6.1 \mathrm{~Hz})$ and 2.90 $(1 \mathrm{H}, \mathrm{dd}, J=6.1 \mathrm{~Hz}, 3.9 \mathrm{~Hz})$ for the aziridine hydrogens, $1.98(3 \mathrm{H}, \mathrm{s})$ for the $\mathrm{C}-6 \mathrm{CH}_{3}$ hydrogens. To a solution of crude 56 from above ( $1.0 \mathrm{mg}, 0.0014 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.4 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$ was added triethylsilane ( $7 \mu \mathrm{~L}$ of a 0.629 M solution in $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 0.043 \mathrm{mmol}$ ) followed by methansulfonic acid ( $8 \mu \mathrm{~L}$ of a 0.514 M solution in $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 0.043 \mathrm{mmol}$ ). After stirring the orange solution at $0{ }^{\circ} \mathrm{C}$ for $25 \mathrm{~min} \mathrm{NEt}_{3}(4 \mu \mathrm{~L}, 0.030 \mathrm{mmol})$ was added and stirred an addition 25 min at $0^{\circ} \mathrm{C} .0 .2 \mathrm{~mL}$ of a $5 \% \mathrm{~K}_{2} \mathrm{CO}_{3}$ aqueous solution in $\mathrm{MeOH}(1: 1$, v:v) was added and the reaction was allowed to warm to rt and stir an addition 1 h . Formation of known amino alcohol $59^{29}$ was indicated by the molecular ion $(\mathrm{M}+\mathrm{Na})$ for $\mathrm{C}_{15} \mathrm{H}_{17} \mathrm{~N}_{3} \mathrm{NaO}_{6}$ : 358.1, together with a weak mass peak corresponding to aziridinomitosene $\mathrm{A}^{8}(\mathbf{4})$, molecular ion ( $\mathrm{M}+\mathrm{Na}$ ) for $\mathrm{C}_{15} \mathrm{H}_{15} \mathrm{~N}_{3} \mathrm{NaO}_{5}: 340.1$. Characteristic signals to support the formation of $\mathbf{4}$ could not be found in the NMR spectrum.

## (1S,2,S)-9-Carbamoyloxymethyl-2,3-dihydro-7-methoxy-6-methyl-1,2-(N-tritylaziridino)-1 H-pyrrolo[1,2-a]indole (57)

To the tetracyclic alcohol $54(2.8 \mathrm{mg}, 0.0050 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.5 \mathrm{~mL})$ at $-78^{\circ} \mathrm{C}$ was added trichloroacetyl isocyante ( $13 \mu \mathrm{~L}$ of a 0.42 M solution in $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 0.054 \mathrm{mmol}$ ) and the reaction was stirred at $-78{ }^{\circ} \mathrm{C}$ for 1 h . The reaction was allowed to warm to rt over 20 min then stirred an additional 1 h . Next, 0.5 mL of a $5 \% \mathrm{~K}_{2} \mathrm{CO}_{3}$ aqueous solution in $\mathrm{MeOH}(1: 1, \mathrm{v}: \mathrm{v})$ was added and the reaction was stirred vigorously at rt . After stirring vigorously at rt for 3 h , the biphasic solution was poured into $\mathrm{H}_{2} \mathrm{O}(5 \mathrm{~mL})$ and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 7 \mathrm{~mL})$. The combined organic extracts were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and solvents were removed (aspirator). The orange solid was purified by preparative TLC on silica gel ( $20 \mathrm{~cm} \times 20 \mathrm{~cm} \times 250 \mu \mathrm{~m}$ pretreated with $\mathrm{NEt}_{3}$ vapor for $30 \mathrm{~min}, 100 \% \mathrm{EtOAc}$ with $2 \% \mathrm{NEt}_{3}$ eluent) to give $2.0 \mathrm{mg}(67 \%)$ of 57 as an orange solid, analytical TLC on silica gel 60 F 254 pretreated with $\mathrm{NEt}_{3}$ vapor, $100 \%$ EtOAc with $2 \% \mathrm{NEt}_{3}$ eluent, $\mathrm{Rf}=0.6$. Molecular ion $(\mathrm{M}+\mathrm{Na})$ calculated for $\mathrm{C}_{34} \mathrm{H}_{29} \mathrm{~N}_{3} \mathrm{NaO}_{5}$ : $m / z=582.2$; found 582.2; IR (neat, $\mathrm{cm}^{-1}$ ) $3465 \mathrm{NH}, 3346 \mathrm{NH}, 1725 \mathrm{C}=\mathrm{O}, 1659 \mathrm{C}=\mathrm{O}, 1642$ $\mathrm{C}=\mathrm{O} ; 500 \mathrm{MHz}{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.46-7.45(6 \mathrm{H}, \mathrm{m}) 7.32-7.24(9 \mathrm{H}, \mathrm{m}) 5.36(1 \mathrm{H}, \mathrm{AB}$, $J=13.4 \mathrm{~Hz}) 5.31(1 \mathrm{H}, \mathrm{AB}, J=13.4 \mathrm{~Hz}) 4.57(1 \mathrm{H}, \mathrm{d}, J=13.7 \mathrm{~Hz}) 4.19(2 \mathrm{H}, \mathrm{bs}) 4.14(1 \mathrm{H}, \mathrm{dd}$, $J=13.7 \mathrm{~Hz}, 3.9 \mathrm{~Hz}) 4.03(3 \mathrm{H}, \mathrm{s}) 2.98(1 \mathrm{H}, \mathrm{d}, J=4.8 \mathrm{~Hz}) 2.88(1 \mathrm{H}, \mathrm{dd}, J=4.8 \mathrm{~Hz}, 3.9 \mathrm{~Hz}) 1.97$ $(3 \mathrm{H}, \mathrm{s}) .{ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta 179.6,179.0,157.5,156.7,142.4,129.4,128.2$, $128.1,127.8,127.5,123.8,113.7,106.5,74.6,61.5,59.1,50.4,42.3,34.8,8.8$.

