20. ABSTRACT (Continue on reverse side if necessary and identify by block number)

The interaction of electrons with the solids Al and Al_2O_3 is described based on the electron gas model for the conduction band electrons in Al, a model insulator theory for the valence electrons in Al_2O_3, and inner shell ionization derived from atomic, generalized oscillator strengths. Contributions to the inverse mean free path and stopping power from the various interaction processes are tabulated for electron energies from 0.5 eV to 10 keV for Al and from 10 eV to 10 keV for Al_2O_3.

Electron range in the continuous-slowing-down approximation and straggling are tabulated for electron energies from 10 eV to 10 keV for both materials.

CONTENTS

I. INTRODUCTION

A quantitative description of the interaction of electrons with matter over a large range of energies is a subject of basic importance in a wide variety of theoretical and applied areas. From the theoretical standpoint, calculations of energy loss and range of electrons in many different materials have formed the basis of at least two extensive tabulations.[1,2] Both of these works are restricted to electron energies ≥ 10 keV and are based on the Bethe theory of stopping power including various modifications and corrections (e.g. density-effect corrections). We feel that similar tabulations for electron energies < 10 keV, based on a priori calculations using currently available theoretical information, will provide useful guides for interpretation of experimental data as well as input for calculations in applied areas.

Our work here will involve model calculations to describe the extended electron states of a solid (valence band or conduction band). The more tightly bound, inner shells of the atoms in the solid will be assumed to be essentially unchanged in character from those in free atoms. Thus, excitation of electrons from the inner shells will be based on calculations of atomic, generalized oscillator strengths (GOS's). More specifically, the differential inverse mean free path (DIMFP), which forms the basic function required in our work, will be derived from an electron gas model describing the conduction band electrons in Al and from a model insulator theory applied to the valence band in Al_2O_3. The DIMFP's for electron interaction with the inner shells of the Al and O atoms

are calculated from a priori atomic GOS calculations for exciting electrons to the continuum from the 2s and 2p sub-shells of Al[3] and the K shell of O.[4] The DIMFP for removing an electron from the K shell of Al is obtained from GOS values based on hydrogenic wavefunctions.[5] Given the DIMFP's associated with the most important electron interaction processes in the solids we then calculate inverse mean free paths, stopping powers, csda ranges, and range and energy straggling for electron energies from a few eV to 10 keV.

The details of the components of our calculations are described more fully in the next four sections. In section VI exchange corrections are discussed, expressions given for the exchange corrected DIMFP's, and formulas used in these tabulations are displayed.

II. GENERAL FORMULATIONS

A charged particle passing through a solid interacts with a large number of electrons simultaneously and it is thus appropriate to speak of a mean free path of the charged particle against energy loss to the solid. Assuming the effect of the charged particle on the medium may be treated in first Born approximation, the inverse mean free path, differential in momentum transfer, $\hbar\vec{k}$, and energy transfer, $\hbar\omega$, for a particle of velocity v is given by

$$\frac{d^2\mu}{dk d\omega} = \frac{2e^2}{\pi\hbar v^2}\,\frac{1}{k}\,\mathrm{Im}\left[\frac{-1}{\epsilon(k,\omega)}\right] \qquad (1)$$

where $\epsilon(k,\omega)$ is the exact dielectric function of the solid.[6,7] We assume in this work that the solid is isotropic and homogeneous.

For our calculations of inverse mean free path, stopping power, etc., it is sufficient to compute inverse mean free paths differential in energy transfer only. This differential inverse mean free path (DIMFP) for energy loss $\hbar\omega$ by an electron with energy $E = mv^2/2$ in the solid is given by

$$\tau(E,\hbar\omega) \equiv \frac{d\mu}{d(\hbar\omega)} = \frac{1}{\pi a_o E}\int_{k_-}^{k_+}\frac{dk}{k}\,\mathrm{Im}\left[\frac{-1}{\epsilon(k,\omega)}\right] \qquad (2)$$

where $\hbar k_{\pm} \equiv \sqrt{2m}\left[\sqrt{E} \pm \sqrt{E-\hbar\omega}\right]$ and $a_o \equiv \hbar^2/me^2$. This expression assumes that the energy-momentum relation for a swift electron in the solid does not differ appreciably from that of a free electron in vacuum.

