Sept. 30, 1965

Ground State Configuration 1S<sub>0</sub>  
S<sub>298.15</sub> = 26.015 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
ΔH<sub>f</sub><sup>0</sup> = 34.2 ± 0.5 kcal. mole<sup>-1</sup>  
ΔH<sub>f</sub><sup>0</sup> 298.15 = 33.2 ± 0.5 kcal. mole<sup>-1</sup>

Electronic Levels and Quantum Weight

| E <sub>1</sub> | g <sub>1</sub> |
|----------------|----------------|
| 0              | 1              |

Heat of Formation.  
The heat of formation was calculated from the equation: H(g) + e<sup>-</sup> → H<sup>-</sup>(g) with the JANAF auxiliary value for H(g) (this supplement); using an I.P. = 6.083096 X 10<sup>3</sup> cm<sup>-1</sup> (.754 e.v. or 17.39 kcal/mole) for H<sup>-</sup>(g) obtained from C. L. Pekeris, Phys. Rev. 128, 1470 (1962). The I.P. value for H<sup>-</sup>(g) reported by C. M. Scherr and R. E. Knight, Rev. Mod. Phys. 35, 436 (1963) is in agreement with the value of Pekeris.

Heat Capacity and Entropy.  
The electronic levels and quantum weights were obtained from C. E. Moore, "Atomic Energy Levels", Vol. I, U. S. National Bureau of Standards Circular 467, June 15, 1949, by assuming that the extra electron would produce an electronic configuration similar to that of the next higher atomic numbered element, in this case Helium. The electronic levels above 1 X 10<sup>5</sup> cm<sup>-1</sup> were omitted because their contribution is negligible below 6000°K. The H<sup>-</sup> H<sub>288</sub> value at 0°K. is -1.481 kcal/mole.

Mercury Monohydride (HgH)

(Ideal Gas) Mol. Wt. = 201.618

MOL. WT. = 201.618

(IDEAL GAS)

Ground State Configuration [ $^2\Sigma^+$ ]  
 $\Delta H_f^\circ = 58 \pm 4$  kcal. mole $^{-1}$   
 $S_{298.15}^\circ = [52.486]$  cal. deg. $^{-1}$  mole $^{-1}$   
 $\Delta H_f^\circ = 298.15 = 57 \pm 4$  kcal. mole $^{-1}$

Electronic Levels and Multiplicities

$$\frac{\epsilon_1 \text{ cm.}^{-1}}{0} \quad \frac{\epsilon_2}{[2]}$$

$$\omega_e x_e = 1387 \text{ cm.}^{-1} \quad \sigma = 1$$

$$B_e = 5.549 \text{ cm.}^{-1} \quad \alpha_e = 0.312 \text{ cm.}^{-1}$$

$$r_e = 1.74 \text{ \AA}$$

Heat of Formation.

The heat of formation was calculated from  $D_0$ , 8.671 kcal. mole $^{-1}$ , taken from G. Herzberg, "Spectra of Diatomic Molecules," 2nd Edition, D. Van Nostrand Company, Inc., New York (1950).

Heat Capacity and Entropy.

Molecular constants were taken from G. Herzberg, loc. cit.

September 30, 1961

$$\Delta H_{298}^{\circ} = 6.82 \pm 0.05 \text{ kcal. mole}^{-1}$$

$$\text{ground state} = \sum_{i=1}^{\infty} \frac{e^{-\epsilon_i/kT}}{Z}$$

$$\Delta H_{298}^{\circ} = 6.50 \text{ kcal. mole}^{-1}$$

$$S_{298}^{\circ} = 49.351$$

$$\omega_e x_e = 39.73 \text{ cm.}^{-1}$$

$$\omega_e = 2309.06 \text{ cm.}^{-1}$$

$$\epsilon_0 = 0.1715 \text{ cm.}^{-1}$$

$$c = 1$$

## Thermodynamic Functions.

Molecular constants are from M. Cowan and W. Gordy [Phys. Rev. 104, 551 (1956)] and D. R. J. Boyd and H. W. Thompson [Spectrochim. Acta 5, 308 (1952)]. The calculated functions are in reasonable agreement with the compilation of K. K. Kelley [U. S. Bur. Mine Bull. 504 (1960)].

## Heat of Formation.

Using the calculated functions derived above and functions for H<sub>2</sub>(g) and I<sub>2</sub>(g) given in the JANAF Tables, equilibrium data from the literature were used to calculate  $\Delta H_{298}^{\circ}$  for the reaction

$$\Delta H_{298}^{\circ} \text{ kcal. mole}^{-1}$$

|   |               |
|---|---------------|
| Taylor and Crist <sup>1</sup> (667° to 764°K)     | -2.375 ± .005 |
| Bodenstein <sup>2</sup> (556° to 781°K)           | -2.053 ± .133 |
| Bright and Hagerly <sup>3</sup> (696° and 779°K)  | -2.219 ± .070 |
| Rittenberg and Urey <sup>4</sup> (671° and 741°K) | -2.156 ± .072 |

The data of Taylor and Crist are the most concordant and are given the most weight. Converting to the solid state of iodine, which has been adopted as a JANAF reference state gives the standard heat of formation of hydrogen iodide.

ΔH<sub>f</sub>° = Unknown

ΔH<sub>f</sub>° 298.15 = -13.819 ± 0.011 kcal. mole<sup>-1</sup>

S° 298.15 = [12] cal. deg.<sup>-1</sup> mole<sup>-1</sup>

T<sub>d</sub> = [690]°K.

Heat of Formation.

The value of ΔH<sub>f</sub>° 298.15 was taken from S. R. Gunn and L. G. Green, J. Am. Chem. Soc. **80**, 4782 (1958). The corresponding value reported by C. E. Measer, L. G. Pasolino and C. E. Thalmeier, J. Am. Chem. Soc. **77**, 4524 (1955) was -15.16 ± 0.6 kcal. mole<sup>-1</sup>. In this paper the results of the previous investigations were also reviewed.

Heat Capacity and Entropy.

C<sub>p</sub> and S° 298.15 were estimated by comparison with those for NaH(c) and LiH(c).

Temperature of Decomposition.

T<sub>d</sub> was assumed to be the temperature at which the value of ΔF<sub>f</sub>° changes from negative to positive.

HK

(IDEAL GAS)

POTASSIUM HYDRIDE (KH)

MOL. WT. = 40.108

Heat of Formation.

Heat Capacity and Entropy.

All molecular and spectroscopic constants were obtained from G. Herzberg, "Spectra of Diatomic Molecules," Chapman and Hall, Ltd., 1933.

Ground State Configuration  $1s^2 +$   
 $S_{298.15}^{\circ} = 47.304 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $\Delta H_f^{\circ} 0 = 30.0 \pm 3.5 \text{ kcal. mole}^{-1}$   
 $\Delta H_f^{\circ} 298.15 = 29.4 \pm 3.5 \text{ kcal. mole}^{-1}$

$\omega_e = 985.0 \text{ cm.}^{-1}$   
 $\omega_e x_e = 14.65 \text{ cm.}^{-1}$   
 $\nu_e = 3.407 \text{ cm.}^{-1}$   
 $\alpha_e = 0.0673 \text{ cm.}^{-1}$   
 $\sigma = 1$

$\Delta H_f^{\circ} 289.15$  was calculated from  $D_0^{\circ} = 1.86 \pm 0.15 \text{ e.v.}$  reported by A. G. Daydon, "Dissociation Energies," Chapman and Hall, Ltd., 1953.

Heat of Formation.

POTASSIUM HYDROXIDES (KOH)

(CRYSTAL)

MOL. WT. = 56.10937

S<sub>298</sub><sup>o</sup> = 18.95 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 T<sub>m</sub> = 522°K  
 T<sub>m</sub> = 673°K

ΔH<sub>f</sub><sup>o</sup> = -100.7 ± 0.1 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> 298.15 = -101.5 ± 0.1 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> = -1.515 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> = 2.240 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> 298.15 (to monomer) = {46.1} kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> 298.15 (to dimer) = {45.6} kcal. mole<sup>-1</sup>

Heat of Formation.

The standard enthalpy of formation, ΔH<sub>f</sub><sup>o</sup> 298 (KOH, c) = -101.5 ± 0.1 kcal. mole<sup>-1</sup>, was calculated from the heat of solution of KOH(c), the heat of hydrolysis of potassium metal and the appropriate auxiliary data.

N. A. Peshetnikov<sup>1</sup> has measured the heat of solution KOH(c) → KOH(650 H<sub>2</sub>O) as -13.665 ± 0.009 kcal. mole<sup>-1</sup> at 298.15°K. in the solution calorimeter. Using the auxiliary heat of dilution reported by V. B. Parker<sup>2</sup>, the selected heat of solution of KOH(c) at infinite dilution is -13.770 kcal. mole<sup>-1</sup>. The heat of solution KOH(c) → KOH(25 H<sub>2</sub>O) has also been measured as -13.80 ± 0.10 kcal. mole<sup>-1</sup> in the solution calorimeter by W. E. Hatton, D. L. Hildenbrand, G. C. Sinke and D. R. Stull<sup>3</sup>. Both results are in good agreement.

The heat of hydrolysis of potassium metal, ΔH<sub>f</sub><sup>o</sup> 298, has been measured in the solution calorimeter by the following investigators.

| Source                      | Number of Moles of H <sub>2</sub> O | ΔH <sub>f</sub> <sup>o</sup> 298 kcal. mole <sup>-1</sup> | ΔH <sub>f</sub> <sup>o</sup> 298 (KOH(m H <sub>2</sub> O)) kcal. mole <sup>-1</sup> | ΔH <sub>f</sub> <sup>o</sup> 298 (KOH, c) kcal. mole <sup>-1</sup> |
|-----------------------------|-------------------------------------|---|---|--|
| Gunn et al. <sup>4</sup>    | 1000                                | -46.877 ± 0.01  | -115.281  | -101.511   |
| Messer et al. <sup>5</sup>  | ∞                                   | -47.02 ± 0.15   | -115.345  | -101.565   |
| Ketchen et al. <sup>6</sup> | ∞                                   | -46.894 ± 0.24  | -115.209  | -101.439   |

The values of ΔH<sub>f</sub><sup>o</sup> 298 (KOH(∞H<sub>2</sub>O)) were calculated from the heats of reaction, ΔH<sub>f</sub><sup>o</sup> 298, using ΔH<sub>f</sub><sup>o</sup> 298 (H<sub>2</sub>O, l) = -68.315 kcal. mole<sup>-1</sup>. Combination of the selected heat of solution of KOH(c) at infinite dilution with the heat of formation of KOH(∞H<sub>2</sub>O) gives the heat of formation of KOH(c) in the last column of the table. A weighted average of these three measurements was taken for the selected heat of formation of KOH(c).

The earlier investigations have been reviewed by F. R. Bichowsky and F. D. Rossini<sup>8</sup> and C. E. Messer et al.<sup>5</sup>, and these earlier reported data are not adopted in the tabulation.

**Heat Capacity and Entropy.**  
 The low temperature heat capacities of KOH(c) from 15° to 340°K. have been measured by W. E. Hatton et al.<sup>3</sup> who have also observed a sharp peak in the heat capacity curve in the temperature range from 210° to 230°K. These values of C<sub>p</sub> were adopted in the calculation. W. D. Powers and G. C. Blalock<sup>9</sup> have measured the high temperature enthalpy changes of the solid KOH in the α and β phases by the drop method. Their enthalpy data are scattered and not precise enough to accurately define the heat capacities in the α phase. Therefore, the selected heat capacities between 340° and 522°K. were estimated from a graphical extrapolation of the low temperature heat capacity curve, and the tabulated H°-H°<sub>298</sub> functions are in agreement with their enthalpy measurements within the experimental uncertainty. The heat capacities of KOH(c) in the β phase were obtained from Powers and Blalock<sup>9</sup>.

The entropy (S<sub>298</sub><sup>o</sup> = 18.95 cal. deg.<sup>-1</sup> mole<sup>-1</sup>) was taken from Hatton et al.<sup>3</sup>, based on an extrapolation of S<sub>15</sub><sup>o</sup> = 0.054 cal. deg.<sup>-1</sup> mole<sup>-1</sup>.

**Transition and Melting Data.**  
 Hatton et al.<sup>3</sup> have found a lambda transition at 227.4°K. in the heat capacity measurement. The adopted heat of α-β transition at 522°K. and heat of melting at 673°K. were obtained from Powers and Blalock<sup>9</sup>. P. S. Seward and K. E. Martin<sup>10</sup> found ΔH<sub>m</sub><sup>o</sup> = 1.83 kcal. mole<sup>-1</sup> at 693°K. In phase diagram studies of the system KOH-K<sub>2</sub>CO<sub>3</sub>.

Heat of Sublimation.

See KOH(g) table for details.

S<sub>298.15</sub><sup>o</sup> = 23.518 cal. deg.<sup>-1</sup> mole<sup>-1</sup>

ΔH<sub>f</sub><sup>o</sup> 298.15 = -98.433 kcal. mole<sup>-1</sup>

T<sub>m</sub> = 675°K.

ΔH<sub>m</sub><sup>o</sup> = 2.240 kcal. mole<sup>-1</sup>

T<sub>b</sub> (monomeric gas) = 1600°K.

ΔH<sub>v</sub><sup>o</sup> (to monomer) = 32.0 kcal. mole<sup>-1</sup>

Heat of Formation.

The heat of formation of KOH(l) at 298°K. was obtained from that of the crystal by adding ΔH<sub>m</sub><sup>o</sup> and the difference between H<sub>675</sub><sup>o</sup> and H<sub>298</sub><sup>o</sup> for crystal and liquid.

Heat Capacity and Entropy.

The heat capacity of the liquid phase, C<sub>p</sub> = 19.86 cal. deg.<sup>-1</sup> mole<sup>-1</sup>, was obtained from the enthalpy measurements in the drop calorimeter by W. D. Powers and O. C. Blalock, ORNL-1653, Oak Ridge Nat'l. Lab., Jan. 1954. The constant C<sub>p</sub> was extrapolated below the melting point and up to 2500°K.

The entropy, S<sub>298.15</sub><sup>o</sup> = 23.51 cal. deg.<sup>-1</sup> mole<sup>-1</sup>, was obtained in a manner analogous to that of the heat of formation.

Melting Data.

See KOH(c) table for details.

Vaporization Data.

The boiling point 1600°K. was calculated as the temperature at which the free energies of formation (ΔF<sub>f</sub><sup>o</sup>) for both KOH(l) and KOH(g) are equal. The difference in the heats of formation (ΔH<sub>f</sub><sup>o</sup>) of KOH(l) and KOH(g) at the boiling point in the heat of vaporization. If K<sub>2</sub>(OH)<sub>2</sub>(g) is also considered as a minor component in the vapor mixture (approximately 2% of total vapor pressure at the boiling point) the calculated boiling point is unchanged as 1600°K. (see KOH(g) table for details).

H. von Wertenberg and P. Albrocht, Z. Elektrochem. 21, 182 (1921), have studied the vapor pressures of liquid KOH and reported the boiling point as 1597°K.

HKO

Bond Distance: K-O = [2.21] Å O-H = [0.96] Å

Bond Angle: K-O-H = [110]°

Product of the Moments of Inertia:  $I_A I_B I_C = [1.22325] \times 10^{-116} \text{ g.}^3 \text{ cm.}^6$

$\sigma^- = 1$

Heat of Formation.

R. F. Porter and R. C. Schoonmaker, J. Phys. Chem. 62, 234 and 468 (1958), have investigated the potassium hydroxide vapor by the mass-spectrometric method and found that the KOH vaporizes mainly as gaseous dimer in the temperature range from 573° to 723°K. Later, Schoonmaker and Porter, J. Chem. Phys. 33, 830 (1959), found the activity of molten alkali hydroxide had been reduced in the presence of MgO in their sample container. Using the reported partial pressures of KOH(g) and K<sub>2</sub>(OH)<sub>2</sub>(g) at 641° and 665°K. and JANAF free energy functions, the third law calculations give  $\Delta H_{298}^0 = -45.4 \pm 5 \text{ kcal. mole}^{-1}$  for 2KOH(g) → K<sub>2</sub>(OH)<sub>2</sub>(g), and  $\Delta H_{298}^0 = 45.41 \pm 3.5 \text{ kcal. mole}^{-1}$  for KOH(c) → KOH(g), and  $\Delta H_{298}^0 = 45.6 \pm 5 \text{ kcal. mole}^{-1}$  for 2KOH(c) → K<sub>2</sub>(OH)<sub>2</sub>(g). The uncertainties given were derived by assuming  $\lambda_{298}$  to be good to a factor of 5 as stated by the authors and including an extra factor of 2 as a possible error in activity. To this was added an estimate of the uncertainty due to functions used. In order to have good agreement between the calculated total pressures of monomeric and dimeric KOH(g) and the observed vapor pressures measured by H. von Wartenberg and P. Albrecht, Z. Elektrochem. 27, 182 (1921), the heat of sublimation to monomeric gas was adjusted to  $\Delta H_{298}^0 = 46.08 \text{ kcal. mole}^{-1}$ . (The heat of sublimation to dimeric gas was unchanged as  $\Delta H_{298}^0 = 45.64 \text{ kcal. mole}^{-1}$ ). The calculated boiling point is 1600°K. which is in good agreement with 1597 ± 10°K. reported by Wartenberg and Albrecht. The heats of formation were calculated from the selected heats of sublimation as  $\Delta H_{298}^0(\text{KOH.g}) = -55.4$  and  $\Delta H_{298}^0(\text{K}_2(\text{OH})_2.\text{g}) = -157.4 \text{ kcal. mole}^{-1}$ .

Heat Capacity and Entropy.

The bond distance K-O was estimated by adding the bond length difference (0.04 Å) between H-OH(g) and H-F(g) to the bond distance K-F(g) (2.1746 Å) which has been accurately measured by R. K. Ritchie and H. Lew, Can. J. Phys. 42, 43 (1964). The bond distance O-H was estimated from that in H<sub>2</sub>O(g). The bent molecular configuration with the bond angle of 110° has also been proposed by S. H. Bauer, R. M. Diner and R. F. Porter, J. Chem. Phys. 29, 991 (1958), but a linear model has also been suggested by R. C. Schoonmaker and R. F. Porter, J. Chem. Phys. 33, 830 (1959). The bent model has been adopted in the tabulation. The three principal moments of inertia are:  $I_A = [0.1256] \times 10^{-39}$ ,  $I_B = [9.8070] \times 10^{-39}$  and  $I_C = [9.9326] \times 10^{-39} \text{ g. cm.}^2$

The K-O stretching frequency (408 cm.<sup>-1</sup>) was obtained from L. H. Spinar and J. L. Margrave, Spectrochim. Acta 12, 244 (1957) in the infrared spectroscopic studies. The O-H stretching and the bending frequencies were estimated by comparison with H-OH, D-OH and T-OH which indicate rapid convergence to a constant as a heavier atom is attached.

L. Brewer and P. Matlack, J. Am. Chem. Soc. 73, 2045 (1951), have calculated theoretically the bond distances of gaseous alkali oxides (Li-O = 1.52 Å, Na-O = 1.94 Å and K-O = 2.27 Å) which have been quoted by Bauer, Diner and Porter, loc. cit., and many other authors.

Sept. 30, 1962; Sept. 30, 1967

$\Delta H^{\circ}_0 = -20.45 \pm 0.03 \text{ kcal/mol}$

$\Delta H^{\circ}_{298, 15} = -21.86 \pm 0.03 \text{ kcal/mol}$

$\Delta H_m^{\circ} = 5.40 \pm 0.10 \text{ kcal/mol}$

$\Delta H^{\circ}_{298, 15} = 55.27 \text{ kcal/mol}$

$S^{\circ}_{298, 15} = 4.789 \pm 0.03 \text{ gibbs/mol}$

$T_m = 961.8^{\circ}\text{K}$

Heat of Formation

The heats of solution of Li(c) and LiH(c) in water have been measured by Cuntz (1) and Hoers (2) using an open Dewar flask calorimeter and by Messer (3) and Gunn (4) using closed bomb calorimetry. Based on the reported values of the enthalpy changes ( $\Delta H^{\circ}$ ) for the reaction (A)  $\text{Li(c)} + \text{H}_2\text{O(l)} = \text{LiOH(aq)} + 1/2\text{H}_2\text{(g)}$ , and (B)  $\text{LiH(c)} + \text{H}_2\text{O(l)} = \text{LiOH(aq)} + \text{H}_2\text{(g)}$ , the corresponding  $\Delta H^{\circ}_{298}$  for LiH(c) are calculated. The results are presented in the table below.

The decomposition pressures of LiH(c) have been determined by Hurd (5), at temperatures 782 - 926°K. By use of the second and third law methods, the enthalpy changes for the decomposition reaction (C)  $\text{LiH(c)} = \text{Li(c)} + 1/2\text{H}_2\text{(g)}$  are evaluated as  $21.87 \pm 0.3$  and  $22.34 \text{ kcal/mol}$ , respectively. Based on the third law  $\Delta H^{\circ}_{298}$  and  $\Delta H^{\circ}_{298}(\text{Li}, 2) = 0.569 \text{ kcal/mol}$ , we derive the value  $\Delta H^{\circ}_{298}(\text{LiH}, c) = -21.77 \pm 0.2 \text{ kcal/mol}$ , which is in good agreement with the values obtained by calorimetric method. Cuntz (1) measured the decomposition pressure at 953°K for the same reaction. The third law  $\Delta H^{\circ}_{298}$  and  $\Delta H^{\circ}_{298}(\text{LiH}, c)$  are evaluated as 21.86 and -21.79 kcal/mol, respectively.

Johnson (6) has determined the standard Gibbs energy of formation ( $\Delta G^{\circ}$ ) for LiH(c) from emf measurements over the temperature range 875 - 885°K. The cell utilized an Amoco Iron flag over which  $\text{H}_2$  was passed as the cathode and a molten Li anode. LiCl, LiBr, and LiI, each saturated with LiH were used as electrolytes. Using the reported emf values at different temperatures (47 data points) for reaction (C), we derive a  $\Delta H^{\circ}_{298} = -21.81 \text{ kcal/mol}$  for LiH(c).

The  $\Delta H^{\circ}_{298}(\text{LiH}, c)$  value reported by Gunn (4) is adopted.

Heat Capacity and Entropy

The low temperature heat capacities are obtained from the data of Kostyukov (7), 3.72 - 295.5°K. The cp data reported by Gunther (8) are consistently lower than the adopted ones in the temperature range 74.0 - 90.5°K but considerably higher at 292.7°K. The high temperature enthalpies have been determined by Fieldhouse (9), 413.2 - 914.3°K, and Vogt (10), 878.15 - 953.15°K. The derived high temperature heat capacities are joined smoothly with the low temperature values and extrapolated smoothly above 953.15°K.

$S^{\circ}_{298}$  is calculated based on the adopted low temperature heat capacities, using  $S^{\circ} = 0.0002 \text{ eu}$ .

Melting Data

The value of  $T_m$  has been reported as 953 (1), 961 ± 1 (10, 17), 959.6 (11), and 961.8 ± 0.3 (13). The value reported by Messer (13) is adopted. The heat of melting ( $\Delta H_m^{\circ}$ ) has been determined as 5.095 ± 0.46 (13) and 5.237 ± 0.040 kcal/mol (14). The first  $\Delta H_m^{\circ}$  value was evaluated cryogenically from the lowering of melting point in the systems LiH-Li<sub>2</sub>O and LiH-CaH<sub>2</sub>. The second value was derived from enthalpy data measured with copper block calorimeter. The adopted  $\Delta H_m^{\circ}$  value is derived from the enthalpy data of Vogt (10) using the adopted heat capacities for LiH(c) and LiH(l).

Heat of Sublimation

The value of  $\Delta H^{\circ}_{298}$  is calculated as the difference between  $\Delta H^{\circ}_{298}$  for LiH(g) and LiH(c).

LITHIUM HYDRIDE (LiH)

(LIQUID)

GFW = 7.94697

S<sup>298</sup>.15 = 5.314 gibbs/mol

ΔH<sup>o</sup><sub>298</sub>.15 = -18.573 kcal/mol

T<sub>m</sub> = 961.8 ± 0.3°K

ΔH<sub>m</sub><sup>o</sup> = 5.40 ± 0.10 kcal/mol

T<sub>d</sub> = 1223°K

Heat of Formation

ΔH<sup>o</sup><sub>298</sub>(l) is obtained from ΔH<sup>o</sup><sub>298</sub>(c) by adding ΔH<sub>m</sub><sup>o</sup> and the difference between H<sub>961.8</sub><sup>o</sup> - H<sub>298</sub><sup>o</sup> for crystal and liquid.

The decomposition pressures of LiH(l) at different temperatures have been investigated by Hill (1), Perlow (2), Johnson, and Gibb (3). Based on their reported equilibrium pressures, the enthalpy changes for the reaction LiH(l) = Li(l) + 1/2H<sub>2</sub>(g) are evaluated by the second and third law methods. The results are presented in the table below. It should be noted that the measured decomposition pressures are highly sensitive to composition and change extremely rapidly between 99 and 100 percent purity. Therefore we give no weight to the equilibrium data.

| Investigator  | Temperature, °K | No. of Points | ΔH <sup>o</sup> <sub>298</sub> , kcal/mol |           |          |
|---------------|-----------------|---------------|---|-----------|----------|
|               |                 |               | Second Law                                | Third Law | Drift eu |
| Hill (1938)   | 973.2           | 1             | 16.93                                     |           | -16.36   |
| Perlow (1941) | 1043-1098       | 2             | 20.10                                     | 17.69     | -2.2     |
| Johnson*      | 1050-1090       | -             | 24.69                                     | 18.36     | -5.9     |
| Gibb (1951)   | 1073-1173       | 2             | 5.66                                      | 15.2      | +8.5     |

\*The vapor pressure values are calculated from an equation quoted by Gibb (3), but derived from the vapor pressures measured by W. C. Johnson, University of Chicago.

\*\*Based on the third law ΔH<sup>o</sup><sub>298</sub>.

Heat Capacity and Entropy

The enthalpies of LiH(l) in the temperature range 975.15-1075.15°K have been measured by Vogt (5). Using the reported enthalpy values, the heat capacity of LiH(l) is derived as 14.9 gibbs/mol. This Cp value is adopted and extrapolated above and below the measured range.

The entropy is obtained in a manner analogous to that of the heat of formation.

Melting Data

See LiH(c) table for details.

Decomposition Temperature

T<sub>d</sub> is calculated as the temperature at which LiH(l) decomposes into Li(l) and H<sub>2</sub>(g) where the partial pressure of H<sub>2</sub>(g) equals one atmosphere.

Heat of Formation

R. Velasco, Can. J. Phys. **35**, 1704 (1957), observed the absorption spectra of LiH(g) in the near ultraviolet with high dispersion and absorbing path lengths up to 16 meters. He found a new band system involving the ground state and a  $\Pi_u$  excited state. Rotational and vibrational analyses of this system were carried out and the observed breaking off of the rotational structure of the bands was interpreted as due to predissociation by rotation. With this assumption very accurate dissociation limits of the B $\Pi$  state were obtained. From these dissociation limits the dissociation energy (D<sub>0</sub>) of the ground state of LiH was found to be 2.4288 ± 0.0002 eV. Based on this D<sub>0</sub> value, we adopt ΔHf<sup>0</sup><sub>298</sub> = 33.61 kcal/mol for LiH(g).

M. Kemperer, J. Chem. Phys. **23**, 2452 (1955), observed the infrared spectrum of LiH(g) in emission in the frequency region 1500 to 970 cm<sup>-1</sup>, using a Perkin-Elmer double-pass monochromator with NaCl optics. Estimating the minimum LiH pressure as 10 mm and assuming the maximum possible Li pressure, he reported K = 0.005 (atm) at 1400°K for the reaction 2Li(g) + H<sub>2</sub>(g) = 2LiH(g). We calculate the corresponding enthalpy change, ΔHr<sup>0</sup><sub>1400</sub>, to be -9.63 kcal/mol, employing ΔS<sup>0</sup><sub>1400</sub> = -17.407 eu. Incorporating this ΔHr<sup>0</sup><sub>1400</sub> value with ΔHf<sup>0</sup><sub>1400</sub> = 35.601 kcal/mol for Li(g), we obtain ΔHf<sup>0</sup><sub>298</sub> = 33.92 kcal/mol for LiH(g), which is in good agreement with the adopted value.

A. G. Gaydon, "Dissociation Energies," Chapman and Hall Ltd., London, 1953, derived the value D<sub>0</sub>(LiH) = 2.5 ± 0.2 eV from earlier spectroscopic data.

Heat Capacity and Entropy

The third electronic level and quantum weight are obtained from Velasco, loc. cit. All the other constants are taken from G. Herzberg, "Spectra of Diatomic Molecules," D. Van Nostrand Co., Inc., and corrected to the average isotopic species. The moment of inertia is 3.7183 × 10<sup>-40</sup> g cm<sup>2</sup>.

$S_{298}^{298} = 10.225$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 $T_m = 744.3^\circ\text{K}$ .

Heat of Formation.  
 The standard enthalpy of formation,  $\Delta H_f^{298}$  (LiOH, c) = -115.84 ± 0.1 kcal. mole<sup>-1</sup>, was calculated from the heat of solution of lithium hydroxide (c), the heat of hydrolysis of lithium metal and the appropriate auxiliary data.  
 N. A. Peabody<sup>7</sup> has measured the heat of solution LiOH(c) → LiOH(400 H<sub>2</sub>O) as -5.479 ± 0.007 kcal. mole<sup>-1</sup> at 298.15°K. by solution calorimetry. Using the auxiliary heat of dilution reported by V. B. Fepker<sup>2</sup>, the selected heat of solution of lithium hydroxide (c) at infinite dilution is -5.632 kcal. mole<sup>-1</sup>.  
 The heat of hydrolysis of lithium metal,  $\Delta H_f^{298}$ , has been measured in the solution calorimeter by the following investigators.  
 Li(c) + H<sub>2</sub>O(l) → LiOH(mH<sub>2</sub>O) + 1/2 H<sub>2</sub>(g)  $\Delta H_f^{298}$

| Source                     | Number of moles of H <sub>2</sub> O | $\Delta H_f^{298}$ kcal. mole <sup>-1</sup> | $\Delta H_f^{298}$ (LiOH, c) kcal. mole <sup>-1</sup> |
|----------------------------|-------------------------------------|---|---|
| Gunn et al. <sup>3</sup>   | 1000                                | -53.115 ± 0.019                             | -121.532  |
| Messer et al. <sup>4</sup> | OO                                  | -53.075 ± 0.20                              | -121.390  |
|                            |                                     |   | -115.900  |
|                            |                                     |   | -115.758  |

The values of  $\Delta H_f^{298}$  (LiOH(c)) were calculated from the heats of reaction  $\Delta H_f^{298}$ , using the  $\Delta H_f^{298}$  (H<sub>2</sub>O, l) = -68.315 kcal. mole<sup>-1</sup>.<sup>5</sup> Combination of the selected heat of solution of LiOH(c) at infinite dilution with the heat of formation of LiOH(c) gives the heat of formation of LiOH(c) in the last column of the table. A weighted average of these measurements was taken for the adopted heat of formation of lithium hydroxide (c).  
 The earlier calorimetric investigations have been reviewed by P. R. Bichowsky and F. D. Rossini<sup>6</sup> and C. E. Messer et al.<sup>4</sup>, and these data are not adopted in the tabulation.

Heat Capacity and Entropy.  
 The low temperature heat capacities of lithium hydroxide (c) from 15.91° to 302.85°K. have been measured by T. H. Bauer, H. L. Johnston and E. C. Kerr<sup>7</sup>. The high temperature heat capacities which were determined from the enthalpy measurements in the temperature range from 418° to 878°K. by the drop method have been reported by C. H. Shomate and A. J. Cohen<sup>8</sup>. The low temperature and the high temperature heat capacities have been joined smoothly by the Shomate method<sup>9</sup>. The smooth values of heat capacity of LiOH(c) were adopted in the tabulation.  
 W. D. Powers and G. C. Blalock<sup>10</sup> have also measured the high temperature enthalpy changes of LiOH(c) by the drop method. Their results are in agreement with the tabulated H<sub>m</sub>-H<sub>298</sub> values within the experimental uncertainty.  
 The entropy ( $S_{298}^{298} = 10.225$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>) was obtained from Bauer et al.<sup>7</sup>, based on an extrapolation of  $S_0^0 = 0.028$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>.

Melting Data.  
 The adopted heat of melting and the melting point were obtained from the enthalpy measurements by Shomate and Cohen<sup>8</sup>. Powers and Blalock<sup>10</sup> also found the heat of melting  $\Delta H_m^0 = 5.029$  kcal. mole<sup>-1</sup> at 746°K. which is in good agreement with the adopted value.

Dec. 31, 1960; Mar. 31, 1966

S<sub>298.15</sub> = 11.574 cal. deg.<sup>-1</sup> mole<sup>-1</sup>T<sub>m</sub> = 744.3°K.ΔH<sub>f</sub>°(to monomer) = 40.1 kcal. mole<sup>-1</sup>ΔH<sub>f</sub>°(to monomer) = 40.1 kcal. mole<sup>-1</sup>ΔH<sub>f</sub>° = 5.010 kcal. mole<sup>-1</sup>ΔH<sub>f</sub>°(to monomer) = 40.1 kcal. mole<sup>-1</sup>Heat of Formation.

The heat of formation of LiOH(l) at 298.15°K. was obtained from that of the crystal by adding ΔH<sub>f</sub>° and the difference between H<sub>744.3</sub><sup>298.15</sup> for crystal and liquid.

Heat Capacity and Entropy.

The selected heat capacity of the liquid phase, C<sub>p</sub> = 20.74 cal. deg.<sup>-1</sup> mole<sup>-1</sup>, was obtained from the enthalpy measurements in the drop calorimeter by C. H. Shomate and A. J. Cohen, *J. Am. Chem. Soc.* **77**, 285 (1955).

W. D. Powers and O. C. Blalock, ORNL-1653, Oak Ridge Nat'l. Lab., have also determined the heat capacity of lithium hydroxide (l), C<sub>p</sub> = 22.03 cal. deg.<sup>-1</sup> mole<sup>-1</sup>, from the enthalpy measurements by the drop method.

The entropy (S<sub>298.15</sub> = 11.574 cal. deg.<sup>-1</sup> mole<sup>-1</sup>) was obtained in a manner analogous to that of the heat of formation.

Melting Data.

See LiOH(c) table for details.

Vaporization Data.

The boiling point was calculated as the temperature at which the free energies of formation (ΔF<sub>f</sub>°) for both LiOH(l) and LiOH(g) are equal. The difference in the heats of formation (ΔH<sub>f</sub>°) of LiOH(l) and LiOH(g) at the boiling point is the heat of vaporization (ΔH<sub>v</sub>°).

Lithium Hydroxide (LiOH)

(Ideal Gas) Mol. Wt. = 23.94637

LITHIUM HYDROXIDE (LiOH)

(IDEAL GAS)

MOL. WT. = 23.94637

 Bond Distances: Li-O = [1.60] Å O-H = [0.96] Å  
 Bond Angle: Li-O-H = [110]°  
 Product of the Moments of Inertia:  $I_{AB}I_C = [0.6156 \times 10^{-11.7}] \text{ g.}^3 \text{ cm.}^6$   
 $\sigma = 1$

Heat of Formation  
 J. Berkowitz, D. J. Meschi and W. A. Chupka, J. Chem. Phys. 33, 535 (1960), have studied the equilibrium of Li<sub>2</sub>O(c) + H<sub>2</sub>O(g) system by the mass-spectrometric method. Using the reported equilibrium constants in the temperature range from 1100° to 1450°K, the heat of reaction Li<sub>2</sub>O(c) + H<sub>2</sub>O(g) → 2LiOH(g) at 298.15°K. has been calculated by both the second and the third law methods as 86.1 and 83.2 kcal. mole<sup>-1</sup>, respectively. (The third law drift is -2.2 ± 2.6 e.u.) The third law value was taken for the calculation of the heat of formation of LiOH(g) at 298.15°K.

Heat Capacity and Entropy  
 Since the bond distance Li-F(g) (r<sub>e</sub> = 1.56389 Å) was accurately measured from the microwave studies by L. Wharton, W. Klemperer, L. P. Gold, R. Strauch, J. J. Gallagher and V. E. Derr, J. Chem. Phys. 39, 1203 (1963), the bond distance Li-O in LiOH(g) was estimated by adding the bond length difference (0.04 Å) between H-OH(g) and H-F(g) to the bond distance Li-F(g). Also the bond distance Li-O(g) was estimated as 1.62 Å from the matrix-isolated infrared spectrum by D. White, K. S. Seshadri, D. P. Dever, D. E. Mann, M. J. Linevsky, J. Chem. Phys. 39, 2463 (1963). These two are in good agreement. The bond distance O-H was estimated from that in H<sub>2</sub>O(g). The adopted bent molecular configuration with bond angle of 110° was proposed by S. H. Bauer, R. M. Diner and P. F. Porter, J. Chem. Phys. 29, 931 (1958). The three principal moments of inertia are I<sub>A</sub> = [0.1237] × 10<sup>-39</sup>, I<sub>B</sub> = [2.1699] × 10<sup>-39</sup> and I<sub>C</sub> = [2.2936] × 10<sup>-39</sup> g. cm.<sup>2</sup>  
 The Li-O stretching frequency was estimated to be the same as that in Li<sub>2</sub>O(g) (ν = 987 cm.<sup>-1</sup>, see Li<sub>2</sub>O(g) table). The bending and the O-H stretching frequencies were estimated by comparison with H-OH, D-OH and T-OH which indicate rapid convergence to a constant as a heavier atom is attached.

Heat of Formation.

The heat of formation is calculated using D<sub>0</sub> = 2.0 ± 0.5 e.v. derived from a graphical extrapolation of the V(0-3) energy levels of the X<sup>2</sup>Σ<sup>+</sup> state reported by A. G. Gaydon, "Dissociation Energies and Spectra of Diatomic Molecules," 2nd Edition, Chapman and Hall Ltd., London, 1953. G. Herzberg, "Molecular Spectra and Molecular Structure, I. Spectra of Diatomic Molecules," 2nd Edition, D. Van Nostrand Co., Inc., New York, 1950, reported D<sub>0</sub> ≃ 2.49 e.v. assuming predissociation of the C<sup>2</sup>Π state of MgH into Mg(<sup>3</sup>P) and H(<sup>2</sup>S).

Heat Capacity and Entropy.

The molecular constants and electronic levels are obtained from Herzberg, loc. cit., except for the electronic levels 35400 and 48000 obtained from M. A. Khan, Proc. Phys. Soc. (London) **80**, 209 - 21 (1962).

Magnesium Monohydroxide (MgOH)  
(Ideal Gas)      GFW = 41.31937

Bond Distances: O-Hg = [1.80] Å      O-H = [0.97] Å

Bond Angle: Mg-O-H = [180°]      θ = 1

Rotational Constant: B<sub>e</sub> = 0.47595 cm<sup>-1</sup>

Heat of Formation

The heat of formation is based on the following estimates. The relation D<sub>0</sub><sup>0</sup>(M-X)/D<sub>0</sub><sup>0</sup>(M-H-X) = 0.46 ± 0.03 for several alkaline earth dihalides has been reported by R. A. Kent, J. D. McDonald and J. L. Margrave, J. Phys. Chem. 70, 874 (1966). Assuming that this relation applies to hydroxides, we may estimate D<sub>0</sub><sup>0</sup>(Mg-OH) = 87 ± 12 kcal/mol. A value of D<sub>0</sub><sup>0</sup>(Mg-OH) = 105 ± 12 kcal/mol is obtained by comparison with D<sub>0</sub><sup>0</sup>(Be-OH) ≤ 111 ± 10, D<sub>0</sub><sup>0</sup>(Ca-OH) = 100 ± 10 and D<sub>0</sub><sup>0</sup>(Sr-OH) = 95 ± 10 kcal/mol. The value for BeOH is from the JANAF tables, while those for CaOH and SrOH are from flame studies of L. V. Gurvich, private communication, High Temperature Institute, Moscow, 1966. The average value of D<sub>0</sub><sup>0</sup>(Mg-OH) = 96 kcal/mol is used to calculate the heat of formation.

A value of D<sub>0</sub><sup>0</sup>(Mg-OH) = 56 ± 5 kcal/mol was derived from intensity measurements on the flame spectrum of magnesium by E. M. Bulewicz and T. M. Suggden, Trans. Faraday Soc. 55, 770 (1959). This appears to be too small.

Heat Capacity and Entropy

The ground state is assumed to be <sup>2</sup> by analogy with isoelectronic MgF. Ultraviolet emission spectra near 3600 Å were observed for MgOH and MgO by D. Pesic and A. G. Gaydon, Proc. Phys. Soc. (London) 73, 244 (1959), and L. Brewer and S. Trajmar, J. Chem. Phys. 35, 1585 (1962). Vibrational and rotational analyses were not performed. Assuming that the observed spectra correspond to the transition A<sup>2</sup>Π ← X<sup>2</sup>Σ, we estimate the first excited state at 27000 cm<sup>-1</sup>. The vibrational frequencies ν<sub>1</sub> and ν<sub>3</sub> are estimated from those of H<sub>2</sub>O(g) and MgO(g). The ν<sub>2</sub> is tentatively estimated at 1000 cm<sup>-1</sup>.

A linear structure is assumed by use of the prediction of A. D. Walsh, J. Chem. Soc. 1953, 2788 (1953), for "MHg" molecules with less than 11 valence electrons (MgOH has 9 valence electrons). Confirmation of this prediction is scanty for molecules having "A" as the most electronegative element; however, recent microwave evidence [R. L. Kuczkowski, D. R. Lide, Jr., and L. C. Krishner, J. Chem. Phys. 44, 3131 (1966)] for the linearity of KOH and CaOH confirms the prediction for these molecules having 8 valence electrons. The O-H bond distance is assumed to be the same as that of H<sub>2</sub>O(g) and the Mg-O bond distance is estimated from that of MgO(g).

Heat of Formation

The gaseous molecules NaOH, MgOH and AlOH have 8, 9 and 10 valence electrons, respectively. Due to the similarity in molecular structure, we assume that the ionization potential (IP) of MgOH is approximately the average of IP(NaOH) and IP(AlOH). Adopting IP = 9 and 7.5 eV for NaOH (1) and AlOH (2), respectively, we obtain IP(MgOH) = 8.5 eV. Based on this value and  $\Delta H_f^{\circ}(\text{MgOH}, g) = -52 \pm 20$  kcal/mol we derive  $\Delta H_f^{\circ}(\text{MgOH}^+, g) = 143 \pm 40$  kcal/mol which is tentatively adopted. The estimated value IP(MgOH) is close to IP(MgF) = 7.8 ± 0.3 eV (1), where MF and MgOH are isoelectronic molecules, and thus confirms the value within its uncertainty.