## Detritylation of 57; detection of 58 and isolation of 59

To a solution of $57(2.7 \mathrm{mg}, 0.0048 \mathrm{mmol})$ and triphenylsilane ( $78 \mu \mathrm{~L}$ of a 0.0614 M solution in $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 0.0048 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.45 \mathrm{~mL})$ cooled to $-78^{\circ} \mathrm{C}$ was added triflic acid ( 0.5 $\mu \mathrm{L}, 0.0048 \mathrm{mmol})$. The reaction was allowed to stir at $-78^{\circ} \mathrm{C}$ for 5 min then slowly warmed to $-40^{\circ} \mathrm{C}$ over 30 min and stirred an addition 15 h at $-40^{\circ} \mathrm{C}$. To the orange solution was added pH 10.3 buffer $(0.2 \mathrm{~mL})$ cooled to $0^{\circ} \mathrm{C}$. The biphasic solution was warmed to rt and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \times 1 \mathrm{~mL})$. The combined organic extracts were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and solvents were removed (aspirator). The orange solid was purified by preparative TLC on silica gel ( $20 \mathrm{~cm} \times 20 \mathrm{~cm} \times 250 \mu \mathrm{~m}, 10: 1 \mathrm{CH}_{2} \mathrm{Cl}_{2}: \mathrm{MeOH}$ eluent $)$ to give $2.0 \mathrm{mg}(72 \%)$ of $\mathbf{5 8}$ as a 3:1 mixture of diastereomers as an orange solid, analytical TLC on silica gel 60 F254, 10:1 $\mathrm{CH}_{2} \mathrm{Cl}_{2}: \mathrm{MeOH}, \mathrm{Rf}=0.63$ for the less polar major diastereomer and $\mathrm{Rf}=0.60$ for the more polar minor diastereomer. Molecular ion $(\mathrm{M}+\mathrm{Na})$ calculated for $\mathrm{C}_{34} \mathrm{H}_{31} \mathrm{~N}_{3} \mathrm{NaO}_{6}: m / z=600.2$, found 600.2. Partial $500 \mathrm{MHz}{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, \mathrm{ppm}\right) \delta 7.60(6 \mathrm{H}, \mathrm{m})$ and $7.32-7.22(9 \mathrm{H}, \mathrm{m})$ for the $N-\operatorname{Tr}$ group, $5.02(1 \mathrm{H}, \mathrm{AB}, J=12.2 \mathrm{~Hz})$ and $5.01(1 \mathrm{H}, \mathrm{AB}, J=12.2 \mathrm{~Hz})$ for the $\mathrm{CH}_{2} \mathrm{OC}$ $(\mathrm{O}) \mathrm{NH}_{2}$ hydrogens, $4.60(2 \mathrm{H}, \mathrm{br} \mathrm{s})$ for the $\mathrm{C}(\mathrm{O}) \mathrm{NH}_{2}$ hydrogens, $4.52(1 \mathrm{H}, \mathrm{dd}, J=12.4 \mathrm{~Hz}, 7.7$
$\mathrm{Hz})$ for one of the $\mathrm{N}-\mathrm{CH}_{2}-\mathrm{CHNTr}$ hydrogen, $4.00(3 \mathrm{H}, \mathrm{s})$ for the $\mathrm{OCH}_{3}$ hydrogens, $3.25(1 \mathrm{H}$, d, $J=5.1 \mathrm{~Hz})$ for the $\mathrm{CH}-\mathrm{OH}$ hydrogen, $1.94(3 \mathrm{H}, \mathrm{s})$ for the $\mathrm{C}-6 \mathrm{CH}_{3}$ hydrogens.