Given $\epsilon(k,\omega)$ for the solid, the quantities of interest here follow directly from $\tau(E,\hbar\omega)$. The inverse mean free path of the electron, μ, is given by integrating over allowed energy transfers as

$$\mu(E) = \int d(\hbar\omega)\,\tau(E,\hbar\omega)\,. \qquad (3)$$

The rate of energy loss of the electron, or the stopping power of the medium, is given by

$$S(E) \equiv -dE/dx = \int d(\hbar\omega)\,\hbar\omega\,\tau(E,\hbar\omega)\,,$$

and the mean square energy loss per unit path length by

$$\Omega^2(E) = \int d(\hbar\omega)(\hbar\omega)^2\,\tau(E,\hbar\omega)\,. \qquad (5)$$

With these results we may calculate the range of an electron in the continuous-slowing-down approximation (csda range) by

$$R_o(E) = \int_{E_o}^{E} dE'/S(E') \quad . \tag{6}$$

The lower limit on this integration will be discussed further in Section VI. The mean square fluctuation in the range or "range straggling" will be calculated from Eq. (3) and Eq. (4) as[8]

$$(R - R_o)^2_{AV} \equiv \int_{E_o}^{E} dE' \, \Omega^2(E')/[S(E')]^3 \quad . \tag{7}$$

In practice, the DIMFP will be evaluated as a sum of contributions from various distinct processes. For example we calculate a DIMFP for removing an electron from a given inner shell, a DIMFP for plasmon excitation, etc. The total DIMFP used to describe the interaction of an electron with the given solid will be given by

$$\tau(E,\omega) = \sum_i \tau_i(E,\omega) \tag{8}$$

where the sum over i adds the contributions from the various interaction processes. The evaluation of the τ_i's for Al and Al_2O_3 is described in the next three sections.

III. DIMFP's FOR THE ALUMINUM CONDUCTION BAND

The conduction band of Al will be described by an electron gas model. The dielectric response function in the form given by Lindhard[6] is

$$\epsilon(k,\omega) = 1 + (\chi^2/z^2)\,[f_1(x,z) + i f_2(x,z)] \tag{9}$$

in terms of the dimensionless variables $x = \hbar\omega/E_f$ and $z = k/2k_f$ with E_f the Fermi energy and k_f the Fermi wavenumber of the electron gas. Also, $\chi^2 \equiv e^2/\pi\hbar v_f$ where v_f is the Fermi velocity. The function f_1 is given by

$$f_1(x,z) = \tfrac{1}{2} + \frac{1}{8z}\left[1-(z-x/4z)^2\right]\ln\left|\frac{z-x/4z+1}{z-x/4z-1}\right| + \frac{1}{8z}\left[1-(z+x/4z)^2\right]\ln\left|\frac{z+x/4z+1}{z+x/4z-1}\right| . \qquad (10a)$$

The function f_2 is defined by

$$f_2(x,z) = \begin{cases} \pi x/8z\,, & \text{for } z+x/4z < 1 \\ \frac{\pi}{8z}\left[1-(z-x/4z)^2\right], & \text{for } |z-x/4z|<1<z+x/4z \\ 0\,, & \text{for } |z-x/4z|>1 \end{cases} . \qquad (10b)$$

From Eq. (2), the DIMFP is given by

$$\tau(E,\hbar\omega) = \frac{\chi^2}{\pi a_o E}\int_{z_-}^{z_+} dz\,\frac{zf_2}{(z^2+\chi^2 f_1)^2+(\chi^2 f_2)^2} \qquad (11)$$

where $z_\pm \equiv k_\pm/2k_f$. Energy losses of an incident electron to an electron gas may be divided into: (a) losses resulting from excitation of single electrons out of the Fermi sea and (b) losses to collective oscillations of the electron gas (plasmon excitation). The contribution to the total DIMFP due to (a) is identified with the region in which f_2 is non-zero. This electron-electron term is written as

$$\frac{d\mu_{ee}}{dx} \equiv \tau_{ee}(\varepsilon,x) = \frac{\chi^2\,\theta(\varepsilon-x)}{\pi a_o(\varepsilon+1)}\int_{\frac{1}{2}(\sqrt{x+1}-1)}^{\frac{1}{2}(\sqrt{x+1}+1)} dz\,\frac{zf_2}{(z^2+\chi^2 f_1)^2+(\chi^2 f_2)^2} \qquad (12)$$

where ϵ is the incident electron energy measured from the Fermi level in units of the Fermi energy, i.e., $\epsilon = (E - E_F)/E_F$, and the step function $\theta(\epsilon - x)$ restricts the incident electron to states above the Fermi level.

