Introduction to the Finite Element Method

Niels Saabye Ottosen and Hans Petersson
University of Lund, Sweden

Prentice Hall
New York London Toronto Tokyo Sydney Singapore

Contents

Preface **xi**

Suggestions to the instructor **xiii**

Acknowledgements **xv**

1 Introduction **1**
- 1.1 Basic description 1
- 1.2 Some specific applications 7

2 Matrix algebra **11**
- 2.1 Definitions 11
- 2.2 Addition and subtraction 13
- 2.3 Multiplication 13
- 2.4 Determinant 16
- 2.5 Inverse matrix 18
- 2.6 Linear equations: number of equations is equal to number of unknowns 19
- 2.7 Linear equations: number of equations is different from number of unknowns 23
- 2.8 Quadratic forms and positive definiteness 23
- 2.9 Partitioning 24
- 2.10 Differentiation and integration 25

3 Direct approach – truss analysis **27**
- 3.1 Simple structure consisting of springs 27
- 3.2 Truss analysis – local and global coordinates 37

4 Strong and weak formulations – one-dimensional heat flow **48**
- 4.1 One-dimensional heat equation – strong form 48
- 4.2 Axially loaded elastic bar 52
- 4.3 Flexible string 54

4.4 Weak form of one-dimensional heat flow 56
4.4.1 Advantages of the weak formulation compared with the strong form 59
4.4.2 Alternative derivation of heat equation 62
4.5 Concluding remarks 64

5 Gradient, Gauss' divergence theorem and the Green–Gauss theorem 65
5.1 Gradient 65
5.2 Gauss' divergence theorem and the Green–Gauss theorem 70

6 Strong and weak forms – two- and three-dimensional heat flow 76
6.1 Heat flux vector – constitutive relation 76
6.2 Heat equation for two and three dimensions – strong form 81
6.3 Weak form of heat flow in two and three dimensions 85
6.4 Other analogous physical problems 87

7 Choice of approximating functions for the FE method – scalar problems 90
7.1 General requirements 91
7.1.1 Convergence criteria 91
7.1.2 Rate of convergence – Pascal's triangle 94
7.2 One-dimensional elements 98
7.2.1 Simplest possible one-dimensional element 98
7.2.2 Quadratic one-dimensional element 106
7.2.3 Cubic and quartic one-dimensional elements – Lagrange interpolation 115
7.3 Two-dimensional elements 118
7.3.1 Simple triangular element 118
7.3.2 Four-node rectangular element – the Lagrange element 126
7.3.3 More complicated rectangular and triangular elements – serendipity elements 131
7.4 Three-dimensional elements 136
7.5 Summary 138

8 Choice of weight function – weighted residual methods 142
8.1 Point collocation method 147
8.2 Subdomain collocation method 149
8.3 Least-squares method 151
8.4 The Galerkin method 152
8.5 Example 153
8.6 Concluding remarks 156

9 FE formulation of one-dimensional heat flow **157**
9.1 Global FE formulation 157
9.1.1 Example 1 164
9.1.2 Further properties of the stiffness matrix 170
9.1.3 Systematic consideration of boundary conditions 171
9.1.4 Example 2 174
9.1.5 Evaluation of the force vector – fulfilment of the global balance principle 175
9.1.6 Evaluation of the load vector – point sources 177
9.2 Expanded FE formulation of one element – assembly process 179
9.2.1 Example 3 183
9.3 FE formulation of one element 184
9.3.1 Example 4 188
9.3.2 Use of local coordinate systems 191
9.4 Axially loaded elastic bar 193
9.4.1 Example 5 195
9.5 Basic features of an FE computer program 197
9.6 Heat flow with convection 198
9.7 C^0-continuity 202
9.8 Concluding remarks 203

10 FE formulation of two- and three-dimensional heat flow **206**
10.1 Two-dimensional heat flow 206
10.1.1 Example 214
10.1.2 Two-dimensional heat flow with convection 219
10.2 Three-dimensional heat flow 220