Heat Capacity and Entropy

Walsh (3) predicted that ABH molecules (H = hydrogen atom) containing 10 or less valence electrons will be linear in their ground state. Since MgOH<sup>+</sup> molecule has 8 valence electrons, we assume it to be linear. The vibrational frequencies are estimated by comparison with those for NaOH(g) and MgOH(g). The O-H bond distance is assumed to be the same as that in H<sub>2</sub>O(g). The Mg-O bond distance is estimated (4). The moment of inertia is 5.874 × 10<sup>-39</sup> g cm<sup>2</sup>. The ground state quantum weight is assumed to be the same as that of NaOH(g). The enthalpy at 0°K is -2.24 kcal/mol.

June 30, 1968

Ground State Configuration  $3 \sum^-$   
 $S_0^0 = 43.3 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $\Delta H_f^0 = 81.0 \pm 2.5 \text{ kcal. mole}^{-1}$   
 $\Delta H_f^0 = 81.0 \pm 2.5 \text{ kcal. mole}^{-1}$

## Electronic Level and Quantum Weight

$$\frac{\sum_{i=1}^{\infty} g_i}{0} \text{ cm.}^{-1} \frac{g_i}{3}$$

$$\omega_e x_e = 94.7 \text{ cm.}^{-1}$$

$$\omega_e = 16.6684 \text{ cm.}^{-1}$$

$$\sigma = 1$$

$$r_e = 1.038 \text{ \AA}$$

## Heat of Formation

The value,  $\Delta H_f^0(298, \text{NH}, g) = 81.0 \pm 2.5 \text{ kcal. mole}^{-1}$ , was calculated from the selected dissociation energy,  $D_0 = 83 \pm 2 \text{ kcal. mole}^{-1}$ , based on the following investigations. J. L. Franklin, V. H. Dibel, R. M. Reese and M. Krause, *J. Am. Chem. Soc.* **80**, 298 (1958) and R. I. Reed and W. Sneeden, *J. Chem. Soc.* 4132 (1959) have determined the dissociation energy of NH(g) by electron impact as  $83 \pm 2 \text{ kcal. mole}^{-1}$  and  $85.3 \pm 6 \text{ kcal. mole}^{-1}$ , respectively. A. L. Companion and F. O. Ellison, *J. Chem. Phys.* **32**, 1132 (1960), and P. C. H. Jordan and H. C. Lonquet-Higgins, *Mol. Phys.* **5**, 121 (1962) have calculated theoretically the dissociation energy by a semi-empirical method and obtained  $83.3 \text{ kcal. mole}^{-1}$  and  $81.2 \text{ kcal. mole}^{-1}$ , respectively. These results are in good agreement. G. Herzberg, "Spectra of Diatomic Molecules", 2nd Ed., D. Van Nostrand Company, New York, 1950, has estimated the dissociation energy  $D_0(\text{NH}, g) = 3.8 \text{ e.v.}$  ( $87.6 \text{ kcal. mole}^{-1}$ ) based on the average of two earlier theoretical calculations by R. S. Mulliken, ( $D_0 = 4.2 \text{ e.v.}$ ), *Rev. Mod. Phys.* **4**, 1 (1932), and O. King ( $D_0 = 3.4 \text{ e.v.}$ ), *J. Chem. Phys.* **5**, 378 (1938). A. G. Gaydon, "Dissociation Energies", 2nd Ed., Chapman & Hall Ltd, London, 1953, favored O. Glockler's estimation  $D_0 = 86.3 \text{ kcal. mole}^{-1}$  which was based upon the comparison of force constants and D values of related hydrides (i.e. CH, OH and FH).

## Heat Capacity &amp; Entropy

The rotational constants  $B_e$  and  $\alpha_e$  were obtained from R. N. Dixon, *Can. J. Phys.* **37**, 1171 (1959). The vibrational constants  $\omega_e$  and  $\omega_e x_e$  were calculated from Dixon's data:  $B_e = 16.6684 \text{ cm.}^{-1}$ ,  $D_e = 16.85 \times 10^{-4} \text{ cm.}^{-1}$  and  $\omega_e = 3125.6 \text{ cm.}^{-1}$  by the relation  $D_e = 4 B_e^2 / \omega_e^2$  and  $\omega_e = \omega_e - 2 \omega_e x_e$ .

D. E. Milligen and M. E. Jacox, *J. Chem. Phys.* **41**, 2838 (1964) have observed from the spectrum of NH the vibrational fundamental  $\omega = 3133 \pm 2 \text{ cm.}^{-1}$  in Ar and  $N_2$  matrices. K. Rosengren and O. C. Flinnetel, *J. Chem. Phys.* **43**, 507 (1965) also reported  $\omega = 3122.2 \pm 0.6 \text{ cm.}^{-1}$  in  $N_2$  matrix and  $\omega = 3131.6 \pm 0.4 \text{ cm.}^{-1}$  in Ar matrix.

Bond Distance: H-N = 1.020 ± 0.02 Å N=O = 1.239 ± 0.005 Å  
 Bond Angle: H-N=O = 114° 25' ± 2°  
 Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 5.939 X 10<sup>-118</sup> g.<sup>3</sup> cm.<sup>6</sup>  
 $\sigma = 1$

Heat of Formation

$\Delta H_f^0$  298.15 for HNO(g) was calculated from D(H-NO) = 48.6 kcal. mole<sup>-1</sup> at 0°K. reported by M. J. Y. Clement and D. A. Ramsay, Can. J. Phys. 39, 205 (1961).

Heat Capacity and Entropy

Vibrational frequencies were assigned by J. L. Bancroft, J. M. Hollis and D. A. Ramsay, Can. J. Phys. 40, 322 (1962) and H. Brown and G. Pimental, J. Chem. Phys. 29, 863 (1958). Bond distances and bond angles were taken from J. L. Bancroft, J. M. Hollis, and D. A. Ramsay, loc. cit. The molecular constants given by F. W. Dalby, Can. J. Phys. 35, 1336 (1958) were: r(N=O) = 1.216 Å; r(N-H) = 1.0628 Å, and  $\angle$  HNO = 108.6°. The three principal moments of inertia are: 1.262 X 10<sup>-40</sup>, 2.1067 X 10<sup>-39</sup>, and 2.2350 X 10<sup>-39</sup> g. cm.<sup>2</sup>

Bond Distances: O-N = 1.20 Å N-O = 1.46 Å O-H = 0.98 Å

Bond Angle: O-N-O = 114° N-O-H = 103°

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 5.50704 X 10<sup>-116</sup> g.<sup>3</sup> cm.<sup>6</sup>

σ = 1

Heat of Formation.

P. O. Ahmre and B. J. Tyler, J. Chem. Soc. 1017 (1961) reported ΔH<sub>f</sub>°<sub>298.15</sub> = -9.06 ± 0.32 kcal. mole<sup>-1</sup> for the reaction: NO(g) + NO<sub>2</sub>(g) + H<sub>2</sub>O(l) = 2HNO<sub>2</sub>(g), yielding ΔH<sub>f</sub>°<sub>298.15</sub> = -18.57 ± 0.20 kcal. mole<sup>-1</sup> for HNO<sub>2</sub>(g). L. H. Jones, R. M. Badger and G. E. Moore, J. Chem. Phys., 19, 1599 (1951) estimated the difference in energy of cis- and trans-HNO<sub>2</sub>(g) to be 506 ± 250 cal. mole<sup>-1</sup>. Hence the value of ΔH<sub>f</sub>°<sub>298.15</sub> for cis-HNO<sub>2</sub>(g) was calculated.

The heat of reaction and the equilibrium constants for the formation of HNO<sub>2</sub>(g) have been calculated by M. M. Karvaev and O. A. Skvortsov, Russ. J. Phys. Chem. 35, 566 (1962). The value of ΔH<sub>f</sub>°<sub>298.15</sub> reported is -18.6 kcal. mole<sup>-1</sup>. However, based on the heat of formation of liquid HNO<sub>2</sub>, P. O. Ahmre and B. P. Levitt, Trans. Faraday Soc., 53, 945 (1957) give ΔH<sub>f</sub>° = -13.7 kcal. mole<sup>-1</sup>. The corresponding value reported by W. A. Rossar and H. Wise, J. Chem. Phys., 26, 571 (1957) is -20.0 kcal. mole<sup>-1</sup>, based on the experimental data of L. O. Wayne and D. M. Yoest, J. Chem. Phys., 19, 41 (1951), and the entropy of the equilibrium mixture of the trans- and cis-HNO<sub>2</sub>(g) calculated by L. H. Jones, R. M. Badger and G. E. Moore, loc. cit.

Heat Capacity and Entropy.

Vibrational frequencies, bond distances, and bond angles were obtained from L. Dor and P. Tarte, Bull. Soc. Roy. Sci., 46, 478 (1953) and L. H. Jones, R. M. Badger and G. E. Moore, loc. cit. The three principal moments of inertia are: 1.0277 X 10<sup>-39</sup>, 6.8242 X 10<sup>-39</sup>, and 7.8520 X 10<sup>-39</sup> g. cm.<sup>2</sup>

## Heat of Formation.

P. O. Ashmore and B. J. Tyler, J. Chem. Soc. 1017 (1961) reported  $\Delta H_f^o$  298.15 = -9.06 ± 0.32 kcal. mole<sup>-1</sup> for the reaction  $\text{NO(g)} + \text{NO}_2(\text{g}) \rightleftharpoons 2\text{HNO}_2(\text{g})$ , yielding  $\Delta H_f^o$  298.15 = -18.57 ± 0.20 kcal. mole<sup>-1</sup> for  $\text{HNO}_2(\text{g})$ . L. H. Jones, R. M. Badger and O. E. Moore, J. Chem. Phys., 19, 1599 (1951) estimated the difference in energy of cis- and trans- $\text{HNO}_2(\text{g})$  to be 506 ± 250 cal. mole<sup>-1</sup>. Hence the value of  $\Delta H_f^o$  298.15 for trans- $\text{HNO}_2(\text{g})$  was calculated.

The heat of reaction and the equilibrium constants for the formation of  $\text{HNO}_2(\text{g})$  have been calculated by M. Keravayev and G. A. Skvortsov, Russ. J. Phys. Chem. 36, 566 (1962). The value of  $\Delta H_f^o$  298.15 reported is -18.8 kcal. mole<sup>-1</sup>. However, based on the heat of formation of liquid  $\text{HNO}_2$ , P. O. Ashmore and B. F. Levitt, Trans. Faraday Soc., 53, 945 (1957) give  $\Delta H_f^o$  = -13.7 kcal. mole<sup>-1</sup>. The corresponding value reported by W. A. Rossier and H. Wise, J. Chem. Phys., 26, 571 (1957) is -20.0 kcal. mole<sup>-1</sup>. The corresponding value reported by L. G. Wayne and D. M. Yeast, J. Chem. Phys., 19, 41 (1951), and the entropy of the equilibrium mixture of the trans- and cis- $\text{HNO}_2(\text{g})$  calculated by L. H. Jones, R. M. Badger and O. E. Moore, loc. cit.

## Heat Capacity and Entropy.

Vibrational frequencies, bond distances, and bond angles were taken from L. H. Jones, R. M. Badger, and O. E. Moore, loc. cit. The values of vibrational frequencies were in good agreement to those reported by L. Dor and P. Tarte, Bull. Soc. Roy. Sci., 478 (1951). The three principal moments of inertia are: 7.660 X 10<sup>-40</sup>, 7.5268 X 10<sup>-39</sup>, and 8.3328 X 10<sup>-39</sup> g. cm.<sup>2</sup>

Heat of Formation:

ΔH<sub>f</sub><sup>298.15</sup> was taken from National Bureau of Standards Report 7437, January 1, 1962. Equilibria involving HNO<sub>3</sub> were measured by E. J. Jones, J. Am. Chem. Soc. 55, 2274 (1933), G. Peck, J. Am. Chem. Soc. 76, 5858 (1954) and H. E. Abel, H. Schmid and M. Stein-Wien, Z. Elektrochem. 35, 692 (1930), yielding ΔH<sub>f</sub><sup>0</sup> = -32.06, -32.02, and -32.09 kcal. mole<sup>-1</sup>, respectively. O. Becker and W. A. Roth, Z. Elektrochem. 40, 836 (1934) and J. Thomsen, "Thermochemische Untersuchungen," Barth, Leipzig, 1922-1926, measured the heat of neutralization of HNO<sub>3</sub>(aq.) with NH<sub>3</sub>, combining these values with the data for NH<sub>3</sub> yields ΔH<sub>f</sub><sup>0</sup> = -32.27 and -32.07 kcal. M. Berthelot, "Sur la Force des Matieres Explosives," 3rd. ed., Paris, 1863, measured the heat of reaction of N<sub>2</sub>O<sub>4</sub>(g) and Cl<sub>2</sub>(g), obtaining ΔH<sub>f</sub><sup>0</sup> = -32.10 kcal. mole<sup>-1</sup>. The value of ΔH<sub>f</sub><sup>298.15</sup> reported by W. R. Forsythe and W. F. Otaque, J. Am. Chem. Soc. 64, 48 (1942) was -31.994 kcal. mole<sup>-1</sup>. The value adopted is the weighted average of these six values.

Heat Capacity and Entropy.

Vibrational frequencies were obtained from A. Palm and M. Kilpatrick, J. Chem. Phys. 23, 1562 (1955). Bond distances and bond angles were taken from D. J. Millen and J. R. Morton, J. Chem. Soc., 1523 (1960). The basic parameters of HNO<sub>3</sub>(g) reported by P. A. Aklonis, L. V. Vilkoj and V. Y. Rosolovskii, Zhur. Strukt. Khim. 1, 1 (1960) were: r(N-O) = 1.22 ± 0.01 Å; r(N-O) = 1.40 ± 0.01 Å; and ∠ O-N-O = 135° ± 2.5°. Forsythe and Otaque, loc. cit. have calculated the absolute entropy of pure nitric acid (g) from calorimetric data. The value obtained was S<sub>298.15</sub> = 63.62 cal. deg.<sup>-1</sup> mole<sup>-1</sup>. The entropy of nitric acid vapor at 298.1°K. has also been computed by H. Cohn, C. K. Ingold, and H. G. Poole, J. Chem. Soc. 4272 (1952) to be 63.70 cal. deg.<sup>-1</sup> mole<sup>-1</sup>. The three principal moments of inertia are: 6.4299 × 10<sup>-39</sup>, 7.0314 × 10<sup>-39</sup>, and 1.3461 × 10<sup>-39</sup> g. cm.<sup>2</sup>

$$\Delta H_f^o = -12.43 \pm 0.02 \text{ kcal. mole}^{-1}$$

$$\Delta F_f^o = -13.49 \pm 0.02 \text{ kcal. mole}^{-1}$$

$$S_{298.15}^o = 9.564 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$$

$$T_d = [700]^\circ\text{K.}$$

## Heat of Formation.

$\Delta H_f^o$  298.15 was obtained from S. R. Gunn and L. G. Green, *J. Am. Chem. Soc.* **80**, 4782 (1958). The value of  $\Delta H_f^o$  298.15 reported by C. E. Messer, L. G. Fasolino and C. E. Thalmeier, *J. Am. Chem. Soc.* **77**, 4524 (1955) was  $-13.60 \pm 0.27 \text{ kcal. mole}^{-1}$  which is in excellent agreement with the value given by S. R. Gunn and L. G. Green, loc. cit. The results of the previous investigations were also reviewed by C. E. Messer, et al., loc. cit.

## Heat Capacity and Entropy.

$C_p$  below 350°K were measured by E. F. Westrum, et al., University of Michigan, Ann Arbor, Michigan, private communication, May 19, 1960.  $C_p$  above 350°K were estimated by comparison with those for LiH(c).  $C_p$ , 59.94 ~ 91.84°K., were also measured by E. V. Sayre and J. J. Heaver, *J. Chem. Phys.* **19**, 584 (1950).  $S^o$  at 100°, 200°, and 298.15° were taken from E. F. Westrum, et al., loc. cit., using  $S_{10}^o(\text{extrap.}) = 0.008 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$ .

## Temperature of Decomposition.

$T_d$  was estimated from the value of  $\Delta F_f^o$  in the table. The value of  $T_d$  given by D. M. Banus, J. J. McSharry and E. A. Sullivan, *J. Am. Chem. Soc.* **77**, 2007 (1955) was 940°K. It was assumed that NaH would behave similarly to LiH and that decomposition pressure would be purity dependent, and this would produce apparently high  $T_d$ 's.

Ground State Configuration  $1s^2 +$

$S^{\circ}_{298.15} = 45.0 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$

$\Delta H^{\circ}_f 0 = 30.2 \pm 4.6 \text{ kcal. mole}^{-1}$

$\Delta H^{\circ}_f 298.15 = 29.7 \pm 4.6 \text{ kcal. mole}^{-1}$

$\omega_e x_e = 19.72 \text{ cm.}^{-1}$

$\omega_e = 4.3012 \text{ cm.}^{-1}$

$\sigma = 1$

Heat of Formation.

$\Delta H^{\circ}_f 298.15$  was calculated from  $D^{\circ} = 2.05 \pm 0.2 \text{ e.v.}$  reported by A. G. Oeydon, "Dissociation Energies and Spectra of Diatomic Molecules," Chapman and Hall Ltd., 1953.

Heat Capacity and Entropy.

All molecular and spectroscopic constants were obtained from G. Herzberg, "Spectra of Diatomic Molecules," D. Van Nostrand, Inc., 1950.

Sodium Hydroxide (NaOH)

(Crystal) Mol. Wt. = 39.99717

Dec. 31, 1960; Mar. 31, 1966

ΔH<sub>f</sub><sup>o</sup> 0 = -100.82 ± 0.1 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> 298.15 = -101.90 ± 0.1 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> = 1.519 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> = 1.519 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> 298.15 (to monomer) = [51.5] kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> 298.15 (to dimer) = [49.0] kcal. mole<sup>-1</sup>

**Heat of Formation.**  
 The standard enthalpy of formation, ΔH<sub>f</sub><sup>o</sup> 298 (NaOH, c) = -101.90 ± 0.1 kcal. mole<sup>-1</sup>, was calculated from the heat of solution of sodium hydroxide (c) and the heat of sodium metal hydrolysis and the appropriate auxiliary data. N. A. Peshetnikov<sup>1</sup> has measured the heat of solution NaOH(c) as -10.445 ± 0.015 kcal. mole<sup>-1</sup> at 298.15°K. by solution calorimetry. Using the auxiliary heat of dilution reported by V. B. Parker<sup>2</sup>, the selected heat of solution of sodium hydroxide (c) at infinite dilution is -10.555 kcal. mole<sup>-1</sup>. Also L. E. Murch and W. F. Glaque<sup>3</sup> measured calorimetrically the heat of solution of solid samples of NaOH·nH<sub>2</sub>O in the range from n = 0.1 to 1.0. When extrapolated to n = 0 and infinite dilution<sup>2</sup>, this result yields the heat of solution of NaOH(c) at infinite dilution, ΔH<sub>f</sub><sup>o</sup> 298 = -10.635 kcal. mole<sup>-1</sup>, which is in good agreement with the value selected.

The heat of sodium metal hydrolysis, ΔH<sub>f</sub><sup>o</sup> 298, has been measured in the solution calorimeter by the following investigators. Na(c) + H<sub>2</sub>O(l) → NaOH(aq) + 1/2 H<sub>2</sub>(g) ΔH<sub>f</sub><sup>o</sup> 298

| Source                      | Number of Moles of H <sub>2</sub> O | ΔH <sub>f</sub> <sup>o</sup> 298 kcal. mole <sup>-1</sup> | ΔH <sub>f</sub> <sup>o</sup> 298 (NaOH(aq, c)) kcal. mole <sup>-1</sup> |

| Gunn et al. <sup>3</sup>    | 1000                                | -44.047 ± 0.008   | -101.899  |
| Messer et al. <sup>4</sup>  | CO                                  | -44.215 ± 0.20  | -101.975  |
| Ketchen et al. <sup>5</sup> | CO                                  | -44.056 ± 0.20  | -101.814  |

The values of ΔH<sub>f</sub><sup>o</sup> 298 (NaOH·nH<sub>2</sub>O) were calculated from the heats of reaction ΔH<sub>f</sub><sup>o</sup> 298 using the ΔH<sub>f</sub><sup>o</sup> 298 (H<sub>2</sub>O, l) = -68.315 kcal. mole<sup>-1</sup>.<sup>6</sup> Combination of the selected heat of solution of NaOH(c) at infinite dilution with the heat of formation of NaOH(c) gives the heat of formation of NaOH(c) in the last column of the table. A weighted average of these three measurements has been taken for the selected heat of formation of sodium hydroxide (c). The earlier investigations have been reviewed by F. R. Bichowsky and F. D. Rossini<sup>7</sup> and C. E. Messer et al.<sup>4</sup>, and these earlier reported data are not adopted in the tabulation.

**Heat Capacity and Entropy.**  
 L. E. Murch and W. F. Glaque<sup>11</sup> have measured low temperature heat capacities of NaOH·0.04014 H<sub>2</sub>O and NaOH·0.37716 H<sub>2</sub>O from 15° to 320°K. and calculated the values of C<sub>p</sub> for the pure phase of NaOH(c). T. B. Douglas and J. L. Dever<sup>9</sup> have measured the enthalpy changes from 273° to 975°K. in the drop calorimeter and derived the heat capacities. The low temperatures and the high temperature heat capacities were joined smoothly by Murch and Glaque, and the smooth values were adopted in the tabulation. Low temperature heat capacities from 60° to 300°K. have also been measured by J. C. R. Kelly and P. E. Snyder<sup>7</sup>, whose data are in good agreement with those reported by Murch and Glaque. M. M. Popov and D. M. Ginzburg<sup>10</sup> have determined the heat capacities of NaOH(c) in the temperature range from 298° to 577°K. from the enthalpy measurements by drop calorimetry. The reported H<sub>500</sub><sup>o</sup>-H<sub>298</sub><sup>o</sup> = 3.112 kcal. mole<sup>-1</sup> is in good agreement with the tabulated value.

**Transition and Melting Data.**  
 The adopted heat of transition and the transition temperature, and the adopted heat of melting and the melting point were obtained from Douglas and Dever,<sup>9</sup> Popov and Ginzburg,<sup>10</sup> and the heat of transition ΔH<sub>tr</sub><sup>o</sup> = 1.930 kcal. mole<sup>-1</sup> at 576.8°K. and the heat of melting ΔH<sub>m</sub><sup>o</sup> = 1.629 kcal. mole<sup>-1</sup> at 595.16°K.

**Heat of Sublimation.**  
 See NaOH(g) table for details.

$S_{298}^{o,15} = 17.727 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$

$T_m = 592.25^{\circ}\text{K.}$

$T_b(\text{monomeric gas}) = 1662.7^{\circ}\text{K.}$

$\Delta H_f^{o,15} = -99.998 \text{ kcal. mole}^{-1}$

$\Delta H_m^{o,15} = 1.519 \text{ kcal. mole}^{-1}$

$\Delta H_v^{o,15}(\text{to monomer}) = 37.9 \text{ kcal. mole}^{-1}$

Heat of Formation.

The heat of formation of NaOH(l) at 298°K. was obtained from that of the crystal by adding  $\Delta H_m^{o,15}$  and the difference between  $H_{298.15}^{o,15}$  for crystal and liquid.

Heat Capacity and Entropy.

The selected heat capacities in the temperature range from 592.3° to 1000°K. were obtained from the enthalpy measurements of sodium hydroxide (l) in the drop calorimeter by T. B. Douglas and J. L. Dever<sup>1</sup>. The heat capacities below the melting point and above 1000°K. were extrapolated from the selected heat capacity curve.

Douglas and Dever<sup>1</sup> have also compared their heat capacity values with those from W. D. Powers and G. C. Blalock<sup>2</sup> who have applied the same drop method to determine the heat capacities of NaOH(l). Both results are in reasonable agreement. M. M. Popov and G. M. Ginzburg<sup>3</sup> applying the same technique obtained different values of heat capacity. The smoothed enthalpy data reported by Ginzburg<sup>4</sup> are 200 to 500 cal. mole<sup>-1</sup> smaller than the tabulated values at the temperature range from 700° to 1000°K.

The entropy ( $S_{298}^{o,15} = 17.65 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$ ) was obtained in a manner analogous to that of the heat of formation.

Melting Data.

See NaOH(c) table for details.

Vaporization Data.

The boiling point 1662.7°K. was calculated as the temperature at which the free energies of formation ( $\Delta F_f^{o,15}$ ) for both NaOH(l) and NaOH(g) are equal. The difference in the heats of formation ( $\Delta H_f^{o,15}$ ) of NaOH(l) and NaOH(g) at the boiling point is the heat of vaporization. If  $\text{Na}_2(\text{OH})_2(\text{g})$  is also considered as a minor component in the vapor mixture (approximately 6% of total vapor pressure at the boiling point) the calculated boiling point is 1653°K. (see NaOH(g) table for details).

H. von Wartenberg and P. Albrecht, Z. Elektrochem. 27, 162 (1921), have studied the vapor pressures of liquid NaOH and reported the boiling point as 1661°K.

Bond Distance: Na-O = [1.97] Å  
 O-H = [0.96] Å

Bond Angle: Na-O-H = [110°]

Product of the Moments of Inertia:  $I_A I_B I_C = [5.3682] \times 10^{-117} \text{ g.}^3 \text{ cm.}^6$

σ = 1

Heat of Formation.

R. C. Schoonmaker and R. F. Porter, J. Chem. Phys. **28**, 454 (1958), have found in their mass-spectrometric studies that the NaOH(l) vaporizes mainly as gaseous dimer in the temperature range from 575° to 723°K. They have also calculated by the slope method the heat of dimerization,  $\Delta H_{298}^{\circ} = -54 \pm 5 \text{ kcal. mole}^{-1}$ , for  $2\text{NaOH}(g) = \text{Na}_2\text{O}(H)_2(g)$  and the heat of sublimation,  $\Delta H_{298}^{\circ} = 46.3 \pm 3 \text{ kcal. mole}^{-1}$ , for  $\text{NaOH}(c) = \text{NaOH}(g)$ . The second law values were determined using ion intensity ratios, however, a third law calculation using a single data point converted by the authors to absolute pressure (J. Phys. Chem. **62**, 488 (1958)) yields  $\Delta H_{298}^{\circ} = -51.6 \text{ kcal. mole}^{-1}$ ,  $\Delta H_{298}^{\circ}(\text{to monomer}) = 49.5 \text{ kcal. mole}^{-1}$  and  $\Delta H_{298}^{\circ}(\text{to dimer}) = 41.1 \text{ kcal. mole}^{-1}$  which are in agreement within the limit of uncertainty. Later, Forter and Schoonmaker, J. Chem. Phys. **31**, 830 (1959), found the activity of molten alkali hydroxide had been reduced in the presence of MgO in their sample container, and the uncertainty in the heat of sublimation might be  $\pm 5 \text{ kcal. mole}^{-1}$ , but the heat of dimerization should not be seriously affected because it was calculated from slopes of both species. In order to have good agreement between the calculated total pressures of monomer and dimer of sodium hydroxide (g) and the observed vapor pressures by H. von Wartenberg and P. Albrecht, Z. Elektrochem. **27**, 162 (1921), the heat of dimerization and the heat of sublimation have been so chosen as  $\Delta H_{298}^{\circ} = -54 \text{ kcal. mole}^{-1}$  and  $\Delta H_{298}^{\circ} = 49.5 \text{ kcal. mole}^{-1}$  and the boiling point is 1653°K. which is in good agreement with 1661 ± 20°K. reported by Wartenberg and Albrecht, loc. cit. The heats of formation were calculated from the selected heat of dimerization and heat of sublimation as  $\Delta H_{298}^{\circ}(\text{NaOH}, g) = -50.4 \text{ kcal. mole}^{-1}$  and  $\Delta H_{298}^{\circ}(\text{Na}_2\text{O}(H)_2, g) = -154.8 \text{ kcal. mole}^{-1}$ .

Heat Capacity and Entropy.

The bent molecular configuration with the bond angle of 110° was proposed by S. H. Bauer, R. M. Diner and P. F. Porter, J. Chem. Phys. **23**, 931 (1956). The bond distance O-H was estimated from that in H<sub>2</sub>O(g). The bond distance Na-O was estimated by adding the bond length difference (0.04 Å) between H-OH(g) and H-F(g) to the bond distance Na-F(g) (1.92595 Å) which has been accurately measured by R. K. Bauer and H. Lew, Can. J. Phys. **41**, 1461 (1963). The Na-O stretching frequency was obtained from L. H. Spinar and J. L. Margrave, Spectrochim. Acta **12**, 244 (1956), in the infrared spectroscopic studies. The O-H stretching and the bending frequencies were estimated by comparison with H-OH, D-OH and T-OH which indicate rigid convergence to a constant as a heavier atom is attached. The three principal moments of inertia are  $I_A = [0.1252] \times 10^{-59}$ ,  $I_B = [6.449] \times 10^{-59}$  and  $I_C = [6.5742] \times 10^{-59} \text{ g. cm.}^2$

Hydroxyl (OH)

$$\omega_e x_e = 82.81 \text{ cm.}^{-1}$$

$$\alpha_e = 0.714 \text{ cm.}^{-1}$$

$$\sigma = 1$$

$$r_e = 0.9706 \text{ \AA}$$

Heat of Formation.

P. Orsy, Trans. Farad. Soc. **55**, 408 (1959) has summarized the determinations of the heat of formation of OH and concludes that the short extrapolation by Barrow, Arkiv. Fysik, **11**, 281 (1956) of the  $E(2\Sigma^+) \rightarrow A(2\Sigma^+)$  system gives the most reliable result. The value of  $D_0 = 101.33 \text{ kcal. mole}^{-1}$  was adopted and leads to a heat of formation of  $9.432 \text{ kcal. mole}^{-1}$ . A recent determination of the dissociation energy from measurements of the concentration of the radicals in water oxygen mixtures by A. P. Furmal and A. V. Frost, Veatn. Mosk. Univ., Ser. II Khim. **15**, 25 (1961) gives  $\Delta H_f^{\circ}(\text{OH}) = 102.8 \pm 0.8 \text{ kcal. mole}^{-1}$  in good agreement with the adopted value. Also V. A. Medvedev, V. V. Korobov and V. P. Balbut, Zhur. Fiz. Khim. **33**, 58 (1959) reported a heat of dissociation of  $102.2 \pm 1 \text{ kcal. mole}^{-1}$  from dissociation of water in a spherical bomb.

Heat Capacity and Entropy.

The molecular constants were all given by G. Herzberg, "Spectra of Diatomic Molecules", D. Van Nostrand Company, Inc. New York, 1950. This calculation gives values in excellent agreement with L. Haar, A. S. Friedman and C. W. Beckett, National Bureau of Standards Monograph No. 20, May 1961. The agreement with the higher order correction calculations of H. L. Johnston, J. Beizer and L. Savedoff, TR 316-5, Ohio State University, available as ATI 159 967, is good between 298 and 4000°K. This earlier work uses different constants and also a different value of the ground state splitting constant, but at 6000°K. the entropy difference is still less than 0.25%.

$$\sigma_e = 0.752 \text{ cm.}^{-1}$$

$$r_e = 1.0289 \text{ \AA}$$

Heat of Formation

The ionization potential of hydroxyl has been determined by M. M. Mann, A. Hustrulid and J. T. Tate, Phys. Rev. 58, 340 (1940) from electron impact data on water vapor, as 13.6 e.v. S. N. Foner and R. L. Hudson, J. Chem. Phys. 25, 602 (1956) have measured the appearance potential of OH<sup>+</sup> from OH as 13.18 ± 0.1 e.v. (303.96 kcal.). This value was the one adopted to obtain the heat of formation of OH<sup>+</sup>(g) from that of OH(g) at 0°K.

Heat Capacity and Entropy

The molecular constants, with the exception of  $\omega_e X_e$ , were all given by O. Herzberg, "Spectra of Diatomic Molecules", D. Van Nostrand Company, Inc. New York, 1950. The value of  $\omega_e X_e$  was estimated by analogy with OH(g) and other diatomic hydrides.  
 The value of  $H_{298}^0$  at 0°K. is -2.06 kcal. mole<sup>-1</sup>.

ω<sub>e</sub> = 3735 ± 560 cm.<sup>-1</sup>  
B<sub>e</sub> = 18.87 cm.<sup>-1</sup>

Heat of Formation

L. M. Branscomb, Joint Institute for Laboratory Astrophysics Report No. 62, Feb. 1st, 1966 has deduced an electron affinity of OH of 1.83 ± 0.04 e.v. (42.2 ± 0.9 kcal.) from the photodetachment spectrum of OH<sup>-</sup>(g). The vibrational state was deduced to be the ground state since no other absorption sequence could be detected by a thorough search. F. M. Page, Faraday Soc. Discussions 13, 87 (1955) has reviewed the methods and results of earlier determinations of the electron affinity of OH(g) and concludes that it is 65 ± 1 kcal. However he does state that it is not generally known whether the flame systems chiefly investigated are in thermodynamic equilibrium. In a later paper F. M. Page and T. M. Sugden, Trans. Faraday Soc. 53, 1092 (1957) conclude that much higher concentrations of radicals are obtained in flames than predicted thermodynamically. However for certain systems at lower temperatures they estimate only a factor of 3 increase in concentration and thus calculate the electron affinity as 61 kcal. mole<sup>-1</sup>. The value reported by Branscomb, loc. cit. is adopted here.

Heat Capacity and Entropy

Branscomb loc. cit. has used his photodetachment spectra to obtain values of ω<sub>e</sub>, B<sub>e</sub> and r<sub>e</sub> for OH<sup>-</sup>(g) which are remarkably similar to those for OH(g). The values of ω<sub>e</sub>x<sub>e</sub> and C<sub>f</sub>e were estimated by comparison with OH(g) and other hydrides. The ground state configuration was assumed to be that of HF(g) with which it is isoelectronic. The value of H<sub>298</sub>-H<sub>298</sub> at 0°K. is -2.057 kcal. mole<sup>-1</sup>.

NBS, 31, 1964

HYDROPEROXYL (HO<sub>2</sub>) (IDEAL GAS)

MOL. WT. = 33.008

Point Group C<sub>1</sub>  
 $\Delta H_f^o = 54,383 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $\Delta H_f^o = 298.15 = 54,383 \text{ cal. mole}^{-1}$   
 Ground State Quantum Weight = [2]

 $\Delta H_f^o = 6 \pm 2 \text{ kcal. mole}^{-1}$ 

## Vibrational Frequencies and Degeneracies

| $\omega$ , cm. <sup>-1</sup> | $g_i$ |
|------------------------------|-------|
| 1389.4                       | (1)   |
| 1101                         | (1)   |
| 3414                         | (1)   |

Bond length: H-O = [0.958] Å

O-O = [1.30] Å

Bond angle: HOO = [120°]  $\sigma = 1$ Product of the Moments of Inertia:  $I_A I_B I_C = [0.6424] \times 10^{-117} \text{ g.}^3 \text{ cm.}^6$ 

## Heat of Formation.

S. M. Foner and R. L. Hudson, J. Chem. Phys. **36**, 2681 (1962) have determined the ionization potential of HO<sub>2</sub> and the appearance potential of HO<sub>2</sub><sup>+</sup> from H<sub>2</sub>O<sub>2</sub>. Using the  $\Delta H_f^o$  of H<sub>2</sub>O<sub>2</sub>(g) determined by P. A. Giguere and I. D. Liu, J. Am. Chem. Soc. **77**, 6477 (1955), they calculate  $\Delta H_f^o$  HO<sub>2</sub> =  $5.7 \pm 2 \text{ kcal. mole}^{-1}$ .

## Heat Capacity and Entropy.

The point group must be C<sub>1</sub> as the two oxygen atoms have been shown to be non-equivalent, from the increased number of infra-red bands obtained when using O<sub>16</sub> enriched with 28% of O<sub>18</sub>, by D. E. Milligen and M. E. Jacox, J. Chem. Phys. **39**, 2027 (1963). They also reported the three frequencies given above in the infra-red spectrum of the matrix isolated HO<sub>2</sub> radical. The bond lengths were taken equal to those estimated by M. E. Boyd, J. Chem. Phys. **37**, 1317 (1962), the angle was that recommended by Milligen and Jacox, loc. cit. Boyd's conclusion that the lowest energy configuration should be an isosceles triangle could not be accepted in view of the nonequivalence of the oxygen atoms. The electronic ground state was taken as 2A<sup>+</sup> as predicted by A. D. Walsh, J. Chem. Soc. London, 2288 (1953).

Heat of Formation

Jordan (1) estimated the dissociation energy (D<sub>0</sub>) of PH(g) as 70.44 kcal/mol using a semiempirical theoretical method. The corresponding value for the heat of formation (ΔH<sub>f,298.15</sub><sup>o</sup>) is 60.6 ± 8 kcal/mol.

Heat Capacity and Entropy

Jordan (1) predicted five electronic levels (X<sup>2</sup>, A<sup>2</sup>, B<sup>2</sup>, D<sup>1</sup>, E<sup>2</sup>) based on the reported value (2) of 29560 cm<sup>-1</sup> for the C<sup>2</sup> level (this level is designated A<sub>31</sub> by Herzberg (2)). Several qualitative spectroscopic investigations of PH(g) have been reported and are in general accord with the predictions of Jordan (1). Ishaq and Pearse (3) reported the values of the rotational constant B<sub>e</sub> and the fundamental vibrational frequency ω<sub>e</sub>. The value of ω<sub>e</sub> is calculated from the Morse potential function. The bond distance is calculated from B<sub>e</sub>. The value of the anharmonic vibrational term ω<sub>e</sub>x<sub>e</sub> is estimated from the relation ω<sub>e</sub>x<sub>e</sub> = ω<sub>e</sub><sup>2</sup>/(4D<sub>0</sub> + 2ω<sub>e</sub>).

June 30, 1982

Lead Monohydride (PbH) (Ideal Gas)

Mol. Wt. = 208.22

ΔH<sub>f</sub> 298.15 = 56.5 ± 4.6 kcal. mole<sup>-1</sup>

S<sub>298.15</sub> = 52.737 cal. deg.<sup>-1</sup> mole<sup>-1</sup>

Ground State Configuration 2Π<sub>1/2</sub>

Electronic Levels and Multiplicities

| ε, cm. <sup>-1</sup> | g <sub>i</sub> |
|----------------------|----------------|

| [6000]               | 2              |

ω<sub>e</sub> = 1564.1 cm.<sup>-1</sup> ω<sub>e</sub>x<sub>e</sub> = 28.75 cm.<sup>-1</sup>

P<sub>e</sub> = 4.971 cm.<sup>-1</sup> α<sub>e</sub> = 0.144 cm.<sup>-1</sup>

σ<sup>o</sup> = 1

Heat of Formation. ΔH<sub>f</sub> 298.15 was calculated from the dissociation energy of PbH(g) reported by A. G. Gaydon, "Dissociation Energies and Spectra of Diatomic Molecules," Chapman and Hall, Ltd., London, 1953.

Heat Capacity and Entropy. Ground state configuration and spectroscopic data were obtained from G. Herzberg, "Spectra of Diatomic Molecules," Van Nostrand, New York (1950). Electronic levels and multiplicity were estimated by comparison with those for PbF(g).

Sulfur Monohydride (SH)  
(Ideal Gas)      GFW = 33.07197

Heat of Formation

Mackie (1) estimated  $\Delta H^\circ_{f,298}$  of SH(g) as  $34.6 \pm 4$  kcal/mol, this value being an average of three independent determinations.

We obtained these three values by the following methods: (A) He calculated  $\Delta H^\circ_{f,298}$  of SH(g) as  $34.9 \pm 4.5$  kcal/mol from  $\Delta H^\circ_{f,298}$  of thiobenzyl alcohol (g),  $\Delta H^\circ_{f,298}$  of the benzyl radical (g) and the heat of dissociation ( $D_0^\circ$ ) of thiobenzyl alcohol reported by Sehn and Darwent (2). (B) A value of  $35.2 \pm 4.5$  kcal/mol was calculated from  $\Delta H^\circ_{f,298}$  of  $C_2H_5$  (g),  $\Delta H^\circ_{f,298}$  of  $C_2H_5SH$ (g) and the appearance potential of  $C_2H_5$  reported by Franklin and Lumpkin (3). (C) He calculated that  $\Delta H^\circ_{f,298}$  of SH(g) is  $33.7 \pm 3$  kcal/mol from  $\Delta H^\circ_{f,298}$  of  $H_2S$ (g) and the mass spectrographic data for the reactions  $H_2S = SH^+ + H + e^-$  and  $SH = SH^+ + e^-$  reported by Palmer and Lessing (4). The adopted value of  $34.5 \pm 4$  kcal/mol compares with a value of  $34.9$  kcal/mol obtained from a linear Birge-Sponer extrapolation of the potential function.

Heat Capacity and Entropy

The high resolution spectra of SH(g) have been studied by Ramsay (5) and Johns and Ramsay (6) in the near UV and by Morrow (7) in the vacuum UV. The energy levels of the doublet ground state and of the first excited state ( $^2\Sigma$ ) were reported by Ramsay (5). Six of the seven higher excited levels ( $8^2\Sigma, 9^2\Sigma, 10^2\Sigma, 11^2\Sigma, 12^2\Sigma, 13^2\Sigma$ ) were reported by Morrow (7), the last five of which are shown as an average of 75000  $\text{cm}^{-1}$ . The remaining electronic level ( $C^2\Delta$ ) is estimated by analogy with the electronic levels of SD(g) reported by Morrow (7).

Ramsay (5) reported the following rotational and vibrational constants:  $B_0 = 9.461 \text{ cm}^{-1}$ ,  $\omega_e = 2702 \text{ cm}^{-1}$ , and  $\omega_e \times_e = 60 \text{ cm}^{-1}$ . The value of  $\alpha_e$  is calculated from the Morse potential function. The rotational constant  $B_e$  is calculated from  $B_e = B_0 + \alpha_e/2$ . The bond distance is calculated from  $B_e$ .

Heat of Formation

Verma (1) has derived an upper limit to the dissociation energy of 24680 cm<sup>-1</sup> (70.56 kcal) from predissociation in the  $B^2\Sigma^+$  state. With JANAF values for Si(g) and H(g) this yields  $\Delta H_f^0(\text{SiH}, g) \geq 87.73$  kcal/mol. We adopt a value of  $\Delta H_f^0(\text{SiH}, g) = 90 \pm 2$  kcal/mol, assuming that the predissociation has a 2 kcal barrier similar to that in the predissociation of the  $A^1\Pi$  state of AlH. Hildenbrand (2) has applied an ionic-covalent correction to the linear Birge-Sponer extrapolation of the ground state dissociation energy and obtains  $D_0(\text{SiH}, g) = 70$  kcal in excellent agreement with the predissociation value.