The plasmon contribution arises from integration of Eq. (11) in the region where $f_2 \to 0$. The integral is zero except on the plasma resonance line defined by $z = z_o(x)$ through the equation

$$F(x, z_o) \equiv z_o^2 + \chi^2 f_1(x, z_o) = 0 . \tag{13}$$

The DIMFP for plasmon excitation is found to be

$$\tau_{pl}(\epsilon, x) = \frac{1}{a_o(\epsilon+1)} \frac{z_o}{|dF/dz|_{z = z_o}} \theta(x - x_{min})\theta(x_{max} - x) \tag{14}$$

where x_{min} and x_{max} are the solutions of the equations

$$x_{min} = 4z_o(x_{min})[\sqrt{\epsilon+1} - z_o(x_{min})] \tag{15}$$

and

$$x_{max} = 4z_o(x_{max})[1 + z_o(x_{max})] . \tag{16}$$

For our later discussion of exchange corrections we need the DIMFP for creation of secondary electrons in this model. The results of Ref. (7) lead to

$$\tau_s(\epsilon, \epsilon') = \frac{\chi^2}{8a_o(\epsilon+1)} \int_{\epsilon'}^{\min(\epsilon'+1, \epsilon)} dx \int_{z_-}^{z_+} \frac{dz}{z^4 |\epsilon(2k_F z, E_F x)|^2} \tag{17}$$

where min(a,b) represents the smaller of the quantities a and b.

The use of this electron gas model, though based implicitly on the assumption of high electron densities, gives unexpectedly good results for real metal conduction band densities. In addition, Eq. (1) is derived in first Born approximation and would be expected to fail when the velocity of the incident electron approaches that of electrons in the electron gas. Lindhard,[6] however, points out that this equation may be reasonably good at any velocity since: (a) the relative velocity of the incident electron and representative electrons in the electron gas remains of the order of the Fermi velocity no matter how slowly the incident electron moves, and (b) at low velocities the Coulomb field of the incident electron is strongly screened by polarization in the electron gas so that for many purposes it can be considered small in the sense of perturbation theory.

IV. DIMFP'S FOR INNER SHELLS

From a general expression for the dielectric function of a homogeneous, isotropic system[9] we may show for values of ω which correspond to ionization of the i^{th} inner shell in a solid that

$$\mathrm{Im}\left[\frac{-1}{\epsilon(k,\omega)}\right] \approx \mathrm{Im}\,\epsilon(k,\omega) \approx \frac{2\pi n_i e^2}{m\omega}\,\frac{df_i(k,\omega)}{d\omega} \tag{18}$$

where $df_i/d\omega$ is the generalized oscillator strength (GOS) for transitions from the i^{th} independent inner shell. Here n_i is the number of i^{th} inner shells per unit volume in the given solid. Equation (2) thus leads to

$$\tau_i(E,\hbar\omega) = \frac{8\pi a_o^2 n_i}{(E/R)(\hbar\omega/R)} \int_{k_-}^{k_+} \frac{dk}{k} \frac{df_i(k,\omega)}{d(\hbar\omega)} \qquad (19)$$

where $\hbar\omega$ is the energy transfer and $R = e^2/2a_o$.