11 Guidelines for element meshes and global nodal numbering **223**
11.1 FE mesh 223
11.2 Methods of solution 225
11.2.1 Bandwidth 225
11.2.2 Systematic Gauss elimination 226
11.2.3 Global nodal point numbering 230
11.3 Estimation of bandwidth 231

12 Stresses and strains **235**
12.1 Stresses 235
12.1.1 Plane stress 241
12.2 Strains 243
12.2.1 Plane strain 247

13 Linear elasticity **248**
13.1 Symmetry properties 251
13.2 Initial strains 253

13.3 Plane stress 254
13.4 Plane strain 255
13.5 Summary of equations for solid mechanics 256
13.5.1 Comparison of the equations of heat flow and solid mechanics 259

14 FE formulation of torsion of non-circular shafts 261
14.1 Saint-Venant torsion theory 261
14.1.1 Differential equation for Saint-Venant torsion theory 261
14.1.2 Boundary conditions 265
14.1.3 Determination of torque 267
14.1.4 Soap film analogy 269
14.1.5 Discussion of Saint-Venant torsion theory 270
14.2 FE formulation 271
14.2.1 Example 276

15 Approximating functions for the FE method – vector problems 282
15.1 Convergence criteria 282
15.2 General approximation techniques 284
15.2.1 Three-node element – constant strain element 288
15.2.2 Four-node rectangle – Melosh element 289

16 FE formulation of three- and two-dimensional elasticity 292
16.1 Weak form of equilibrium equations – three-dimensional case 292
16.2 FE formulation of three-dimensional elasticity 295
16.3 Weak form of equilibrium equations – two-dimensional case 299
16.4 FE formulation of two-dimensional elasticity 302
16.4.1 Example 1 306
16.4.2 Example 2 308

17 FE formulation of beams 311
17.1 Beam theory 312
17.1.1 Equilibrium conditions 312
17.1.2 Kinematic relations 313
17.1.3 Constitutive relation 315
17.1.4 Choice of position of x-axis 315
17.1.5 Differential equations for Bernoulli's beam theory 317
17.2 Weak form of equilibrium equation 318
17.3 FE formulation 319
17.3.1 Completeness and compatibility requirements 323
17.3.2 Simplest possible beam element 324
17.3.3 Evaluation of element stiffness matrix 328
17.3.4 Evaluation of element boundary vector 329

17.3.5 Beam element with no distributed loading 330
17.3.6 Evaluation of element load vector – uniform load 331
17.3.7 Evaluation of element load vector – concentracted force and moment 332

18 FE formulation of plates 335
18.1 Plate theory 335
18.1.1 Equilibrium conditions 335
18.1.2 Kinematic relations 339
18.1.3 Constitutive relation 340
18.1.4 Further derivations 341
18.1.5 Differential equations for plate theory 342
18.1.6 Moments and shear forces acting on an arbitrary plane 344
18.1.7 Discussion of proper boundary conditions 347
18.2 Weak form of equilibrium equation – proper static boundary conditions 349
18.3 Concentrated shear forces at corners 352
18.4 FE formulation 356
18.4.1 Completeness and compatibility requirements 360
18.4.2 Two simple non-conforming plate elements 361

19 Isoparametric finite elements 364
19.1 Restrictions on the mapping 364
19.2 Four-node isoparametric quadrilateral element 366
19.3 Eight-node isoparametric quadrilateral element 370
19.4 Three-dimensional isoparametric elements 373
19.5 General isoparametric formulation – convergence requirements 374
19.6 Integral transformations 376
19.6.1 Transformation of integrals over one-, two- and three-dimensional regions 376
19.6.2 Transformation of boundary integrals 380
19.7 Evaluation of FE equations using isoparametric elements 382
19.7.1 Example 385
19.8 Need for numerical integrations 386

20 Numerical integration 387
20.1 Newton–Cotes quadrature 389
20.1.1 Example 1 390
20.1.2 Example 2 391
20.2 Gauss integration 391
20.2.1 Example 3 392
20.2.2 Example 4 394

20.3 Introductory remarks on the order of Gauss integration of isoparametric elements 394
20.4 Reduced integration and spurious zero-energy modes 396
20.4.1 Suggested order of Gauss integration of isoparametric elements 402