Heat Capacity and Entropy

The observed electronic levels and rotational and vibrational constants are from Herzberg et al. (2), Klynnng and Lindgren (3), and Verma (1). The estimated levels are from the calculations of Jordan (4). The upper states are all assumed to have ground state molecular constants. This approximation introduces negligible error when the first state is as high as 21000 cm<sup>-1</sup> and has the same multiplicity as the ground state.

Ground State Configuration [2Π] ΔH<sub>f</sub><sup>o</sup> = [123.7] kcal. mole<sup>-1</sup>  
 S<sub>298.15</sub><sup>o</sup> = [51.638] cal. deg.<sup>-1</sup> mole<sup>-1</sup> ΔH<sub>f</sub><sup>o</sup> 298.15 = [123.4] kcal. mole<sup>-1</sup>

Electronic Levels and Multiplicities

$$\frac{\epsilon_{i'}}{\epsilon_1} = \frac{\epsilon_i}{0} \quad [4]$$

ω<sub>e</sub> x<sub>e</sub> = [1400] cm.<sup>-1</sup> ε = 1  
 ω<sub>e</sub> = [5.1] cm.<sup>-1</sup> x<sub>e</sub> = [0.09] cm.<sup>-1</sup> r<sub>e</sub> = [1.821] Å

Heat of Formation.

ΔH<sub>f</sub><sup>o</sup> was estimated as 123.7 kcal. mole<sup>-1</sup> by J. S. Gordon, Astroystema International, Livingston, New Jersey, private communication, January 10, 1963. ΔH<sub>f</sub><sup>o</sup> 298.15 was then calculated.

Heat Capacity and Entropy.

Molecular constants were estimated by J. S. Gordon, loc. cit. r<sub>e</sub> was calculated from the relationship r<sub>e</sub> = (16.858778/μB<sub>e</sub>)<sup>1/2</sup> Å.

 $\rho = 2$

Heat Capacities and Entropy

H. W. Woolley, R. B. Scott and P. G. Brickwedde, J. Research Nat. Bur. Standards 51, 379 (1946), calculated the thermodynamic functions by a method of direct summation for normal H<sub>2</sub> (75% ortho and 25% para) using spectroscopic constants derived from an analysis of U. V. band spectra. These constants are more preferable for use in a summation method than those obtained by G. Herzberg, Can. J. Res. A29, 144 (1950) from the measured quadrupole transitions in the ground state which accurately describe the lower vibrational levels only. In any case the difference in the functions resulting from the two sets of data are less than 0.3%.

Since the entropies of Woolley et al. contain a contribution from nuclear spin, a correction of -Rln4 was applied. However, the entropy due to the mixing of ortho and para hydrogen which is a consequence of nuclear spin is included in the total entropy since this results in correct equilibrium constants based upon third law calculations. Differences in the values of R and C<sub>p</sub> were found to have a negligible effect upon the functions.

Similar calculations with a different method of estimating the higher rotational levels by H. L. Johnston, L. G. Saverdoff, and J. Beizer, Technical Report No. 2, Project R.P.-316, Ohio State Univ. (1949), result in functions that are 0.5% lower above 5000°K.

For details concerning the dissociation energy see the monatomic hydrogen sheet.

See KOH(g) table for details.

Heat Capacity and Entropy.

S. H. Bauer, R. H. Diner and R. F. Porter, J. Chem. Phys. 29, 991 (1958), have proposed a model for the dimeric alkali hydroxide (g) which consists of a square planar configuration for the alkali and oxygen atoms, with two hydrogen bridges between the oxygens (the hydrogen and oxygen atoms formed a rhombus perpendicular to the alkali-oxygen plane). R. C. Schoonmaker and R. F. Porter, J. Chem. Phys. 31, 830 (1959), have suggested a square planar model without hydrogen bonding with alkali-oxygen bond distances 0.2 Å larger than those assumed for the monomeric alkali hydroxides. J. Berkowitz, D. J. Meschl and W. A. Chupka, J. Chem. Phys. 33, 533 (1960), have also postulated a model for Li<sub>2</sub>(OH)<sub>2</sub>(g) which consists of a trans configuration with hydrogens above and below the plane of the rhombus, and the bond angle O-Li-O = 100°. The last one was adopted for the molecular configuration of K<sub>2</sub>(OH)<sub>2</sub>, but the bond angle O-K-O was modified to 90° (i.e. a square planar configuration for potassium and oxygen atoms). The bond angle K-O-H in K<sub>2</sub>(OH)<sub>2</sub>(g) was assumed to be 110°. The bond distance K-O in K<sub>2</sub>(OH)<sub>2</sub>(g) was estimated 10% longer than that in KOH(g). The bond distance O-H was estimated to be the same in H<sub>2</sub>O(g). The three principal moments of inertia are  $I_A = [17.5202] \times 10^{-39}$ ,  $I_B = [38.5534] \times 10^{-39}$  and  $I_C = [55.6452] \times 10^{-39}$  g. cm.<sup>2</sup>

The first six selected vibrational frequencies were taken to be equal to those for K<sub>2</sub>P<sub>2</sub>(g) (see K<sub>2</sub>P<sub>2</sub>(g) table), and the rest were O-H stretching and bending frequencies which have been suggested by Berkowitz et al., loc. cit.

Heat of Formation.

J. Berkowitz, D. J. Meschi and W. A. Chupka, J. Chem. Phys. 35, 533 (1960), have studied the Li2O(c)-H2O(g) equilibrium by the mass-spectrometric method. Using the reported equilibrium constants in the temperature range from 1100° to 1450° K. the heat of reaction Li2OH2(g) -> 2LiOH(g) at 298° has been calculated by the second law and the third law methods as 63.2 and 63.7 kcal. mole<sup>-1</sup>, respectively. (The third law drift is 0.5 ± 1.5 e.u.) Combination of the third law value ( $\Delta H_f^0_{298} = 63.7$  kcal. mole<sup>-1</sup>) with the heat of formation of lithium hydroxide ( $\Delta H_f^0_{298} = -58.8$  kcal. mole<sup>-1</sup>) gives the heat of formation of dimeric lithium hydroxide ( $\Delta H_f^0_{298} = -181.4$  kcal. mole<sup>-1</sup>) which has been adopted in the tabulation.

J. B. Berkowitz-Matuck and A. Buchler, J. Phys. Chem. 67, 1368 (1963), have also studied the Li2O(c)-H2O(g) equilibrium by the transpiration method, and reported two equilibrium constants ( $K_{1095} = 0.105$  and  $K_{1145} = 0.357$ ) for the reaction Li2O(c) + H2O(g) -> Li2OH2(g). Using the third law method, the heat of reaction has been calculated from the equilibrium constants as 12.7 kcal. mole<sup>-1</sup> at 298.15° K. The heat of formation of Li2OH2(g) can be derived as  $\Delta H_f^0_{298} = -188.2 \pm 3.5$  kcal. mole<sup>-1</sup> which is different from the adopted value of Berkowitz, Meschi and Chupka, loc. cit. Berkowitz-Matuck and Buchler attempted to explain the difference by inferring that the solid-gas equilibrium was not properly established in the measurement of Berkowitz, Meschi and Chupka, however, the absence of drift in the third law analysis does not support this conclusion.

Heat Capacity and Entropy.

S. H. Bauer, R. M. Diner and R. F. Porter, J. Chem. Phys. 29, 991 (1958), have proposed a model for the dimeric alkali hydroxide (g) which consists of a square planar configuration for the alkali and oxygen atoms, with two hydrogen bridges between the oxygens (the hydrogen and oxygen atoms formed a rhombus perpendicular to the alkali-oxygen plane). R. C. Schoonmaker and R. F. Porter, J. Chem. Phys. 31, 830 (1959), have suggested a square planar model without hydrogen bonding with alkali-oxygen bond distances 0.2 Å larger than those assumed for the monomeric alkali hydroxides. J. Berkowitz, D. J. Meschi and W. A. Chupka, J. Chem. Phys. 33, 533 (1960), have also postulated a model for Li2OH2(g) which consists of a trans configuration with hydrogens above and below the plane of the rhombus, and the bond angle O-Li-O = 100°. The last one was adopted for the molecular configuration of Li2OH2(g), but the bond angle O-Li-O was modified to 90° (i.e. a square planar configuration for lithium and oxygen atoms). This bond angle O-H in Li2OH2(g) was assumed to be 110°. The bond distance Li-O in Li2OH2(g) was estimated 10% longer than that in LiOH(g). The bond distance O-H was estimated to be the same in H2O(g). The three principal moments of inertia are:  $I_A = [9.445] \times 10^{-39}$ ,  $I_B = [3.7789] \times 10^{-39}$  and  $I_C = [12.6035] \times 10^{-39}$  g. cm.<sup>2</sup>

The first six selected vibrational frequencies were taken to be equal to those for Li2F2(g) (see Li2F2(g) table) and the rest were O-H stretching and bending frequencies.

ΔH<sub>f</sub><sup>o</sup> = -16.3 ± 2.2 kcal. mole<sup>-1</sup>

ΔH<sub>f</sub><sup>o</sup> 298.15 = -18.2 ± 2.2 kcal. mole<sup>-1</sup>

S<sub>298.15</sub><sup>o</sup> = 7.43 ± 0.20 cal. deg.<sup>-1</sup> mole<sup>-1</sup>

T<sub>D</sub> = [560]°K.

Heat of Formation.

The heat of hydrolysis of MgH<sub>2</sub>(c) was measured by O. C. Sinke and D. R. Stull, Thermal Laboratory, The Dow Chemical Company, private communication, July, 1956. The value of ΔH<sub>f</sub><sup>o</sup> 298.15 was calculated to be -19.1 ± 2 kcal. mole<sup>-1</sup>. From the decomposition pressure measurements for MgH<sub>2</sub>(c) reported by F. H. Ellinger, et al., J. Am. Chem. Soc. 77, 2647 (1955) and J. F. Stampfer, Jr., C. E. Holley, Jr. and J. F. Suttle, J. Am. Chem. Soc. 82, 3504 (1960), the values of ΔH<sub>f</sub><sup>o</sup> 298.15 for MgH<sub>2</sub>(c) were found to be -17.9 ± 1.0 and -17.7 kcal. mole<sup>-1</sup>, respectively. The value used was the average of these three.

Heat Capacity and Entropy.

The low temperature heat capacities (25-300°K.) was measured by O. C. Sinke and D. L. Hildenbrand, Thermal Laboratory, The Dow Chemical Company, private communication, February 1958. Above 300°K. the C<sub>p</sub> values were estimated by comparison with those for MgF<sub>2</sub>(c). S<sub>298.15</sub> was obtained from O. C. Sinke and D. L. Hildenbrand, loc. cit., using S<sub>25</sub><sup>o</sup> (extrap.) = 0.037 cal. deg.<sup>-1</sup> mole<sup>-1</sup>.

Temperatures of Decomposition.

T<sub>D</sub> was estimated from the value of ΔF<sub>f</sub><sup>o</sup> in the table.

## Heat of Formation.

The adopted value is an average of -221.10 and -220.85 kcal/mol obtained from ΔH<sub>f</sub><sup>o</sup> 298 = 9.08 and 8.84 kcal/mol for the dehydration reaction Mg(OH)<sub>2</sub>(c) = MgO(c) + H<sub>2</sub>O(l). The two values correspond to naturally occurring brucite and to synthetic Mg(OH)<sub>2</sub> prepared from MgO by hydration at 177°C under a steam pressure of about 9 atm. The enthalpies of reaction are derived from studies of Taylor and Wells on the heats of solution of various samples of Mg(OH)<sub>2</sub> and MgO in aqueous HCl. These studies show that the heat of dehydration is quite dependent on the nature of the MgO sample; e.g., values for synthetic Mg(OH)<sub>2</sub> vary monotonically from 9.79 to 8.84 kcal/mol for MgO ignited at temperatures from 450 to 1425°C, respectively. The authors ascribe this difference primarily to increase in particle size at the higher ignition temperatures. We have adopted the results at 1425°C, since they are reasonably consistent with the high temperature samples on which the JANAF heat of formation for MgO is based. The uncertainty is estimated as ± 0.5 kcal/mol.

Shomate and Huffman have confirmed the heat of solution of MgO (ignited at 1000°C) within about 0.3 kcal. Their value may be combined with the heat of solution for synthetic Mg(OH)<sub>2</sub>, determined under similar conditions by Torgeson and Sahaia, to obtain ΔH<sub>f</sub><sup>o</sup> = 8.85 kcal/mol for the dehydration reaction. At the other extreme, the heat of solution data of Olsauque and Archibald lead to ΔH<sub>f</sub><sup>o</sup> = 9.74 kcal/mol; however, this value corresponds to MgO ignited at 350°C. The MgO sample was microcrystalline and had significant excess Cp, as suggested by Olsauque and Archibald and later confirmed by data of T. H. K. Barron et al., Proc. Roy. Soc. (London) A250, 70 (1959). Olsauque and Archibald intentionally used the microcrystalline form which would be similar to the product in their decomposition pressure measurements (190 and 212°C). Thus, it is not surprising that third law analysis of their decomposition pressures yields essentially the same heat of formation as their solution data (see summary below). Decomposition data at higher pressures have been reported by W. S. Rufe, Am. J. Sci. 256, 729 (1958); D. M. Roy and R. Roy, ibid. 255, 573 (1957); O. C. Kennedy, ibid. 254, 567 (1956); O. M. Zhabrova and B. M. Kedenatzi, J. Gen. Chem. USSR (Eng. Transl.) 21, 1129 (1954); and L. O. Berg and I. S. Rassonkaya, Dokl. Akad. Nauk SSSR 81, 855 (1951). These data do not significantly affect the heat of formation, however, because of uncertainties in the attainment of equilibrium and in reduction to standard state values.

| Mg(OH) <sub>2</sub> Sample | Temp. of MgO Formation, °C | Heat of Dehydration ΔH <sub>f</sub> <sup>o</sup> 298.15 (kcal/mol) | ΔH <sub>f</sub> <sup>o</sup> 298.15 |

## Heat Capacity and Entropy.

Low temperature heat capacities are from the data (22-321°K) of Olsauque and Archibald, loc. cit., who used a synthetic, microcrystalline sample prepared by reaction of KOH with aqueous MgCl<sub>2</sub> at 210°C. The entropy is derived from the heat capacities using S<sup>o</sup> = 0-027 eu. Above 321°K the heat capacities are extrapolated graphically. Enthalpy data (393-567°K) reported by P. N. Lashchenko and D. I. Kompanik, Zh. Prikl. Khim. 9, 628 (1955), were stated to be based on a calorimeter temperature close to room temperature. Within this uncertainty and the experimental scatter of about ± 5%, the enthalpy data are consistent with the selected values.

## Temperature of Decomposition.

T<sub>d</sub> is calculated as the temperature at which ΔG<sup>o</sup> = 0 for Mg(OH)<sub>2</sub>(c) = MgO(c) + H<sub>2</sub>O(g).H<sub>2</sub>MgO<sub>2</sub>

Magnesium Dihydroxide ( Mg(OH)<sub>2</sub> )  
(Ideal Gas)      GFW = 58.32674

MAGNESIUM DIHYDROXIDE [Mg(OH)<sub>2</sub>]      (IDEAL GAS)      GFW = 58.32674

Heat of Formation  
Vapor densities of magnesium-bearing species over magnesium oxide were determined, using the transpiration method, by C. A. Alexander, J. S. Ogden and A. Levy, J. Chem. Phys. 33, 3057 (1963). The MgO reacted with water vapor present in the carrier gas to form a gaseous product, presumably Mg(OH)<sub>2</sub>. The authors eliminated MgOH (and other species requiring the formation of gaseous oxygen) as a likely product by holding constant the partial pressure of water but varying the ratio of oxygen and argon in the carrier gases. Experiments with different partial pressures of water indicated that each mole of water produced an equivalent number of moles of product in the vapor. This eliminates Mg(OH)<sub>2</sub> as a possible product, but not, for example, (MgO)<sub>2</sub>H<sub>2</sub>O. Species of the latter type are quite unlikely with magnesium, so the reaction is considered to be MgO(c) + H<sub>2</sub>O(g) = Mg(OH)<sub>2</sub>(g). Equilibrium data (1853-2020°K) given graphically by Alexander et al. yield ΔH<sub>f</sub><sup>o</sup><sub>298</sub> = 67.6 ± 1.9 kcal/mol by second law analysis and ΔH<sub>f</sub><sup>o</sup><sub>298</sub> = 65.2 kcal/mol with a drift of -1.5 ± 1 eu by third law analysis.

Heat Capacity and Entropy  
The infrared spectra of Mg(OH)<sub>2</sub>(c) were observed in the region 365-3700 cm<sup>-1</sup> by C. Cabannes-Ott, Ann. Chim. (Paris) 5, 903-60 (1960). The vibrational frequencies of the gas are estimated by comparison with those for Mg(OH)<sub>2</sub>(c), H<sub>2</sub>O(g), H<sub>2</sub>O<sub>2</sub>(g), MgO(g) and MgF<sub>2</sub>(g), and are adjusted to give reasonable agreement between the second and third law heats of reaction. The bond distances are estimated by comparison with those of MgF<sub>2</sub>(g), MgO(g) and H<sub>2</sub>O(g). The O-Mg-O angle is assumed to be 180°, while the Mg-O-H angle is assumed to be the same as that in H<sub>2</sub>O(g). The three principal moments of inertia are I<sub>A</sub> = 2.713 x 10<sup>-40</sup>, I<sub>B</sub> = 18.6455 x 10<sup>-39</sup> and I<sub>C</sub> = 18.9168 x 10<sup>-39</sup> g cm<sup>2</sup>.

Bond Distance: Mo-O = [1.83] Å O-H = [0.958] Å  
 Bond Angle: O-Mo-O = [109.5°] H-O-Mo = [104.5°]  
 HO-Mo-OH plane perpendicular to O-H-Mo plane σ = [2]  
 Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [1.5399 × 10<sup>-113</sup>] g<sup>3</sup> cm<sup>6</sup>

Heat of Formation  
 The enhanced volatility of metallic molybdenum and molybdenum trioxide in the presence of water vapor at high temperatures has been investigated by several workers (1, 2, 3) using transpiration techniques. Glemser and Haeseler (1) and Buiten (2) have shown that the major volatilization reaction of the oxide is:  
 A. Mo<sub>2</sub>O<sub>3</sub>(s) + H<sub>2</sub>O(g) ⇌ MoO<sub>2</sub>(OH)<sub>2</sub>(g)  
 For the reaction of metallic molybdenum with water vapor, Belton and Jordan (3) reported the existence of MoO<sub>2</sub>(OH)<sub>2</sub>(g) according to the equilibrium:  
 B. Mo(s) + 4H<sub>2</sub>O(g) ⇌ MoO<sub>2</sub>(OH)<sub>2</sub>(g) + 3H<sub>2</sub>(g).  
 Second and third law analyses of these equilibrium data are summarized below.

| Investigator             | Reaction | Range, °K | No. of Points | ΔH <sub>f</sub> <sup>o</sup> (kcal/mol) | ΔH <sub>f</sub> <sup>o</sup> (kcal/mol) | Diff |
|--------------------------|----------|-----------|---------------|---|---|------|
| Glemser and Haeseler (1) | A        | 873-963   | Equation      | 36.2                                    | 31.940.3                                | -4.2 |
| Buiten (2)               | A        | 673-773   | Equation      | 30.0                                    | 32.240.3                                | 3.6  |
| Belton and Jordan (3)    | B        | 1473-1773 | Equation      | 30.1                                    | 28.6±0.1                                | -0.1 |

\* Third law values  
 The adopted value, ΔH<sub>f</sub><sup>o</sup>(MoO<sub>2</sub>(OH)<sub>2</sub>, g) = -203.4 ± 1.0 kcal/mol, is an average of these three results.

Heat Capacity and Entropy  
 The assumed tetrahedral structure for MoO<sub>2</sub>(OH)<sub>2</sub> is from Jordan (4). The O-H bond length and H-O-Mo bond angle are assumed to be the same as for H<sub>2</sub>O(g). The Mo-O bond length is from the compilation of Sutton (5) and assumed to be the same as for Ag<sub>2</sub>MoO<sub>4</sub>. Individual moments of inertia are I<sub>A</sub> = 23.782 × 10<sup>-39</sup>, I<sub>B</sub> = 25.415 × 10<sup>-39</sup>, and I<sub>C</sub> = 25.478 × 10<sup>-39</sup> g cm<sup>2</sup>. The vibrational frequencies are estimated by comparison with those for H<sub>2</sub>SO<sub>4</sub>(g) (6, 7) and are adjusted to give S<sup>o</sup>(MoO<sub>2</sub>(OH)<sub>2</sub>, g) = 137.4 gibbs/mol at 1600°K. This entropy value is derived from a second law analysis of the equilibrium data for reaction B reported by Belton and Jordan (3).

Bond Distance: N-H = 1.024 Å

Bond Angle: H-N-H = 103°

Product of the Moments of Inertia:  $I_A I_B I_C = 8.5 \times 10^{-120}$  g.<sup>3</sup> cm.<sup>6</sup>

$\sigma = 2$

Heat of Formation.

The heat of formation of amidogen at 298.15°K.,  $\Delta H_f^0$  (NH<sub>2</sub>, g) = 39.8 kcal. mole<sup>-1</sup> was obtained from the pyrolysis of N<sub>2</sub>H<sub>4</sub> by J. A. Kerr, R. C. Sekhar, and A. P. Trostman-Dickenson, J. Chem. Soc. 3217 (1963). They have re-investigated the rate constants of the thermal decomposition N<sub>2</sub>H<sub>4</sub> → 2NH<sub>2</sub> at different temperatures using the same technique as M. Swarc, J. Chem. Phys. 17, 505 (1949), and revised the activation energy to 57.1 kcal. mole<sup>-1</sup> for the reaction at 874°K. (instead of 60 kcal. mole<sup>-1</sup> at 1000°K. reported by Swarc). The activation energy was assumed to be the same as the dissociation energy of the N-N bond in hydrazine. Using all JANAF auxiliary data, one obtains  $D_0$  (H<sub>2</sub>N-NH<sub>2</sub>) = 55.4 ± 3 kcal. mole<sup>-1</sup> and  $\Delta H_f^0$  298 (NH<sub>2</sub>, g) = 40.1 ± 3 kcal. mole<sup>-1</sup>.

P. M. Page, Trans. Faraday Soc. 57, 1254 (1961), has measured the electron affinity of NH<sub>2</sub> and has applied the results to calculate the dissociation energy,  $D_0$  (H-NH<sub>2</sub>) = 102 ± 3 kcal. mole<sup>-1</sup>. This value leads to the heat of formation  $\Delta H_f^0$  298 (NH<sub>2</sub>, g) = 40.4 ± 3 kcal. mole<sup>-1</sup> which is in good agreement with the value selected. E. R. Lippincott and M. O. Dayhoff, Spectrochim. Acta, 15, 807 (1960) calculated theoretically the dissociation energy  $D_0$  (H<sub>2</sub>N-NH<sub>2</sub>) = 59 kcal. mole<sup>-1</sup> which gives  $\Delta H_f^0$  298 (NH<sub>2</sub>, g) = 41.9 kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy.

The bond distance and angle were measured from the electronic absorption spectra of NH<sub>2</sub> by K. Dressler and D. A. Ramey, Phil. Trans. Roy. Soc. London Ser. A 251, 553 (1959). The three principal moments of inertia are  $I_A = 0.1189 \times 10^{-39}$  g. cm.<sup>2</sup>,  $I_B = 0.2149 \times 10^{-39}$  g. cm.<sup>2</sup> and  $I_C = 0.3338 \times 10^{-39}$  g. cm.<sup>2</sup>

The selected vibrational frequencies were obtained from the infrared spectrum of NH<sub>2</sub> by matrix isolation by D. E. Milligan and M. E. Jacox, J. Chem. Phys. 43, 4487 (1965). K. N. Tanner and R. L. King, Nature 181, 963 (1958) have also determined the vibrational frequencies  $\omega_1 = 3200$  cm.<sup>-1</sup> and  $\omega_3 = 3280$  cm.<sup>-1</sup> by flash photolysis and calculated  $\omega_2 = 1060$  cm.<sup>-1</sup>. The symmetric and the enthalpic stretching frequencies are in good agreement. M. Tasubi, Spectrochim. Acta 15, 505 (1960), has observed NH<sub>2</sub> bending frequencies, 1572 cm.<sup>-1</sup>, 1619 cm.<sup>-1</sup> and 1623 cm.<sup>-1</sup> in HCONH<sub>2</sub>(g), C<sub>6</sub>H<sub>5</sub>NH<sub>2</sub>(g) and CH<sub>3</sub>NH<sub>2</sub>(g), respectively. In light of these observations and the adopted  $\omega_2$ , Tanner and King's bending frequency seems to be in error.

Bond Distances: N-H = [1.014] Å N-N = [1.23] Å

Bond Angles: H-N-N = [100]°

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [1.3986] X 10<sup>-117</sup> g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation.

The standard enthalpy of formation, ΔH<sub>f</sub>° 298 (N<sub>2</sub>H<sub>2</sub>) (g) = 50.9 kcal. mole<sup>-1</sup>, was calculated from the appearance and ionization potentials of di-imide reported by S. M. Pomer and R. L. Hudson, J. Chem. Phys. 29, 442 (1958), using the JANAF ΔH<sub>f</sub>° (N<sub>2</sub>H<sub>2</sub>) (g) = 26.1 kcal. mole<sup>-1</sup> in calculation. For example:

From the above heat of formation and that for NH(g) in the JANAF Tables 12-31-65, one can calculate a N-N bond energy of 109.4 ± 5 kcal. mole<sup>-1</sup> at 0°K. This is in agreement with the N-N bond in molecules such as N<sub>2</sub>P<sub>2</sub>.

Heat Capacity and Entropy.

The bond distances and angle were obtained from a quantum-mechanical calculation by W. Wheland and P. S. K. Chen, J. Chem. Phys. 24, 67 (1956). The three principal moments of inertia are I<sub>A</sub> = [0.3116] X 10<sup>-39</sup>, I<sub>B</sub> = [1.9686] X 10<sup>-39</sup> and I<sub>C</sub> = [2.2802] X 10<sup>-39</sup> g. cm.<sup>2</sup>

Since there are 12 valency electrons in N<sub>2</sub>H<sub>2</sub>, A. D. Walsh, J. Chem. Soc. 2288 (1953), has predicted a bent ground state, existing in either a cis or a trans configuration for diimide. E. J. Blau and B. P. Hochheimer, J. Chem. Phys. 41, 1174 (1964), have measured the infrared spectrum of diimide which was frozen in a cold trap as one of the decomposition products of N<sub>2</sub>H<sub>4</sub>. The spectrum of the solid N<sub>2</sub>H<sub>2</sub> at liquid nitrogen temperature agrees with the predicted non-linear planar structure, and the molecule N<sub>2</sub>H<sub>2</sub> appears mainly in cis form. They have also assigned six fundamental vibrational frequencies for cis N<sub>2</sub>H<sub>2</sub>(s) which have been adopted here for gaseous cis N<sub>2</sub>H<sub>2</sub>. Blau and Hochheimer also observed two gas phase bands (1277 - 1314 and 3050 - 3190 cm.<sup>-1</sup>). K. Rosenngren and G. C. Pimentel, J. Chem. Phys. 43, 507 (1965), have observed these bands in matrix isolation studies. They assigned ω<sub>1</sub> or ω<sub>4</sub> = 3074 cm.<sup>-1</sup> and ω<sub>3</sub> = 1279 cm.<sup>-1</sup> which are in satisfactory agreement with the selected frequencies.

Bond Distance: Ne-O = [2.17] Å O-H = [0.96] Å  
 Bond Angle: Ne-O-Ne = [90°] Ne-O-H = [110]°  
 Products of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [8.156754] X 10<sup>-114</sup> g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation.

See NaOH(g) table for details.

Heat Capacity and Entropy.

S. H. Bauer, R. H. Diner and R. F. Porter, J. Chem. Phys. 29, 891 (1958), have proposed a model for the dimeric alkali hydroxide (g) which consists of a square planar configuration for the alkali and oxygen atoms, with two hydrogen bridges between the oxygens (the hydrogen and oxygen atoms formed a rhombus perpendicular to the alkali-oxygen plane). R. C. Schoonmaker and R. F. Porter, J. Chem. Phys. 31, 830 (1959), have suggested a square planar model without hydrogen bonding with alkali-oxygen bond distances 0.2 Å larger than those assumed for the monomeric alkali hydroxides. J. Berkowitz, D. J. Meechi and W. A. Chupka, J. Chem. Phys. 33, 533 (1960), have also postulated a model for Li<sub>2</sub>(OH)<sub>2</sub>(g) which consists of a trans configuration with hydrogens above and below the plane of the rhombus, and the angle O-H-O = 100°. The last one was adopted for the molecular configuration of Na<sub>2</sub>(OH)<sub>2</sub>, but the angle Ne-O-H in Na<sub>2</sub>(OH)<sub>2</sub>(g) was modified to 90° (i.e., a square planar configuration for sodium and oxygen atoms). The bond angle Ne-O-H in Na<sub>2</sub>(OH)<sub>2</sub>(g) was assumed to be 110°. The bond distance O-H was estimated to be the same in H<sub>2</sub>O(g). The three principal moments of inertia are I<sub>A</sub> = [14.0831] X 10<sup>-39</sup>, I<sub>B</sub> = [18.1878] X 10<sup>-39</sup> and I<sub>C</sub> = [31.8449] X 10<sup>-39</sup> g. cm.<sup>2</sup>

The first six selected vibrational frequencies were taken to be equal to those for Na<sub>2</sub>F<sub>2</sub>(g) (see Na<sub>2</sub>F<sub>2</sub>(g) table), and the rest were O-H stretching and bending frequencies which have been suggested by Berkowitz et al., loc. cit.

Heat of Formation

Taken from National Bureau of Standards Circular 500. "Selected Values of Chemical Thermodynamic Properties," 1952.

Heat Capacity and Entropy

A. S. Friedman and L. Hear, J. Chem. Phys. **22**, 2051 (1954), using the infra-red spectra analysis of W. S. Benedict, H. H. Claassen and J. H. Shaw, J. Research Natl. Bur. Standards **49**, 91 (1952), have calculated the thermodynamic functions for water including the anharmonic corrections. Friedman and Hear in comparing their calculation to that of a direct summation by Glatt, Adams, and Johnston, Ohio State University Res. Foundation Tech. Report No. 316-8 (1953), found that the difference between the two calculations was less than the uncertainty in the direct summation.

C<sub>p</sub> values from 100° to 5000°K. are from Friedman and Hear. C<sub>p</sub> from 5000° to 6000°K. was extrapolated linearly. Using the tabulated functions of Friedman and Hear C<sub>p</sub>, S, and  $H_p - H_0$  at T = 298.15°K. was calculated by the method of Lagrangian curvilinear interpolation, W. J. Taylor, J. Research Natl. Bur. Standards **35**, 151 (1945).

The bond length and angle were obtained from a compilation by L. E. Sutton, "Tables of Interatomic Distances and Configurations in Molecules and Ions," The Chem. Soc., Burlington House, London W1, 1958.

DFW = 98.07754

(LIQUID)

ΔH<sup>sub</sup>298.15 = -194.548 kcal/mol

ΔH<sup>sub</sup>m = 2.56 kcal/mol

ΔH<sup>sub</sup>v = [13.35] kcal/mol

S<sup>sub</sup>298.15 = 37.501 gibbs/mol

T<sub>m</sub> = 283.55°K

T<sub>b</sub> = [608.6]°K

Heat of Formation.

The heat of combustion (ΔH<sub>c</sub><sup>sub</sup>) of rhombic sulfur (c) to H<sub>2</sub>SO<sub>4</sub>(aq), i.e. S(c, rhombic) + 3/2 O<sub>2</sub>(g) + H<sub>2</sub>O(l) = H<sub>2</sub>SO<sub>4</sub>(aq), has been determined by many investigators. Based on the reported ΔH<sub>c</sub><sup>sub</sup> data, values of ΔH<sub>f</sub><sup>sub</sup>298(H<sub>2</sub>SO<sub>4</sub>, l) are derived using heats of solution and dilution for H<sub>2</sub>SO<sub>4</sub>(l), taken from D. D. Wagman, W. H. Evans, I. Halow, V. B. Parker, S. M. Bailey and R. H. Schumm, "Selected Values of Chemical Thermodynamic Properties," Technical Note 270-1, Natl. Bur. Std., 1965. The results obtained are presented in the table below. The value of ΔH<sub>f</sub><sup>sub</sup>298(H<sub>2</sub>SO<sub>4</sub>, l) is adopted as -194.548 ± 0.10 kcal/mol, which is the same as that given by Technical Note 270-1, loc. cit.

| Investigator                 | Product  | ΔH <sub>c</sub> <sup>sub</sup> , kcal/mol | ΔH <sub>f</sub> <sup>sub</sup> , kcal/mol |

Heat Capacity and Entropy.

The heat capacities, 283.46 to 300°K, were measured by W. P. Olauque, E. W. Hornung, J. E. Kunzler, and P. R. Rubin, J. Am. Chem. Soc. **82**, 62 (1960). The Cp values above 300°K are obtained from graphical extrapolation. The value of S<sup>sub</sup>298 was reported by Olauque, Hornung, Kunzler and Rubin, loc. cit., based on low temperature heat capacity measurements of H<sub>2</sub>SO<sub>4</sub>(c).

Melting Data.

T<sub>m</sub> and ΔH<sub>m</sub><sup>sub</sup> are taken from T. R. Rubin and W. F. Olauque, J. Am. Chem. Soc. **74**, 800 (1952). The value, T<sub>m</sub>=283.53°K, has been reported by C. M. Osble, H. F. Betz and S. H. Maron, J. Am. Chem. Soc. **72**, 1445 (1950), as well as J. E. Kunzler and W. P. Olauque, J. Am. Chem. Soc. **74**, 797 (1952). The heat of melting (ΔH<sub>m</sub><sup>sub</sup>) has also been determined by the following investigators:

Vaporization Data.

T<sub>b</sub> is the temperature at which the Gibbs energy change (ΔG<sup>sub</sup>) for the reaction H<sub>2</sub>SO<sub>4</sub>(l) = H<sub>2</sub>SO<sub>4</sub>(g) approaches zero. The difference between ΔH<sub>f</sub><sup>sub</sup> for H<sub>2</sub>SO<sub>4</sub>(g) and H<sub>2</sub>SO<sub>4</sub>(l) at T<sub>b</sub> is ΔH<sub>v</sub><sup>sub</sup>. According to O. P. Luchinskii, Zh. Fiz. Khim. **30**, 1207 (1956), the total vapor pressure over H<sub>2</sub>SO<sub>4</sub>(l) reaches one atmosphere at 553°K with a vapor composition of 76.6 mole percent SO<sub>3</sub>, 22.6% H<sub>2</sub>SO<sub>4</sub>, and 0.8% H<sub>2</sub>O. This composition implies that the real liquid phase enhances the vapor decomposition by reducing the partial pressure of water vapor.

Heat of Formation

The vapor phase equilibria of the H<sub>2</sub>SO<sub>4</sub>, H<sub>2</sub>O and SO<sub>3</sub> system have been studied by (1) E. Bodenstain and M. Katayama, Z. Elektrochem. 15, 244 (1909), Z. Physik. Chem. 59, 26 (1909); (2) G. P. Luchinskii, Zh. Fiz. Khim. 30, 1207 (1956), and (3) A. V. Suvorov, R. B. Dobrovin and S. M. Galstiev, Russ. J. Inorg. Chem. (English Transl.) 10, 710 (1965). The data of Bodenstain and Katayama and of Suvorov et al. were obtained from FT studies, while those of Luchinskii were based on vapor pressure measurements. A translation of Luchinskii's paper is not yet available, so it is not known whether he obtained the vapor composition experimentally or by calculation. Using the reported equilibrium values for the reaction H<sub>2</sub>SO<sub>4</sub>(g) = H<sub>2</sub>O(g) + SO<sub>3</sub>(g), we evaluate the corresponding enthalpy changes by both the second and third law methods. The results are presented in the table below. The value of H<sub>f,298</sub><sup>o</sup> for H<sub>2</sub>SO<sub>4</sub>(g) is adopted as -177 ± 2 kcal/mol.

\*Calculation based on the third law ΔH<sub>f,298</sub><sup>o</sup> value.

Heat Capacity and Entropy

The molecular structure and bond angles (O-S-O, HO-S-OH) are estimated by comparison with those for SF<sub>2</sub>O<sub>2</sub>(g) reported by D. R. Lide, D. E. Mann and R. M. Fristrom, J. Chem. Phys. 25, 734 (1957). The S-O and S-OH bond distances are assumed to be the same as those in H<sub>2</sub>SO<sub>4</sub>(c), determined by R. Pascard, Compt. Rend. 240, 2162 (1955). The OH distance and S-O-H angle are taken from those for H<sub>2</sub>O(g). Electric deflection studies by A. Böhler, J. L. Stauffer and R. Klemperer, J. Chem. Phys. 45, 605 (1967), indicate that H<sub>2</sub>SO<sub>4</sub>(g) is polar, which is consistent with the assumed C<sub>2v</sub> structure.

The infrared absorption spectrum in the range 4000 to 400 cm<sup>-1</sup> of normal and deuterated H<sub>2</sub>SO<sub>4</sub>(g) above H<sub>2</sub>SO<sub>4</sub>(l) was observed by S. M. Chackalalackal and P. R. Safford, J. Am. Chem. Soc. 88, 723 (1966). The authors assigned nine vibrational frequencies, which are adopted here. The three principal moments of inertia are: I<sub>A</sub> = 1.570 x 10<sup>-38</sup>, I<sub>B</sub> = 1.586 x 10<sup>-38</sup>, and I<sub>C</sub> = 1.702 x 10<sup>-38</sup> g cm<sup>2</sup>.

Four of the six missing frequencies are obtained from P. A. Giguère and R. Svoice, J. Am. Chem. Soc. 85, 287 (1963), which were estimated by cooperation with infrared frequencies for the crystal and Raman values for the liquid. The remaining two frequencies, ν<sub>7</sub> = 450 and ν<sub>14</sub> = 450 cm<sup>-1</sup>, are assigned arbitrarily so that the second and third law values for ΔH<sub>f,298.15</sub> derived from equilibrium data are in reasonable agreement.

Dec. 31, 1962; June 30, 1963; Mar. 31, 1967

ΔH<sub>f</sub><sup>0</sup> = UnknownΔH<sub>f</sub><sup>0</sup>298.15 = -270.5 ± 0.4 kcal/molS<sub>298.15</sub> = [34.6 ± 6] gibbs/mol

Td = [393]°K

Heat of Formation

V. I. Spitsyn and N. N. Patsukova<sup>1</sup> have measured calorimetrically the heats of reaction (1) and (2) at 298°K as -13.80 ± 0.01 and -13.05 ± 0.02 kcal/mol, respectively. The reactions are given as follows:

Combination of reactions (1) and (2) gives ΔH<sub>f</sub><sup>0</sup>298 = -0.75 ± 0.04 kcal/mol for WO<sub>3</sub>(c) + H<sub>2</sub>O(l) → H<sub>2</sub>WO<sub>4</sub>(c), which leads to ΔH<sub>f</sub><sup>0</sup>298(H<sub>2</sub>WO<sub>4</sub>, c) = -270.5 ± 0.4 kcal/mol.

To obtain WO<sub>3</sub>(c) in a form soluble in the calorimetric solution, Spitsyn and Patsukova dehydrated H<sub>2</sub>WO<sub>4</sub>(c) at the relatively low temperature of 250°C. The resulting WO<sub>3</sub>(c) was a very fine lemon-yellow powder which may have excess surface free energy compared with the JANAF standard state. The latter is WO<sub>3</sub> formed at high temperature in a calorimetric bomb. The actual heat of formation of tungstic acid should be less negative if this effect is significant.

The previously accepted values<sup>2,3,4</sup> -280.2 ± 0.4 kcal/mol, was based on the pressure-temperature-composition studies of G. P. Huttig and B. Kurre<sup>5</sup> for the WO<sub>3</sub>-H<sub>2</sub>O system. We suspect that the data do not correspond to equilibrium (see entropy section) for the reaction H<sub>2</sub>WO<sub>4</sub>(c) = WO<sub>3</sub>(c) + H<sub>2</sub>O(g).

Heat Capacity and Entropy

C<sub>p</sub>300 = 27.0 gibbs/mol is estimated using Kopp's rule. Since the decomposition temperature of H<sub>2</sub>WO<sub>4</sub>(c) is approximately 400°K, which is relatively low for hydrogen and oxygen to reach their maximum Cp contribution, we estimate Cp400 = 31.0 gibbs/mol for H<sub>2</sub>WO<sub>4</sub>(c).

The entropy, S<sub>298</sub> = 34.6 eu, is estimated so that the decomposition pressure of water is one atmosphere at 120°C. This value is quite uncertain as suggested by comparison with the following estimates. A lower limit may be obtained from S<sub>298.5</sub> = 26.8 eu for H<sub>2</sub>SO<sub>4</sub>(c). Summation of the entropies for WO<sub>3</sub>(c) and H<sub>2</sub>O(c) [10.7 eu] yields 28.8 eu, an estimate which is somewhat larger than the lower limit. An upper limit may be obtained by assuming that the pressure of about 14 mm at 190°C corresponds to equilibrium for the reaction H<sub>2</sub>WO<sub>4</sub>(c) = WO<sub>3</sub>(c) + H<sub>2</sub>O(g). This pressure, based on the plateau in the temperature-composition data of Huttig and Kurre<sup>5</sup>, yields S<sub>298</sub> = 46.5 eu when combined with the adopted ΔH<sub>f</sub><sup>0</sup>298 and JANAF auxiliary data. Since the estimate appears to be unreasonably large, we suggest that this region of the curve may correspond to the reaction WO<sub>3</sub>·0.5 H<sub>2</sub>O(c) = WO<sub>3</sub>(c) + 0.5 H<sub>2</sub>O(g). In contrast, the observed pressures<sup>5</sup> for samples having mole ratios (H<sub>2</sub>O/WO<sub>3</sub>) of 1.2 - 1.35 leads to S<sub>298</sub> = 34 eu, if the reaction is WO<sub>3</sub>·H<sub>2</sub>O(c) = WO<sub>3</sub>(c) + H<sub>2</sub>O(g).

Temperature of Decomposition

Td is calculated as the temperature at which the Gibbs energy change of the reaction H<sub>2</sub>WO<sub>4</sub>(c) → WO<sub>3</sub>(c) + H<sub>2</sub>O(g) approaches zero.

Spitsyn and Patsukova<sup>1</sup> observed that some dehydration of stoichiometric H<sub>2</sub>WO<sub>4</sub>(c) occurs at temperatures as low as 90°C. Thermal studies<sup>6,7</sup> on tungstic acid containing some excess water indicated the start of dehydration somewhere in the region of 60 - 120°C. These temperatures yield a lower limit for Td on the presumption that the experiments correspond to a partial pressure of water of less than one atmosphere.