Generalized oscillator strengths for the ionization of L shell electrons in Al have been calculated by Manson[3] using a nonrelativistic Hartree-Slater central field model of the atom. These GOS values have been used as input for numerical evaluation of the integral over momentum transfer in Eq. (19) to obtain differential cross sections, $\tau_i/n_i = d\sigma_i/d(\hbar\omega)$, for the 2s and 2p subshells of Al. These cross sections when multiplied by the appropriate value of n_i give the DIMFP for the particular material. For example, τ_{2s}^{Al,Al_2O_3} would denote the DIMFP for removing a 2s electron from an Al atom with the density of Al atoms corresponding to that in Al_2O_3. This same type of notation will be used for contributions to the inverse mean free path and stopping power. The binding energy for 2s and 2p electrons in Al is taken to be 118.524 eV and 80.88 eV, respectively, for these calculations.

Similar calculations have been done for the 1s shell in oxygen. The values of the GOS for excitation to the continuum from the 1s shell of O were taken from the work of McGuire.[4] The binding energy of the 1s shell in O is taken to be 536.6 eV.

Our calculation of the DIMFP for excitation of electrons from the K shell of Al to the continuum is based on cross sections derived using hydrogenic wave functions. A detailed discussion of this type of cross section calcuation is

given in Ref. 5. We have used the equations in this reference to calculate the DIMFP based on a binding energy for the K shell in Al of 1545.8 eV and an "effective atomic number" of $Z_s = 12.5643$.

V. DIMFP'S FOR VALENCE ELECTRONS IN Al_2O_3

Since Al_2O_3 is a good insulator with a band gap of about 9 eV[10] it is desirable to represent the response of its valence electrons on the basis of a quite different model than that used for the conduction band in Al. The model which we have developed for this purpose is related to that employed by Fry[11] in which the ground state wave function of the valence electrons is described in the tight-binding approximation, while excited states are represented by orthogonalized plane waves (OPW). In our use of the model to obtain a dielectric response function we fix the normalization of the OPW excited states by requiring that the sum rule $\int_0^\infty d\omega\ \omega \mathrm{Im}[\epsilon(k,\omega)] = 2\pi^2 ne^2/m$, where n is the density of electrons in the valence band. In addition we assume that the solid is uniform and homogeneous. The dielectric response function corresponding to this model solid is convenient and flexible for use, can be fitted to the optical dielectric function in the limit of very long wavelengths ($k \to 0$), and describes the single-particle properties of excited electrons. The existence of plasma oscillations emerges naturally as one studies the response of the system to longitudinal electric perturbations.[12]

Since a detailed discussion of the insulator model is planned for publication[13] we quote here only the results needed for these calculations. The

result required here is the imaginary part of the dielectric response function for the model insulator given by

$$\mathrm{Im}\left[\epsilon(k,\omega)\right] = \pi n e^2 \Gamma / \hbar\beta k \Lambda \tag{20}$$

where

$$\Gamma \equiv \left\{ \frac{1}{3}\left[\frac{1}{\{\alpha^2+(k-p)^2\}^3} - \frac{1}{\{\alpha^2+(k+p)^2\}^3} \right] \right.$$

$$- \frac{32\alpha^4}{(\alpha^2+p^2)^2(4\alpha^2+k^2)^2}\left[\frac{1}{\alpha^2+(k-p)^2} - \frac{1}{\alpha^2+(k+p)^2} \right] \tag{21}$$

$$\left. + \frac{1024\, pk\, \alpha^8}{(\alpha^2+p^2)^4(4\alpha^2+k^2)^4} \right\} ,$$

$$\Lambda \equiv \left[\omega_s + \frac{\hbar\beta}{m}(k^2+\alpha^2) \right]\left[\frac{1}{8\alpha^5} - \frac{32\alpha^3}{(4\alpha^2+k^2)^4} \right] \tag{22}$$

and

$$p = \left[m(\omega-\omega_s)/\hbar\beta \right]^{1/2} . \tag{23}$$

Here $\hbar\omega_s$ is the excitation energy of the valence electrons and β and α are parameters which may be adjusted to make the theory agree with optical dielectric function measurements in the $k\to 0$ limit. In the $k\to 0$ limit we have

$$\mathrm{Im}\left[\epsilon(0,\omega)\right] = \frac{2^9 \pi n e^2}{3\hbar\beta} \frac{\alpha^7}{(\omega_s+\frac{\hbar\beta}{m}\alpha^2)} \frac{p^3}{(\alpha^2+p^2)^6} . \tag{24}$$