To a solution of amino alcohol $\mathbf{5 8}(2.0 \mathrm{mg}, 0.0035 \mathrm{mmol})$ prepared above in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.3 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$ was added triethylsilane ( $11 \mu \mathrm{~L}$ of a 0.628 M solution in $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 0.0069 \mathrm{mmol}$ ) and trifluoroacetic acid ( $12 \mu \mathrm{~L}$ of a 0.573 M solution in $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 0.0069 \mathrm{mmol}$ ). After stirring the orange solution at $0^{\circ} \mathrm{C}$ for 30 min , diisopropylethylamine ( $2 \mu \mathrm{~L}, 0.010 \mathrm{mmol}$ ) was added and stirred at $0^{\circ} \mathrm{C}$ for an additional 30 min . Solvents were removed (aspirator) and the orange solid was purified by preparative TLC on silica gel $\left(20 \mathrm{~cm} \times 20 \mathrm{~cm} \times 250 \mu \mathrm{~m}, 10: 1 \mathrm{CH}_{2} \mathrm{Cl}_{2}: \mathrm{MeOH}\right.$ eluent) to give 1.0 mg ( $83 \%$ ) of amino alcohol 59 identical by ${ }^{1} \mathrm{H}$ NMR and mass spectrometry comparisons with literature data. 29,30

Alternatively, a solution of tetracycle $57(2.0 \mathrm{mg}, 0.0036 \mathrm{mmol})$ and triphenylsilane ( $109 \mu \mathrm{~L}$ of a 0.0653 M solution in $\left.\mathrm{CH}_{2} \mathrm{Cl}_{2}, 0.0071 \mathrm{mmol}\right)$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.40 \mathrm{~mL})$ cooled to $-78{ }^{\circ} \mathrm{C}$ was treated with triflic acid $(0.6 \mu \mathrm{~L}, 0.0071 \mathrm{mmol})$. The reaction was allowed to stir at $-78{ }^{\circ} \mathrm{C}$ for 5 min and then was slowly warmed to $-40^{\circ} \mathrm{C}$ over 30 min and stirred an addition 15 h at -40 ${ }^{\circ} \mathrm{C}$. To the orange solution was added DIEA ( $2 \mu \mathrm{~L}, 0.011 \mathrm{mmol}$ ) and the mixture was stirred at $-40^{\circ} \mathrm{C}$ for an additional 30 min . Solvents were then removed (aspirator) and the orange solid was purified by preparative TLC on silica gel as above to give $1.0 \mathrm{mg}(83 \%)$ of amino alcohol 59.29

## Supplementary Material

Refer to Web version on PubMed Central for supplementary material.

## ACKNOWLEDGMENT

The authors thank Prof. L. Jimenez for kindly providing an NMR spectrum of synthetic aziridinomitosene A. This work was supported by the National Institutes of Health (CA17918).

## Table 1

Conversion of 15 to enol triflate 14. ${ }^{a}$

| entry | base | Time | Yield | $\boldsymbol{E}: \boldsymbol{Z}$ |
| :---: | :---: | :---: | :---: | :---: |
| 1 | KHMDS | 15 h | $63 \%$ | $25: 75$ |
| 2 | NaHMDS | 15 h | $61 \%$ | $40: 60$ |
| 3 | LiHMDS | 7 d | $28 \%$ | $>95: 5$ |
| 4 | NaH | 15 h | $72 \%$ | $54: 46$ |
| 5 | MesLi | 4 d | $20 \%$ | $>95: 5$ |
| 6 | LiH | 7 d | $65 \%$ | $93: 7$ |
| $a$ |  |  |  |  |

[^1]Oxidation of $\mathbf{3 2}$ to quinones $\mathbf{3 1}$ and $\mathbf{3 4}$.

$a_{\text {Isolated combined yield of } \mathbf{3 1} \text { and } \mathbf{3 4} \text { from crude } \mathbf{3 2}}$
$b_{\text {Purified }} \mathbf{3 2}$ used.
${ }^{c}$ Phosphazene base $\mathrm{P}_{1}-t-\mathrm{Bu}$.