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [1.443 × 10<sup>-113</sup>] g<sup>3</sup> cm<sup>6</sup>      σ = [2]

Heat of Formation.

The adopted heat of formation, ΔH<sub>f</sub><sup>o</sup> 298 = -216.5 ± 1.0 kcal/mol, is derived from equilibrium data<sup>1,2,3,4,5</sup> obtained by the transpiration method. The data are in reasonable agreement and they are summarized below. Beilton and McCarron<sup>1</sup> have concluded that W<sub>2</sub>H<sub>2</sub>O is the species responsible for the increased volatilization of W(c) and W<sub>3</sub>(c) in the presence of water vapor. Based on their data for W(c) and the earlier data for W<sub>3</sub>(c), Beilton and McCarron ruled out the possibility of significant amounts of (W<sub>3</sub>)<sub>2</sub>H<sub>2</sub>O and W<sub>3</sub>(c)H<sub>2</sub>O.

Heat Capacity and Entropy.

The vibrational frequencies are estimated by comparison with those for H<sub>2</sub>SO<sub>4</sub>(g) reported by P. A. Giguere and R. Savoia, J. Am. Chem. Soc. **85**, 287 (1963), and S. M. Chackalackal and P. B. Stafford, J. Am. Chem. Soc. **88**, 723 (1966). These frequencies are also adjusted so that S<sub>298.15</sub><sup>o</sup>(H<sub>2</sub>WO<sub>4</sub>,g) is 136.7 eu as reported by Beilton and McCarron, loc. cit. This entropy was derived from second law analysis of the equilibrium constants for reaction A.

The configuration of W<sub>3</sub> group is assumed to be tetrahedral. The bond angle W-O-W is estimated to be the same as the angle of H<sub>2</sub>O(g). The bond distances are assumed to be the same as those in W<sub>3</sub>(g) and H<sub>2</sub>O(g). The three principal moments of inertia are I<sub>A</sub> = 2.328 × 10<sup>-36</sup>, I<sub>B</sub> = 2.487 × 10<sup>-36</sup> and I<sub>C</sub> = 2.493 × 10<sup>-36</sup> g cm<sup>2</sup>.

(IDEAL GAS)

PHOSPHORUS HYDRIDE (PH<sub>2</sub>)

Point Group [C<sub>2v</sub>]

ΔH<sub>f</sub><sup>o</sup> 0 = [50.6 ± 23] kcal. mole<sup>-1</sup>

S<sub>298.15</sub><sup>o</sup> = [50.8] cal. deg<sup>-1</sup> mole<sup>-1</sup>

ΔH<sub>f</sub><sup>o</sup> 298.15 = [30.1 ± 23] kcal. mole<sup>-1</sup>

Ground State Multiplicity = [2]

Vibrational Frequencies and Degeneracies

ω, cm<sup>-1</sup>

[2327] (1)

[1020] (1)

[2322] (1)

Bond Distances: P-H = [1.419] Å

σ = 2

Bond Angle: H-P-H = [93.7]°

Product of Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [6.95 × 10<sup>-119</sup>] g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation.

ΔH<sub>f</sub><sup>o</sup> 298.15 was estimated by V. N. Distefano, R. L. Pottar, and S. N. Fox, "The Thermodynamic Functions of Some Combustion Products Containing Phosphorus-I", American Cyanamid Company. The ΔH<sub>f</sub><sup>o</sup> 298.15 was estimated by taking 63% of the dissociation energy of PH<sub>2</sub> and using it as the dissociation energy of PH<sub>2</sub>. D. Willes and C. Manklar, J. Phys. Chem. 61, 902 (1957) have estimated the ΔH<sub>f</sub><sup>o</sup> 298.15 for PH<sub>2</sub>(g) to be 30 kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy.

The vibrational spectra of PH<sub>2</sub> from the flash photolysis of PH<sub>3</sub> has been reported by D. A. Ramsay, Nature 179, 375 (1956) and in N. Y. Acad. Sci. 61, 485, (1957). Similarities between the spectra of NH<sub>2</sub> and PH<sub>2</sub> were found. For NH<sub>2</sub> and NH<sub>3</sub> bond angles and bond distances were reported to be about the same. By analogy then the bond angles and bond distances of PH<sub>2</sub> and PH<sub>3</sub> should be nearly the same. The moments of inertia for PH<sub>2</sub> were therefore calculated from the molecular constants for PH<sub>3</sub>. The principal moments were found to be I<sub>A</sub> = 3.587 × 10<sup>-40</sup> g. cm.<sup>2</sup>, I<sub>B</sub> = 2.959 × 10<sup>-40</sup> g. cm.<sup>2</sup>, and I<sub>C</sub> = 6.546 g. cm.<sup>2</sup> × 10<sup>-40</sup>.

Distefano and Pottar (loc. cit.) have assumed the ground state degeneracy to be 2, because of the unpaired electron. The vibrational frequencies reported by Distefano and Pottar (loc. cit.) have been used. They used a simple force field and the force constants of PH<sub>3</sub> to obtain the vibrational frequencies.

Bond Distance: S-H = 1.328 Å  
 Bond Angle: H-S-H = 92.2°  
 Moments of Inertia:  $I_A I_B I_C = 4.89 \times 10^{-119} \text{ g.}^3 \text{ cm.}^6$   
 $\sigma = 2$

Heat of Formation.

The heat of formation of hydrogen sulfide has been calorimetrically measured by H. Zeumer and W. A. Roth, Z. Elektrochem. 40, 777 (1934), and A. P. Kaputinskii and R. T. Kentovskii, Zhur. Fiz. Khim. 32, 2810 (1958), as  $\Delta H_f^o(298) = -4.80 \pm 0.15 \text{ kcal. mole}^{-1}$  and  $\Delta H_f^o(298) = -4.94 \pm 0.08 \text{ kcal. mole}^{-1}$ , respectively. A weighted average of these two values was taken for the standard enthalpy of formation of hydrogen sulfide.

Heat Capacity and Entropy.

The bond distance, angle and vibrational frequencies were obtained from H. C. Allen, Jr. and E. K. Plyler, J. Chem. Phys. 25, 1132 (1956).

J. S. Gordon, private communication, Feb. 7, 1961, has calculated  $C_p$  from 298 to 6000°K. by the method of R. E. Pennington and K. A. Kobe, J. Chem. Phys. 22, 1442 (1954), which takes second order corrections for vibrational anharmonicity, vibration-rotation interaction, and centrifugal stretching into account. The correction constants were obtained from Allen and Plyler, loc. cit. Below 298°K. the rigid-rotator harmonic oscillator method was used to calculate the functions, but at 298°K. and above Gordon's thermodynamic functions were adopted in this tabulation.

TITANIUM DIHYDRIDE (TiH<sub>2</sub>)  
(CRYSTAL)

MOL. WT. = 49.916

$$\Delta H_f^0 = [-32.5 \pm 2.0] \text{ kcal. mole}^{-1}$$

$$\Delta H_f^{298.15} = [-34.5 \pm 2.0] \text{ kcal. mole}^{-1}$$

$$S_{298.15}^0 = 7.101 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$$

Heat of Formation.

The heat of combustion of TiH<sub>1.73</sub>(c), the stable species of titanium hydride, was reported to be -247.8 kcal. by A. Sieverts and A. Götts, Z. anorg. allgem. Chem. 199, 384 (1931). From this data the value of ΔH<sub>f</sub> 298.15 for TiH<sub>1.73</sub>(c) was calculated to be -29.40 kcal. mole<sup>-1</sup>. The heat of dissociation of titanium hydride having compositions between the rough limits TiH<sub>1.75</sub>-TiH<sub>1.92</sub> was given as 19.15 kcal. per mole of H<sub>2</sub> dissociated by T. R. P. Gibb, Jr., J. McSharry, and R. W. Bragdon, J. Am. Chem. Soc. 73, 1751 (1951). Assuming this value is applicable to compositions between the limits TiH<sub>1.73</sub>-TiH<sub>2</sub>, the difference in the heat of formation of titanium hydride between TiH<sub>1.73</sub> and TiH<sub>2</sub> was estimated to be -5.17 kcal. mole<sup>-1</sup>. Thus the value of ΔH<sub>f</sub> 298.15 for TiH<sub>2</sub>(c) was calculated.

Heat Capacity and Entropy.

The low temperature C<sub>p</sub> for TiH<sub>1.97</sub>(c), 24-363°K., were measured by B. Stallinski and Z. Bieganski, Bull. Acad. Polon. Sci., Ser. Sci. Chim., 8, No. 5, 243 (1960). This data were adopted for TiH<sub>2</sub>(c) due to lack of the measured C<sub>p</sub> values. A small but well marked λ-type anomaly with a maximal value of C<sub>p</sub> at 288.5°K. in the C<sub>p</sub> vs. T curve was observed. C<sub>p</sub> 298.15 was reported by B. Stallinski and Z. Bieganski, loc. cit., based on S<sub>298</sub> (extrap.) = 0.065 cal. deg.<sup>-1</sup> mole<sup>-1</sup>.

Bond Length: N-H = 1.0124 Å Bond Angle: H-N-H = 106.67°  
Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 3.4826 × 10<sup>-119</sup> g.<sup>3</sup> cm.<sup>6</sup>

A weighted average based on analysis using JANAF functions was selected. Haber, Tammaru and Oeholm, Z. Elektrochem.

21, 206 (1915) obtained ΔH<sub>298</sub><sup>0</sup> = 11.10 for NH<sub>3</sub> → 0.5 N<sub>2</sub> + 1.5 H<sub>2</sub> by flow calorimetry. Estimated uncertainty is 1% and the formation value was corrected by 0.025 kcal. for non-ideality of NH<sub>3</sub>. Becker and Koch, *ibid.*, 20, 836 (1934) measured ΔH<sub>f</sub><sup>0</sup> for NH<sub>3</sub>(g) + H<sub>2</sub>O(l) = H<sub>2</sub>O(g) + 2NH<sub>3</sub>(g), ΔH<sub>f</sub><sup>0</sup> (hydrates of H<sub>2</sub>O<sub>2</sub> and (NH<sub>4</sub>)<sub>2</sub>CO<sub>3</sub>) and the necessary ΔH<sub>f</sub><sup>0</sup> leading to ΔH<sub>298</sub><sup>0</sup> = 182.9 ± 0.24 for 3H<sub>2</sub>O(l) + N<sub>2</sub>(g) → 1.5 O<sub>2</sub>(g) + 2NH<sub>3</sub>(g). Equilibrium data from Larson and Dodge, J. Am. Chem. Soc. 45, 2918 (1923) and Haber, Tammaru and Fommez, Z. Elektrochem. 21, 89 (1915) were analyzed as tabulated by Stephenson and McMahon, J. Am. Chem. Soc. 61, 437 (1939) from the non-ideality corrections of Olliepie and Bestie, Phys. Rev. 36, 743 (1930). Data (1000-3000 atm) from Minchester and Dodge, A.I.Ch.E. Journal 2, 431-6 (1956) were omitted because of uncertainty in non-ideality while data (1 atm) of Haber and Maschke, Z. Elektrochem. 21, 128 (1915) were assumed ideal. High-temperature calorimetry of the direct decomposition includes Haber and Tammaru, Z. Elektrochem. 21, 191 (1915) and Wittig and Schmetz, *ibid.*, 63, 470 (1959).

\*Third law values for equilibrium data are followed by second law values in parentheses.

Heat Capacity and Entropy.

The functions are an approximation of the non-rigid rotator anharmonic oscillator based on calculations of Harrison and Kobe, Chem. Eng. Progr. 49, No. 7, 349 (1955) and Yungman, Orwlich and Ritscheva, Trudy Gosudarst. Inst. Priklad. Khim. 49, 20 (1962). In these calculations anharmonicity of  $\nu_2$  associated with inversion doubling was treated by summation over the energy levels. Both calculations include rotational distortion corrections while Yungman, *et al.*, also allow for anharmonicity and vibration-rotation interaction of the other fundamentals. JANAF functions agree with the results to within 0.02 e.u. in the range 298-1500°K.

Two sets of rigid rotator harmonic oscillator functions were also tested for consistency with the ammonia data (see below). These were obtained from molecular dimensions and either calculated zero order frequencies ( $\nu$ ) or observed wave numbers ( $\nu'$ ) obtained by Benedict and Plyler, Can. J. Phys. 35, 1235 (1957) from high resolution infrared studies. Herzberg, "Infrared and Raman Spectra", pp. 503-4, 1945 states that  $\nu'$  should be used and the RRHO $\nu'$  functions give better, but not perfect, agreement with the observed C<sub>p</sub> for NH<sub>3</sub>. Principal moments of inertia are I<sub>A</sub> = 4.414 × 10<sup>-40</sup> end I<sub>B</sub> = I<sub>C</sub> = 2.809 × 10<sup>-40</sup> g.<sup>2</sup> cm.<sup>2</sup> Electron diffraction studies by Bastiansen and Bagley, Acta Chem. Scand. 18, 2077 (1964) give slightly different constants (bond distance 1.019 Å and angle = 109.1°).

Heat Capacity, C<sub>p</sub>

| T, °K  | Observed    | JANAF  |
|--------|-------------|--------|
| 253.15 | 8.271(e)    | 8.268  |
| 298.15 | 8.521(e)    | 8.515  |

| 800.   | 12.070-2(f) | 12.225 |

(e) N. S. Osborne, H. P. Stinson, T. S. Slicht, Jr., and G. S. Crago, NBS Sci. Papers 20, 65 (1954-6) measured C<sub>p</sub> of gaseous NH<sub>3</sub> (258 to 423°K and 0.5 to 20 atm) within an estimated maximum error of 0.3% (about 0.03 cal. deg.<sup>-1</sup> mole<sup>-1</sup>) and obtained C<sub>p</sub> by use of a suitable equation of state.

(f) R. Overstreet and W. F. Dinque, J. Am. Chem. Soc. 59, 254 (1937) determined the entropy of the real gas at the normal boiling point as S<sub>298.72</sub> = 44.06 ± 0.10 cal. deg.<sup>-1</sup> mole<sup>-1</sup>.

(c) (S<sup>0</sup>-S)<sub>298.72</sub> = 0.17 cal. deg.<sup>-1</sup> mole<sup>-1</sup> from the virial coefficient equation derived by Hirschfelder, McClure and Weeks, J. Chem. Phys. 10, 201 (1942) from the PVT data of Meyers and Jessup, Refrig. Eng. 11, 345 (1925).

(d) Combination of ΔH<sub>f</sub><sup>0</sup> 800 = -12.85 kcal. mole<sup>-1</sup> from the calorimetric measurement of F. E. Wittig and W. Schmetz, Z. Elektrochem. 63, 470 (1959) with ΔG<sub>800</sub><sup>0</sup> = 9.315 kcal. mole<sup>-1</sup> from equilibrium data (f).

(e) Σ second law analysis of the equilibrium data (f).

(f) K<sub>p</sub> values based on the equilibrium data of Haber, Tammaru and Fommez and of Larson and Dodge were analyzed by regression analysis to give ΔG<sub>800</sub><sup>0</sup> = 9.315 ± 0.004, ΔH<sub>800</sub><sup>0</sup> = -12.666 ± 0.017 and ΔC<sub>p</sub> 800 = -2.31 ± 0.20.

Heat of Formation.

The proton affinity of water has been measured by the ion impact method as -169 kcal/mol by V. L. Tal'rose and E. L. Frenkivich, Doklady Akad. Nauk SSSR 111, 376 (1956), J. An. Chem. Soc. 80, 2344 (1958). The selected heat of formation of hydronium ion, ΔH<sub>f</sub><sup>o</sup>(H<sub>3</sub>O<sup>+</sup>, g) = 139.1 kcal/mol, was derived from the ΔH<sub>f</sub><sup>o</sup> = -169 kcal/mol for H<sub>2</sub>O(g) + H<sup>+</sup>(g) → H<sub>3</sub>O<sup>+</sup>(g), using the JANAF ΔH<sub>f</sub><sup>o</sup>(H<sub>2</sub>O, g) = -57.1 and ΔH<sub>f</sub><sup>o</sup>(H<sup>+</sup>, g) = 385.2 kcal/mol.

The values of 185 and 207 kcal/mol for the heat of formation of H<sub>3</sub>O<sup>+</sup>(g) have also been reported by F. M. Field and J. L. Franklin, "Electron Impact Phenomena," Academic Press, New York, 1957, and R. R. Bernecker and F. A. Long, J. Phys. Chem. 65, 1565 (1961), respectively. These two values were based on the electron impact studies which may involve unaccounted excitations and excess energy in the fragments. Other literature values have been reviewed by D. M. Bishop, J. Chem. Phys. 43, 4453 (1965).

J. A. Green and T. M. Sugden, Ninth Symposium (International) on Combustion, Academic Press, New York, 1963, based on the studies of the positive ions in flames by mass spectrometry, prefer the value derived from the proton affinity of water obtained by Tal'rose and Frankvitch, rather than the electron impact data. From the approximate equilibrium constant calculations for the reaction HCO<sup>+</sup>(g) + H<sub>2</sub>O(g) = H<sub>3</sub>O<sup>+</sup>(g) + CO(g), D. G. Clifton, AD444078, G. M. Defense Research Laboratory, General Motors Corp., Santa Barbara, Calif., July 1964, has also found that the heat of formation of H<sub>3</sub>O<sup>+</sup>(g) derived from the proton affinity of water, not from the electron impact data, leads to agreement with the experimental data given by Green and Sugden.

Heat Capacity and Entropy.

Since the molecule H<sub>3</sub>O<sup>+</sup>(g) has the same number of valence electrons as NH<sub>3</sub>(g), a pyramidal molecular configuration (C<sub>3v</sub>) is assumed for H<sub>3</sub>O<sup>+</sup>(g) in the tabulation. D. G. Clifton, J. Chem. Phys. 41, 3656 (1964), has obtained a bond distance O-H of 0.95 Å from an application of covalent bond radii and the effect of electric charge, and a bond angle H-O-H of 109° by extrapolating a plot of bond length versus bond angle for NH<sub>3</sub>(g) and PH<sub>3</sub>(g) to 0.95 Å. Both values are adopted in the tabulation. The three principal moments of inertia are I<sub>A</sub> = 0.4004 X 10<sup>-39</sup>, I<sub>B</sub> = I<sub>C</sub> = 0.2445 X 10<sup>-39</sup> g cm<sup>2</sup>. D. M. Bishop, loc. cit., has calculated theoretically the bond distance H-O of 0.95 Å and the bond angle H-O-H of 114° 26' with a planar D<sub>3h</sub> molecular configuration. The vibrational frequencies were calculated by the valence force method from the estimated stretching and bending force constants of Clifton.

ΔH<sub>f</sub><sup>o</sup> = -297.5 ± 0.3 kcal. mole<sup>-1</sup>  
ΔH<sub>m</sub><sup>o</sup> = 3.100 kcal. mole<sup>-1</sup>  
T<sub>m</sub> = 315.51°K

ΔH<sub>f</sub><sup>o</sup> 298.15 = -501.5 ± 0.3 kcal. mole<sup>-1</sup>  
S<sub>298.15</sub><sup>o</sup> = 26.42 cal. deg.<sup>-1</sup> mole<sup>-1</sup>

Heat of Formation.

The heat of formation was determined by W. S. Holmes [private communication July 5, 1962, Albright and Wilson (MPG) Ltd., Oldbury, Birmingham, Great Britain (in press by Faraday Society)]. W. S. Holmes measured the enthalpy of combustion of white phosphorus (α form) in oxygen in a bomb calorimeter. The product, P<sub>4</sub>O<sub>10</sub>(hexagonal), was hydrolyzed in 10N perchloric acid to give H<sub>3</sub>PO<sub>4</sub>. Measurement of the enthalpy of solution of H<sub>3</sub>PO<sub>4</sub>(c) then enabled the ΔH<sub>f</sub><sup>o</sup> 298.15 to be calculated according to the following cycle:

\* All ΔH<sub>f</sub><sup>o</sup>'s were measured.

E. P. Egan, Jr. and B. B. Luff, J. Phys. Chem., 65, 523 (1961), from partial molal heat contents of H<sub>3</sub>PO<sub>4</sub> solutions found that a smooth extrapolation to 100% H<sub>3</sub>PO<sub>4</sub> would give them a ΔH<sub>f</sub><sup>o</sup> 298.15 for H<sub>3</sub>PO<sub>4</sub>(c) which was 755 cal. mole<sup>-1</sup> greater than the ΔH<sub>f</sub><sup>o</sup> 298.15 reported in the National Bureau of Standards Circular 500. The Circular 500 (loc. cit.) heat of formation refers to the work of Thomson, "Thermochemische Untersuchungen," Vol. 2, Barth, Leipzig (1882-1886). The heats of formation summarized:

| ΔH <sub>f</sub> <sup>o</sup> 298.15   | Source                    |
|---------------------------------------|---------------------------|
| -305.7 ± 0.3 kcal. mole <sup>-1</sup> | W. S. Holmes (loc. cit.)  |
| -306.2 kcal. mole <sup>-1</sup>       | Circular 500 (loc. cit.)  |
| -305.4 kcal. mole <sup>-1</sup>       | Egan and Luff (loc. cit.) |

The selected ΔH<sub>f</sub><sup>o</sup> 298.15, -305.7 ± 0.3 kcal. mole<sup>-1</sup>, was corrected by +4.17 kcal. mole<sup>-1</sup>, which is the ΔH<sub>f</sub><sup>o</sup> 298.15 of white (α) phosphorus.

Heat Capacity and Entropy.

Third law entropy was calculated from the low temperature heat capacities measured by E. P. Egan, Jr. and Z. T. Wakefield, J. Phys. Chem., 61, 1500 (1957).

Melting.

The heat of fusion, ΔH<sub>m</sub><sup>o</sup>, was reported by E. P. Egan, Jr. and B. B. Luff, J. Phys. Chem., 65, 523 (1961) from ΔH<sub>m</sub><sup>o</sup> data measured by E. P. Egan, Jr. and Z. T. Wakefield, J. Phys. Chem., 61, 1500 (1957). The melting point T<sub>m</sub> = 315.51°K was taken from the work of W. H. Ross and R. M. Jones, J. Am. Chem. Soc., 47, 2165 (1925).

Orthophosphoric Acid (H<sub>3</sub>PO<sub>4</sub>) (Liquid)

Mol. Wt. = 97.999  
 $\Delta H_f^\circ 298.15 = -298.81 \pm 0.5$  kcal. mole<sup>-1</sup>  
 $S_{298.15}^\circ = 35.0$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 $T_m = 315.61^\circ K$   
 $\Delta H_m = 3.100$  kcal. mole<sup>-1</sup>

Heat of Formation. Calculated from  $\Delta H_f^\circ 298.15$  for H<sub>3</sub>PO<sub>4</sub>(c) and  $\Delta H_m^\circ$  given by E. P. Egan, Jr., and B. B. Luff, J. Phys. Chem. 65, 523 (1961) using the  $\Delta H_m^\circ$  data reported by E. P. Egan, Jr., and Z. T. Wakefield, J. Phys. Chem. 61, 1500 (1957).

Heat Capacity and Entropy. The heat capacity is estimated. The entropy at 298.15°K. is calculated using  $S_{298.15}^\circ$  of H<sub>3</sub>PO<sub>4</sub>(c) and the  $\Delta H_m^\circ$  at 298.15°K.

Melting Data.  $T_m$  reported by W. H. Ross and R. M. Jones, J. Am. Chem. Soc. 47, 2165 (1925).  $\Delta H_m^\circ$  from E. P. Egan, Jr., and Z. T. Wakefield (loc. cit.).

$S_{298.15}^\circ = 50.24 \text{ cal deg}^{-1} \text{ mole}^{-1}$

$\Delta H_f^\circ 0 = +7.0 \pm 0.4 \text{ kcal mole}^{-1}$

Point Group C<sub>3v</sub>

Vibrational Levels and Multiplicities

|                           |                           |
|---------------------------|---------------------------|
| $\omega, \text{ cm}^{-1}$ | $\omega, \text{ cm}^{-1}$ |
| 2332.9 (1)                | 2327.7 (2)                |
| 992 (1)                   | 1122.4 (2)                |

H-P-H angle = 93° 50'

$\sigma = 3$

$I_A = I_B = 6.29 \times 10^{-40} \text{ g cm}^2$

$I_C = 7.24 \times 10^{-40} \text{ g cm}^2$

Heat of Formation

The heat of formation was derived by S. R. Gunn and L. G. Green, *J. Phys. Chem.*, **65**, 779 (1961). In order to obtain the  $\Delta H_f^\circ 298.15$  they measured the heat of explosive decomposition of phosphine gas. There is a good deal of uncertainty about the heat of formation of PH<sub>3</sub>(g), for instance:

$\Delta H_f^\circ 298.15$   
+3.6 kcal mole<sup>-1</sup>

+6.3 kcal mole<sup>-1</sup>

-2.34 kcal mole<sup>-1</sup>

+1.6 kcal mole<sup>-1</sup>

Source

The heat of reaction between gaseous PH<sub>3</sub> and saturated bromine water. H. J. Ogier, *Ann. Chim. Phys.*, **20**, 5 (1880).

The heat of combustion of PH<sub>3</sub>(g) in O<sub>2</sub>(g) to form H<sub>3</sub>PO<sub>4</sub>. M. P. Lemoult, *Compt. Rend.*, **115**, 374 (1907).

Equilibrium data of W. N. Ipatiew, and A. W. Frost, *Ber. dtsh. chem. Ges.*, **63B**, 1104 (1930). Their data showed a wide variation in  $\Delta H$ , as much as 11 kcal mole<sup>-1</sup>.

National Bureau of Standards, Report No. 7437, "Preliminary Report on the Thermodynamic Properties of Selected Light-Element and Some Related Compounds," 1 January 1962 (page 80-91).

The heats of formation have been reviewed by T. L. Cottrell, "The Strength of Chemical Bonds," Butterworth's Scientific Publications, London, (1958); and by F. R. Bichowsky and F. D. Rossini, "The Thermochemistry of the Chemical Substances," Reinhold Publishing Corp., New York (1936).

The heat of formation was based on white (α) phosphorus and thus required an adjustment for the red (V) phosphorus reference state.

Heat Capacity and Entropy

The fundamental wave number and degeneracy assignments are from the infrared spectral data by V. N. McComaghie and H. H. Nielsen, *J. Chem. Phys.*, **21**, 1836, (1953). The molecular constants are those obtained from infrared data by H. H. Nielsen, *J. Chem. Phys.*, **20**, 759 (1952). Nielsen (loc. cit.) has reported the molecular constants after calculating the Coriolis coupling effect between the wave numbers 2 and 4, or (992 cm<sup>-1</sup>) and (1122.4 cm<sup>-1</sup>).

HYDRAZINE (N<sub>2</sub>H<sub>4</sub>)

(LIQUID)

MOL. WT. = 32.04528

S<sub>298.15</sub> = 29.05 ± 0.1 cal. deg.<sup>-1</sup> mole<sup>-1</sup>

T<sub>m</sub> = 274.69°K.

T<sub>b</sub> = 386.9°K.

ΔH<sub>f</sub>° 298.15 = 12.10 ± 0.1 kcal. mole<sup>-1</sup>

ΔH<sub>m</sub>° = 3.025 kcal. mole<sup>-1</sup>

ΔH<sub>v</sub>° = 9.70 kcal. mole<sup>-1</sup>

Heat of Formation.

A. W. Hughes, R. J. Corruccini and E. C. Ollbert, J. Am. Chem. Soc. **61**, 2639 (1939), measured the heats of combustion of hydrazine and hydrazine monohydrate. The data, adjusted as suggested by L. G. Cole and E. C. Ollbert, J. Am. Chem. Soc. **73**, 5423 (1951), are summarized below. Heats of solution determined by V. C. Bushnell, A. M. Hughes and E. C. Ollbert, J. Am. Chem. Soc. **59**, 2142 (1937) interrelate N<sub>2</sub>H<sub>4</sub>(l) and N<sub>2</sub>H<sub>4</sub>·H<sub>2</sub>O(l). An intermediate value was selected from the resulting heats of formation.

| Source   | Reaction  | ΔH <sub>f</sub> ° 298 | ΔH <sub>f</sub> ° 298 |
|----------|---|-----------------------|-----------------------|
| Hughes   | N <sub>2</sub> H <sub>4</sub> (l) + O <sub>2</sub> (g) → N <sub>2</sub> (g) + 2H <sub>2</sub> O(l)                  | -148.68 ± 0.06        | 12.05                 |
| Hughea   | N <sub>2</sub> H <sub>4</sub> ·H <sub>2</sub> O(l) + O <sub>2</sub> (g) → N <sub>2</sub> (g) + 3H <sub>2</sub> O(l) | -147.00 ± 0.06        | ---                   |
| Bushnell | N <sub>2</sub> H <sub>4</sub> (l) + H <sub>2</sub> O(l) → N <sub>2</sub> H <sub>4</sub> ·H <sub>2</sub> O(l)        | -1.80                 | 12.17*                |

\*From combination of second and third reactions.

Heat Capacity and Entropy.

Heat capacities (12-340°K) of hydrazine crystal and liquid were determined by D. W. Scott, G. D. Oliver, M. E. Oras, W. N. Hubbard and H. M. Huffman, J. Am. Chem. Soc. **71**, 2293 (1949). Values beyond the experimental range for the liquid were extrapolated linearly. The entropy was obtained from the heat of melting and the smoothed heat capacities of the crystal using S<sub>298</sub>° = 0.023 cal. deg.<sup>-1</sup> mole<sup>-1</sup>.

Melting Data.

Taken from Scott et al., loc. cit.

Vaporization Data.

The normal boiling point and heat of vaporization are those calculated for the ideal gas from these tables. The boiling point found for the real gas (397.3°K) by W. Hieber and A. Woerner, Z. Elektrochem. **40**, 252 (1934) is in good agreement. The selected heat of vaporization, ΔH<sub>v</sub>° = 10.69 kcal. mole<sup>-1</sup>, is based on the vapor pressure data of Scott et al., loc. cit., series III. Vapor pressure measurements of Hieber and Woerner, loc. cit., and E. T. Cheng and N. A. Gokcen, AD-458286, Defense Documentation Center, January, 1964, are in satisfactory agreement as shown below.

| Source                 | Temp. Range<br>°K. | ΔH <sub>v</sub> ° 298 (kcal. mole <sup>-1</sup> )<br>2nd Law | ΔH <sub>v</sub> ° 298 (kcal. mole <sup>-1</sup> )<br>3rd Law | 3rd Law Drift<br>e.u. |
|------------------------|--------------------|--|--|-----------------------|
| Scott, et al. (1949)   | 273-343            | 10.683 ± 0.003   | 10.696   | 0.05 ± 0.01           |
| Cheng, Gokcen (1964)   | 276-325            | 10.40 ± 0.03   | 10.68  | 0.91 ± 0.09           |
| Hieber, Woerner (1934) | 293-387            | 10.82 ± 0.03   | 10.71  | -0.33 ± 0.07          |

The second law-third law consistency of Scott et al. reflects the use of these data in selection of the gas phase functions (see H<sub>4</sub>N<sub>2</sub> gas).

Bond Distances: N-H = 1.022 Å N-N = 1.449 Å

Bond Angle: H-N-H = 109.4° H-N-N = 112.0°

Torsional angle between two NH<sub>2</sub> groups ≥ 90° from eclipsed position.Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 7.307 X 10<sup>-117</sup> g.<sup>3</sup> cm.<sup>6</sup>

## Heat of Formation.

This was obtained from the heat of formation of the liquid and the selected heat of vaporization,  $\Delta H_{vap}^o = 10.69$  kcal. mole.<sup>-1</sup>, derived from the vapor pressure data (Series III) of D. W. Scott, G. D. Oliver, M. E. Gross, W. N. Hubbard and H. M. Huffman, J. Am. Chem. Soc. **71**, 2695 (1949). Other vapor pressure data from W. Hieber and A. Noerner, Z. Elektrochem. **40**, 252 (1934) and E. T. Cheng and N. A. Gokcen, AD-458288, Defense Documentation Center, January, 1964, are in satisfactory agreement (see N<sub>2</sub>H<sub>4</sub> liquid table).

## Heat Capacity and Entropy.

Functions were calculated from the constants given above using the rigid rotor harmonic oscillator method. The entropy was increased by R ln 2 because two rotameric forms are implied by use of the torsional frequency. Small but arbitrary adjustments were made in the assignment of the bending mode frequencies in order to reproduce the vapor pressure data of Scott et al., loc. cit., as closely as possible. Calculated values of  $S_{289}^o = 57.03$  and  $S_{340}^o = 59.70$  cal. deg.<sup>-1</sup> mole.<sup>-1</sup> may be compared with 56.89 and 59.69, respectively, derived from the data of Scott et al.. Internal rotation calculations would require a complex potential function in order to fit the data. The barrier to inversion (990 cal. mole.<sup>-1</sup> ~ 2.8 kcal.) is slightly less than the barrier to internal rotation at the trans position (1110 cal. mole.<sup>-1</sup> ~ 3.2 kcal.) according to analyses of the microwave data by T. Kenuey, Sci. Papers, Inst. Phys. Chem. Res. (Tokyo) **55**, No. 1, 1-39 (1962) and T. Kenuey and T. Kojima, J. Phys. Soc. Japan **18**, 364-8 (1963).

From matrix isolation and gas phase infrared studies, E. Catalano, R. H. Sarnorn and J. W. Frazer, J. Chem. Phys. **39**, 2265 (1963), have suggested possible uncertainties in the assignment of the bending mode frequencies in the region from 1630 to 740 cm.<sup>-1</sup>. The question hinges on the uncertain existence of a gas phase fundamental at about 1600 cm.<sup>-1</sup> as observed by P. A. Diguere and I. D. Liu, J. Chem. Phys. **20**, 136 (1952). No corresponding matrix band was found and the gas phase band appeared to be due to absorption on the cell windows. A vapor phase Raman frequency at 1564 cm.<sup>-1</sup> was observed, however, by Yu. I. Kotov and V. M. Tatevaki, Opt. i Spektroskopiya **15**, 65 (1963). Catalano et al. suggest one assignment based on the uncertain fundamental and a tentative alternative assignment excluding it. The two assignments give entropies that are 0.26 cal. deg.<sup>-1</sup> mole.<sup>-1</sup> lower and 0.12 higher than the third law value. The lower calculated entropy is probably more reasonable, but the higher value could be more easily modified to agree with the third law value. Thus the alternative assignment was adopted with  $\nu_{11}$  arbitrarily increased from ~810 to 933 cm.<sup>-1</sup>.

The structural constants are based primarily on the electron diffraction study of Y. Morino, T. Iijima and Y. Murata, Bull. Chem. Soc. Japan **33**, 46 (1960). Related analyses of the infrared fine structure of the torsional frequency (377 cm.<sup>-1</sup>), A. Yemaguchi, I. Ichihama, T. Shimanouchi and S. Mizushima, Spectrochim. Acta **16**, 1471 (1960), and of the microwave spectra, Kenuey and Kojima, loc. cit., are in close agreement. The microwave data give an H-N-H angle of 106° and a torsional angle of 90°2'. Principal moments of inertia of the adopted structure are I<sub>A</sub> = 0.574 X 10<sup>-39</sup>, I<sub>B</sub> = 3.573 X 10<sup>-39</sup> and I<sub>C</sub> = 3.563 X 10<sup>-39</sup> g. cm.<sup>2</sup>

MERCURY (Hg)

(REFERENCE STATE)

MOL. WT. = 200.61

The reference state is chosen as follows:

0° to 234.29°K Crystal  
 234.29° to 629.73°K Liquid  
 629.73° to 8000°K Ideal Gas

$$S_{298.15}^{\circ} = 18.171 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$$

$$\Delta H_f^{\circ} 298.15 = 14.652 \pm 0.015 \text{ kcal. mole}^{-1}$$

$$\Delta H_m^{\circ} = 0.5486 \pm 0.0001 \text{ kcal. mole}^{-1}$$

$$\Delta H_v^{\circ} 629.73 = 14.133 \pm 0.020 \text{ kcal. mole}^{-1}$$

$$T_m = 234.29^{\circ}\text{K}$$

$$T_b = 629.73^{\circ}\text{K}$$

Heat Capacity.

The heat capacities of F. L. Smith and N. M. Wolcott, *Phil. Mag.* **1** (8), 854 (1956), 1.2°-20.2°K, R. H. Busey and W. F. Olsauque, *J. Am. Chem. Soc.* **75**, 806 (1953), 15°-350°K, and N. B. Douglas, A. P. Ball, and D. C. Oirmings, *J. Research Natl. Bur. Standards*, **46**, 334 (1951), 300°-770°K, have been smoothly joined. There is fair agreement between the selected values and those of O. L. Fickard and F. E. Simon, *Proc. Phys. Soc. A61*, 1 (1948), L. O. Carpenter and P. H. Oakley, *Phil. Mag.* **15**, 511 (1931), L. O. Carpenter and L. O. Stoodley, *Phil. Mag.* **10**, 249 (1930), E. Cohen, O. I. Krivshner, and A. L. Moenvald, *Z. phys. Chem.* **A95**, 437 (1920), A. L. Dixon and W. H. Rodenbusch, *J. Am. Chem. Soc.* **49**, 1162 (1927), F. Simon, *Z. phys. Chem.* **107**, 282 (1923), *Ann. Physik* **58**, 241 (1922), J. N. Brønsted, *Z. Elektrochem.* **18**, 714 (1912), and P. Pollitzer, *Z. Elektrochem.* **17**, 5 (1911).

Melting Data.

From Busey and Olsauque, loc. cit.

Boiling Point and Heat of Vaporization.

Calculated from the vapor pressures determined by K. D. Carlson, R. J. Thorn, and P. W. Gilles, private communication, October 1961, P. M. Ernberger and H. W. Pitman, *Rev. Sci. Instrum.* **26**, 584 (1955), P. H. Spedding and J. L. Dye, *J. Phys. Chem.* **59**, 581 (1955), and J. A. Beattie, B. E. Blaisdell, and J. Kaminsky, *Proc. Am. Acad. Arts Sciences* **71**, 375 (1937). Earlier measurements are less accurate and have not been used. Gas imparfaction has been allowed for by the method of Busey and Olsauque, loc. cit.

MERCURY MONIODE (HgI)

Ground State Configuration <sup>2</sup>2

$\Delta H_f^{\circ} 298.15 = 31.9 \pm 1.1 \text{ kcal. mole}^{-1}$

$S_{298.15}^{\circ} = 67.068 \text{ cal. deg}^{-1} \text{ mole}^{-1}$

Electronic Level and Multiplicity

$\frac{\epsilon \cdot \text{cm}^{-1}}{0} \frac{g-1}{2}$

$\omega_e \nu_e = 125.0 \text{ cm}^{-1}$

$\omega_e \nu_e = 1.00 \text{ cm}^{-1}$

$\sigma = 1$

$B_e = [0.0351] \text{ cm}^{-1}$

$\alpha_e = [0.0003] \text{ cm}^{-1}$

$r_e = [2.49] \text{ \AA}$

Heat of Formation

K. Wieland and A. Herzog, Helv. Chim. Acta, 32, 869 (1949) gave  $8.3 \pm 1.1$  kcal for the heat of dissociation into gaseous atoms.

Heat Capacity and Entropy

Vibrational constants were taken from K. Wieland, Zeits. f. Electrochemie 54, 761 (1960). Rotational constants were estimated using equation III 123, p. 106, G. Herzberg, "Spectra of Diatomic Molecules," van Nostrand, New York 1950. The bond length was estimated to be 0.965 of the mercuric bond length by analogy with the mercury chlorides.

MERCURY DIIODIDE (HgI<sub>2</sub>) (Crystal)

Mol. Wt. = 454.43  
 $\Delta H_f^{298,15} = -25.2 \pm 0.4$  kcal. mole<sup>-1</sup>  
 $S_{298,15}^{298,15} = [43.338] \pm 1.5$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 $T_c = 402^\circ K$   
 $\Delta H_t = 0.601 \pm 0.04$  kcal. mole<sup>-1</sup>  
 $T_m = 530^\circ K$   
 $\Delta H_m = 4.533 \pm 0.05$  kcal. mole<sup>-1</sup>

Heat of Formation. Taken from National Bureau of Standards (U.S.) Circular 500, "Selected Values of Chemical Thermodynamic Properties", (1952).

Heat Capacity and Entropy. The heat capacity was calculated from the heat content data of M. Guinchant, Comp. Rend. 59, 145 (1907) and R. Ewald, Ann. d. Physik (4) 44, 1213 (1914). The entropy was estimated by adjusting its value to provide the best fit of the melting, sublimation and vaporization phenomena.

Transition. The heat and temperature of transition were taken from National Bureau of Standards Circular 500 (loc. cit.).

Melting. The heat of melting was taken from M. Guinchant (loc. cit.), the temperature of melting from National Bureau of Standards Circular 500 (loc. cit.).

Mercury Diiodide (HgI<sub>2</sub>)

HgI<sub>2</sub>

MERCURY DIIODIDE (HgI<sub>2</sub>) (Liquid)

Mol. Wt. = 454.43  
 ΔH<sub>f</sub><sup>o</sup> 298.15 = [-20.862] ± 0.45 kcal. mole<sup>-1</sup>  
 Δ<sub>v</sub><sup>o</sup> 298.15 = [51.544] ± 1.5 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 T<sub>m</sub> = 530°K  
 ΔH<sub>m</sub> = 4.653 ± 0.05 kcal. mole<sup>-1</sup>  
 T<sub>b</sub> = 627°K  
 ΔH<sub>v</sub> = 14.141 ± 0.25 kcal. mole<sup>-1</sup>

Heat of Formation. Calculated from ΔH<sub>f</sub><sup>o</sup> 298(c).

Heat Capacity and Entropy. Heat capacity measurements were obtained from the data of M. Guinchant, Comp. Rend. 58, 145 (1907) in the range 540-600°K and were assumed constant above and below this range. A glass type transition was assumed at 353°K below which the heat capacity was that of HgI<sub>2</sub>(c). The entropy was calculated from the entropy of the crystal and the measured entropy of fusion.

Fusion and Vaporization. T<sub>m</sub> and T<sub>b</sub> are taken from National Bur. of Standards (U.S.) Circular 500 (1952). ΔH<sub>m</sub> is from the data of M. Guinchant (loc. cit.) and ΔH<sub>v</sub> was obtained from the data of E. B. R. Pridoux, J. Chem. Soc. (London) 97, 2052 (1910) and F. M. G. Johnson, J. Amer. Chem. Soc. 53, 777 (1911).