Given the imaginary part of the dielectric function, Eq. (20), for fixed values of n, β, ω_s, and α the real part of $\epsilon(k,\omega)$ may be obtained numerically using the

Kramers-Kronig relation,

$$\mathrm{Re}[\,\epsilon(k,\omega)\,] = 1 + \frac{2P}{\pi}\int_0^\infty d\omega_o \; \frac{\omega_o \,\mathrm{Im}[\,\epsilon(k,\omega_o)\,]}{\omega_o^2 - \omega^2} \quad . \tag{25}$$

We fit Eq. (24) to experimental measurements of the imaginary part of the optical dielectric function as measured by Arakawa and Williams[10] with 15 valence electrons per Al_2O_3 unit, density of Al_2O_3 of 4.05 g/cm^3, $\hbar\omega_s$ = 9 eV, $\beta = \frac{1}{2}$, and $\alpha a_o = 0.78$. Given these values, $\mathrm{Im}[\,-\frac{1}{\epsilon(k,\omega)}\,]$ is calculated from the results of Eq. (20) and Eq. (25). The remaining 9 of the 24 valence electrons in Al_2O_3 are taken to form a second tight-binding level with $\hbar\omega_s$ = 29 eV, $\beta = \frac{1}{2}$, and $\alpha a_o = 1.6$.

VI. EXCHANGE CORRECTED DIMFP'S AND FORMULAE FOR THE TABULATIONS

We have included the effect of electron exchange in our calculations in a simple manner based on the form of the Mott formula (non-relativistic Møller formula) for scattering of an incident electron with a free electron. The cross section for finding a scattered electron with energy in the interval W:W+dW is given by[8]

$$\frac{d\Phi}{dW} = \frac{\pi e^4}{E}\left[\frac{1}{W^2} + \frac{1}{(E-W)^2} - \frac{1}{W(E-W)}\right] \tag{26}$$

for an incident electron of energy E, except for energies close to W = 0 and W = E. Near W = 0 and W = E the interference term (third term on the right side of Eq. (26)) is effectively zero.

The DIMFP for excitation of an electron from a particular state i may be written in the form

$$\tau_i(E,\hbar\omega) = \frac{1}{E} F_i(E,\hbar\omega) \quad . \tag{27}$$

If we assume that the width of the level from which an electron is excited is quite narrow, we obtain from Eq. (27) the DIMFP for production of a secondary electron with energy E_s as

$$\tau_i^s(E,E_s) = \frac{1}{E} F_i(E, E_i^B + E_s) \tag{28}$$

where E_i^B is the binding energy of the i^{th} state (a positive quantity). The exchange corrected DIMFP is taken as

$$\tau_i^{exc}(E,\hbar\omega) = \frac{1}{E}\Big\{ F_i(E,\hbar\omega) + F_i(E,\ E + E_i^B - \hbar\omega) - \Big[1 - \sqrt{E_i^B/E}\Big]\Big[F_i(E,\hbar\omega) F_i(E,\ E + E_i^B - \hbar\omega)\Big]^{1/2}\Big\} \quad . \tag{29}$$

Since $E\tau_i \propto 1/(\hbar\omega)^2$ for large E and $\hbar\omega$, Eq. (29) reduces in this limit to the form given by Eq. (26). The factor $1 - \sqrt{E_i^B/E}$ reduces the contribution of the third term in Eq. (29) as $E \to E_i^B$. This form for the exchange corrected DIMFP has been used in our calculations for all the inner shells and for the two valence levels in Al_2O_3 (since our model assumes the width of these levels to be quite narrow).