HgI<sub>2</sub>

Mercury Diiodide (HgI<sub>2</sub>)  
(Ideal Gas) Mol. Wt. = 454.43

MERCURY DIIODIDE (HgI<sub>2</sub>) (Ideal Gas)

Mol. Wt. = 454.43  
 $\Delta H_f^0$  298.15 = -3.085 ± 0.5 kcal. mole<sup>-1</sup>  
 $S_{298.15}^0$  = 80.331 cal. deg. <sup>-1</sup> mole<sup>-1</sup>  
 Point Group = D<sub>2h</sub> h

Vibrational Levels and Multiplicities

$\omega_e$ , cm.<sup>-1</sup>  
 $\frac{156}{33} \left\{ \begin{matrix} 1 \\ 2 \end{matrix} \right\}$   
 (233) (1)

Hg-I distance = 2.58 Å  
 Moment of Inertia = 280.5 X 10<sup>-39</sup> g. cm.<sup>2</sup>  $\sigma = 2$

Heat of Formation. The heat of formation of the crystal as given in National Bureau of Standards (U.S.) Circular 500, "Selected Values of Chemical Thermodynamic Properties", 1952 was combined with the 3rd law heat of sublimation at 298°K derived from the data of K. Niwa and Z. Shibata, J. Fac. Sci. Hokkaido Imp. Univ. Ser. III 2, 183 (1938); D. W. Magee, Univ. Microfilms No. 14474 Ann Arbor, Mich., and P. M. G. Johnson, J. Amer. Chem. Soc. 52, 777 (1931).

Heat Capacity and Entropy. The vibrational constants were given by W. Klemperer and L. Lindeman, J. Chem. Phys. 25, 397 (1956). The anti-symmetric stretching frequency was estimated by analogy with the bromide and chloride. The bond length was an average of the values given by H. Braune and S. Krokke, Naturwissenschaften 21, 349 (1933); A. H. Gregg, G. C. Hampson, G. I. Jenkins, P. L. P. Jones and L. E. Sutton, Trans. Farad. Soc. 33, 852 (1937) and P. A. Akshin, V. P. Spiridinov and A. N. Khodochemkov, Zhur. Fiz. Khim. 33, 20 (1959).

ΔH<sub>f</sub><sup>o</sup> 298.15 = -21.699 ± 0.024 kcal. mole<sup>-1</sup> S<sub>298.15</sub><sup>o</sup> = 16.795 ± 0.03 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 T<sub>decomp</sub> = 749°K.

Heat of Formation.

Obtained from the entropy obtained by T. W. Bauer and H. L. Johnston, J. Am. Chem. Soc. 75, 2217 (1953) and the free energy of formation as determined from the numerous cell measurements described by Bauer and Johnston. The value adopted for ΔF<sub>f</sub><sup>o</sup> 298.15 was -42,707 ± 14 cal. mole<sup>-1</sup>.

Heat Capacity and Entropy.

The heat capacity has been measured from 15° to 298°K. by Bauer and Johnston loc. cit. The extrapolation below 15°K was done assuming a T<sup>3</sup> law and gave S<sub>15</sub><sup>o</sup> = 0.264 e.u. Above 298° the data was extrapolated smoothly and adjusted to give the observed decomposition vapor pressures of G. B. Taylor and G. A. Hulett, J. Phys. Chem. 17, 565 (1913).

Decomposition.

According to Taylor and Hulett, loc. cit., the vapor pressure reaches 1.89 atmospheres at 749°K. This corresponds to the decomposition to 2 Hg(g) + O<sub>2</sub>(g), the equilibrium constant being unity at 1.69 atm.

Ground State Configuration  $1^1I$

$\Delta H_f^\circ = [11]$  kcal/mol

$S^\circ_{298.15} = [57]$  gibbs/mol

$\Delta H_f^\circ_{298.15} = [10]$  kcal/mol

Electronic Levels and Quantum Weights

$$\frac{\epsilon_i, \text{cm}^{-1}}{0} \quad 1 \quad \frac{g_i}{1}$$

$\omega_e X_e = [680]$   $\text{cm}^{-1}$        $\omega_e X_e = [4.7]$   $\text{cm}^{-1}$        $\sigma = 1$

$B_e = [0.336]$   $\text{cm}^{-1}$        $\alpha_e = [0.00277]$   $\text{cm}^{-1}$        $r_e = [1.84]$   $\text{Å}$

Heat of Formation

The heat of formation ( $\Delta H_f^\circ$ ) of HgO(g) is estimated to be  $10 \pm 15$  kcal/mol. This value is obtained from the heat of formation of PbO(g) and comparison of the heats of formation of analogous lead and mercury compounds using the method of Karapet'yants (1). The corresponding dissociation energy ( $D_0^\circ$ ) of HgO(g) is  $64 \pm 15$  kcal/mol.

Heat Capacity and Entropy

The equilibrium internuclear separation ( $r_e$ ) of HgO(g) is estimated from the corresponding quantity for PbO(g) and comparison of Hg-X and Pb-X bond distances for cases in which values of both distances are known. The rotational constant  $B_e$  is calculated from  $r_e$ . The fundamental vibrational frequency  $\omega_e$  is estimated from Guggenheimer's relation for multiple bonded molecules (2). The anharmonic vibrational term  $\omega_e X_e$  is calculated from  $\omega_e X_e = \omega_e^2 / (4D_0 + 2\omega_e)$ . The value of  $\alpha_e$  is calculated from the Morse potential function. The ground state configuration is estimated from the building-up principle (3), the united atom theory (3), and from analogy with BeO.

MERCURY MONOIODIDE, DIMERIC (Hg<sub>2</sub>I<sub>2</sub>) (Crystal)

Mol. Wt. = 655.04  
 $\Delta H_f^{298,15} = -28,462 \pm 0.5 \text{ kcal. mole}^{-1}$   
 $S_{298,15} = 57,670 \pm 2.0 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $T_m = 563^\circ\text{K}$   
 $\Delta H_m = [6.5] \pm 2.0 \text{ kcal. mole}^{-1}$

Heat of Formation. The average value of the cell measurements of W. C. Vosburgh, J. Amer. Chem. Soc. 50, 2386 (1928); E. Cohen Zeits. f. physik, Chemie 94, 210 (1920); T. Yoshida, J. Chem. Soc. Japan 49, 435 (1927); L. W. Øholm, Acta. Soc. Scientiarum Fennicae 41, 1 (1915) and the calorimetric values of R. Varot, Ann. Chim. Phys. (7) 8, 91 (1896) and W. Nernst, Zeits. f. physik. Chemie 2, 23 (1888) was adopted.

Heat Capacity and Entropy. The heat capacity at 298.15° was taken from National Bureau of Standards (U.S.) Circular 500 (1952) and was estimated above this by analogy with mercurous chloride. The entropy was obtained from the heat and free energy of formation obtained from the cell measurements listed under heat of formation.

Melting. P. Yvon, Comp. Rend. 76, 1607 (1973) gives 563°K for the melting point. The heat of melting was estimated by assuming the entropy of melting per atom to be the same as that for mercuric iodide.

March 31, 1962

Hg<sub>2</sub>I<sub>2</sub>

MERCURY MONIODIDE, DIMERIC (Hg<sub>2</sub>I<sub>2</sub>) (Liquid)  
Mol. Wt. = 655.04  
ΔH<sub>f</sub><sup>o</sup> 298.15 = [-23.021 ± 2.5] kcal. mole<sup>-1</sup>  
S<sub>298.15</sub><sup>o</sup> = [66.868 ± 6.0] cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
T<sub>m</sub> = 563°K  
ΔH<sub>m</sub><sup>o</sup> = [6.5 ± 2.0] kcal. mole<sup>-1</sup>  
T<sub>b</sub> = [530]°K (decomp.)

Heat of Formation. Calculated from ΔH<sub>f</sub><sup>o</sup> (crystal) and the estimated heat of melting and heat capacity.  
Heat Capacity and Entropy. C<sub>p</sub> was estimated as 1.33 times the heat capacity of mercuric iodide. The entropy was calculated from S<sup>o</sup> crystal, the estimated ΔH<sub>m</sub><sup>o</sup> and the heat capacities of solid and liquid.

Melting and Vaporization. The melting point was given by P. Yvon, Comp. Rend. 76, 1607 (1973); the heat of melting was estimated from that of mercuric iodide, by assuming the entropies of melting per atom to be equal. Mercurous iodide decomposes to Hg(s) and HgI<sub>2</sub>(s) at the boiling point which was estimated from the free energy change of the reaction.

Hg<sub>2</sub>I<sub>2</sub>

Iodine, Monatomic (I) (Ideal Gas) Mol. Wt. = 126.91

Thermodynamic Functions.

Atomic constants were taken from C. E. Moore [U. S. Natl. Bur. Standards Circ. 467, Vol. III (1958)]. The higher levels were averaged. Calculated thermodynamic functions are in good agreement with those of W. H. Evans, T. R. Munson, and D. D. Wagman [J. Research Natl. Bur. Standards, 55, 147 (1955)].

Heat of Formation.

The dissociation energy of diatomic iodine is given as  $D_0^{\circ} = 12452.5 + 1.5$  cm.<sup>-1</sup> by R. D. Verma [J. Chem. Phys. 32, 758 (1960)]. Converting to calories and combining with the heat of sublimation of iodine yields the heat of formation of the ideal monatomic gas. Evans, Munson, and Wagman [loc. cit.] list several investigations of the dissociation energy from equilibrium data. These are all less precise than the spectroscopic value and are not given any weight. The "best" average of the thermal data yields  $D_0^{\circ} = 35.588$  kcal. mole<sup>-1</sup> (spectroscopic = 35.608 kcal. mole<sup>-1</sup>).

 $\Delta H_{298.15}^\circ$  (to dimer) = 55.84 kcal/mol

Heat of Formation

The heats of solution of KI(c) have been critically reviewed by V. B. Fenker, U. S. Natl. Bur. Std. MSDS-NBS 2, 1965. Six pertinent results are quoted in the table below. Adopting the best value,  $\Delta H_{298}^\circ = 4.86 \pm 0.03$  kcal/mol, reported by Parker, and  $\Delta H_{298}^\circ = -60.32$  and  $-13.19$  kcal/mol for  $K^+(H_2O)$  and  $I^-(H_2O)$ , respectively, obtained from U.S. Natl. Bur. Std. Tech. Note 270-1, 1965, we obtain  $\Delta H_{298}^\circ$  (KI, c) =  $-78.37 \pm 0.1$  kcal/mol, which is adopted.

\*Values are adjusted to 298.15°K and to infinite dilution.  
 \*\*n is the number of moles of H<sub>2</sub>O per mole of KI(c) in solution.

Heat Capacity and Entropy

The low temperature heat capacities are based on those measured by W. T. Berg and J. A. Morrison, *Proc. Roy. Soc. (London)* **A242**, 467 (1957), 2.86 - 268.0°K. The adopted values are in good agreement with the Cp values reported by W. W. Seales, *Phys. Rev.* **112**, 49 (1958), 2 - 7°K. The data of K. Clusius, J. Goldmann, and A. Perlick, *Z. Naturforsch.* **4A**, 424 (1949), 10.27 - 269.9°K, appear to be too low in the temperature range 70 - 270°K and are not used. Low temperature enthalpies, 83 - 273°K, have been measured by F. Koref, *Ann. Physik* **3**, 49 (1911). The value of  $S_{298}^\circ$  is derived based on the adopted low temperature heat capacities, using  $S_{298}^\circ = 0.0033$  eu.

The high temperature enthalpies were determined by S. M. Skuratov and S. A. Lapushkin, *Russ. J. Gen. Chem. (English Transl.)* **21**, 2485 (1951), 623 - 923°K; A. S. Dworkin, private communication, Oak Ridge National Laboratory, Oak Ridge, Tenn., Dec. 1, 1964, 854 - 954°K; and C. B. Cooper, *J. Chem. Phys.* **21**, 777 (1953), 297 - 973°K. Heat Capacities are derived from the enthalpies by a curve fitting method which requires a smooth joint with the low temperature Cp. Enthalpy values used in the curve fit include smooth values calculated from the equation of Skuratov and the value  $H_{954}^\circ - H_{298}^\circ = 9.2$  kcal/mol from Dworkin. Deviation of the input values from the selected enthalpies are all less than 0.3 percent, while the deviations of the data of Cooper range from ±1.0 percent at 570°K to -1.6 percent at 974°K. Since the latter point is 20° above the melting point, there appears to be an error in Cooper's measurement of temperature. Cp above the melting point is obtained by graphical extrapolation.

Melting Data

Tm has been reported to be 953, 952 and 954°K by R. C. Ray and V. Dayal, *Trans. Faraday Soc.* **32**, 741 (1936); T. E. Phipps and E. G. Partridge, *J. Am. Chem. Soc.* **51**, 1311 (1929); and J. W. Johnson and M. A. Bredig, *J. Phys. Chem.* **53**, 604 (1958), respectively. The last value is adopted. The heat of melting was determined by A. S. Dworkin and M. A. Bredig, *J. Phys. Chem.* **54**, 269 (1960), using drop calorimetry.

Heat of Sublimation

The difference between  $\Delta H_{298}^\circ$  for KI(g) and KI(c) is  $\Delta H_{298}^\circ$  (to monomer). The  $\Delta H_{298}^\circ$  (to dimer) is calculated as the enthalpy change for the following reaction:  $2KI(c) = K_2I_2(g)$ .

POTASSIUM IODIDE (KI) (LIQUID) GFW = 166.0064

$$\Delta H_{298.15}^{\circ} = -74.771 \text{ kcal/mol}$$

$$\Delta H_m^{\circ} = 5.74 \text{ kcal/mol}$$

$$\Delta H_v^{\circ} = 45.62 \text{ kcal/mol}$$

$$S_{298.15}^{\circ} = 27.273 \text{ gibbs/mol}$$

$$T_m = 954^{\circ}\text{K}$$

$$T_b = 1618^{\circ}\text{K}$$

Heat of Formation

The heat of formation,  $\Delta H_{298}^{\circ}$ , is obtained from  $\Delta H_{298}^{\circ}$  (KI, c) by adding  $\Delta H_m^{\circ}$  and the difference between  $H_{954}^{\circ} - H_{298}^{\circ}$  for crystal and liquid.

Heat Capacity and Entropy

The heat capacity is derived as 17.3 gibbs/mol from the enthalpy measurements, 954 - 1014°K, by A. S. Dworkin, private communication, Oak Ridge National Laboratory, Oak Ridge, Tenn., Dec. 1, 1964. This Cp value is adopted in the temperature range 298 - 2500°K.  $S_{298}^{\circ}$  is obtained in a manner analogous to that of the heat of formation.

Melting Data

See KI(c) table for details.

Vaporization Data

The boiling point,  $T_b = 1618^{\circ}\text{K}$ , is calculated as the temperature at which the sum of the partial pressures of KI(g) and  $K_2I_2(g)$  equals one atmosphere. The value of  $\Delta H_v^{\circ}$  is calculated as the heat required to produce one mole of vapor mixture, which contains 78 percent monomer (KI) and 22 percent dimer ( $K_2I_2$ ) at  $T_b$ .

$T_b$  was reported as 1603 and 1590 K by H. von Wartenberg and P. Albrecht, Z. Elektrochem. 51, 162 (1921), and O. Ruff and S. Muggdan, Z. Anorg. Chem. 117, 147 (1921), respectively.

Dec. 31, 1961 / June 30, 1967

$\omega_e = 186.287 \pm 0.04 \text{ cm}^{-1}$        $\omega_0 \nu_a = 0.6775 \pm 0.006 \text{ cm}^{-1}$        $\sigma = 1$   
 $B_0 = 0.06072 \text{ cm}^{-1}$        $\alpha_e = 0.000267 \text{ cm}^{-1}$        $\nu_e = 3.0478 \text{ \AA}$

Heat of Formation

The heat of formation is derived from the sublimation and vaporization data analyzed below. Many investigators have determined the total pressures of KI(g) and KI(l) over KI(c) or KI(l) by static methods or "apparent" pressures by Knudsen effusion or transpiration. These pressures are converted to monomer pressures by use of functions [see K<sub>2</sub>I<sub>2</sub>(g) table] which are consistent with the dimer-monomer equilibrium data of Datz (9). Second and third law analyses of the monomer pressures show reasonable agreement. The selected value of  $\Delta H_f^{298}$  = -30.0 ± 0.5 kcal/mol is also in good agreement with -30.23 ± 1.15 and -30.46 kcal/mol derived from  $D_0^{\circ} = 3.32 \pm 0.05$  and 3.33 eV reported by Gaydon (12) and Herzberg (11), respectively.

| Investigator           | Reaction** | Temperature-K | No. of Points | $\Delta H_f^{298}$ , kcal/mol | Drift | $\Delta H_f^{298}$ , kcal/mol |

\*Based on the third law  $\Delta H_f^{298}$  value.

\*\* (A) KI(c) = KI(g); (B) KI(l) = KI(g)

Heat Capacity and Entropy

The ground state configuration is obtained from Herzberg (11). The adopted values of  $\omega_e$ ,  $\omega_0 \nu_a$ ,  $B_0$ ,  $\alpha_e$  and  $\nu_e$  were determined using millimeter wave molecular beam spectroscopy by Rusk and Gordy (12), and corrected to the average isotopic species. Similar values were reported by Honig et al. (13) from microwave spectra, except  $\omega_e$  which was given as 189.74 cm<sup>-1</sup>. The value of  $\omega_a$  was derived to be 200 and 173 cm<sup>-1</sup> by Barrow and Caunt (14) and Rice and Klemperer (15). The moment of inertia is 4.5979 x 10<sup>-38</sup> g cm<sup>2</sup>.

ΔH<sup>o</sup> = Unknown

ΔH<sup>o</sup><sub>298.15</sub> = -64.55 ± 0.1 kcal/mol

ΔH<sup>o</sup> = 3.50 kcal/mol

S<sup>o</sup><sub>298.15</sub> = [20.5] gibbs/mol

T<sub>m</sub> = 742°K

Heat of Formation.

The heat of formation, ΔH<sup>o</sup><sub>f,298</sub>(LiI, c) = -64.55 kcal/mol, was calculated from the heat of solution of lithium iodide (c) at infinite dilution and the ionic heats of formation of Li<sup>+</sup>(COH<sub>2</sub>O) and I<sup>-</sup>(COH<sub>2</sub>O).

V. B. Farker, "Thermal Properties of Aqueous Uni-univalent Electrolytes," NSRDS-NBS 2, Apr. 1, 1965, reviewed the literature heat of solution data and gave the "best" value, ΔH<sup>o</sup><sub>so</sub> = -15.130 ± 75 cal/mol for LiI(c) - LiI(COH<sub>2</sub>O) at 298.15°K. The ionic heat of formation, ΔH<sup>o</sup><sub>f,298</sub>(Li<sup>+</sup>·COH<sub>2</sub>O) = -66.49 kcal/mol was calculated from ΔH<sup>o</sup><sub>f,298</sub>(LiOH·COH<sub>2</sub>O) = -121.46 kcal/mol (see JANAF LiOH(c) Table, Mar. 31, 1966) with ΔH<sup>o</sup><sub>f,298</sub>(OH<sup>-</sup>·COH<sub>2</sub>O) = -54.97 kcal/mol from NES Technical Note 270-1, "Selected Values of Chemical Thermodynamic Properties," Oct. 1, 1965. The value ΔH<sup>o</sup><sub>f,298</sub>(I<sup>-</sup>·COH<sub>2</sub>O) = -13.19 kcal/mol was also obtained from NES Technical Note 270-1. Combination of the ionic heats of formation of Li<sup>+</sup>(COH<sub>2</sub>O) and I<sup>-</sup>(COH<sub>2</sub>O) gives the heat of formation of LiI(COH<sub>2</sub>O), ΔH<sup>o</sup><sub>f,298</sub> = -79.68 kcal/mol.

Heat Capacity and Entropy.

A. S. Dworikin, private communication, Oak Ridge National Laboratory, Dec. 1964, has measured the enthalpy changes by the drop method (642-802°K), yielding (H<sub>742</sub><sup>o</sup>)<sub>298</sub> = 6.0 kcal/mol for the crystal at the melting point. Heat capacities derived from his data were Cp 692° = 14.8 and Cp 772 = 15.1 cal/deg-mol for the crystal and liquid, respectively. The tabulated heat capacities were estimated based on these values and on the heat capacities of LiCl(c), NaCl(c) and NaI(c).

The entropy, S<sup>o</sup><sub>298.15</sub> = 20.5 eu, was estimated by adding the entropy difference between NaI(c) and NaCl(c) to the entropy of lithium chloride (c) at 298.15°K. Comparisons with other alkali halides give results within ± 0.5 eu of this value.

K. K. Kelley, U. S. Bur. Mines Bull. 584 (1960), 592 (1961), has estimated the heat capacities (Cp = 12.30 + 2.44 X 10<sup>-3</sup>T gibbs/mol) and the entropy (S<sup>o</sup><sub>298</sub> = 17.50 eu).

Melting Data.

The selected heat of fusion (ΔH<sup>o</sup><sub>f,298</sub> = 3.50 kcal/mol) was obtained from enthalpy measurements in a drop calorimeter by A. S. Dworikin and M. A. Bredig, J. Phys. Chem. 64, 269 (1960).

## LITHIUM IODIDE (LiI)

(LIQUID)

OPW = 133.8434

$\Delta H^*_{298.15} = [23.568] \text{ gibbs/mol}$

$\Delta H^*_{298.15} = -61.749 \text{ kcal/mol}$

$\Delta H^*_{\text{m}} = 3.50 \text{ kcal/mol}$

$\Delta H^*_{\text{f}}(\text{to equilibrium mixture}) = 23.3 \text{ kcal/mol}$

$\Delta H^*_{\text{f}}(\text{to monomer only}) = [32.6] \text{ kcal/mol}$

$T_{\text{m}} = 742^\circ\text{K}$

$T_{\text{b}}(\text{to equilibrium mixture}) = 1449^\circ\text{K}$

$T_{\text{b}}(\text{to monomer only}) = [1497]^\circ\text{K}$

Heat of Formation.

The heat of formation was calculated from that of the crystal by adding the heat of fusion and the difference between  $H^*_{42} - H^*_{298}$  for crystal and liquid.

Heat Capacity and Entropy.

A. S. Dworin, private communication, Oak Ridge National Laboratory, Dec. 1964, has derived the heat capacity,  $C_p = 15.1 \text{ gibbs/mol}$ , from enthalpy measurements,  $742 - 802^\circ\text{K}$ , by the drop method. The liquid heat capacity was assumed to be a constant,  $15.1 \text{ gibbs/mol}$ . The entropy was obtained in a manner analogous to that of the heat of formation.

Melting Data.

See LiI(c) table for detail.

Vaporization Data.

$T_{\text{b}}$  (to monomer only) is determined as the temperature at which the Gibbs energy change ( $\Delta G^*$ ) for the reaction  $\text{LiI(l)} = \text{LiI(g)}$  approaches zero. The corresponding enthalpy change ( $\Delta H^*$ ) at boiling point is the heat of vaporization  $\Delta H^*_{\text{v}}$  (to monomer only).

$T_{\text{b}}$  (to equilibrium mixture) is the temperature at which the sum of the calculated partial vapor pressures of  $\text{LiI(g)}$  and  $\text{Li}_2\text{I}_2(\text{g})$  reaches one atmosphere (trimer and higher polymer have been neglected in calculation). This value is in good agreement with the boiling point of  $1444^\circ\text{K}$  from the least squares fit of the total vapor pressure data measured by O. Ruff and S. Mugdan, Z. anorg. Chem. **117**, 147 (1921).  $\Delta H^*_{\text{v}}$  (to equilibrium mixture) at the boiling point is calculated as the heat of vaporization of one mole of liquid to vapor containing 30.44 mole percent of dimer. For detailed information see LiI(g) and  $\text{Li}_2\text{I}_2(\text{g})$  tables.

Heat of Formation.

The heat of formation (ΔHf°<sub>298</sub> (LiI, g) = -21.75 ± 2 kcal/mol) was calculated from the selected heat of sublimation and the heat of formation for lithium iodide (c). The heat of sublimation has been determined spectroscopically from the ion intensity measurement (2nd law method) by L. N. Gorokhov, Dokl. Akad. Nauk SSSR 142, 113 (1962), as ΔHs° (to monomer) = 42.9 ± 0.6 and ΔHs° (to dimer) = 43.2 ± 0.4 kcal/mol in the temperature range from 626-722°K. Gorokhov also reported the partial vapor pressure of monomeric lithium iodide (P<sub>monomer</sub> = 3 X 10<sup>-3</sup> mm Hg) and the ratio of dimer to monomer (P<sub>dimer</sub>/P<sub>monomer</sub> = 6) which have been used for third law calculation. Using the same technique, L. Friedman, J. Chem. Phys. 23, 477 (1955), reported the heats of sublimation as ΔHs°<sub>727</sub> (to monomer) = 41.9 ± 0.5 and ΔHs°<sub>727</sub> (to dimer) = 40.8 ± 0.5 kcal/mol in the temperature range from 630° to 730°K. J. Berkowitz, H. A. Teaman and W. A. Chupka, J. Chem. Phys. 36, 2170 (1962) have also studied the lithium iodide vapor in the mass spectrometer and reported the second law values of the heat of dimerization at 800°K as 37.9 and 40.4 kcal/mol, respectively. Using the JANAF thermodynamic functions, all the heats of sublimation and dimerization at different temperatures have been reduced to 298°K and summarized in the following table. The total vapor pressure over the liquid has been measured by a boiling point method in the temperature range 1223° to 1413°K by O. Ruff and S. Muggen, Z. snorg. Chem. 111, 147 (1921). (Their data have been quoted by H. von Wartenberg and H. Schulz, Z. Elektrochem. 27, 568 (1921).) In order to have good agreement between the calculated vapor pressure and the observed total vapor pressure, the heats of sublimation have been so chosen as ΔHs°<sub>298</sub> (to monomer) = 42.8 kcal/mol and ΔHs°<sub>298</sub> (to dimer) = 42.6 kcal/mol and the heat of dissociation of dimer, ΔHd°<sub>298</sub> = 43.0 kcal/mol. The calculated boiling point (to equilibrium mixture) is 1449°K which agrees with 1443°K reported by Wartenberg and Schulz, and also 1462°K by Ruff and Muggen.

Heat Capacity and Entropy.

The bond distance and the rotational constants (B<sub>e</sub> and α<sub>e</sub>), corrected to the isotopic abundance of 7.4% Li<sup>6</sup> and 92.6% Li<sup>7</sup>, were obtained from the microwave studies by A. Honig, M. Mandel, M. L. Stinch and C. H. Townes, Phys. Rev. 96, 629 (1954). The vibrational constants (ω<sub>e</sub> and ω<sub>e</sub>x<sub>e</sub>) were determined from the infrared spectrum by W. Klemperer, W. O. Norris, A. Buchler and A. O. Enalle, J. Chem. Phys. 33, 1534 (1960).

The tabulated thermodynamic functions are in reasonable agreement with those calculated by R. L. Wilkins, J. Chem. Eng. Data 5, 337 (1960), who used slightly different molecular constants.

Bond Distances: O-N = [1.15] Å N-I = [2.3] Å

Bond Angle: O-N-I = [120]°

Product of the Moment of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [7.742 x 10<sup>-41</sup>] g<sup>3</sup> cm<sup>6</sup>

Heat of Formation

The heat of formation ( $\Delta H_f^{\circ} = 298.15$ ) for NOI (g) is estimated by comparison with those for FNO(g), ClNO(g), and BrNO(g), and the related cyanogen halides.

Heat Capacity and Entropy

The molecular structure and bond angle are estimated by comparison with those for ClNO(g) and BrNO(g). The N-O bond distance is assumed to be the same as that in NO(g). The N-I bond distance ( $r_{N-I}$ ) is calculated based on an assumption that  $r_{ON-Cl} - r_{ON-I} = r_{Cl-I} - r_{I-I}$ . The vibrational frequencies are estimated by comparison with those for FNO(g), ClNO(g) and BrNO(g). The three principal moments of inertia are: I<sub>A</sub> = 8.834 x 10<sup>-40</sup>, I<sub>B</sub> = 2.916 x 10<sup>-38</sup> and I<sub>C</sub> = 3.005 x 10<sup>-38</sup> g cm<sup>2</sup>.

(CRYSTAL) MOL. WT. = 149.901

(CRYSTAL)

ΔH<sub>f</sub><sup>0</sup> = -68.6 ± 0.2 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>0</sup> 298.15 = -68.8 ± 0.2 kcal. mole<sup>-1</sup>  
 ΔH<sub>m</sub> = 5.64 kcal. mole<sup>-1</sup>

S<sub>298.15</sub> = 23.5 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 T<sub>m</sub> = 933°K.

Heat of Formation.

The heat of formation was obtained as follows:

- (1) HI·100H<sub>2</sub>O + NaOH·100H<sub>2</sub>O → NaI·20H<sub>2</sub>O  
 T. W. Richards, A. W. Rowe, J. Am. Chem. Soc. **44**, 684 (1922).  
 ΔH<sub>f</sub><sup>0</sup> 298 (kcal. mole<sup>-1</sup>) = -13.51 ± 0.02
- (2) Na(c) + 100H<sub>2</sub>O(l) → NaOH·100H<sub>2</sub>O + 1/2H<sub>2</sub>(g)  
 S. R. Dunn, L. O. Green, J. Am. Chem. Soc. **60**, 4782 (1938).  
 ΔH<sub>f</sub><sup>0</sup> 298 (kcal. mole<sup>-1</sup>) = -44.069 ± 0.006
- (3) NaOH·100H<sub>2</sub>O → NaOH·100H<sub>2</sub>O + 900H<sub>2</sub>O(l)  
 National Bureau of Standards Circular 500.  
 ΔH<sub>f</sub><sup>0</sup> 298 (kcal. mole<sup>-1</sup>) = +0.031 ± 0.004
- (4) 1/2H<sub>2</sub>(g) + 1/2I<sub>2</sub>(s) → HI(g)  
 JANAF Tables.  
 ΔH<sub>f</sub><sup>0</sup> 298 (kcal. mole<sup>-1</sup>) = +6.30 ± 0.05
- (5) HI(g) + 100H<sub>2</sub>O(l) → HI·100H<sub>2</sub>O  
 W. A. Roth, Z. Elektrochem. **50**, 107 (1944).  
 ΔH<sub>f</sub><sup>0</sup> 298 (kcal. mole<sup>-1</sup>) = -19.30 ± 0.05
- (6) NaI·20H<sub>2</sub>O → NaI(c) + 20H<sub>2</sub>O(l)  
 J. Wast, E. Lange, Z. physik. Chem. **116**, 161 (1925).  
 E. Lange, A. L. Robinson, Chem. Revs. **9**, 89 (1931).  
 Askew, Bullock, Smith, Tinkler, Gatty, Wolfenden, J. Chem. Soc., **1954**, 1368.  
 ΔH<sub>f</sub><sup>0</sup> 298 (kcal. mole<sup>-1</sup>) = +1.75 ± 0.06

(1) + (2) + (3) + (4) + (5) + (6) gives Na(c) + 1/2I<sub>2</sub>(s) → NaI(c)  
 ΔH<sub>f</sub><sup>0</sup> 298 (kcal. mole<sup>-1</sup>) = -68.80 ± 0.2

Heat Capacity and Entropy.

Smoothed heat capacities between 3° and 270°K. have been presented by M. T. Berg and J. A. Morrison, Proc. Roy. Soc. (London) **242A**, 467 (1957). Above 270°K. the heat capacity was obtained by comparing with KI(c) on a reduced temperature plot of C<sub>p</sub>/T versus T. The values so obtained were increased by 1.4% to bring them into line with the low temperature data.

Melting Data.

A. Dworkin and M. Bredig, J. Phys. Chem. **54**, 269 (1950) have measured both T<sub>m</sub> and ΔH<sub>m</sub>.

$S_{298.15}^o = 28.862 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $T_m = 933^\circ\text{K.}$   
 $T_b = 1577^\circ\text{K. (equilibrium mixture)}$

$\Delta H_f^o 298.15 = -63.695 \text{ kcal. mole}^{-1}$   
 $\Delta H_m = 5.64 \text{ kcal. mole}^{-1}$

Heat of Formation.  
 $\Delta H_f^o 298.15$  was calculated from the heat of formation of the crystal plus the heat of melting and the difference between  $H_{933}^o - H_{298}^o$  for crystal and liquid.

Heat Capacity and Entropy.  
 $C_p$  was estimated assuming each atom contributed  $7/5 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$ .  $S_{298.15}^o$  was calculated in a manner similar to  $\Delta H_f^o 298.15$ .

Melting Data.  
 See table for crystal.

Vaporization Data.  
 The boiling point is that given by K. K. Kelley, U. S. Bureau of Mines Bulletin 363, 1955 from examination of the high temperature vapor pressure.

B<sub>e</sub> = [0.02940] cm.<sup>-1</sup>

ω<sub>e</sub>x<sub>e</sub> = 0.25 cm.<sup>-1</sup>

α<sub>e</sub> = [0.00000] cm.<sup>-1</sup>

σ = 1

Heat of Formation. ΔH<sub>f</sub><sup>°</sup> 298.15 was calculated from the dissociation energy of PbI(g) reported by A. G. Gaydon, "Dissociation Energies and Spectra of Diatomic Molecules," Chapman and Hall, Ltd., London, 1953.

Heat Capacity and Entropy. Ground state configuration, ω<sub>e</sub> and ω<sub>e</sub>x<sub>e</sub> were obtained from G. Herzberg, "Spectra of Diatomic Molecules," Van Nostrand, New York, 1950. B<sub>e</sub> and α<sub>e</sub> were estimated by comparison with the corresponding values for the other diatomic halide molecules. Electronic levels and multiplicities were estimated from those for PbF(g).

GFW = 174.8044

(IDEAL GAS)

TITANIUM MONOIODIDE (TiI)

Ground State Configuration [4f]

S<sub>298.15</sub> = 64.22 ± 2.0 gibbs/mol

ΔHf° = [65.8 ± 10.0] kcal/mol

ΔHf°<sub>298.15</sub> = [65.5 ± 10.0] kcal/mol

Heat of Formation

The heat of formation, ΔHf°<sub>298</sub> of TiI (g) is calculated from the dissociation energy, D<sub>0</sub>, which is estimated as 73 kcal/mol. This estimate is obtained from the relation D(TiI<sub>2</sub>) < D(TiI) < D(TiI<sub>3</sub>), where D represents the average energy per bond, which is valid for the titanium fluorides. The dissociation energy of TiF(g) from which the relation is derived was estimated relative to that of TiF<sub>2</sub>(g) by Zmbov and Margrave (1).

Heat Capacity and Entropy

The vibrational frequency, ω<sub>e</sub>, and the anharmonic vibrational term, ω<sub>e</sub>x<sub>e</sub>, are estimated from those of TiCl(g) and comparisons of the mercury and alkali monohalides. The internuclear distance is estimated from Guggenheimer's relation (2). B<sub>e</sub> is calculated from r<sub>e</sub>. The ground state term and electronic levels are estimated from the ground state multiplet of Ti<sup>+</sup>(3). σ<sub>e</sub> is estimated from the Morse potential function.

| 0 | 0              | 4              |

Heat of Formation  
 $B_e = [0.03789] \text{ cm.}^{-1}$   
 $r_e = [2.9] \text{ \AA}$

The dissociation energy was estimated from a correlation of the JANAF values for TiCl(g), TiI(g), and ZrCl(g). The resulting value, 29.7 kcal. mole<sup>-1</sup>, was employed with auxiliary JANAF heats of formation for Zr(g) and I(g) in calculating ΔH<sup>0</sup><sub>f</sub> 298.15.

Heat Capacity and Entropy.

The vibrational frequency was estimated from those of TiI(g), TiCl(g), and the alkali halides. The ground state configuration was assumed to be analogous to the ground term of TiCl(g) as given by E. A. Shenoyakaya, et al., Optics and Spectroscopy, 12, 359 (1962). The internuclear distance was estimated from those of TiBr(g), TiI(g) and ZrI(g).

September 30, 1961

IODINE (I<sub>2</sub>)

(REFERENCE STATE)

MOL. WT. = 253.82

0°K to 366.75°K Crystal  
 366.75°K to 458.59°K Liquid  
 458.59°K to 8000°K Ideal Diatomic Gas

## Heat of Formation.

Zero by definition.

## Heat Capacity of Crystal.

The recent measurements of D. A. Shirley and W. F. Giauque [J. Am. Chem. Soc. 81, 4778 (1959)] over the temperature range 13° to 327°K are adopted, no weight being given to the earlier work of E. Lange [Z. physik. Chem. 110, 343 (1924)], which deviate by 1% or more. L. G. Carpenter and T. F. Harle [Phil. Mag. 23, 193 (1937)] measured the heat capacity of crystalline and liquid iodine by an adiabatic method. Their data are in poor agreement with Shirley and Giauque in the range 275° to 330°K and are given no weight. K. J. Frederick and J. H. Hildebrand [J. Am. Chem. Soc. 60, 1436 (1938)] measured the enthalpy of crystalline and liquid iodine relative to 298°K by the method of mixtures. For calibration they used a slug of copper. The enthalpy of copper which they used now appears to be too high [K. K. Kelley, U. S. Bur. Mines Bull. 584 (1960)]. The results of Frederick and Hildebrand were corrected by a factor which varied linearly from zero at 300°K to 0.995 at 400°K and 0.990 at 500°K. These corrected enthalpies and the heat capacities of Shirley and Giauque above 298°K were used to derive the equations for crystalline iodine:

$$H_p - H_{298} = -12.1048 T + 0.029506 T^2 - 6.686 \times 10^{-5} T^{-1} + 3228.65$$

$$C_p = -12.1048 + 0.059012 T + 6.686 \times 10^{-5} T^{-2}$$

## Heat Capacity of Liquid, Melting Point, and Heat of Melting.

For the liquid, the corrected results of Frederick and Hildebrand give:

$$H_p - H_{298} = 19.281 T - 2516.5$$

$$C_p = 19.281$$

The melting point given by Frederick and Hildebrand is 113.6°C. The difference in the heat content equations at the melting point gives the heat of melting as 3706.7 cal. mole<sup>-1</sup>.

## Heat of Sublimation, Ideal Gas Functions.

See tables for ideal gases for details.

Iodine (I<sub>2</sub>)

IODINE (I<sub>2</sub>)

(LIQUID)

MOL. WT. = 253.82

ΔH<sub>f</sub><sup>o</sup> 298 = +3.232 kcal. mole<sup>-1</sup>  
 S<sub>298</sub><sup>o</sup> = 35.936 cal. mole<sup>-1</sup> deg.<sup>-1</sup>  
 ΔH<sub>m</sub> = 3708.7 cal. mole<sup>-1</sup>  
 ΔH<sub>v</sub> = 10025.5 cal. mole<sup>-1</sup>

T<sub>m</sub> = 366.75°K  
 T<sub>b</sub> = 458.39°K

Heat of Formation.

Obtained as the heat of fusion calculated to 298.15°K by adding H<sub>366.75</sub>-H<sub>298.15</sub> for solid and subtracting H<sub>366.75</sub>-H<sub>298.15</sub> for liquid.

Heat Capacity.

The liquid heat capacity of 19.281 cal. mole<sup>-1</sup> deg.<sup>-1</sup> derived from the data of Fradrick and Hildebrand (see Reference State) was extrapolated back to 298.15°K and up to 1000°K.

Entropy.

The value at 400°K calculated for the reference state was back calculated to 298.15°K by means of the constant heat capacity of 19.281 cal. mole<sup>-1</sup> deg.<sup>-1</sup>

Vaporization.

See ideal gas tables for details.

Thermodynamic Functions.  
The molecular constants are from the work of D. H. Rank and W. H. Baldwin [J. Chem. Phys. 19, 1210 (1951)] with a revised value of  $\omega_e = 214.52$  as given by R. D. Verma [J. Chem. Phys. 32, 738 (1960)]. The value of  $\omega_e x_e$  has been adjusted to allow for the dropping of higher order corrections not used in the computer program. The calculated thermodynamic functions are in good agreement with those of W. H. Evans, T. R. Munson, and D. D. Wagman [J. Research Natl. Bur. Standards 55, 147 (1955)], who used very slightly different constants. L. Matheson and A. L. O. Rees [J. Chem. Phys. 25, 753 (1956)] give further refinements to the spectroscopic data which are negligible for our purpose. Their  $\omega_e$  is also slightly low since it is based on Rank and Baldwin.

Heat of Formation.  
The heat of sublimation of iodine was calculated from published vapor pressure data as follows, using thermodynamic functions of condensed and gaseous phases described above.

|   | $\Delta H_f^{\circ}$ , kcal. mole <sup>-1</sup> |
|---|---|
| Baxter, Hickey, and Holmes <sup>1</sup> (273° to 328°K)                 | 15.657 ± .004                                   |
| Baxter and Orusa <sup>2</sup> (323° to 368°K)                           | 15.657 ± .002                                   |
| Remay and Young <sup>3</sup> (solid) (331° to 386°K)                    | 15.871 ± .018                                   |
| Remay and Young <sup>3</sup> (liquid) (386° to 454°K)                   | 15.876 ± .007                                   |
| Haber and Kerschbaum <sup>4</sup> (225° to 283°K)                       | 15.765 ± .012                                   |
| Ollilepple and Fraser <sup>5</sup> (303° to 333°K)                      | 15.655 ± .005                                   |
| Sklyarenko, Markin, and Balyeva <sup>6</sup> (283° to 303°K)            | 15.813  |
| Neumann <sup>7</sup> (as given by Haber and Kerschbaum) (232° to 292°K) | 15.899 ± .034                                   |
| Wiedemann <sup>8</sup> (393° to 453°K)                                  | 15.635 ± .008                                   |
| Braune and Stresemann <sup>9</sup> (305° to 358°K)                      | 15.658 ± .012                                   |
| Arctowski <sup>10</sup> (288° to 345°K)                                 | 15.623 ± .080                                   |
| Wright <sup>11</sup> (352° to 372°K)                                    | 15.659 ± .003                                   |
| Dewar <sup>12</sup> (273° to 303°K)                                     | 15.821 ± .103                                   |
| Richter <sup>13</sup> (358° to 383°K)                                   | 15.639 ± .043                                   |

The uncertainties given are the average deviation from the mean. The data of Braune and Stresemann are as recalculated by Oerry and Ollilepple<sup>14</sup>. The data of Haber and Kerschbaum appear systematically too high. The results of Sklyarenko, et al., Neumann, Arctowski, Dewar, and Richter are scattered and are not given any weight. A weighted average of the remaining data yield  $\Delta H_f^{\circ} = 15.66 \pm 0.01$  kcal. mole<sup>-1</sup>, which calculates to  $\Delta H_f^{\circ} = 14.924$  cal. mole<sup>-1</sup>.

Dec. 31, 1961 June 30, 1967

POTASSIUM IODIDE, DIMERIC (K<sub>2</sub>I<sub>2</sub>) (IDEAL GAS)

Point Group [D<sub>2h</sub>]

S°<sub>298.15</sub> = [94.6] gibbs/mol

Ground State Quantum Weight = [1]

ΔH°<sub>f,0</sub> = -99.5 ± 1 kcal/mol

ΔH°<sub>f,298.15</sub> = -100.9 ± 1 kcal/mol

Vibrational Frequencies and Degeneracies

Bond Distance: K-I = [3.29] Å

Bond Angles: K-I-K = [75°] I-K-I = [108°]

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [5.041 × 10<sup>-111</sup>] g<sup>3</sup> cm<sup>6</sup>

σ = [4]

Heat of Formation

The chemical equilibrium for the reaction K<sub>2</sub>I<sub>2</sub>(g) = 2KI(g) has been studied by S. Datz, ORNL-2933, Oak Ridge, Tenn., 1960, and S. Datz, W. T. Smith, Jr. and E. H. Taylor, J. Chem. Phys. 31, 538 (1961). They measured the temperature dependence of the molecular weight of KI(g) which was determined by measurement of the absolute pressure exerted by a known weight of completely vaporized salt contained in an isothermal fused silica bulb of known volume. Based on the reported P-V-T measurements, the enthalpy change of the reaction at 298°K is evaluated by the second and third law methods. The results are given in the table below.

R. C. Miller and P. Kusch, J. Chem. Phys. 25, 860 (1956), determined the molecular composition of KI vapor by measurement of the velocity distribution of the molecules in the beam produced as the vapor effused through a small slit in a source. The analysis was based on an assumption that the velocity distribution within the oven is Maxwellian and that the vapor effuses through the ideal slit of kinetic theory. The velocity distributions of potassium and thallium atomic beams were found to be in excellent agreement with the theoretical distributions, so the determination of the molecular composition of KI beams was tried. Using the derived equilibrium constants, we calculate the enthalpy change of the dissociation reaction by the second and third law methods. The results are presented in the following table.

The value of ΔH°<sub>f,298</sub>(K<sub>2</sub>I<sub>2</sub>,g) is adopted as -100.9 ± 1 kcal/mol.

| Investigator | Temperature, °K | No. of Points | ΔH° <sub>f,298</sub> , kcal/mol |           | Drift, kcal/mol |
|--------------|-----------------|---------------|---------------------------------|-----------|-----------------|
|              |                 |               | Second Law                      | Third Law |                 |
| Datz         | 1228-1395       | 10            | 40.09±0.82                      | 40.66     | 0.44±0.6        |
|              | 1292-1408       | 6             | 41.37±1.91                      | 41.01     | -0.2±1.4        |
| Miller-Kusch | 816-921         | 10            | 54.62±2.46                      | 36.28     | -21.4±2.8       |

Heat Capacity

The molecular structure and bond distance and angles were estimated by J. Berkowitz, J. Chem. Phys. 29, 1386 (1958). The vibrational frequencies are estimated by comparison with those calculated by J. Berkowitz, J. Chem. Phys. 32, 1519 (1960), and adjusted to give good agreement between second and third law evaluations of the equilibrium data. The three principal moments of inertia are: I<sub>A</sub> = 5.194 × 10<sup>-39</sup>, I<sub>B</sub> = 2.866 × 10<sup>-37</sup> and I<sub>C</sub> = 3.366 × 10<sup>-37</sup> g cm<sup>2</sup>.

Point Group D<sub>2h</sub>  
 $S_{298.15}^{\circ} = [79.0] \text{ gbbbs/mol}$   
 $\Delta H_f^{\circ} = -85.3 \pm 4 \text{ kcal/mol}$   
 $\Delta H_f^{\circ} = -86.5 \pm 4 \text{ kcal/mol}$   
 Ground State Quantum Weight = 1

Vibrational Frequencies and Degeneracies

Bond Distance: Li-I = 2.54 Å      Li-Li = 2.71 Å  
 Bond Angle: I-Li-I = 116° ± 4°

Product of the Moments of Inertia:  $I_A I_B I_C = 1.63429 \times 10^{-112} \text{ g}^3 \text{ cm}^6$

Heat of Formation

This was obtained from the heat of formation of the crystal and the heat of sublimation of the dimer, which derivation has been given in the LiI(g) table.

Heat Capacity and Entropy

J. Berkowitz, J. Chem. Phys. 29, 1366 (1958), 32, 1519 (1960), has calculated the molecular structure and vibrational frequencies based on an ionic model. The planar rhombic structure, proposed by Berkowitz, has been confirmed by the lack of polarity in electric deflection by A. Büchler, J. L. Stauffer and W. Klemperer, J. Am. Chem. Soc. 85, 4544 (1964). The selected bond distances and angle were obtained from the electron diffraction studies of monomer-dimer vapor by P. A. Aktschin and N. G. Rambidi, Z. Physik Chem. 213, 111 (1960). The bond distances (Li-I = 2.72 Å and I-I = 4.520 Å) calculated by Berkowitz are in good agreement with those from Aktschin and Rambidi. The three principal moments of inertia are  $I_A = 4.2152 \times 10^{-9}$ ,  $I_B = 194.8074 \times 10^{-39}$  and  $I_C = 199.0226 \times 10^{-39} \text{ cm}^2$ .

S. H. Bauer, T. Ito and R. F. Porter, J. Chem. Phys. 33, 685 (1960), have estimated six vibrational frequencies (501, 501, 148, 200, 284, 360 cm<sup>-1</sup>) for Li<sub>2</sub>I<sub>2</sub>(g) in the electron diffraction studies of the Li<sub>2</sub>Cl<sub>2</sub>(g). W. Klemperer and W. O. Norris, J. Chem. Phys. 33, 1071 (1961), have observed two fundamental vibrational frequencies (248 and 375 cm<sup>-1</sup>) in the infrared spectrum and tentatively assigned them as E<sub>2u</sub> and E<sub>3u</sub> modes; these have been adopted in the table. The remaining four vibrational frequencies were obtained from J. Berkowitz, loc. cit., because his model and derivation are self-consistent.

Lead Diiodide (PbI<sub>2</sub>) (crystal)

Mol. Wt. = 461.03  
 ΔH<sub>f</sub><sup>o</sup> 298.15 = -41.86 ± 0.06 kcal. mole<sup>-1</sup>  
 S<sub>298.15</sub><sup>o</sup> = 41.869 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> 298.15 = 41.70 ± 0.10 kcal. mole<sup>-1</sup>  
 T<sub>m</sub> = 680°K.  
 ΔH<sub>m</sub><sup>o</sup> = 3.87 kcal. mole<sup>-1</sup>

Heat of Formation. Calculated from the data reported by H. Braune and F. Korf, Z. anorg. Chem. 87, 175 (1914) and R. H. Gerke, J. Am. Chem. Soc. 44, 1664 (1922).

Heat Capacity, Entropy, and Melting Data. C<sub>p</sub> (10° to 298.15°K.) obtained from Edgar F. Westrum, Jr., University of Michigan, Ann Arbor, Michigan, private communication, May, 1961. Above 298.15°K., C<sub>p</sub> given by K. K. Kelley, U. S. Bur. Mines Bull. 584 (1960) was used. The two heat capacity curves were joined smoothly at 298.15°K. by graphical extrapolation. T<sub>m</sub> and ΔH<sub>m</sub><sup>o</sup> reported by M. Blanc and G. Petit, Compt. rend., 248, 1305 (1959).

Heat of Sublimation. Calculated from vapor pressure data of K. Jellinek and A. Rudat, Z. Physik. Chem., A143, 55 (1929) and B. Oretner and K. Jellinek, Z. Physik. Chem., A165, 97 (1933).

Lead Diodide (PbI<sub>2</sub>)

I<sub>2</sub>Pb

Lead Diodide (PbI<sub>2</sub>) (Liquid)

Mol. Wt. = 461.03  
 $\Delta H_f^\circ 298.15 = [-10.637] \text{ kcal. mole}^{-1}$   
 $S_{298.15}^\circ = [42.786] \text{ cal. deg}^{-1} \text{ mole}^{-1}$   
 $T_m = 690^\circ \text{K.}$   
 $\Delta H_m^\circ = 3.67 \text{ kcal. mole}^{-1}$   
 $T_b = 1135^\circ \text{K.}$   
 $\Delta H_v^\circ = 26.99 \pm 0.10 \text{ kcal. mole}^{-1}$

Heat of Formation. Calculated from that of the crystal.

Heat Capacity, Entropy, and Melting Data.  $C_p$  obtained from K. K. Kelley, U. S. Bur. Mines Bull. 584 (1960).  $T_m$  and  $\Delta H_m^\circ$  reported by M. Blanc and G. Petit, Compt. rend. 249, 1305-6 (1959). A glass transition temperature of 454°K. is assumed.

Vaporization Phenomena.  $T_b$  and  $\Delta H_v^\circ$  calculated from  $\Delta H_f^\circ 298.15$  and free energy functions for condensed and gaseous states.

## Heat of Formation

The heat of formation of TiI<sub>2</sub>(c) is calculated from the heat of reaction for the process 2TiI<sub>2</sub>(c) = Ti(c) + TiI<sub>4</sub>(g), and the heat of formation of TiI<sub>4</sub>(c). Vapor pressure data for this reaction were reported by Herczog and Pidgeon (1) over the temperature range 750° to 902°K. Second and third law analyses of these data give values for  $\Delta H_{298}$  of  $60.5 \pm 0.8$  and  $60.8$  kcal/mol respectively, the third law drift being  $0.4 \pm 1.0$  eu. The third law  $\Delta H_{298}$  is used to obtain the adopted value of  $\Delta H_f^\circ$ .

## Heat Capacity and Entropy

The estimated heat capacity is that reported by Kelley (2). The value of  $S^\circ_{298.15}$  is estimated from that of TiCl<sub>2</sub>(c) and the difference between ionic entropy contributions of Cl<sup>-</sup> and I<sup>-</sup>.

## Heat of Sublimation

The heat of sublimation of TiI<sub>2</sub>(c) is taken as the difference in the heats of formation of TiI<sub>2</sub>(c) and TiI<sub>2</sub>(g) at the sublimation temperature. The sublimation temperature is taken as the point at which  $\Delta G_f^\circ = 0$  for the reaction TiI<sub>2</sub>(c) = TiI<sub>2</sub>(g).

σ = 2

Heat of Formation

The heat of formation of TiI<sub>2</sub>(g) is calculated from that of TiI<sub>2</sub>(c) and the heat of vaporization. Vapor pressure data over the temperature range 750°K to 902°K have been reported by Herzog and Pidgeon (1). Second and third law analyses of these data give values for ΔH<sub>f</sub><sup>o</sup> of 31.9 and 58.9 kcal/mol, respectively. The third law drift for these data is 8.3 ± 1.1 eu, with one point rejected due to failure of a statistical test. The adopted value of ΔH<sub>f</sub><sup>o</sup><sub>298</sub> is calculated from the third law heat of vaporization.

Heat Capacity and Entropy

The interatomic distances are estimated from those of TiCl<sub>2</sub>(g), TiCl<sub>4</sub>(g), TiBr<sub>2</sub>(g), TiBr<sub>4</sub>(g) and TiI<sub>4</sub>(g). The vibrational frequencies are estimated from a valence force field model. The force constant k is estimated as 1.0 millidynes/Å and the constant K<sub>0</sub>/l<sup>2</sup> is assumed to be 0.05 millidynes/Å.

The electronic levels are assumed to be the same as TiCl<sub>2</sub>(g). The levels of TiCl<sub>2</sub> are estimated by assuming they correspond to the inverted states of TiCl<sub>2</sub>(g) (2). The linear configuration is adopted, since experimental evidence indicates that other transition metal dihalides are linear (3, 4, 5, 6).

I<sub>2</sub>Zr

Zirconium Diodide (ZrI<sub>2</sub>) (Crystal)

Mol. Wt. = 345.04  
 ΔH<sub>f</sub><sup>°</sup> 288.15 = [-62] kcal. mole<sup>-1</sup>  
 S<sub>298.15</sub><sup>°</sup> = [35.8] cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 T<sub>m</sub> = [700]°K.  
 ΔH<sub>m</sub><sup>°</sup> = [6] kcal. mole<sup>-1</sup>  
 T<sub>b</sub> = [1300]°K.  
 ΔH<sub>v</sub><sup>°</sup> = [27] kcal. mole<sup>-1</sup>

Heat of Formation. Estimated from a consideration of ΔH<sub>f</sub> ZrI<sub>4</sub>(c) and of the disproportionation data given by R. F. Rolsten, "Iodide Metals and Metal Iodides", John Wiley and Sons, Inc., New York, (1961).

Heat Capacity and Entropy. Heat capacity estimated by comparison to the other zirconium halides and titanium halides. Entropy estimated from additive constants.

Melting and Vaporization. ΔH<sub>m</sub> was estimated. T<sub>m</sub>, T<sub>b</sub>, and ΔH<sub>v</sub> from L. Brewer, National Nuclear Energy Series, Div. IV, 195, paper 7, McGraw-Hill Book Co., Inc., New York, 1950.

I<sub>2</sub>Zr

Zirconium Diodide (ZrI<sub>2</sub>)

Zirconium Diodide (ZrI<sub>2</sub>) (Liquid)

Mol. Wt. = 345.04  
 $\Delta H_f^o$  298.15 = [-56] kcal. mole<sup>-1</sup>  
 $S_{298.15}^o$  = [44.5] cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 $T_m$  = [700]°K.  
 $\Delta H_m$  = [6] kcal. mole<sup>-1</sup>  
 $T_b$  = [1300]°K.  
 $\Delta H_v$  = [27] kcal. mole<sup>-1</sup>

Heat of Formation. Based upon the  $\Delta H_f$  ZrI<sub>2</sub>(c) and the estimated functions of both crystal and liquid.

Heat Capacity and Entropy. Entropy based upon the estimated values for  $C_p(c)$ ,  $\Delta H_m$ , and  $C_p(l)$ .

Melting and Vaporization.  $\Delta H_m$  was estimated.  $T_m$ ,  $T_b$ , and  $\Delta H_v$  from L. Brewer, National Nuclear Energy Series, Div. IV, 199, paper 7, McGraw-Hill Book Co., Inc., 1950.

I<sub>2</sub>Zr

Zirconium Diiiodide (ZrI<sub>2</sub>) (Ideal Gas)

Mol. Wt. = 345.04  
 ΔH<sub>f</sub><sup>0</sup> 298.15 = [-16] kcal. mole<sup>-1</sup>  
 S<sub>298.15</sub><sup>0</sup> = [82.4] cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 Point group C<sub>2v</sub>

Vibrational Levels and Multiplicities

ω, cm.<sup>-1</sup>  
 (e<sub>g</sub>) (1)  
 (i<sub>2g</sub>) (1)  
 (2i<sub>g</sub>) (1)

rZr-I = [2.66 Å]      Δ I-Zr-I = 120°      σ = 2  
 Product of Moments of Inertia I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 1.0716 X 10<sup>-111</sup> g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation. Based upon the estimated value of the ΔH<sub>f</sub><sup>0</sup> for the crystal and the appropriate crystal and gas functions.

Heat Capacity and Entropy. Molecular constants were all estimated by comparison to similar molecules of zirconium and titanium.

I<sub>2</sub>Zr

GFW = 428.6132

(CRYSTAL)

TITANIUM TRIIODIDE (TiI<sub>3</sub>)

Titanium Triiodide (TiI<sub>3</sub>)  
(Crystal)

GFW = 428.6132

ΔHf° = unknown

ΔHf°<sub>298.15</sub> = [-77 ±5] kcal/mol

ΔHs° = [35.4] kcal/mol

**Heat of Formation**  
The heat of formation of TiI<sub>3</sub>(c) is calculated from the free energy of formation at 623°K combined with the increment ΔGf°<sub>623</sub> - ΔGf°<sub>298.15</sub> of TiI<sub>2</sub>(c), TiI<sub>3</sub>(c) and TiI<sub>4</sub>(g). The free energy of formation, ΔGf°<sub>298.15</sub>, is estimated such that ΔGf°<sub>623</sub> = 0 for the process 2TiI<sub>3</sub>(c) = TiI<sub>2</sub>(c) + TiI<sub>4</sub>(g). This assumption is based on the observations of Herczeg and Pidgeon (1) and Fast (2).

**Heat Capacity and Entropy**  
The heat capacities of TiI<sub>3</sub>(c) and the value of S°<sub>298.15</sub> estimated by Kelley (3) have been adopted.

**Heat of Sublimation**  
The heat of sublimation of TiI<sub>3</sub>(c) is taken as the difference in the heats of formation of TiI<sub>3</sub>(c) and TiI<sub>3</sub>(g) at the sublimation temperature. The sublimation temperature is estimated as the point at which ΔGr° = 0 for the process TiI<sub>3</sub>(c) = TiI<sub>3</sub>(g).

Bond Distance: Ti-I = [2.7] Å

Bond Angle: I-Ti-I = [100°]

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [1.3 × 10<sup>-110</sup>] g cm<sup>6</sup>

Heat of Formation

The heat of formation, ΔH<sub>f</sub><sup>o</sup><sub>298.15</sub>, of TiI<sub>3</sub>(g) is estimated from the average Ti-I bond energy. The bond energy is estimated from the corresponding quantities for TiB<sub>4</sub>(g), TiB<sub>3</sub>(g) and TiI<sub>4</sub>(g).

Heat Capacity and Entropy

The interatomic distance is estimated from those of TiI<sub>4</sub>, TiCl<sub>4</sub> and TiCl<sub>3</sub>. The pyramidal bond angle is estimated by assuming that TiI<sub>3</sub>(g) is similar to the group V trihalides. The principal moments of inertia are I<sub>A</sub> = I<sub>B</sub> = 1.9 × 10<sup>-37</sup> g cm<sup>2</sup> and I<sub>C</sub> = 3.6 × 10<sup>-37</sup> g cm<sup>2</sup>. The vibrational frequencies are estimated from valence force field predictions and comparisons with group V trihalides. The electronic levels are estimated from the levels of Ti<sup>3+</sup> reported by C. E. Moore, U. S. Natl. Bur. Std., Circ. 467, 1949.

Heat of Formation.

E. M. Larsen and J. J. Leddy, *J. Am. Chem. Soc.* **76**, 5983 (1956), studied the reaction  $Zr(c) + 3ZrI_4(g) = 4ZrI_3(c)$  in the temperature range 475 to 975°K. and pressure range 5 to 15 atm. They present a plot of the fractional reaction, at a number of temperatures, as a function of reaction time; however, they express doubt concerning the attainment of thermodynamic equilibrium.

The free energy function change for this reaction was calculated at 100° intervals from 500 to 1100°K. At each temperature the equilibrium constant was assumed to be 1, and  $\Delta H_f$  298 accordingly calculated. These values and the heat of formation of  $ZrI_4(g)$  [see  $ZrI_4$  table] were used to compute a series of values for the heat of formation of  $ZrI_3(c)$  at 298.15°K. The following table gives representative values at four temperatures.

| T(°K.) | K <sub>p</sub> | ΔH <sub>r</sub> 298             | ΔH <sub>f</sub> 298.15 [ZrI <sub>3</sub> (c)] |
|--------|----------------|---------------------------------|---|
| 500    | 1              | -86.0 kcal. mole <sup>-1</sup>  | -80.2 kcal. mole <sup>-1</sup>                |
| 700    | 1              | -80.3 kcal. mole <sup>-1</sup>  | -86.2 kcal. mole <sup>-1</sup>                |
| 900    | 1              | -113.5 kcal. mole <sup>-1</sup> | -92.1 kcal. mole <sup>-1</sup>                |
| 1100   | 1              | -135.9 kcal. mole <sup>-1</sup> | -97.7 kcal. mole <sup>-1</sup>                |

If one assumes an initial pressure of from 5 to 10 atm. for  $ZrI_4$  and stoichiometric amounts of reactants, then, on the basis of zirconium, the reaction must proceed to the extent of 80 to 90% for the pressure of  $ZrI_4$  to attain a value of 1 atm. and hence an equilibrium constant of 1. The data of Larsen and Leddy indicate that the reaction proceeds to the extent of 86% at 975°K. From this it was assumed that at around 1000°K. the equilibrium constant attains a value of 1 giving -95 kcal. mole<sup>-1</sup> for the heat of formation of  $ZrI_3$  at 298.15°K.

Their data was subjected to a second law calculation but the results are of doubtful value in view of the uncertainty in the attainment of thermodynamic equilibrium at the lower temperatures. The limits of error assigned to the heat of formation are ±15 kcal. mole<sup>-1</sup> corresponding to a temperature spread of ±500° in the above table.

Heat Capacity and Entropy.

The heat capacity was estimated in the same manner as for  $ZrBr_3(c)$  [see  $ZrBr_3(c)$  table]. The values  $\rho_p = 60^{\circ}\text{K.}$  and  $\rho_g = 115^{\circ}\text{K.}$  were taken to be the same as those estimated for  $ZrI_4(c)$ . The internal contribution was obtained from the estimated  $ZrI_3$  vibrational frequencies and the anharmonicity factor, "g", was taken to be  $2.5 \times 10^{-3}$ . The specific heat above 300°K. was obtained by graphical extrapolation.

For the above estimation, it was assumed that the crystalline lattice is made up of  $ZrI_3$  molecules. However, E. Holz [see R. F. Rolater, "Iodide Metals and Metal Iodides", John Wiley & Sons, Inc., New York, 1961, page 46] came to the conclusion that crystalline  $ZrI_3$  is composed of a chain lattice of  $(Zr_2I_6)_n$  units. The results of an analysis for a crystalline lattice composed of  $Zr_2I_6$  units would probably not differ significantly from that for a crystalline lattice composed of  $ZrI_3$  units since both are approaching the classical harmonic heat capacity of 12R calories per formula weight of  $ZrI_3$  at relatively low temperatures.

Until more quantitative information becomes available, it is felt that the above analysis gives a fair approximation to the heat capacity of  $ZrI_3$ .

Temperature of Disproportionation.

As described in the "Heat of Formation" section, this was assumed to be  $1000^{\circ} \pm 500^{\circ}\text{K.}$

Liquid Phase.

It is assumed that the liquid phase is thermodynamically unstable under ordinary conditions.

Sublimation Data.

The heat of sublimation at 298.15°K. was obtained from the difference in the heats of formation of the gas and solid at 298.15°K. The sublimation point was obtained from the free energy crossover between gas and solid.

Bond Distance: Zr-I = [2.59] Å

Bond Angle: I-Zr-I = [101]°

σ = [3]

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [1.1545 X 10<sup>-110</sup>] gm.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation.

The heats of formation, from the gaseous atoms, of the gaseous zirconium tetrahalides were computed from data issued in these tables. The zirconium-halide bond energy, taken as 1/4 of this heat of formation, was found to be linear with internuclear separation. From gaseous titanium tri- and tetrachloride, it was found that the bond energy of the trichloride was around 7 kcal. mole<sup>-1</sup> greater than that for titanium tetrachloride. This amount was added to the bond energy of zirconium tetrachloride to get that of zirconium trichloride which, when used with its estimated internuclear distance, was found to lie almost exactly on the bond energy versus internuclear distance curve for the tetrahalides. The bond energy for each of the gaseous trihalides of zirconium was determined from this curve and their estimated bond distances.

For zirconium triiodide, the heat of formation from the gaseous atoms was -275 kcal. mole<sup>-1</sup> and from the elements in their standard state, -53 kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy.

The measured internuclear distances for the triiodides of phosphorus, arsenic, and antimony were plotted as a function of the atomic weight of these elements and a smooth curve was drawn through the points. The bond distance in ZrI<sub>3</sub> was taken from this plot. The bond angle was assumed to be 101°. The individual moments of inertia are: I<sub>A</sub> = I<sub>B</sub> = 1.8520 X 10<sup>-37</sup> gm. cm.<sup>2</sup>, I<sub>C</sub> = 3.3661 X 10<sup>-37</sup> gm. cm.<sup>2</sup>.

Force constants for ZrI<sub>3</sub> were estimated from those of the triiodides of phosphorus and arsenic. These were used in a valence force field calculation giving ω<sub>1</sub> = 195, ω<sub>2</sub> = 88, ω<sub>3</sub> = 181, and ω<sub>4</sub> = 65 cm.<sup>-1</sup>. For the fluorides and chlorides of P, As, and Sb, ω<sub>1</sub> is greater than ω<sub>3</sub> but there appears to be a reversal as one goes to the bromides and iodides with ω<sub>3</sub> becoming greater than ω<sub>1</sub>. An empirical correlation procedure for ZrI<sub>3</sub> gave ω<sub>1</sub> = 195, ω<sub>2</sub> = 90, ω<sub>3</sub> = 260, and ω<sub>4</sub> = 65 cm.<sup>-1</sup> in which ω<sub>2</sub> > ω<sub>1</sub>. Since ω<sub>3</sub> > ω<sub>1</sub> for PI<sub>3</sub> and AsI<sub>3</sub>, the correlation value for ω<sub>3</sub> was used to represent this frequency in ZrI<sub>3</sub>.

Lead Tetraiodide (PbI<sub>4</sub>)  
(Ideal Gas) Mol. Wt. = 714.85

June 30, 1962

Lead Tetraiodide (PbI<sub>4</sub>) (Ideal Gas)

Mol. Wt. = 714.85  
 ΔH<sub>f</sub><sup>o</sup> 298.15 = [-0.4] kcal. mole<sup>-1</sup>  
 S<sub>298.15</sub><sup>o</sup> = 111.4 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 Point Group T<sub>d</sub>

Vibrational Levels and Multiplicities

ω<sub>i</sub>, cm.<sup>-1</sup>  
 137 (1)  
 37 (2)  
 168 (3)  
 48 (3)

Pb-I distance = 2.77 Å I-Pb-I angle = 109° 28'  
 I<sub>A</sub>PbI<sub>3</sub>C = 8.0044 X 10<sup>-110</sup> g.<sup>3</sup> cm.<sup>6</sup> σ = 12

Heat of Formation. ΔH<sub>f</sub><sup>o</sup> 298.15 was estimated by comparison with the value of ΔH<sub>f</sub><sup>o</sup> 298.15 for PbI<sub>2</sub>(g).

Heat Capacity and Entropy. Vibrational frequencies and molecular constants were obtained from G. Nagarajan, Bull. Soc. Chim. Belg., 71, 119 (1962).

Titanium Tetraiodide (TiI<sub>4</sub>)  
(Crystal) GFW = 555.5176

$\Delta H_f^\circ = -89.3 \pm 2.0$  kcal/mol  
 $\Delta H_f^{298,15} = -89.8 \pm 2.0$  kcal/mol  
 $\Delta H_t^\circ = 2.37 \pm 0.15$  kcal/mol  
 $\Delta H_m^\circ = 4.74 \pm 0.15$  kcal/mol

$S_{298,15}^\circ = 59.8 \pm 1.6$  gibbs/mol  
 $T_t = 379^\circ\text{K}$   
 $T_m = 428^\circ\text{K}$

Heat of Formation

The heat of formation of TiI<sub>4</sub>(c) was measured by Johnson et al. (1), based on the heats of hydrolysis of TiBr<sub>4</sub>(c) and TiI<sub>4</sub>(c) in sulfuric acid. These data result in a heat of reaction of -57.88 kcal/mol for the process TiI<sub>4</sub>(c) + 2Br<sub>2</sub>(l) = TiBr<sub>4</sub>(c) + 2I<sub>2</sub>(c), when recalculated with revised values of ΔHf° for HBr(aq) and HI(aq) (2). Combination of ΔHf°<sub>298</sub> with auxiliary JANAF data gives the adopted value of ΔHf°<sub>298</sub>.

Heat Capacity and Entropy

King et al. (3) reported the heat capacity and enthalpy of TiI<sub>4</sub>(c) over the temperature range 51° to 428°K. The value of S°<sub>298</sub> is calculated from these data based on S°<sub>51</sub> = 14.62 eu. The value of H°<sub>51</sub> - H°<sub>0</sub> is calculated to be 0.356 kcal/mol from a Debye-Einstein extrapolation of the measured heat capacities.

Transition Data

A first order transition was observed by King et al. (2) at 379°K. They reported the measured value of 2.37 kcal/mol, noting that this value had an uncertainty of 0.15 kcal/mol due to hysteresis in the transition.

Melting Data

The melting temperature and heat of melting were reported by King et al. (2). The large uncertainty on ΔHm° is due to the uncertainty and close proximity of the transition at 379°K.

Titanium Tetraiodide (TiI<sub>4</sub>)

(Liquid)      GFW = 555.5176

TITANIUM TETRAIODIDE (TiI<sub>4</sub>)

(LIQUID)

GFW = 555.5176

$\Delta H_f^\circ =$  unknown

$\Delta H_f^\circ_{298.15} = -83.25$  kcal/mol

$\Delta H_m^\circ = 4.74 \pm 0.15$  kcal/mol

$\Delta H_v^\circ = 13.50 \pm 0.5$  kcal/mol

$S^\circ_{298.15} = 74.532$  gibbs/mol

$T_m = 428^\circ K$

$T_b = 652.6^\circ K$

Heat of Formation

The heat of formation of TiI<sub>4</sub>(l) is calculated from the heat of melting,  $\Delta H_m^\circ_{298}$ , the heat of formation of TiI<sub>4</sub>(c), and the values of  $H^\circ_{428} - H^\circ_{298.15}$  for both crystal and liquid.

Heat Capacity and Entropy

King et al. (1) reported the enthalpy of TiI<sub>4</sub>(l) above the melting temperature. The heat capacity derived from these data is constant. The entropy,  $S^\circ_{298}$ , of TiI<sub>4</sub>(l) is calculated from  $\Delta S^\circ_{428}$  and the values of  $S^\circ_{428} - S^\circ_{298.15}$  of both crystal and liquid.

Melting Data

The melting temperature and heat of melting were reported by King et al. (1).

Vaporization Data

The boiling temperature,  $T_b$ , is taken as the point at which  $K_p = 1$  for the reaction TiI<sub>4</sub>(l) = TiI<sub>4</sub>(g). The heat of vaporization is calculated as the difference between  $\Delta H_f^\circ$  of the liquid and gas at the boiling temperature. The vapor pressure data are discussed in the table for TiI<sub>4</sub>(g).

Heat of Formation

The heat of formation of TiI<sub>4</sub>(g) is calculated from that of TiI<sub>4</sub>(l) and the heat of vaporization of the liquid. Blocher and Campbell (1) reported vapor pressure data for TiI<sub>4</sub>(l) over the temperature range 473° to 655°K. Second and third law analyses of these data give values for ΔH<sub>v</sub><sup>o</sup> of 17.2 ± 0.1 and 16.98 kcal/mol, respectively, the third law drift being -0.4 ± 0.2 eu. The adopted value of ΔH<sub>f</sub><sup>o</sup> is based on the third law heat of vaporization.

Heat Capacity and Entropy

The interatomic distances are estimated from those of TiBr<sub>4</sub>(c), TiBr<sub>4</sub>(g) and TiI<sub>4</sub>(c) (2). The tetrahedral model is assumed by analogy with TiCl<sub>4</sub>(g) and TiBr<sub>4</sub>(g). The principal moments of inertia are: I<sub>A</sub> = I<sub>B</sub> = I<sub>C</sub> = 3.51 × 10<sup>-37</sup> g cm<sup>2</sup>. The vibrational frequencies of TiI<sub>4</sub>(g) have been estimated by Ushanova et al. (3). The given estimates are based on their predictions and valence force field calculations.

ZIRCONIUM TETRAIODIDE (ZrI<sub>4</sub>) (CRYSTAL) MOL. WT. = 598.86

$\Delta H_f^0 = [-115.4] \pm 1.0 \text{ kcal. mole}^{-1}$   
 $\Delta H_f^{298.15} = -115.9 \pm 0.8 \text{ kcal. mole}^{-1}$   
 $\Delta H_f^{298.15} = 31.0 \pm 0.7 \text{ kcal. mole}^{-1}$   
 $T_b = 704^\circ\text{K.}$

Heat of Formation.

A. G. Turnbull, J. Phys. Chem. **65**, 1652 (1961), measured the heat of reaction for the following reactions:  
 (1)  $\text{ZrI}_4(\text{c}) + 4\text{NaOH}(\text{aq.}) = \text{ZrO}_2(\text{hyd.}) + 4\text{NaI}(\text{aq.}) + 2\text{H}_2\text{O}$   
 (2)  $\text{ZrI}_4(\text{c}) + 2\text{H}_2\text{O} = \text{ZrOOH}^+(\text{aq.}) + 4\text{I}^-(\text{aq.}) + 3\text{H}^+(\text{aq.})$

Turnbull used the same procedure to calculate the heat of formation of zirconium tetraiodide as he did for zirconium tetrabromide [see ZrBr<sub>4</sub> table]. The heat of formation of the solid zirconium tetraiodide from reaction (1) was  $-115.6 \pm 0.8 \text{ kcal. mole}^{-1}$  and from reaction (2) was  $-116.3 \pm 0.8 \text{ kcal. mole}^{-1}$ . An average of these was taken as the heat of formation of the tetraiodide.

Heat Capacity and Entropy.

The heat capacity from 0 to 300°K. was calculated in the same manner as for ZrBr<sub>4</sub>(c) [see ZrBr<sub>4</sub>(c) table]. The values,  $\Theta_D^0 = 60^\circ\text{K.}$  and  $\Theta_E^0 = 115^\circ\text{K.}$  were used in the analysis. The value,  $a = 1.5 \times 10^{-3}$ , was obtained from a consideration of the sublimation calculations [see below]. The heat capacity above 300°K. represents a graphical extrapolation.

Melting.

$T_m = 772^\circ\text{K.}$  was reported by O. Rahlfs and W. Fischer, Z. anorg. allgem. Chem. **211**, 349 (1933).

Sublimation Data.

Vapor pressure measurements have been reported by Rahlfs and Fischer (loc. cit.). Four values of "a" were used to compute the thermodynamic functions of the solid. That value of "a" was chosen which gave agreement between 2nd and 3rd law values for the heat of sublimation. The sublimation results for the four values of "a" are given in the following table.

| "a"                    | ΔH <sub>g</sub> <sup>0</sup> (298) [3rd law] | ΔH <sub>g</sub> <sup>0</sup> (298) [2nd law] |
|------------------------|--|--|
| 3.0 X 10 <sup>-3</sup> | 29.99 kcal. mole <sup>-1</sup>               | 31.65 kcal. mole <sup>-1</sup>               |
| 2.5 X 10 <sup>-3</sup> | 30.39 kcal. mole <sup>-1</sup>               | 31.34 kcal. mole <sup>-1</sup>               |
| 2.0 X 10 <sup>-3</sup> | 30.76 kcal. mole <sup>-1</sup>               | 31.17 kcal. mole <sup>-1</sup>               |
| 1.5 X 10 <sup>-3</sup> | 31.02 kcal. mole <sup>-1</sup>               | 31.04 kcal. mole <sup>-1</sup>               |

A temperature dependent third law heat of sublimation at 298°K. was obtained for "a" =  $3.0 \times 10^{-3}$ ; this temperature trend decreased for smaller values of "a" and there was essentially no temperature dependence for "a" =  $1.5 \times 10^{-3}$ . Various high temperature extrapolations were not used since, by experience with ZrBr<sub>4</sub>(c), they produced insignificant changes in the heat values. The heat of sublimation was taken to be 31.0 kcal. mole<sup>-1</sup> since the entire analysis was conducted to obtain 2nd and 3rd law agreement.

From experience with a number of other compounds, that were found to be amenable to the theoretical treatment used here, the value "a" =  $1.5 \times 10^{-3}$  appears to be rather low, but no further analysis was deemed practical since all parameters for the gas and solid are estimated.

The sublimation point obtained from the free energy crossover of solid and gas was 703°K. The value reported by Rahlfs and Fischer (loc. cit.), was 704°K. The sublimation point was taken as 704°K.

Since the sublimation point is lower than the melting point, the liquid phase is thermodynamically unstable under ordinary conditions.

Heat of Formation

Calculated from the heats of formation and sublimation for the crystal at 298.15°K. (see crystal table for details).

Heat Capacity and Entropy

The interatomic distance was obtained from an involved correlation of the interatomic distances and covalent radii of the tetrahalides of Pb, Si, Ti, Ge, and Sn. I. N. Godnev, A. M. Aleksandrovskaya, and I. V. Regina, Optics and Spectroscopy 7, 172 (1959), estimated the interatomic distance and report 2.67 Å as the Zr-I distance. The I-Zr-I angle was taken as the tetrahedral angle. The three principal moments of inertia are: I<sub>A</sub> = I<sub>B</sub> = I<sub>C</sub> = 4.0355 × 10<sup>-37</sup> gm. cm.<sup>2</sup>.

The fundamental vibrational frequencies are estimated. The product of ω<sub>1</sub> and intermolecular distance for the tetraiodides of Pb, Ti, Ge, and Sn was found to be approximately constant. Using the estimated Zr-I intermolecular distance a value of 147 cm.<sup>-1</sup> was obtained for ω<sub>1</sub>. Plots of ω<sub>1</sub> and ω<sub>2</sub> versus intermolecular distance for these molecules were constructed and smooth curves drawn through the points. Values of ω<sub>1</sub> and ω<sub>2</sub> for ZrI<sub>4</sub> were read off from these plots; they were 146 cm.<sup>-1</sup> and 44 cm.<sup>-1</sup> respectively. Using ω<sub>1</sub> = 146 cm.<sup>-1</sup> and ω<sub>2</sub> = 45 cm.<sup>-1</sup>, ω<sub>3</sub> = 237 cm.<sup>-1</sup> and ω<sub>4</sub> = 58 cm.<sup>-1</sup> were obtained from a valence force field calculation. Godnev, Aleksandrovskaya, and Regina (loc. cit.) estimated the vibrational frequencies and reported ω<sub>1</sub> = 152 cm.<sup>-1</sup>, ω<sub>2</sub> = 44 cm.<sup>-1</sup>, ω<sub>3</sub> = 211 cm.<sup>-1</sup> and ω<sub>4</sub> = 55 cm.<sup>-1</sup>.

Heat of Formation.

Zero by definition.

Heat Capacity of Crystal.

Low temperature heat capacity measurements have been reported by L. M. Roberts [Proc. Phys. Soc. (London) 70B, 744-52 (1957)] (1.5°-20°K), by C. A. Krier, R. S. Craig, and W. E. Wallace [J. Phys. Chem. 61, 522 (1957)] (12°-320°K), by T. M. Dauphinee, D. L. Martin, and H. Preston-Thomas [Proc. Roy. Soc. (London), A253, 214 (1955)] (20°-350°K), by F. Simon and W. Zeidler [Z. physikal. Chem. 123, 383 (1926)] (15°-300°K), and by E. D. Eastman and W. H. Rodabaugh [J. Am. Chem. Soc. 40, 489 (1918)] (70°-230°K). A smooth curve was drawn through a large scale plot of the data, giving the most weight to the first three references. Above 300°K. the heat capacity data were adjusted to join smoothly with the heat content measurements of T. B. Douglas, A. P. Ball, D. C. Ginnings, and W. D. Davis [J. Am. Chem. Soc. 74, 2472 (1952)].

Heat Capacity of Liquid and Heat of Melting.

The heat of melting and liquid heat capacity are from the heat content measurements of T. B. Douglas, A. P. Ball, D. C. Ginnings, and W. D. Davis (loc. cit.).

Heat of Sublimation, Ideal Gas Functions.

See tables for K(g) and K<sub>2</sub>(g) for details.

POTASSIUM (K)

(LIQUID)

MOL. WT. = 39.100

$\Delta H_f^0 298 = 0.546 \text{ kcal. mole}^{-1}$   
 $T_m = 336.35^\circ\text{K.}$   
 $T_b = 1037^\circ\text{K.}$   
 $\Delta H_m = 0.558 \text{ kcal. mole}^{-1}$   
 $\Delta H_v = 18.38 \text{ kcal. per formula weight}$

Heat of Formation.

Back calculated from the heat of melting and the heat contents of solid and liquid at the melting point.

Heat of Melting and Heat Capacity.

The heat of melting, melting point, and liquid heat capacity were measured by T. B. Douglas, A. P. Ball, D. C. Ginnings, and W. D. Davis [J. Am. Chem. Soc. 74, 2472 (1952)]. The heat capacity curve was extrapolated back to 298°K. and up to 2000°K. in a reasonable manner.

Entropy.

Back calculated from the entropy of the liquid at the melting point and the extrapolated heat capacity from the melting point to 298°K.

Vaporization.

Potassium vaporizes to a mixture of monatomic and diatomic gas. The total vapor pressure reaches 1 atm. at 1037°K. The vapor composition at this temperature is 94.5 mole % monatomic and 5.5 mole % diatomic gas. The heat of vaporization of 39.1 grams of liquid potassium to this equilibrium mixture is 18.38 kcal. See also tables for K(g) and K<sub>2</sub>(g).

Thermodynamic Functions.

Thermodynamic functions were calculated using electronic levels and multiplicities from P. Riaberg [Arkiv. Fysik 10, 583 (1956)] and C. E. Moore [Nat. Bur. Standards Circ. 467 (1949)]. Higher levels were averaged. The results are in excellent agreement with W. H. Evans, T. R. Munson, and D. D. Wagman [J. Research Natl. Bur. Standards 55, 83 (1955)].

Heat of Formation.

Evans, Munson, and Wagman (loc. cit.) have revised the vapor pressure data on potassium. Their calculations were revised slightly for the changes made in the functions for the condensed state. In addition, the recent data of M. M. Hakanasi, M. Hadsen, M. A. Salke, and C. F. Bonilla [J. Phys. Chem. 60, 138 (1956)] were considered in selecting the heat of sublimation of 21.31 ± 0.20 kcal. mole<sup>-1</sup>. A review of the properties of potassium vapor using imperfect gas theory to establish the dimer dissociation energy has recently been published by R. J. Thorn and G. H. Minnow [J. Phys. Chem. 65, 1297 (1961)]. Although the imperfect gas treatment appears to be favored by the experimental data available, this could not be unequivocally established. Unpublished vapor pressure data cited by Thorn and Minnow are in agreement with the values selected here, assuming ideal gas behavior.

Heat of Formation.

The heat of formation at 0°K. was obtained from that of the ideal monatomic potassium gas by adding the enthalpy of ionization, calculated from the ionization limit given by C. E. Moore "Atomic Energy Levels", Natl. Bur. Standards Circ. 467 (1949). This was converted to 298°K. by using the formation equation K(ref. state) - e<sup>-</sup>(ref. state) = K<sup>+</sup>(monatomic gas), thus K<sup>+</sup> involves the difference in enthalpies of two reference states as well as its own enthalpy.

Heat Capacity and Entropy.