If we now define the more energetic of the two electrons after collision to be the primary, and account for exchange through Eq. (29), Eq. (3) gives the

the contribution to the inverse mean free path due to excitation of an electron from the i^{th} level as

$$\mu_i(E) = \int_{E_i^s}^{(E+E_i^s)/2} d(\hbar\omega)\, \tau_i^{exc}(E,\hbar\omega) \quad . \tag{30}$$

Similarly for the stopping power and mean square energy loss per unit path length we have from Eq. (4) and Eq. (5)

$$\varsigma_i(E) = \int_{E_i^s}^{(E+E_i^s)/2} d(\hbar\omega)\, \hbar\omega\, \tau_i^{exc}(E,\hbar\omega) \tag{31}$$

and

$$\Omega_i^2(E) = \int_{E_i^s}^{(E+E_i^s)/2} d(\hbar\omega)(\hbar\omega)^2\, \tau_i^{exc}(E,\hbar\omega) \quad . \tag{32}$$

The exchange correction for excitation of electrons from the Al conduction band of finite width requires a slightly different form. We take

$$\tau_{ee}^{exc}(\epsilon,x) = \left\{ \tau_{ee}(\epsilon,x) + \tau_s(\epsilon,\epsilon-x) - [1-(\epsilon+1)^{-1/2}][\tau_{ee}(\epsilon,x)\tau_s(\epsilon,\epsilon-x)]^{1/2} \right\} \tag{33}$$

where τ_{ee} and τ_s are defined in Eq. (12) and Eq. (17). Thus the contributions to the inverse mean free, stopping power, and mean square energy loss per unit path length due to excitation of electrons from the conduction band in Al are calculated from

$$\mu_{ee}(\epsilon) = \int_0^{x/2} dx\, \tau_{ee}^{exc}(\epsilon,x) \quad , \tag{34}$$

$$S_{ee}(\epsilon) = \int_0^{x/2} dx\, x\, \tau_{ee}^{exc}(\epsilon,x) \quad , \tag{35}$$

and

$$\Omega_{ee}^2(\epsilon) = \int_0^{x/2} dx\, x^2\, \tau_{ee}^{exc}(\epsilon,x) \quad . \tag{36}$$

No exchange correction is applied to τ_{pl}, Eq. (14). The inverse mean free path contribution due to plasmon excitation is given by

$$\mu_{pl}(\epsilon) = \int_{x_{min}}^{x_{max}} dx\, \tau_{pl}(\epsilon,x) \quad . \tag{37}$$

The contribution to stopping power and mean square energy loss per unit path length are given by

$$S_{pl}(\epsilon) = \int_{x_{min}}^{x_{max}} dx\, x\, \tau_{pl}(\epsilon,x) \tag{38}$$

and

$$\Omega_{pl}^2(\epsilon) = \int_{x_{min}}^{x_{max}} dx\, x^2\, \tau_{pl}(\epsilon,x) \quad . \tag{39}$$

For the remaining calculations we form the sums

$$S_{exc}(E) = \sum_i S_i(E) \tag{40}$$

and

$$\Omega^2_{exc}(E) = \sum_i \Omega^2_i(E) \tag{41}$$

where the index i includes the terms appropriate for a given solid, including exchange corrections as indicated above. The csda range is calculated from

$$R_{(10)}(E) = \int_{10\ eV}^{E} dE'/S_{exc}(E') \tag{42}$$

corresponding to an electron slowing down in a continuous manner from an energy E to 10 eV. The mean square fluctuation in the csda range based on Eq. (7) is calculated as

$$[\Delta R_{(10)}]^2_{AV} = \int_{10\ eV}^{E} dE'\, \Omega^2_{exc}(E')/[S_{exc}(E')]^3 . \tag{43}$$

VIII. ALUMINUM: EXPLANATION OF TABLES

GENERAL NOTES

1. Electron energies are measured from the top of the conduction band (Fermi level). The Fermi energy is taken to be $E_F = 11.6$ eV.
2. The density of solid Al is taken to be 2.71 g/cm^3.
3. The computer-printed units are translated as:

EV ..... eV	A ..... Å
EV2 ..... $(eV)^2$	A-1 ..... $Å^{-1}$
G/CM3 ..... g/cm^3	A2 ..... $Å^2$

4. The numerical print-out is in the form, e.g.
   2.8D-01 ≡ 2.8×10^{-1}.

TABLE 1A - INVERSE MEAN FREE PATH OF ELECTRONS IN ALUMINUM

EL - EL	μ_{ee} as given by Eq. (34)
PLASMON	μ_{pl} as given by Eq. (37)
AL(nℓ)	$\mu_{n\ell}^{Al}$ as given by Eq. (30) with Eq. (19)
INVERSE MFP	μ - total inverse mean free path = sum of individual contributions.