These were calculated using the electronic energy levels tabulated above, taken from C. E. Moore, loc. cit.

| T, °K. | C <sub>v</sub> | S° - (F° - H <sub>298</sub> °)/T | H° - H <sub>298</sub> ° | $\Delta H_f^{\circ}$ | $\Delta F_f^{\circ}$ | Log K <sub>p</sub> |

| B <sub>e</sub> = [0.3068] cm <sup>-1</sup>     | a <sub>e</sub> = [0.0027] cm <sup>-1</sup>             | r <sub>e</sub> = [2.2] Å                    |

Heat of Formation

Brewer and Margrave (1) suggested that the ΔHf° value for KO(g) from the gaseous ions can be taken as the mean of the corresponding ΔHf° values for the alkali fluoride and chloride with a maximum uncertainty of 10 kcal/mol. We obtain the values ΔHf° = -137.84 and -117.7 kcal/mol for the reactions K<sup>+</sup>(g) + F<sup>-</sup>(g) = KF(g) and K<sup>+</sup>(g) + Cl<sup>-</sup>(g) = KCl(g), respectively. Assuming ΔHf° = -127.83 kcal/mol for the reaction K<sup>+</sup>(g) + O<sup>-</sup>(g) = KO(g), we calculate ΔHf°<sub>298</sub>(KO, g) = 19.0 kcal/mol with the JANAF auxiliary values for the gaseous ions.

Based on the assumption that D<sub>0</sub>(KO) = 1/2(D<sub>0</sub>(K<sub>2</sub>) + D<sub>0</sub>(O<sub>2</sub>)), or ΔHf° = 64.9 kcal/mol for the reaction KO(g) = K(g) + O(g), we evaluate ΔHf°<sub>298</sub>(KO, g) = 15.6 kcal/mol or ΔHf°<sub>298</sub>(KO, g) = 15.2 kcal/mol.

According to Somayajulu (2), in a sequence of similar diatomic molecules, k<sub>r</sub>v<sub>e</sub>/D<sub>0</sub> = constant, where k<sub>r</sub> = force constant, r<sub>e</sub> = equilibrium bond distance and D<sub>0</sub> = dissociation energy. Using r<sub>e</sub> = 1.62 Å, D<sub>0</sub> = 77.9 kcal/mol for LiO(g), r<sub>e</sub> = 2.2 Å and k<sub>r</sub>(KO)/r<sub>e</sub>(LiO) = 0.3015, we calculate D<sub>0</sub> = 55 kcal/mol for KO(g), yielding ΔHf°<sub>298</sub>(KO, g) = 26.1 kcal/mol. The value k<sub>r</sub> is derived from the relation k<sub>r</sub> = 4π<sup>2</sup>ν<sup>2</sup>μ where ν is the vibrational frequency of the diatomic molecule and μ is the reduced mass. The value of ΔHf°<sub>298</sub>(KO, g) is tentatively adopted as 17 ± 10 kcal/mol.

Heat Capacity and Entropy

The ground state configuration is assumed to be the same as that for the OH(g) molecule, which has the same number of valence electrons. The values of ω<sub>e</sub> and ω<sub>e</sub>x<sub>e</sub> are estimated by comparison with those for LiF(g) and KF(g). The bond distance is estimated from those for HO(g), HF(g) and KF(g). B<sub>e</sub> and a<sub>e</sub> are derived from r<sub>e</sub>, ω<sub>e</sub> and ω<sub>e</sub>x<sub>e</sub> by the method suggested by Herzberg (3).

Heat of Formation  
 The electron affinity (E. A.) of K<sup>0-</sup>(g) is unavailable, therefore the value of ΔHf<sup>0</sup><sub>298</sub>(K<sup>0-</sup>, g) is estimated. Assuming that the enthalpy change (ΔHf<sup>0</sup>) of the reaction (1) K(g) + O<sup>+</sup>(g) = K(g) + O<sup>+</sup>(g) is approximately the average of the ΔHf<sup>0</sup> value for the reaction (2) KO(g) = K(g) + O(g) and (3) KF(g) = K(g) + F(g), we obtain ΔHf<sup>0</sup> = 1/2(63.5 + 117.3) = 90.4 kcal/mol for reaction (1). However, we compare the ΔHf<sup>0</sup> values for the reactions (4) HO(g) = H(g) + O(g), (5) HO<sup>-</sup>(g) = H(g) + O<sup>-</sup>(g), and (6) HF(g) = H(g) + F(g), and find that ΔHf<sup>0</sup> for reaction (5) is experimentally determined as 109.7 kcal/mol which is about 8 kcal/mol more negative than the average of ΔHf<sup>0</sup> values for reactions (4) and (6). Based on this fact we estimated ΔHf<sup>0</sup> = 80 kcal/mol for reaction (1), yielding ΔHf<sup>0</sup><sub>298</sub>(K<sup>0-</sup>, g) = -33 kcal/mol. The value of ΔHf<sup>0</sup><sub>298</sub>(K<sup>0-</sup>, g) is tentatively adopted as -33 ± 20 kcal/mol. The electronic affinity of KO(g) is derived to be 2.2 ± 0.8 eV. The value of E. A. for HO(g) is determined as 1.8 ± 0.1 eV.

Heat Capacity and Entropy  
 The ground state configuration is assumed to be the same as that of KF(g) which is isoelectronic with K<sup>0-</sup>(g). The values of ω<sub>e</sub>, ω<sub>e</sub>X<sub>e</sub> and r<sub>e</sub> are estimated by comparison with those for KF(g). The values of B<sub>e</sub> and α<sub>e</sub> are calculated from r<sub>e</sub>, ω<sub>e</sub> and ω<sub>e</sub>X<sub>e</sub> using the method recommended by G. Herzberg, "Spectra of Diatomic Molecules," D. Van Nostrand Co., Inc. New York, 1950. The enthalpy at 0°K is -2.30 kcal/mol.

Thermodynamic Functions.

Spectroscopic data are the same as that selected by W. H. Evans, T. R. Munson, and D. D. Wagman [J. Research Natl. Bur. Standards 55, 63 (1955)]. The calculated functions are in excellent agreement with their results.

Heat of Formation.

The heat of dissociation selected by Evans, Munson, and Wagman (loc. cit.) was used with the previously adopted heat of sublimation of the monomer to derive the heat of formation.

Dipotassium Monoxide (K<sub>2</sub>O)  
(Crystal) Mol. Wt. = 94.20

K<sub>2</sub>O

MOL. WT. = 94.20

(CRYSTAL)

DIPOTASSIUM MONOXIDE (K<sub>2</sub>O)

ΔH<sub>f</sub>° = Unknown

ΔH<sub>f</sub>° 298.15 = -86.8 ± 0.5 kcal. mole<sup>-1</sup>

S<sub>298.15</sub> = [22.5 ± 1.5] cal. deg.<sup>-1</sup> mole<sup>-1</sup>

T<sub>d</sub> = 1154°K. (600 mm Hg)

Heat of Formation.

ΔH<sub>f</sub>° 298.15 was reported by M. Rengsd, Ann. Chim. et phys. [8] 14, 540 (1908), based on the measurements of the heats of solution of K(c) and K<sub>2</sub>O(c) in H<sub>2</sub>O. The same value of ΔH<sub>f</sub>° 298.15 was also given by R. da Forcrand, Compt. rend. 159, 991 (1914).

Heat Capacity and Entropy.

Both C<sub>p</sub> and S<sub>298.15</sub> were estimated by comparison with those of the Na<sub>2</sub>O(c).

Temperature of Decomposition.

T<sub>d</sub> was taken from, "Data on Chemicals for Ceramic Use", National Research Council Bulletin 118 (1949).

DIPOTASSIUM DIOXIDE (K<sub>2</sub>O<sub>2</sub>)

(CRYSTAL)

MOL. WT. = 110.20

ΔH<sub>f</sub>° = Unknown

ΔH<sub>f</sub>° 298.15 = -118.5 ± 1.0 kcal. mole<sup>-1</sup>

S° 298.15 = [27.0 ± 1.5] cal. deg.<sup>-1</sup> mole<sup>-1</sup>

ΔH<sub>m</sub>° = Unknown

T<sub>m</sub> = 763°K.

Heat of Formation.

ΔH<sub>f</sub>° 298.15 was reported by National Bureau of Standards Report 7437, "Preliminary Report on the Thermodynamic Properties of Selected Light-Element and Some Related Compounds," January 1, 1962. The value was based on the measured decomposition pressure of K<sub>2</sub>O<sub>2</sub>(c) by M. Centnerzwer and M. Elmenthal, IX Congr. IUPAC, 3A, 201 (1955).

Heat Capacity and Entropy.

The heat capacities and S°<sub>298.15</sub> were estimated by comparison with those for Na<sub>2</sub>O<sub>2</sub>(c), MgO(c), and K<sub>2</sub>O(c).

Temperature of Melting.

T<sub>m</sub> was reported by Centnerzwer and Elmenthal, loc. cit.

K<sub>2</sub>O<sub>2</sub>

Lithium (Li)

(Reference State) At. Wt. = 6.940

ΔH<sub>f</sub><sup>o</sup> 298.15 = 50.41 ± 0.30 kcal. mole<sup>-1</sup> (Diatomic Gas)

ΔH<sub>f</sub><sup>o</sup> 298.15 = 6.954 cal. deg.<sup>-1</sup> mole<sup>-1</sup>

T<sub>m</sub> = 453.69°K

ΔH<sub>m</sub> = 0.7171 ± 0.0037 kcal. mole<sup>-1</sup>

Heat of Formation.

Zero by definition.

Heat Capacity and Entropy.

Heat capacities have been reported by the following authors for the temperature ranges indicated: L. M. Roberts, Proc. Phys. Soc. **70**, 744 (1957), 1.5 to 20°K (Li 99.5% pure); F. Simon and R. C. Swain, Z. Phys. Chem. **B28**, 189 (1935), 18° to 300°K; D. L. Martin, Proc. Roy. Soc. **A251**, 444 (1960), 22° to 300°K (Li 99.95% pure); T. B. Douglas, L. F. Epstein, J. L. Dever, and W. H. Howland, J. Am. Chem. Soc. **77**, 2144 (1955), 299° to 1200°K (Li 99.98% pure). Martin, in a series of determinations, found that C<sub>p</sub> depended on the thermal history of the sample; a peak at roughly 107°K was ascribed to a martensitic transformation. There is excellent continuity between the results of Roberts and of Martin, while those of Douglas et al. differ by 1% at 300°K and have been smoothly joined. The values of Simon and Swain were not used as they were 5% lower than Martin's and did not show the peak at 107°K; also their values for Al<sub>2</sub>O<sub>3</sub>, reported at the same time, are lower than recent measurements. Heat capacities between 1200°K and the normal boiling point were obtained from the heat content equation given by Douglas et al. between 420° and 300°K.

Melting.

Douglas et al. (loc. cit.) report the triple point to be 180.54°C, which is here adopted as the melting point since the densities of solid and liquid lithium at 180°C are not available for calculating ΔT<sub>m</sub>/ΔF. The same authors give the heat of melting as 432.3 ± 2.2 abs. Joule G.<sup>-1</sup>.

Heat of Sublimation.

Lithium vapor contains an appreciable amount of dimer, whose heat of dissociation has been selected by W. H. Evans, R. Jacobson, T. R. Munson, and D. D. Wagman, J. Res. Natl. Bureau of Standards **55**, 83 (1955), from spectroscopic and molecular beam measurements to be 25.76 ± 0.10 kcal. mole<sup>-1</sup> at 0°K. This heat of dissociation, together with the thermodynamic functions calculated in this work, has been used to find the partial pressures of Li(g) and Li<sub>2</sub>(g) from the measured total vapor pressures. H. Hartmann and R. Schneider, Z. anorg. allgem. Chem. **180**, 275 (1929), report values from 1204° to 1353°K; while M. Mancherat, C. Rendus **268**, 499 (1939), reports effusion measurements from 735° to 915°K. Mancherat's pressures are calculated on the assumption of monatomic vapor and have been recalculated to find the true total pressure. Effusion measurements by L. C. Lewis, Z. Physik **69**, 766 (1931), and A. Bogros, C. Rendus **191**, 560 (1930) and Ann. Phys. **17**, 199 (1932), have been disregarded. Mancherat considers them to be inaccurate because of impurities in the lithium used, and Lewis used a doubtful calibration method. Heats of sublimation to monatomic vapor calculated from the vapor pressures of Hartmann and Schneider and of Mancherat agree to within 2% and the average value has been adopted. The heat of sublimation of the dimer was then calculated using this value.

LITHIUM (LI)

(LIQUID)

At. Wt. = 6.940

$S_{298.15}^0 = 8.113 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $\Delta H_m^0 = 0.7171 + 0.0035 \text{ kcal. mole}^{-1}$   
 $T_b$  (Monatomic gas) = 1639°K

$\Delta H_f^0 298.15 = 0.569 \text{ kcal. mole}^{-1}$   
 $T_m = 453.69^\circ\text{K}$   
 $T_b = 1620^\circ\text{K}$  (Equilibrium mixture)  
 $\Delta H_v 1638 = 35.16 \text{ kcal. mole}^{-1}$

Heat of Formation.

Obtained from the heat of fusion by adding  $H_{453.69} - H_{298.15}$  for the solid and subtracting  $H_{1639.15} - H_{298.15}$  for the liquid.

Heat Capacity.

The data of T. B. Douglas, L. F. Epstein, J. L. Dever, and W. H. Howland, J. Am. Chem. Soc. 77, 2144 (1955) were taken and extrapolated below  $T_m$  and above  $1200^\circ\text{K}$  in a reasonable manner.

Entropy.

Back calculated from the entropy of the liquid at the melting point and the extrapolated heat capacity from the melting point to  $298^\circ\text{K}$ .

Vaporization.

Lithium vaporizes to a mixture of monatomic and diatomic gas. The total vapor pressure reaches 1 atm. at  $1620^\circ\text{K}$ ; the vapor pressure of the monatomic gas reaches 1 atm. at  $1639^\circ\text{K}$  and the heat of vaporization to monatomic gas is  $35.16 \text{ kcal. mole}^{-1}$ . See also Li(crystal).

Heat of Formation.

Same as the heat of sublimation to the monatomic gas; see notes on Li<sub>2</sub>(crystal).

Heat Capacity and Entropy.

The energy levels have been taken from C. B. Moore, National Bureau of Standards Circular 467, U. S. Government Printing Office, Washington (1949) p. 9. Closely spaced levels have been averaged and the appropriate multiplicities assigned to the averages.

Heat of Formation.

The heat of formation at 0°K. was obtained from that of the ideal monatomic lithium gas by adding the enthalpy of ionization, calculated from the ionization limit given by C. E. Moore "Atomic Energy Levels" Natl. Bur. Standards Circ. 467 (1949). This was converted to 298°K. by using the formation equation  $Li(\text{ref. state}) - e^-(\text{ref. state}) = Li^+(\text{monatomic gas})$ , thus Li<sup>+</sup> involves the difference in enthalpies of two reference states as well as its own enthalpy.

Heat Capacity and Entropy.

These were calculated using the electronic energy levels tabulated above, taken from C. E. Moore loc. cit.

Mar. 31, 1965

Li<sup>+</sup>

(Ideal Gas) GFW = 20.9457

(Ideal Gas) OFW = 20.9457

Ground State Configuration [ 3  $\Sigma$  ]  $\Delta H_f^\circ = 80 \pm 40$  kcal/mol

$S_{298.15}^\circ = [49.7]$  gibbs/mol  $\Delta H_f^\circ = 80 \pm 40$  kcal/mol

Electronic Levels and Quantum Weights

$$\frac{\epsilon_i, \text{cm}^{-1}}{0} \frac{g_i}{[3]}$$

$$\omega_{e^2e} = [7] \text{cm}^{-1} \quad \sigma = 1$$

$$B_e = [1.25] \text{cm}^{-1} \quad r_e = [1.71] \text{\AA}$$

Heat of Formation.

The adopted  $\Delta H_f^\circ$  is calculated from the following estimates:

| Method   | $D_0^\circ$<br>kcal/mol | $D_0^\circ$<br>kcal/mol | $\Delta H_f^\circ$<br>kcal/mol |
|--|-------------------------|-------------------------|--------------------------------|
| Estimate $D_0^\circ$ from geometric mean for $Li_2$ and $N_2$                            | 76                      | 75                      |                                |
| Estimate from $D_0^\circ$ for series $N_2(g)$ , $CN(g)$ , and $BeN(g)$                   | 40 - 100                |                         | 110 - 50                       |
| Estimate from $D_0^\circ$ for series $HN(g)$ , $HO(g)$ , $HF(g)$ , $LiF(g)$ and $LiO(g)$ | 20 - 60                 |                         | 130 - 90                       |

J. L. Margrave and P. Sthapitanonda, J. Phys. Chem. **55**, 1231 (1955), report estimated dissociation energies in the range 111-178 kcal/mol, based on approximate ionic binding energies calculated from ionic radii for  $N^-$  in the range 0.70 to 1.08  $\text{\AA}$ .

Heat Capacity and Entropy.

The molecular constants  $\omega_e$ ,  $r_e$  and  $\omega_{e^2e}$  are estimated by comparison with those of CN, BN, CO, BO and LiO. The values of  $\alpha_e$  and  $B_e$  are calculated from the above constants. The ground state configuration is assumed to be  $3\Sigma$  by analogy with NH and OH $^+$ .

| T, K | $C_p^\circ$ | $S^\circ$ | $-(G^\circ - H_{298}^\circ)/T$ | $H^\circ - H_{298}^\circ$ | $\Delta H_f^\circ$ | $\Delta G_f^\circ$ | Log K $p$ |

Sept. 30, 1966

Point Group  $C_2$

$S^\circ_{298.15} = 58.61$  gibbs/mol

Ground State Quantum Weight = 1

$\Delta H^\circ_{298.15} = [43.5 \pm 10]$  kcal/mol  
 $\Delta H^\circ_{298.15} = [43.0 \pm 10]$  kcal/mol

Vibrational Frequencies and Degeneracies

| $\omega$ , $cm^{-1}$ | (1) |
|----------------------|-----|
| 1350                 | (1) |
| 330                  | (1) |
| 650                  | (1) |

O-N =  $1.30 \pm 0.05$  Å  
 Bond Angle: Li-O-N =  $100 \pm 0^\circ$   
 Product of the Moments of Inertia:  $I_A I_B I_C = 2.6523 \times 10^{-116} g^3 cm^6$   
 $\sigma = 1$

Heat of Formation

The heat of formation ( $\Delta H^\circ_{298}$ ) for LiON(g) has not been determined experimentally. The  $\Delta H^\circ_{298}$  value adopted is calculated from the estimated Li-O and O-N bond energies. The value,  $D(Li-O) = 88$  kcal/mol, is obtained by averaging the bonds in  $Li_2O(g)$ . The value,  $D(O-N) = 69$  kcal/mol, is calculated on the assumption that  $D(ClON-O) = D(N-OH)$ . The  $\Delta H^\circ_{298}$  of LiOH(g), calculated similarly from bond energies (i.e.  $D(Li-O) = 88$  kcal/mol and  $D(O-H) = 111$  kcal/mol), is 10 kcal/mol more than the measured value. Therefore, we subtract 10 kcal/mol from the  $\Delta H^\circ_{298}$  of LiON, 53 kcal/mol, estimated from the above bond energies, and arrive at 43 kcal/mol for the adopted value.

Heat Capacity and Entropy

The vibrational frequencies, bond distances and bond angle were obtained from W. L. S. Andrews and G. C. Pimentel, loc. cit. The three principal moments of inertia are:  $I_A = 1.2706 \times 10^{-36}$ ,  $I_B = 3.9776 \times 10^{-39}$  and  $I_C = 5.2482 \times 10^{-39} g cm^2$ .

Lithium Sodium Oxide (LiNaO)

LiNaO

Lithium Sodium Oxide (LiNaO) (ideal Gas)

Mol. Wt. = 45.931

ΔH<sub>f</sub>° 298.15 = [-25 ± 30] kcal. mole<sup>-1</sup>

S° 298.15 = [61.270] cal. deg<sup>-1</sup> mole<sup>-1</sup>

Vibrational Levels and Multiplicities

(*g<sub>v</sub>*, cm<sup>-1</sup>)

[400] (1)

[1000] (1)

[900] (1)

Li-O-Na angle = [105°], O-Li distance = [1.82] Å, ONa distance = [2.21] Å

Product of moments of inertia, I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [3.179 X 10<sup>-115</sup>] g.<sup>3</sup> cm.<sup>6</sup>

σ° = 1

Heat of Formation. Estimated from bond energies derived from heats of formation used in JANAP tables.

Heat Capacity and Entropy. The molecular constants have been estimated by comparison of similar molecules.

Dec. 31, 1960; Mar. 31, 1964

(IDEAL GAS)

LITHIUM MONOXIDE (LiO)

Ground State Configuration ( $^2\Pi$ )  
 $S_{298.15}^{\circ} = [50.395] \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $\Delta H_f^{\circ} = 20.1 \pm 5 \text{ kcal. mole}^{-1}$   
 $\Delta H_f^{\circ} 298.15 = 20.1 \pm 5 \text{ kcal. mole}^{-1}$

## Electronic Levels and Quantum Weight

$$\frac{\epsilon_i \text{ cm.}^{-1}}{0} \frac{g_i}{4}$$

$$\omega_e x_e = [4.835] \text{ cm.}^{-1}$$

$$\alpha_e = [0.01288] \text{ cm.}^{-1}$$

$$P_e = [1.333] \text{ cm.}^{-1}$$

$$\sigma = -1$$

$$r_e = [1.62] \text{ \AA}$$

## Heat of Formation.

D. White, K. S. Saundri, D. F. Dever, and D. E. Mann, and M. J. Linevsky, J. Chem. Phys. **39**, 2463 (1963) calculated the heat of formation from their mass spectral data by two different methods.

For the first calculation (a) they combined the slope of the log  $\Pi$  vs  $1/T$  curve for  $\text{LiO}^+$  with the slopes for  $\text{Li}^+$  and  $\text{Li}_2\text{O}^+$  for the reaction  $\text{Li}_2\text{O}^+(g) \rightarrow \text{Li}(g) + \text{LiO}(g)$ . For the second calculation (b) they assumed a cross section  $\sigma_{\text{LiO}}/\sigma_{\text{Li}_2\text{O}} = 1$  and from this they calculated a partial pressure for  $\text{LiO}(g)$  at  $1500^\circ\text{K}$  and an equilibrium constant for the reaction  $\text{Li}_2\text{O}(g) \rightarrow \text{Li}(g) + \text{LiO}(g)$ . They obtained (a)  $\Delta H_f^{\circ} 298 = 18.3 \text{ kcal. mole}^{-1}$  and (b)  $\Delta H_f^{\circ} 298 = 16.3 \text{ kcal. mole}^{-1}$ , and used the average value from the two methods for the heat of formation of  $\text{LiO}(g)$ . The JANAF heat of formation,  $20.1 \pm 5 \text{ kcal. mole}^{-1}$ , was obtained in the same way using their data and the present tables i.e. (a)  $\Delta H_f^{\circ} 298 = 22.0 \text{ kcal. mole}^{-1}$  and (b)  $\Delta H_f^{\circ} 298 = 18.3 \text{ kcal. mole}^{-1}$ .

## Heat Capacity and Entropy.

The molecular constants,  $\omega_e x_e$ ,  $\alpha_e$ ,  $P_e$ , and  $\sigma$ , were calculated from  $\omega_e$  and  $r_e$ , reported by White et al. The ground state configuration,  $^2\Pi$ , was estimated by J. S. Gordon, Thiokol Chemical Corp., Reaction Motor Division, Denver, N. J., "Thermodynamic Data for Combustion Products", January, 1960, by A. Buehler and J. L. Stauffer, J. Chem. Phys. **29**, 2299 (1963) and by White et al.

 ω<sub>e</sub> = [1.360] cm<sup>-1</sup>  
 σ = 1  
 r<sub>e</sub> = [1.6] Å

Heat of Formation

Data on the electron affinity (E.A.) of LiO (g) are unavailable, therefore the value of ΔH<sup>o</sup>F<sup>o</sup>(LiO<sup>-</sup>, g) is estimated. We first assume that the enthalpy change (ΔH<sup>o</sup>) of the reaction (1) LiO(g) + O<sup>-</sup>(g) is close to the average of the ΔH<sup>o</sup>F<sup>o</sup> values for the reactions (2) LiO(g) + O(g) and (3) LiF(g) = Li(g) + F(g). The atom F(g) is isoelectronic with O<sup>-</sup>(g). In other words, the ΔH<sup>o</sup>F<sup>o</sup> for reaction (1) is approximately 1/2(76.91 + 135.84) = 106.4 kcal/mol. Then we compare the ΔH<sup>o</sup>F<sup>o</sup> values for the reactions (4) HO(g) = H(g) + O(g), (5) HO<sup>-</sup>(g) = H(g) + O<sup>-</sup>(g), and (6) HF(g) = H(g) + F(g), and find that ΔH<sup>o</sup>F<sup>o</sup> for reaction (5) is experimentally determined as 109.7 kcal/mol which is about 8 kcal/mol more negative than the average of ΔH<sup>o</sup>F<sup>o</sup> values for reactions (4) and (6). Based on this fact we estimate ΔH<sup>o</sup>F<sup>o</sup> = 96.4 kcal/mol for reaction (1), yielding ΔH<sup>o</sup>F<sup>o</sup>(LiO<sup>-</sup>, g) = -15.5 kcal/mol.

Applying the difference in electron affinity between H(g) and Li(g) to OH(g) gives an approximate value, E. A. = 1.7 eV (39.2 kcal/mol) for LiO(g). The value of E. A. for H(g), Li(g) and OH(g) are taken from U. S. Bur. Std. Rept. 8628, Jan. 1, 1965. Based on ΔH<sup>o</sup>F<sup>o</sup> = 39.2 kcal/mol for the reaction LiO<sup>-</sup>(g) = LiO(g) + e<sup>-</sup>(g), we derive ΔH<sup>o</sup>F<sup>o</sup> = -19.1 kcal/mol for LiO<sup>-</sup>(g), which is in reasonable agreement with the above estimated value.

The value of ΔH<sup>o</sup>F<sup>o</sup> for LiO<sup>-</sup>(g) is tentatively adopted as -16 ± 15 kcal/mol. Using this ΔH<sup>o</sup>F<sup>o</sup> value, we derive E. A. = 1.6 ± 0.7 eV for LiO(g). The electron affinity of OH(g) is 1.8 ± 0.1 eV.

Heat Capacity and Entropy

The ground state configuration is assumed to be the same as that of LiF(g) which is isoelectronic with LiO<sup>-</sup>(g). The values of ω<sub>e</sub>, ω<sub>e</sub>X<sub>e</sub> and r<sub>e</sub> are estimated by comparison with the observed data for LiF(g). The values of B<sub>e</sub> and α<sub>e</sub> are calculated from r<sub>e</sub>, ω<sub>e</sub> and ω<sub>e</sub>X<sub>e</sub> by use of the method suggested by G. Herzberg, "Spectra of Diatomic Molecules," D. Van Nostrand Co., Inc., New York, 1950. The enthalpy at 0°K is -2.137 kcal/mol.

June 9, 1950

Li<sub>2</sub>

LITHIUM, DIATOMIC ( $Li_2$ )  
(IDEAL GAS)

MOL. WT. = 13.880

$\Delta H_f^0 = 50.288$  kcal. mole<sup>-1</sup>  
 $\Delta H_f^0 = 50.288$  kcal. mole<sup>-1</sup>  
 $\Delta H_f^0 = 50.4 \pm 0.9$  kcal. mole<sup>-1</sup>  
 $\Delta H_f^0 = 50.288$  kcal. mole<sup>-1</sup>  
 $\Delta H_f^0 = 50.288$  kcal. mole<sup>-1</sup>

$\omega_e = 353.59$  cm.<sup>-1</sup>  
 $\omega_e = 2.625$  cm.<sup>-1</sup>  
 $\omega_e = 2.625$  cm.<sup>-1</sup>

$B_e = 0.6812$  cm.<sup>-1</sup>  
 $B_e = 0.6812$  cm.<sup>-1</sup>  
 $B_e = 0.6812$  cm.<sup>-1</sup>

$r_e = 2.673$  Å  
 $r_e = 2.673$  Å  
 $r_e = 2.673$  Å

Heat of Formation.

Same as the heat of sublimation to the diatomic gas; see notes on Li (crystal).

Heat Capacity and Entropy.

The spectroscopic constants of  $Li_2$  listed by G. Hertzberg, "Spectra of Diatomic Molecules", 2nd Edn., D. Van Nostrand Co., Inc., New York (1950) have been corrected for the presence of 7.5%  $Li^6$  in naturally occurring lithium, J. R. Stehn and E. P. Clancy, "Chart of the Nuclides", General Electric Co., Schenectady (1956).

Li<sub>2</sub>

$\Delta H_f^0 = -141.6 \pm 0.5 \text{ kcal. mole}^{-1}$   
 $\Delta H_f^{298.15} = -143.1 \pm 0.5 \text{ kcal. mole}^{-1}$   
 $\Delta H_m = [14] \text{ kcal. mole}^{-1}$   
 $S_{298.15}^0 = 9.056 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $T_m = 1843^\circ\text{K.}$

Heat of Formation.

The selected heat of formation was calculated as follows:

- Reaction
- (I)  $\text{Li}_2\text{O}(c) + \text{H}_2\text{O}(l) = 2\text{LiOH}(\infty\text{H}_2\text{O})$
  - (II)  $\text{Li}(c) + 1/2 \text{O}_2(g) = \text{LiOH}(\infty\text{H}_2\text{O})$
  - (III)  $\text{H}_2(g) + 1/2 \text{O}_2(g) = \text{H}_2\text{O}(l)$
  - (IV)  $2\text{Li}(c) + 1/2 \text{O}_2(g) = \text{Li}_2\text{O}(c)$
- (a) V. P. Kolesov, S. M. Skuratov, and I. D. Zalkin, Russian J. Inorganic Chemistry, **3**, 558 (1959).  
 (b) S. R. Gunn and L. G. Green, J. Am. Chem. Soc., **80**, 4782 (1958).  
 (c) F. D. Rossini, D. D. Wagman, W. H. Evans, S. Levine, and I. Jaffe, "Selected Values of Chemical Thermodynamic Properties" National Bureau of Standards Circular 500, 1952 (reprinted 1961).  
 (d) Reaction (IV) is the sum of  $-(I) + 2(II) - (III)$ .

Kolesov, et al. (loc. cit) measured the enthalpy of the reaction of Li<sub>2</sub>O with water at 20° in 5 experiments. The mean  $\Delta H_f^0$  was  $-31.41 \pm 0.08 \text{ kcal.}$  This was brought to 298°K by Kolesov using enthalpy data of (a) H. L. Johnston and T. W. Bauer, J. Am. Chem. Soc., **73**, 1119 (1951), for Li<sub>2</sub>O, (b) N. S. Osborne, J. F. Stimson, and D. C. Oimings, J. Res. Natl. Bur. Stds. A, **23**, 197 (1939) for H<sub>2</sub>O, (c) F. T. Gucker and K. N. Schmirke, J. Am. Chem. Soc., **55**, 1013 (1933) for  $\Delta H_f^0$  of LiOH(aq) and (d) Rossini, et al., (loc. cit) for aqueous LiOH. In addition to the above, N. N. Beketov, Bull. Acad. Sci. Russ. **33**, 186 (1898) and H. R. Forcrand, Compt Rend. **144**, 1403 (1907) have reported experimental heats for Li<sub>2</sub>O. Rossini et al. and Johnston and Bauer have reported heats of formation for Li<sub>2</sub>O recalculated from older data. L. G. Fasolino, in a Natl. Research Corp. Quarterly Report, July 1 to Sept. 30, 1962, reported a  $\Delta H_f^0$  of  $-141.1 \pm 4.2 \text{ kcal.}$  He measured the heat of combustion of Li(c) in O<sub>2</sub>(g) in a Parr bomb.

Heat Capacity and Entropy.

The low temperature  $C_p$  data of H. L. Johnston and T. W. Bauer, (loc. cit.) from 17° -298°K. was joined graphically to the high temperature  $C_p$  data of C. H. Shomate and A. J. Cohen, J. Am. Chem. Soc. **71**, 285 (1955) [425°-1045°K] and E. N. Rodgina, and K. A. Gornelakii, Russian J. Phys. Chem. **35**, 698 (1961) [370°-1125°K]. The  $S_{298.15}^0$  was reported by Johnston and Bauer using  $S_{16}^0$  (extrap.) = 0.003 cal. deg.<sup>-1</sup> mole<sup>-1</sup>.

Melting Data.

The melting point of Li<sub>2</sub>O is uncertain. The selected melting point, 1843°K., was measured by A. E. van Arkel, E. A. Flood, and N. F. H. Bright, Can. J. Chem. **31**, 1009 (1953). L. Brewer and J. L. Margrave, J. Phys. Chem. **59**, 421 (1955) reported the melting point 1700°K. They also stated that H. van Konster and F. Jaeger, Proc. Roy. Acad. Sci., Amsterdam **16**, 857 (1914) had reported 1700° (1973°K) as the melting point. The heat of melting, [14] kcal. mole<sup>-1</sup>, was estimated by A. Gassner, "The Thermochemical Properties of the Oxides, Fluorides, and Chlorides to 2500°K", Argonne National Laboratory, University of Chicago, ANL-5750, 1957.

Heat of Sublimation.

Li<sub>2</sub>O(c) vaporizes to Li<sub>2</sub>O(g), LiO(g), Li<sub>2</sub>O<sub>2</sub>(g), Li(g), and O<sub>2</sub>(g) [J. Berkowitz, W. A. Gupka, O. D. Blue and J. L. Margrave, J. Phys. Chem., **63**, 644 (1959); D. White, K. S. Seshadri, D. F. Dever, D. E. Mann, and M. J. Linevsky, J. Chem. Phys. **33**, 2483 (1963); D. L. Hildenbrand, W. F. Hsill, and N. D. Potter, J. Chem. Phys. **39**, 296 (1963); D. L. Hildenbrand, L. P. Theard, W. F. Hall, and N. D. Potter, Fifth Quarterly Technical Report, U-2289, Aeronutronic Division of Philco Corporation, 15 September 1963; L. P. Firsosy and A. N. Mesnyanov, Russian J. Phys. Chem., **34**, 1232 (1960). The major species (0°-1700°K.) are reported to be Li<sub>2</sub>O(g), Li(g), and O<sub>2</sub>(g) with lesser amounts of LiO(g) and Li<sub>2</sub>O<sub>2</sub>(g). Hildenbrand, et al., U-2298, have reported about equal amounts of Li<sub>2</sub>O' and Li<sup>+</sup> (1300 to 1550°K.) and about 1/30th of this amount of LiO'. White, et al., calculated  $\Delta H_m^0$  from their mass spectra data. They made two different calculations (a) for Li<sub>2</sub>O(c) → Li<sub>2</sub>O(g), and (b) for Li<sub>2</sub>O(g) → 2Li(g) + 1/2 O<sub>2</sub>(g), and found: (a) 102.5 kcal. and (b) 99.0 kcal. They used a weighted average of (a) and (b) and obtained 101.6 kcal. at 0°K. The selected  $\Delta H_m^0$  of 298 of 102.3 ± 3 kcal. was obtained in the same manner using their data and the present JANAF functions, 1.e. (a) 104.2 kcal. and (b) 100.3 kcal. Knudsen-effusion data of White et al., corrected for dissociation gave 3rd law heats at 298°K of 101.9 kcal. and a 2nd law heat of 94 kcal. Recalculation of Hildenbrand's dissociation pressure with JANAF values gives Li<sub>2</sub>O pressures slightly different than those reported. The recalculated pressures give a 3rd law  $\Delta H_m^0$  of 101.7 kcal. for both cells. The corresponding 2nd law values are 85 and 95.5 kcal. for cell 7 and 8. The 3rd law treatment of both sets of data show relatively large trends of  $\Delta H_m^0$  with T which are probably too large to be only due to errors in the functions. (Continued on Lithium Oxide Li<sub>2</sub>O(g) table)

DILITHIUM MONOXIDE (Li<sub>2</sub>O)

S<sub>298.15</sub> = 13.160 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 ΔH<sub>f</sub>° 298.15 = -132.129 kcal. mole<sup>-1</sup>  
 ΔH<sub>m</sub>° = [14] kcal. mole<sup>-1</sup>  
 T<sub>m</sub> = 1843°K.  
 T<sub>b</sub> = [2835°K.]  
 ΔH<sub>v</sub>° = Unknown

Heat of Formation.

ΔH<sub>f</sub>° (l) was obtained from ΔH<sub>f</sub>° (c) by adding ΔH<sub>m</sub> and the difference between H<sub>1843</sub>-H<sub>298</sub> for crystal and liquid.

Heat Capacity and Entropy.

The heat capacity was estimated at 8 cal. deg.<sup>-1</sup> g. atom<sup>-1</sup> from comparisons with similar compounds and from Kopp's rule. The entropy was obtained in a manner analogous to that of the heat of formation.

Melting Data.

See melting data given on the Li<sub>2</sub>O crystal table.

Vaporization Data.

The vapor over Li<sub>2</sub>O(c) at 1700°K. is composed of Li<sub>2</sub>O(g), Li(ε), O<sub>2</sub>(g), LiO(g), and Li<sub>2</sub>O<sub>2</sub>(g). Thus a boiling point becomes almost meaningless. The value, 2835°K. listed above is the temperature at which the free energy of Li<sub>2</sub>O(g) and the free energy of Li<sub>2</sub>O(l) are equal. L. Brewer, Chem. Rev. 52, (1953) estimated a boiling point of 2600°K.

Li<sub>2</sub>O

Dilithium Monoxide (Li<sub>2</sub>O)  
(Ideal Gas) Mol. Wt. = 29.880

DILITHIUM MONOXIDE (Li<sub>2</sub>O) (IDEAL GAS)

MOL. WT. = 29.880

Point Group  $D_{\infty h}$   
 $\Delta H_f^0 = 54.732 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $\Delta H_f^0 = -39.6 \pm 2.5 \text{ kcal. mole}^{-1}$   
 $S^0_{298.15} = 54.732 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $\Delta H_f^0_{298.15} = -39.9 \pm 2.5 \text{ kcal. mole}^{-1}$   
 Ground State Quantum Weight = [1]

Vibrational Frequencies and Degeneracies  
 $\omega, \text{ cm.}^{-1}$   
 [760] (1)  
 [140] (2)  
 987 (1)

Bond Distance: Li-O = [1.59] Å  
 Bond Angle: Li-O-Li = 180°  
 Rotational Constant:  $B_0 = 0.48045 \text{ cm.}^{-1}$

$\sigma = 2$

Heat of Formation.

The heat of formation was calculated from the heat of formation of the crystal and the heat of sublimation.

Heat Capacity and Entropy.

D. White, K. S. Seshairi, and D. F. Dever, and D. E. Mann, and M. J. Linevsky, *J. Chem. Phys.* **35**, 2463 (1963) made an estimate of the bond distance Li-O = 1.59 Å based on an analysis of their vibrational spectra. They found that Li<sub>2</sub>O was a linear molecule. A. Buchler and J. L. Stauffer, *J. Chem. Phys.* **39**, 2299 (1963) have shown from electric deflection experiments that Li<sub>2</sub>O is very probably linear. They also report from the results of an effusion experiment evidence that the electron diffraction data and Li-O bond distance, 1.82 Å reported by F. A. Akhshin and N. G. Rambidi, *Dokl. Akad. Nauk. SSSR* **118**, 973 (1958) [English Translation, *Proc. Acad. Sci. USSR, Phys. Chem. Sect.* **118**, 83 (1958)] are for Mo-O in Li<sub>2</sub>MoO<sub>4</sub> rather than for Li-O in Li<sub>2</sub>O. Buchler and Stauffer (loc. cit.) estimate an Li-O distance of 1.55 Å. White, et al., (loc. cit.) have estimated the vibrational frequencies  $\nu_1 = [760] \text{ cm.}^{-1}$  and  $\nu_2 = [140] \text{ cm.}^{-1}$  and assigned  $\nu_3 = 987 \text{ cm.}^{-1}$  from their infrared matrix spectra. The principal moments of inertia calculated from the molecular constants are:  $I_A = 0$ , and  $I_B = I_C = 5.8256 \times 10^{-59} \text{ g. cm.}^2$ .

Heat of Sublimation (continued from Li<sub>2</sub>O(c) table).

A sample of LiAlO<sub>2</sub> was melted 7 times in argon in an arc-image furnace, H. Prophet, "Melting Point of Lithium Aluminate", ARPA-1-150, Dow Chemical Co., Mar. 9, 1961. The sample decomposed on fusion and successive melting points approached that of Al<sub>2</sub>O<sub>3</sub>. The residue was found to be 95% Al<sub>2</sub>O<sub>3</sub> and 5% LiAl<sub>2</sub>O<sub>5</sub>. The sample and residue were characterized by X-ray diffraction. A reasonable assumption from this is that  $\Delta H_f^0(3000^\circ\text{K}) = 0$  for 2LiAlO<sub>2</sub>(c) = Al<sub>2</sub>O<sub>3</sub>(c) + Li<sub>2</sub>O(g). From this  $\Delta H_f^0$  a  $\Delta H_f^0$  of 50 kcal. was calculated. A vapor pressure study of the molecular species over the decomposing LiAlO<sub>2</sub> might help resolve the discrepancies in lithium oxide  $\Delta H_f^0$  values.

ΔH<sub>f</sub>° = Unknown  
 ΔH<sub>f</sub>° 298.15 = -151.2 ± 2.0 kcal. mole<sup>-1</sup>  
 S<sub>298.15</sub>° = [13.5 ± 1.0] cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 T<sub>d</sub> = 468°K.

Heat of Formation.

ΔH<sub>f</sub>° 298.15 was reported by R. de Forcrand, Compt. rend. 130, 1465 (1900), based on the measured heats of the reactions of Li<sub>2</sub>O<sub>2</sub>(c) with HCl(aq.) and LiOH(aq.) with H<sub>2</sub>O<sub>2</sub>(aq.).

Heat Capacity and Entropy.

Both C<sub>p</sub> and S<sub>298.15</sub> were estimated by comparison with those of the Na<sub>2</sub>O<sub>2</sub>(c), respectively.

Temperature of Decomposition.

T<sub>d</sub> was reported to be about 300°C. by N. M. Wiederhorn, N. F. Surprenant, and A. J. Leffler, "Research on New Methods of Separation of Air into O<sub>2</sub> and N<sub>2</sub> Components," C-63025, First-Quarterly Progress Report, September 1961, Arthur D. Little, Inc. The value adopted was reported by Bulletin of the National Research Council, No. 118, "Data on Chemicals for Ceramic Use", June, 1949, obtained from M. Centnerzwer and M. Elmenthal, Bull. Intern. acad. polonaise, Classe. sci. math. nat., A 499 (1933).

Heat of Formation.