TABLE 1B - STOPPING POWER OF ALUMINUM FOR ELECTRONS

EL - EL	S_{ee} as given by Eq. (35)

PLASMON	S_{pl} as given by Eq. (38)
AL(nℓ)	$S_{n\ell}^{Al}$ as given by Eq. (31) with Eq. (19)
STOPPING POWER	S - total stopping power = sum of individual contributions

TABLE 1C - CSDA RANGES AND STRAGGLING OF ELECTRONS IN ALUMINUM

CSDA RANGE (E TO 10 EV)	$R_{(10)}$ - the range of an electron in the continuous-slowing-down approximation in going from an energy E to 10 eV, as given by Eq. (42).
MEAN SQUARE ENERGY LOSS	Ω_{exc}^2 - the mean square fluctuation in the energy loss per unit path length, as given by Eqs. (41), (36), (39) and (5) plus (19).
MEAN SQUARE RANGE FLUCTUATION	$[\Delta R_{(10)}]_{AV}^2$ - the mean square fluctuation in the range about the mean csda range $R_{(10)}$, as given by Eq. (43).
RELATIVE RANGE STRAGGLING	$\{[\Delta R_{(10)}]_{AV}^2\}^{1/2}/R_{(10)}$

IX. ALUMINUM OXIDE: EXPLANATION OF TABLES

GENERAL NOTES:

1. Electron energies are measured from the bottom of the conduction band.
2. The density of solid Al_2O_3 is taken to be 4.05 g/cm^3.
3. The computer-printed units are translated as:

EV ..... eV	A ..... Å
EV2 ..... $(eV)^2$	A-1 ..... $Å^{-1}$
G/CM3 ..... g/cm^3	A2 ..... $Å^2$
AL203 ..... Al_2O_3	

4. The numerical print-out is in the form, e.g., 2.8D-2 ≡ 2.8×10^{-2}.

TABLE 2A - INVERSE MEAN FREE PATH OF ELECTRONS IN Al_2O_3

VAL (9 EV)	$\mu_{(9\ eV)}$ as given by Eq. (30) +(2) +(20) +(25)
VAL (29 EV)	$\mu_{(29\ eV)}$ as given by Eq. (30) +(2) +(20) +(25)
AL($n\ell$)	$\mu_{n\ell}^{Al,Al_2O_3}$ as given by Eq. (30) +(19)
O(1S)	μ_{1s}^{O,Al_2O_3} as given by Eq. (30) +(19)
INVERSE MFP	μ - total inverse mean free path = sum of individual contributions.

TABLE 2B - STOPPING POWER OF ALUMINUM OXIDE FOR ELECTRONS

VAL (9 EV)	$S_{(9\ eV)}$ as given by Eq. (31) +(2) +(20) +(25)
VAL (29 EV)	$S_{(29\ eV)}$ as given by Eq. (31) +(2) +(20) +(25)
AL($n\ell$)	$S_{n\ell}^{Al,Al_2O_3}$ as given by Eq. (31) +(19)
O(1S)	S_{1s}^{O,Al_2O_3} as given by Eq. (31) +(19)
STOPPING POWER	S - total stopping power = sum of individual contributions.

TABLE 2C - CSDA RANGE AND STRAGGLING OF ELECTRONS IN Al_2O_3

CSDA RANGE (E TO 10 EV)	$R_{(10)}$ - the range of an electron in the continuous-slowing-down approximation in going from an energy E to 10 eV, as given by Eq. (42).
MEAN SQUARE ENERGY LOSS	Ω_{exc}^2 - the mean square fluctuation in the energy loss per unit path length, as given by Eqs. (41), (32) +(19), and (32) + (2) +(20) +(25).
MEAN SQUARE RANGE FLUCTUATION	$[\Delta R_{(10)}]_{AV}^2$ - the mean square fluctuation in the range about the mean csda range $R_{(10)}$, as given by Eq. (43).
RELATIVE RANGE STRAGGLING	$\{[\Delta R_{(10)}]_{AV}^2\}^{1/2}/R_{(10)}$