The heat of formation, -58 kcal., was calculated from an equilibrium constant for the reaction 1/2 O<sub>2</sub>(g) + Li<sub>2</sub>O(g) → Li<sub>2</sub>O<sub>2</sub>(g) and the current JANAP functions. The equilibrium constant, 0.39, was estimated by D. White, K. S. Seehadri, D. F. Dever, and D. E. Mann, and M. J. Linevsky, J. Chem. Phys. **35**, 2463 (1963), from their mass spectrometric data.

Heat Capacity and Entropy.

White, et al., (loc. cit.), from their spectral data have assigned two observed frequencies and estimated the remaining frequencies using the ionic model calculations of J. Berkowitz, J. Chem. Phys. **29**, 1386 (1958) and **32**, 1519 (1960) as a guide. They proposed a planar rhombic structure of D<sub>2h</sub> symmetry, similar to the alkali halide dimers, for the previously undetected Li<sub>2</sub>O<sub>2</sub> molecule, and estimated the angle, 116°, and bond distance, 1.90 Å, from their matrix spectra. The principal moments calculated from these molecular constants are I<sub>A</sub> = 13.795 × 10<sup>-39</sup>, I<sub>B</sub> = 2.356 × 10<sup>-39</sup>, and I<sub>C</sub> = 16.129 × 10<sup>-39</sup> g. cm.<sup>2</sup>.

Heat of Formation

The heats of solution of  $\text{LiCl}(\text{c})$ ,  $\text{Li}_2\text{SO}_4(\text{c})$ ,  $\text{SiO}_2(\text{quartz})$  and  $\text{Li}_2\text{SiO}_3(\text{c})$  in 20 per cent hydrofluoric acid at 74.7°C were measured by F. C. Kraeck, Ann. Rept. Director of the Geophysical Laboratory, No. 1215, 69 (1953). The authors derived two values of  $\Delta H^\circ_{298}$  of  $\text{Li}_2\text{SiO}_3(\text{c})$  from those of  $\text{LiCl}(\text{c})$  and  $\text{Li}_2\text{SO}_4(\text{c})$ , presumably employing auxiliary data from U. S. Natl. Bur. Std. Circ. 500, 1952. We recalculate  $\Delta H^\circ_{298}$  of  $\text{Li}_2\text{SiO}_3(\text{c})$  as -59.74 (chloride scheme, originally -59.36) and -59.83 kcal/mol (sulfate scheme, originally -60.86), using recent  $\Delta H^\circ_{298}$  values for  $\text{LiCl}(\text{c})$ ,  $\text{Li}_2\text{SO}_4(\text{c})$ ,  $\text{HCl}(\text{aq})$ ,  $\text{H}_2\text{SO}_4(\text{aq})$ , and  $\text{Li}_2\text{O}(\text{c})$ . The corresponding enthalpy changes,  $\Delta H^\circ_{298}$ , for the reaction  $\text{Li}_2\text{O}(\text{c}) + \text{SiO}_2(\text{quartz}) = \text{Li}_2\text{SiO}_3(\text{c})$  are derived as -33.08 and -34.17 kcal/mol. Adopting the weighted average  $\Delta H^\circ_{298} = -33.44$  kcal/mol with  $\Delta H^\circ_{298}(\text{Li}_2\text{O}, \text{c}) = -143.1$  kcal/mol and  $\Delta H^\circ_{298}(\text{SiO}_2, \text{quartz}) = -217.7$  kcal/mol, we obtain  $\Delta H^\circ_{298}$  of  $\text{Li}_2\text{SiO}_3(\text{c})$ . This  $\Delta H^\circ_{298}(\text{Li}_2\text{SiO}_3, \text{c})$  value is independent of future changes in  $\Delta H^\circ_{298}$  of  $\text{Li}_2\text{O}(\text{c})$  but the values of  $\Delta H^\circ_{298}$  and  $\Delta H^\circ_m$  are not independent.

The heats of solution of  $\text{LiOH}(\text{c})$  and  $\text{Li}_2\text{SiO}_3(\text{c})$  in 20 percent HF(aq) at 50°C were measured by W. E. Hatton, D. L. Hildenbrand, G. C. Sinks, and D. R. Stull, unpublished work, Thermal Laboratory, The Dow Chemical Co., Midland, Michigan, 1959. The  $\text{Li}_2\text{SiO}_3$  sample was prepared from lithium carbonate and silica by fusion under vacuum at 1500°C. Analysis gave 66.74 percent  $\text{SiO}_2$  and 15.12 percent  $\text{Li}$ . The corresponding calculated values are 66.79 and 15.43. Also present were 0.5 percent K and 0.06 percent Na. Corrections were made for impurities in the heat of formation measurements. The results are given as follows:

The  $\Delta H^\circ_{298}$  for the second reaction was determined by D. R. Torgeson and T. G. Sahara, J. Am. Chem. Soc. 70, 2156 (1948). Based on the calculated enthalpy change for the overall reaction,  $\Delta H^\circ_{298} = -13.14$  kcal/mol and  $\Delta H^\circ_{298} = -115.84$ , -217.7 and -66.32 kcal/mol for  $\text{LiOH}(\text{c})$ ,  $\text{SiO}_2(\text{low quartz})$ , and  $\text{H}_2\text{O}(\text{l})$ , respectively, we derived  $\Delta H^\circ_{298}(\text{Li}_2\text{SiO}_3, \text{c}) = -394.21 \pm 1.0$  kcal/mol, which is in agreement with the adopted value.

C. Kroger and E. Fingas, Z. Anorg. Allgem. Chem. 214, 12 (1933), measured the equilibrium pressure of  $\text{CO}_2$  over a mixture of  $\text{Li}_2\text{CO}_3(\text{c})$ ,  $\text{SiO}_2(\text{quartz})$ , and  $\text{Li}_2\text{SiO}_3(\text{c})$  from 585 to 781°K. The enthalpy change ( $\Delta H^\circ_{298}$ ) of the reaction  $\text{Li}_2\text{CO}_3(\text{c}) + \text{SiO}_2(\text{c}) = \text{Li}_2\text{SiO}_3(\text{c}) + \text{CO}_2(\text{g})$  is evaluated by the second and third law methods to be 30.94 and 29.47 kcal/mol, respectively. Using  $\Delta H^\circ_{298} = -290.84$ , -217.7 and -94.05 kcal/mol for  $\text{Li}_2\text{CO}_3(\text{c})$ ,  $\text{SiO}_2(\text{c})$  and  $\text{CO}_2(\text{g})$ , respectively, and third law  $\Delta H^\circ_{298}$ , we obtain  $\Delta H^\circ_{298}(\text{Li}_2\text{SiO}_3, \text{c}) = -394.82 \pm 5$  kcal/mol, which is not used.

Heat Capacity and Entropy

The low temperature heat capacities, 25 - 340°K, were measured by Hatton et al., loc. cit., with an adiabatic vacuum calorimeter, using a nickel-plated copper sample container. During the filling and sealing of the calorimeter, the compound was handled in an anhydrous,  $\text{CO}_2$ -free atmosphere so as to avoid contamination. The purity of the sample is not well established. The high temperature heat capacities are estimated by summation of the Cp's of the constituent oxides  $\text{Li}_2\text{O}$  and  $\text{SiO}_2$ , and a subsequent correction based upon a comparison of the heat capacities of  $\text{Na}_2\text{SiO}_3(\text{c})$  and its constituent oxides. These estimated Cp values are plotted, and the resulting curve is joined smoothly with the low temperature Cp curve at 298°K. The entropy,  $S^\circ_{298}$ , is derived using the measured low temperature heat capacities, based on  $S^\circ_{298} = 0.023$  eu.

LITHIUM METASILICATE (Li<sub>2</sub>SiO<sub>3</sub>) (LIQUID)

S°<sub>298.15</sub> = 22.958 gibbs/mol  
T<sub>m</sub> = 1474 ± 1°K  
ΔH<sub>f</sub>°<sub>298.15</sub> = -389.441 kcal/mol  
ΔH<sub>m</sub>° = 6.7 ± 0.5 kcal/mol

**Heat of Formation**  
ΔH<sub>f</sub>° (ℓ) is obtained from ΔH<sub>f</sub>°(c) by adding ΔH<sub>m</sub>° and the difference between H<sub>1474</sub>° - H<sub>298</sub>° for crystal and liquid.  
Tchernobaevff, Rev. Met. 21, 729 (1905), measured the heat of reaction between SiO<sub>2</sub> and Li<sub>2</sub>CO<sub>3</sub> in a bomb calorimeter, using carbon as the auxiliary combustible material. Based on the derived ΔH<sub>r</sub>°<sub>298</sub> = 24.99 kcal/mol for the reaction Li<sub>2</sub>CO<sub>3</sub>(c) + SiO<sub>2</sub>(c) → Li<sub>2</sub>SiO<sub>3</sub>(gl) + CO<sub>2</sub>(g), the heat of formation for Li<sub>2</sub>SiO<sub>3</sub>(gl) is evaluated as -389.30 kcal/mol, which is in fair agreement with the adopted value.

**Heat Capacity and Entropy**  
The heat capacity is estimated by comparison with those for Na<sub>2</sub>SiO<sub>3</sub>(ℓ), Na<sub>2</sub>O(ℓ) and Li<sub>2</sub>O(ℓ). A glass transition is assumed at 1000°K; i.e., the heat capacities below 1000°K are taken to be the same as those for Li<sub>2</sub>SiO<sub>3</sub>(c). The entropy is obtained in a manner analogous to that of the heat of formation.

**Melting Data**  
The melting point has been reported as 1474 ± 1 and 1461°K by F. C. Kracek, J. Phys. Chem. 34, 2841 (1930), and H. S. Van Klooster, Z. Anorg. Chem. 69, 135 (1911), respectively. The value reported by Kracek is adopted.  
R. Schwarz and H. Sturm, Ber. 17, 1730 (1914), used a cooling-curve method to compare the heats of fusion of Li<sub>2</sub>SiO<sub>3</sub>(c) and NaCl(c). From the reported ratio, ε(Li<sub>2</sub>SiO<sub>3</sub>)/ε(NaCl) = 0.261/0.402, where ε = heat of fusion in kcal/g, and heat of fusion of NaCl(c), the value ΔH<sub>m</sub>° = 6.7 kcal/mol is derived.

Lithium Metatitanate ( $\text{Li}_2\text{TiO}_3$ )

$\Delta H_f^\circ 0 = -396.8 \text{ kcal. mole}^{-1}$   
 $\Delta H_f^\circ 298.15 = -399.3 \text{ kcal. mole}^{-1}$   
 $\Delta H_f^\circ 298.15 = 21.930 \pm 0.1 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $\Delta H_{cl}^\circ = 2.75 \text{ kcal. mole}^{-1}$   
 $T_m = 1485^\circ\text{K.}$   
 $T_m = 1820^\circ\text{K.}$

Heat of Formation.

The  $\Delta H_f^\circ 298.15$  was calculated from measurements of solution calorimetry by S. S. Todd and K. K. Kelley, "Heat and Free Energy Data for Tricalcium Dicitrate, Spinel, Lithium Metatitanate and Zinc Titanium Spinel", U. S. Bureau Mines Report Invest. 5193 (1956), according to the following equation:

The  $\Delta H_f 298.15 \text{ TiO}_2(c)$  value for rutile was obtained from the JANAF Tables and the other  $\Delta H_f 298.15$  values were obtained from "Selected Values of Chemical Thermodynamic Properties" NBS Circular 500 (1952).

Heat Capacity and Entropy.

The low temperature heat capacities were taken from E. G. King, J. Am. Chem. Soc. 77, 2150 (1955). These low temperature heat capacities were fit to the high temperature heat contents from A. U. Christensen, K. C. Conway, and K. K. Kelley, "High Temperature Heat Contents and Entropies of Aluminates and Ferrites of Lithium, Sodium, and of Lithium Titanate", U. S. Bur. Mines Rept. Invest. 5585 (1960).

The  $S_{298.15}^\circ = 21.9$  was obtained from E. G. King, loc. cit. based on the measured  $S_{298.15}^\circ \text{Si}$  and the extrapolated  $S_{1-0}^\circ$ .

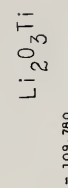

Transition Data.

A. U. Christensen, K. C. Conway, and K. K. Kelley, loc. cit. reported that lithium metatitanate undergoes a transition from the  $\alpha$  to the  $\beta$  form at  $1,485^\circ\text{K.}$  with an absorption of  $2.750 \text{ kcal. mole}^{-1}$ .

Melting Data.

The  $T_m$  and  $\Delta H_m$  were obtained from A. U. Christensen, K. C. Conway, and K. K. Kelley, loc. cit.

$\text{Li}_2\text{O}_3\text{Ti}$

Lithium Metatitanate ( $\text{Li}_2\text{TiO}_3$ )  
(Liquid) Mol. Wt. = 109.780

LITHIUM METATITANATE ( $\text{Li}_2\text{TiO}_3$ ) (LIQUID) MOL. WT. = 109.780

$S_{298.15}^{\circ} = 35.355 \text{ cal. mole}^{-1} \text{ deg.}^{-1}$   
 $\Delta H_f^{\circ} 298.15 = -374.374 \text{ kcal. mole}^{-1}$   
 $\Delta H_m^{\circ} = 26.33 \text{ kcal. mole}^{-1}$   
 $T_m = 1820^{\circ}\text{K.}$

Heat of Formation.  
The  $\Delta H_f^{\circ} 298.15$  was obtained from the heat of formation of the crystal by adding  $\Delta H_m$  and the difference between  $H_{1820}^{\circ}\text{-H}_{298}^{\circ}$  for crystal and liquid.

Heat Capacity and Entropy.  
The heat capacities were reported by A. U. Christensen, K. C. Conway, and K. K. Kelley, "High-Temperature Heat Contents and Entropies of Aluminates and Ferrites of Lithium, Sodium, and of Lithium Titanate", U. S. Bureau Mines Report Invest. 5565 (1960). The measured heat capacity is extrapolated to an assumed glass transition temperature of  $1214^{\circ}\text{K.}$ , below which the heat capacity is taken to be equal to that of the crystal. The  $S_{298.15}^{\circ}$  was obtained in a manner analogous to that of the heat of formation.

Melting Data.  
The  $T_m$  and  $\Delta H_m$  were obtained from A. U. Christensen, K. C. Conway and K. K. Kelley, loc. cit.

Heat of Formation

The heats of solution of LiCl(c), Li<sub>2</sub>SO<sub>4</sub>(c), SiO<sub>2</sub>(quartz) and Li<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(c) in 20 per cent hydrofluoric acid at 74.7°C were measured by F. C. Kracek, Ann. Rept. Director of the Geophysical Laboratory, No. 1215, 69 (1953). The authors derived two values of ΔHsoln of Li<sub>2</sub>O(c) from those of LiCl(c) and Li<sub>2</sub>SO<sub>4</sub>(c), presumably employing auxiliary data from U. S. Natl. Bur. Std. Circ. 500, 1952. We recalculate ΔHsoln of Li<sub>2</sub>O(c) as -58.74 (chloride scheme, originally -59.36) and -59.83 kcal/mol (sulfate scheme, originally -60.86), using recent ΔH<sub>f</sub><sup>298</sup> values for LiCl(c), Li<sub>2</sub>SO<sub>4</sub>(c), HCl(aq), H<sub>2</sub>SO<sub>4</sub>(aq), and Li<sub>2</sub>O(c). The corresponding enthalpy changes, ΔH<sub>f</sub><sup>298</sup>, for the reaction Li<sub>2</sub>O(c) + 2SiO<sub>2</sub>(quartz) = Li<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(c) are derived as -33.21 and -34.30 kcal/mol. Adopting the weighted average ΔH<sub>f</sub><sup>298</sup> = -33.57 kcal/mol with ΔH<sub>f</sub><sup>298</sup>(Li<sub>2</sub>O, c) = -143.1 kcal/mol and ΔH<sub>f</sub><sup>298</sup>(SiO<sub>2</sub>, quartz) = -217.7 kcal/mol, we obtain ΔH<sub>f</sub><sup>298</sup> = -612.07 kcal/mol for Li<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(c). This ΔH<sub>f</sub><sup>298</sup>(Li<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>, c) value is independent of future changes in ΔH<sub>f</sub><sup>298</sup> of Li<sub>2</sub>O(c) but the values of ΔHsoln and ΔH<sub>f</sub><sup>298</sup> are not independent.

The heats of solution of LiOH(c) and Li<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(c) in 20 per cent HF(aq) at 80°C were measured by W. E. Hatton, G. C. Sinke, D. L. Hildenbrand, and D. R. Stull, unpublished work, Thermal Laboratory, The Dow Chemical Co., Midland, Michigan, 1959. By use of a reaction scheme similar to that described on the Li<sub>2</sub>SiO<sub>3</sub>(c) table, the enthalpy change at 298°K for the reaction 2LiOH(c) + 2SiO<sub>2</sub>(c) = Li<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(c) + H<sub>2</sub>O(l) was calculated to be -13.44 kcal/mol. Incorporating this value with ΔH<sub>f</sub><sup>298</sup> = -115.84, -227.7 and -68.315 kcal/mol for LiOH(c), SiO<sub>2</sub>(c), and H<sub>2</sub>O(l), respectively, we obtain ΔH<sub>f</sub><sup>298</sup>(Li<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>, c) = -612.20 ± 2.0 kcal/mol, which is in excellent agreement with the adopted value.

Heat Capacity and Entropy

Both heat capacities and S<sub>298</sub><sup>o</sup> are estimated by comparison with those for Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(c), Na<sub>2</sub>O(c) and Li<sub>2</sub>O(c).

Transition Data

The transition temperature, T<sub>t</sub> = 1209°K, is taken from F. C. Kracek, J. Am. Chem. Soc. 61, 2863 (1939). The author estimated a heat of transition of 1 to 2 cal/g based on the arrest in the cooling and heating curves. The value of ΔH<sub>t</sub><sup>o</sup> is calculated assuming the heat of transition at 1209°K is 1.5 cal/g.

Melting Data

Incongruent melting of Li<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(c) at 1033° has been reported by F. C. Kracek, J. Phys. Chem. 34, 2641 (1930); J. Am. Chem. Soc. 61, 2863 (1939). The liquidus temperature of 1034° at the composition 19.92 per cent Li<sub>2</sub>O and 80.08 per cent SiO<sub>2</sub>, reported by Kracek (1939), is adopted as T<sub>m</sub>. The heat of melting is evaluated such that ΔH<sub>m</sub><sup>o</sup> + ΔH<sub>f</sub><sup>298</sup> = 11.43 kcal/mol, where the value 11.43 kcal/mol is the difference between ΔH<sub>f</sub><sup>298</sup> for Li<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(c) and Li<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(l). The latter were determined by solution calorimetry by Kracek (see Heat of Formation sections in Li<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(l) and Li<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(t) tables).

Lithium Disilicate (Li<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>)  
(Liquid) GFW = 150.047

GFW = 150.047

(LIQUID)

LITHIUM DISILICATE (Li<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>)

$\Delta H_f^{298.15} = -600.640 \pm 1.0$  kcal/mol

$\Delta H_m^* = [12.86]$  kcal/mol

$S_{298.15}^* = [38.297]$  gibbs/mol

$T_m = 1307^\circ K$

Heat of Formation

The heats of solution of LiCl(c), Li<sub>2</sub>SO<sub>4</sub>(c), SiO<sub>2</sub>(quartz) and Li<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(gl) in 20 percent hydrofluoric acid at 74.7°C were measured by F. C. Knacek, Ann. Rept. Director of the Geophysical Laboratory, No. 1215, 69 (1953). Following the same procedure as described in Li<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(c) table, we derived the enthalpy changes,  $\Delta H_f^{298}$ , for the reaction Li<sub>2</sub>O(c) + 2SiO<sub>2</sub>(quartz) = Li<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(gl) as -21.78 and -22.87 kcal/mol. Adopting the weighted average  $\Delta H_f^{298} = -22.14$  kcal/mol with  $\Delta H_f^{298}(Li_2O, c) = -143.1$  kcal/mol and  $\Delta H_f^{298}(SiO_2, quartz) = -217.7$  kcal/mol, we obtain  $\Delta H_f^{298} = -600.640$  kcal/mol for Li<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(gl). This  $\Delta H_f^{298}(Li_2Si_2O_5, gl)$  value is independent of future changes in  $\Delta H_f^*$  of Li<sub>2</sub>O(c) but the values of  $\Delta H_{soln}$  and  $\Delta H_r^*$  are not independent.

Heat Capacity and Entropy

The heat capacity is estimated by comparison with those for Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(l), Na<sub>2</sub>SiO<sub>3</sub>(l) and Li<sub>2</sub>SiO<sub>3</sub>(l). A glass transition temperature at 800°K is assumed, i.e. the heat capacities below 800°K are taken from those for Li<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(c) and above 800°K are assumed to be constant.

The  $S_{298}^*$  value is obtained from  $S_{298}^*(c)$  by adding  $\Delta S_m^*$  and the difference between  $S_{1307}^* - S_{298}^*$  for crystal and liquid.

Melting Data

See Li<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(c) table for details.

ΔH<sub>0</sub><sup>o</sup> = Unknown

S<sub>298.15</sub> = [9 + 2] gibbs/mol

ΔH<sub>298.15</sub> = -47.2 ± 1.0 kcal/mol

Heat of Formation.

The adopted ΔH<sub>298.15</sub> = -47.2 ± 1.0 kcal/mol was determined calorimetrically by Neumann et al.<sup>1</sup> by heating Li (c) at 600°C under 5 atm N<sub>2</sub> pressure for 1 minute. The ΔH<sub>298.15</sub> = -131.1 kcal/mol of reaction Li<sub>3</sub>N(c) + 3 H<sub>2</sub>O(l) = 3 LiOH(aq) + NH<sub>3</sub>(aq) was measured by Guntz.<sup>2</sup> Based on this ΔH<sub>298.15</sub> the heat of formation was calculated to be -47.02 ± 2 kcal/mol which is in very good agreement with that of Neumann et al.<sup>1</sup>. Unfortunately the author does not report the amount of water in LiOH(aq) and we assumed 300 H<sub>2</sub>O as the best estimate. Heats of formation for NH<sub>3</sub>(aq) = [-19.17] kcal/mol and H<sub>2</sub>O(l) = [-68.315] kcal/mol were taken from Wagman et al.<sup>3</sup>. The ΔH<sub>f</sub> of LiOH + 300 H<sub>2</sub>O (-121.30 kcal/mol) was derived from the heats of formation and solution of LiOH(c) (see JAFAP table) and the heat of dilution selected by Parker.<sup>4</sup>

Heat Capacity and Entropy.

S. Satoh, Sci. Papers Inst. Phys. Chem. Research (Tokyo) **35**, 182 (1939), has measured enthalpies (273-578°K) and derived an equation for the specific heat of Li<sub>3</sub>N. The adopted heat capacities were obtained from this equation. Above 773°K the heat capacities were graphically extrapolated. The entropy was estimated from the contribution 3.5 eu per Li given by W. M. Latimer, "Oxidation Potentials," 2nd Edition, Prentice-Hall, Inc., New York, 1952, and a -1.5 eu contribution for N.

Dec. 31, 1960; Sept. 30, 1962

## MAGNESIUM (Mg)

(CRYSTAL)

AT. WT. = 24.32

$$\Delta H_f^\circ 298.15 = 0$$

$$\Delta H_f^\circ 298.15 = 7.814 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$$

$$\Delta H_m = 2.14 \text{ kcal. mole}^{-1}$$

$$\Delta H_f^\circ 0 = 0$$

$$\Delta H_f^\circ 298.15 = 35.28 \pm 0.01 \text{ kcal. mole}^{-1}$$

$$T_m = 922 \pm 0.5^\circ\text{K}$$

## Heat of Formation.

Zero by definition.

## Heat Capacity and Entropy.

The following heat capacity measurements were considered in drawing a smooth curve of  $C_p$  with  $T$ : P. L. Smith (1.26-4.2°K) Phil. Mag. 46, 744 (1955); J. R. Clement and H. R. Jeffers (3-13°K) Phys. Rev. 105, 1435 (1957); K. Clausius and J. V. Vaughn (11.3-228.4°K) J. Am. Chem. Soc. 52, 4686, (1930); R. S. Craig, C. A. Krier, L. W. Coffey, E. A. Bates, and W. E. Wallace (12-320°K) J. Am. Chem. Soc. 76, 238 (1954); W. Mennchen and K. Bornkessel (190-300°K) Z. Metallkunde 51, 482-5 (1960); H. Seelkamp (291-773°K) Z. anorg. Chem. 195, 345 (1931); and D. R. Stull and R. A. McDonald (700-900°K) J. Am. Chem. Soc. 77, 5293 (1955). The following heat capacity measurements were noted but not used as the data were either not tabulated, or erratic, or inconsistent or would not have altered the  $C_p$ - $T$  curve: D. L. Martin (0.4-1.5°K) Proc. Phys. Soc. (London) 76, 1482-8 (1961); I. Betermann, S. A. Friedberg, and J. E. Goldman (1.6-4.2°K) Phys. Rev. 87, 562 (1952); E. P. Eastman and W. H. Rodebush (74.9-288.5°K) J. Am. Chem. Soc. 40 489 (1918); W. O. Saba, K. F. Sterrett, R. S. Craig, and W. E. Wallace (298-543°K) J. Am. Chem. Soc. 79, 3537 (1957); F. M. Jaeger and T. J. Poppema (273-873°K) Rec. Trav. chim. 55, 492 (1936); J. H. Averbey and E. Griffiths (323-895°K) Proc. Phys. Soc. 36, 378 (1926); E. D. Eastman, A. M. Williams and T. F. Young (375-873°K) J. Am. Chem. Soc. 46, 1178 (1926); and P. Schübel (323-773°K) Z. anorg. chem. 87, 81 (1914).  $S_{298.15}^\circ$  was obtained by numerical integration using the low temperature  $C_p$  data cited above.

## Melting.

Melting point is from J. L. Houghton and R. J. M. Payne (922 ± 0.5°K) J. Inst. Met. 54, 279 (1954). Also noted but not used were: R. Chadwick (923°K) J. Inst. Met. 39, 285-300 (1928); W. R. D. Jones (920.5°K) J. Inst. Met. 46, 356-419 (1931).

The heat of melting is from D. R. Stull and R. A. McDonald (loc. cit.)

## Heat of Sublimation.

Is obtained by third law calculations from the vapor pressure data on the solid by P. F. Coleman and A. E. Egerton, Phil. Trans Roy. Soc. (London) A234, 177-204 (1935) and the value is confirmed by similar use of the vapor pressure data on the liquid by E. Schell and F. Wolf, Z. Metallkunde 50, 229-33 (1959); A. Wejnarth, Tek. Tid. 72, 33-9, 44-8 (1942); A. Schneider and E. K. Stoll, Z. Elektrochem. 47, 519-26 (1941); E. Baur and R. Brunner, Helv. Chim. Acta, 17, 958-69 (1934); and H. Hartmann and R. Schneider, Z. anorg. Chem. 160, 275-83 (1929). Additional data noted but not used on the vapor pressure, as values were not tabulated or they were erratic, of the solid are by J. F. Smith and R. L. Smythe, Acta Metallurgica, 7, 261-7 (1959); A. Ruckner, Metallwirtschaft, 15, 64-5 (1936); W. Leitgeb, Metallwirtschaft, 14, 269 (1935); and of the liquid by P. A. Vetter and O. Kubaschewski, Z. Elektrochem. 57, 243 (1953); W. Leitgeb, Z. anorg. Chem. 202, 312 (1931); C. Zwikker, Physico, 9, 246 (1928); O. Ruff and H. Hartmann, Z. anorg. Chem., 135, 29-45 (1924); and J. Johnston, Ind. Eng. Chem., 3, 876 (1917).

AT. WT. = 24.32

(LIQUID)

MAGNESIUM (Mg)

$S_{298.15}^o = [10.159] \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $\Delta H_m^o = 2,140 \text{ cal. mole}^{-1}$   
 $\Delta H_v = 30.5 \text{ kcal. mole}^{-1}$

$\Delta H_f^o 298.15 = [2.158] \text{ kcal. mole}^{-1}$   
 $T_m = 922 \pm 0.5^\circ\text{K}$   
 $T_b = 1379^\circ\text{K}$

Heat of Formation.

$\Delta H_f^o 298.15 (= \Delta H_m 298.15)$  obtained from  $\Delta H_m 922$  by adding  $H_{922} - H_{298.15}$  for solid and subtracting  $H_{922} - H_{298.15}$  for liquid.

Heat Capacity and Entropy.

The heat capacity measurements of D. R. Stull and R. A. McDonald (950-1100°K) J. Am. Chem. Soc. 77, 5283 (1955) were used. Outside of the observed range  $C_p$  was extrapolated linearly with temperature. Below  $T_m$  the linear extrapolation was continued until the  $C_p$  curve for the solid is encountered at 710°K. At lower temperatures the  $C_p$  of the crystal is used.  $S_{298.15}$  was calculated from that of the solid.

Melting.

See crystal for details.

Vaporization.

The normal boiling point was calculated by the third law and  $\Delta H_v 298.15$ . This compares with 1377°K computed from the general vapor pressure equation for liquid Mg given on p 221 of Omelina Handbuch der anorganischen Chemie, System-Nummer 27 (1952), and experimentally determined values: 1376 ± 5°K by A. Schneider and U. Esch, Z. Elektrochem 45, 888 (1953); 1380°K by E. Baur and R. Brunner, Helv. Chim. Acta 17, 958 (1934); 1370°K by W. Leitgeb, Z. anorg. Chem. 202, 305 (1931); and 1393°K by Greenwood, Chem. News 104, 31 (1911).

The  $\Delta H_v 1378$  is based on the liquid and ideal gas tables.

Heat of Formation.  
ΔH<sub>f</sub><sup>o</sup> 298.15 (-ΔH<sub>s</sub> 298.15) is calculated as described on the table for crystal.

Heat Capacity and Entropy.

Thermodynamic functions were calculated using electronic levels and multiplicities from C. E. Moore [Nat. Bur. Standards Circ. 467, Vol. 1 (1949)]. Higher levels were averaged.

Magnesium Unipositive Ion (Mg<sup>+</sup>)

Heat of Formation

We derive the heat of formation at 0°K from the reaction Mg(g) - e<sup>-</sup>(g) + Mg<sup>+</sup>(g) using the JANAF auxiliary value for Mg(g) and an ionization potential of 176.278 kcal/mol from C. E. Moore, U. S. Natl. Bur. Std. Circ. 467, Vol. I, 1949.

Heat Capacity and Entropy

We take the electronic levels and quantum weights from C. E. Moore, loc. cit. H° - H°<sub>298</sub> = -1.481 kcal/mol at 0°K.

MOL. WT. = 38.328

(IDEAL GAS)

MONOMAGNESIUM MONONITRIDE (MgN)

Ground State Configuration  $[2^1\Pi]$   $\Delta H_f^0 = [69 \pm 6]$  kcal. mole $^{-1}$

$S_{298.15}^0 = [53.713]$  cal. deg. $^{-1}$  mole $^{-1}$   $\Delta H_f^0 298.15 = [69 \pm 6]$  kcal. mole $^{-1}$

Electronic Levels and Quantum Weight

|                     |       |
|---------------------|-------|
| $E_i$ , cm. $^{-1}$ | $g_i$ |
| 0                   | [4]   |

$\mu_e^0 = [700]$  cm. $^{-1}$   $\mu_e^0 = [4.8]$  cm. $^{-1}$   $\nu = 1$

$B_e = [0.5542]$  cm. $^{-1}$   $\alpha_a = [0.0052]$   $r_e = [1.85]$  Å

Heat of Formation.

The  $\Delta H_f^0 298.15$  for MgN was estimated from bond strengths using MgO and comparison with analogous pairs of compounds such as PN and PO, and also the bond strengths of C-N and C-O in organic compounds.

Heat Capacity and Entropy.

The  $r_e$  value for MgN was estimated from MgO by comparison with similar pairs PO and PN, SiO and SiN, and AlO and AlN. Using Ogashehmer's Relation, Proc. Phys. Soc. (London) 56, 456 (1946),  $\mu$  for MgO was found to lie between the single and multiple bonding cases. Magnesium nitride was assumed to be similar to MgO and  $\mu_e = 700$  cm. $^{-1}$  was obtained. It was assumed that the  $\chi_e \mu_e^{1/2}$  value for MgN was equal to that for MgO thus giving  $\mu_e^0 \chi_e = 4.8$  cm. $^{-1}$ .  $B_e$  was calculated from  $r_e$ . The  $\alpha_a$  value was calculated from  $B_e$ ,  $\mu_e^0$  and  $\mu_e^0 \chi_e$ .

 T<sub>B</sub> = 3466°K.

Heat of Formation.

C. E. Holley and E. J. Huber, *J. Am. Chem. Soc.*, **73**, 5577 (1951) reported ΔH<sub>f</sub>° 298 (MgO, c) = -143.7 kcal. mole<sup>-1</sup> by combustion calorimetry. Heat of solution measurements by C. H. Shomate and E. H. Huffman, *J. Am. Chem. Soc.*, **65**, 1625 (1943) yielded ΔH<sub>f</sub>° 298 (MgO, c) = -143.84 kcal. mole<sup>-1</sup>, well within the adopted ΔH<sub>f</sub>° 298 (MgO, c) = -143.7 ± 0.3 kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy.

Low temperature heat capacities have been reported by:

1. W. Lien and N. Phillips, *J. Chem. Phys.*, **29**, 1415 (1958), 1.5-4°K.
2. W. F. Glusque and R. C. Archibald, *J. Am. Chem. Soc.*, **59**, 561 (1937), 20-301°K.
3. G. S. Parks and K. K. Kelley, *J. Phys. Chem.*, **50**, 47 (1926), 94-291°K.
4. T. H. K. Barron, N. T. Berg, and J. A. Morrison, *Proc. Roy. Soc. (London)*, **A250**, 70 (1959), 10-270°K.
5. P. Gunther, *Ann. Physik*, **51**, 828 (1916), 21-84°K.
6. A. C. Victor and T. B. Douglas, *J. Res. N.B.S.*, **67A**, 325 (1963), 373-1173°K.
7. L. B. Pankratz and K. K. Kelley, *U.S. Bur. Mines RI 6295*, (1963), 400-1800°K.

High temperature heat contents have been reported by:

The samples of (1) and (2) were finely divided magnesia and the other samples were periclase. Periclase is taken to be the standard state. The high temperature heat content data of (6) and (7) were joined by a Shomate plot with the low temperature C<sub>p</sub> data of (4). The heat capacity was extrapolated linearly above 1800°K to a value of 14 cal. mole<sup>-1</sup> deg.<sup>-1</sup> at 3100°K. S<sub>298.15</sub> = 6.44 cal. deg.<sup>-1</sup> mole<sup>-1</sup> is from (4).

Melting Data.

T<sub>m</sub> (MgO, c) = 3098 ± 20°K by R. N. McNally, F. I. Peters, and P. H. Ribbe, *J. Am. Ceram. Soc.*, **45**, 491 (1961) was adopted. Their value is 41°K higher than the earlier measurements of C. W. Knoll, *J. Wash. Acad. Sci.*, **3**, 315 (1913). K. K. Kelley, *Bur. Mines Bull.*, **393** (1936) calculated ΔH<sub>m</sub>° (MgO, c) = 18.5 ± 1.5 kcal./mole from melting point measurements in the MgO - ZrO<sub>2</sub> system.

Sublimation Data.

T<sub>B</sub> is the temperature at which the free energy change of the reaction MgO(c) = MgO(g) approaches zero. The difference between ΔH<sub>f</sub>° 298.15 for MgO(c) and MgO(g) is ΔH<sub>s</sub>° 298.15°.

| T, °K. | C <sub>p</sub> | S° - (F° - H <sub>298°)/T</sub> | H° - H <sub>298°</sub> | ΔH <sub>f</sub> <sup>o</sup> | ΔF <sub>f</sub> <sup>o</sup> | Log K <sub>f</sub> |

$\Delta H_f^o = [12.033] \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $\Delta H_m^o = [19.5 \pm 1.5] \text{ kcal. mole}^{-1}$   
 $\Delta H_v^o = [113.4] \text{ kcal. mole}^{-1}$

$S_{298.15}^o = [12.033] \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $T_m = 3098^\circ\text{K.}$   
 $T_B = [3533]^\circ\text{K.}$

Heat of Formation.

$\Delta H_f^o$  298.15(1) was calculated from  $\Delta H_f^o$  298.15(c) by adding  $\Delta H_m^o$  and the difference between  $H_m^o$  and  $H_{298}^o$  for crystal and liquid.

Heat Capacity and Entropy.

A glass transition is assumed at 2066°K.  $C_p$ (l) below 2066°K. were assumed to be equal to those of MgO(c). At and above 2066°K. the heat capacities were assumed to be constant at 7.25 cal. deg.<sup>-1</sup> g. atom<sup>-1</sup>. The entropy was obtained in a manner analogous to that of the heat of formation.

Melting Data.

See MgO(c) table for details.

Vaporization Data.

W. R. Mott, *Trans. Am. Electrochem. Soc.* 54, 255 (1918) estimated the boiling point at 3873°K. by comparing crater distances of arc image deposits with reference compounds.  $T_B = 3533^\circ\text{K.}$  is the temperature at which the free energy change of the reaction  $\text{MgO(l)} = \text{MgO(g)}$  approaches zero. The difference between  $\Delta H_f^o$  3533 for MgO(g) and MgO(l) is  $\Delta H_v^o$ .

Dec. 31, 1960; Dec. 31, 1965

MAGNESIUM OXIDE (MgO)

MOL. WT. = 40.3114

Round State Configuration  $3\Sigma$   
 $\Delta H_f^0 = 1.0 \pm 20$  kcal mole<sup>-1</sup>  
 $S_{298.15}^0 = 52.889$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 $\Delta H_f^0(298.15) = 1.0 \pm 20$  kcal. mole<sup>-1</sup>

Electronic Levels and Quantum Weights

$$\frac{E_i, \text{ cm.}^{-1}}{g_i}$$

$$\omega_e = 902 \text{ cm.}^{-1}$$

$$\alpha_e = [0.0094] \text{ cm.}^{-1}$$

$$r_e = [1.672] \text{ \AA}$$

Heat of Formation.

There is considerable discordance in the heat of formation results even though results were adjusted to a common  $3\Sigma$  ground state where necessary. A mean  $\Delta H_f^0(298 \text{ MgO, g}) = 1.0 \pm 20$  kcal. mole<sup>-1</sup> was selected.

R. L. Altmann, J. Phys. Chem. **57**, 366 (1953) made a Knudsen effusion and oxygen transpiration study of the vaporization of MgO. The predominant vapor species over MgO(c) were shown to be Mg(g) and O<sub>2</sub>(g). MgO transpiration results with oxygen at 1 atm yielded a 3rd law heat of sublimation  $\Delta H_g^0(298 \text{ MgO, g}) = 162.3$  kcal. mole<sup>-1</sup> and  $\Delta H_f^0(298 \text{ MgO, g}) = 19.6$  kcal. mole<sup>-1</sup>.

J. Drowart, O. Eksteen and G. Verhaegen, Trans. Far. Soc. **50**, 1920 (1954) used the Knudsen effusion-mass spectrometer technique to determine relative ion intensities and enthalpies for the reaction  $\text{MgO(g)} + \text{O(g)} \rightarrow \text{Mg(g)} + \text{O}_2(\text{g})$ . After adjusting their values for a  $3\Sigma$  ground state we calculated  $\Delta H_f^0(298 \text{ MgO, g}) = 11.9$  kcal. mole<sup>-1</sup>. Similar calculations for their data on  $\text{MgO(g)} + \text{WO}_2(\text{g}) \rightarrow \text{Mg(g)} + \text{WO}_3(\text{g})$  yielded  $\Delta H_f^0(298) = 10.5$  kcal. mole<sup>-1</sup>. The agreement is fortuitous, however, since uncertainties in the JANAF values for  $\text{WO}_2(\text{g})$  and  $\text{WO}_3(\text{g})$  are on the order of 7 kcal. each.

R. F. Porter, W. A. Chupka and M. O. Inghram, J. Chem. Phys. **23**, 1347 (1955) mass spectrometrically determined an upper limit for the vapor pressure of MgO(g) over MgO(c) at 1950°K. Their results reduce to a lower limit of 148.6 kcal. mole<sup>-1</sup> for  $\Delta H_f^0(298.15 \text{ MgO, c})$  or a lower limit of 4.9 kcal. mole<sup>-1</sup> for  $\Delta H_f^0(298 \text{ MgO, g})$ .

E. Bulewicz and T. Sugden, Trans. Far. Soc. **55**, 720 (1959), using a flame photometric technique, reported  $D_0^0 = 98 \pm 2$  kcal. mole<sup>-1</sup> for MgO.  $\Delta H_f^0(298 \text{ MgO, g}) = -4.1$  kcal. mole<sup>-1</sup> was calculated.

I. Veita and L. Ourvich, Optika and Spektroskopiya **1**, 22 (1956) used a flame technique to obtain  $D_0^0 = 100$  kcal. mole<sup>-1</sup>. A 4 kcal. mole<sup>-1</sup> adjustment for  $1\Sigma$  to  $3\Sigma$  yields  $\Delta H_f^0(298 \text{ MgO, g}) = -2.1$  kcal. mole<sup>-1</sup>.

The flame method data of L. Huldt and A. Lagerquist, Arkiv Fysik **2**, 333 (1950) yielded a  $3\Sigma$  adjusted  $D_0^0 = 115$  kcal. mole<sup>-1</sup>.  $\Delta H_f^0(298 \text{ MgO, g}) = -21.1$  kcal. mole<sup>-1</sup> was calculated.

L. Brewer and R. F. Porter, J. Chem. Phys. **22**, 1876 (1954) have shown by vapor pressure measurements on MgO(c) that the solid vaporizes mainly into molecular species. They gave spectroscopic evidence that the  $1\Sigma$  electronic state of MgO(g) is not the principal vaporizing species. Using their vapor pressures for the reaction  $\text{MgO(c)} = \text{MgO(g)}$  and a  $3\Sigma$  ground state we calculated 2nd and 3rd law heat of sublimation at 298°K. of 120.0 and 129.1 kcal. mole<sup>-1</sup>. The 3rd law value yields  $\Delta H_f^0(298 \text{ MgO, g}) = -14.6$  kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy.

The fundamental frequency and anharmonicity correction were reported by L. Brewer and R. Porter, J. Chem. Phys. **22**, 1876 (1954) and are based on a  $3\Sigma$  ground state. The rotational constants were estimated by H. L. Schlick 55 al. AVCO Corp. RAD-SR-62-251, 15 Dec. 1962. Although the ground state and spectroscopic constants are in doubt, the free energies are probably within 1% in 3 of true values.

Dec. 31, 1960; Sept. 30, 1964; Dec. 31, 1967

 $\Delta_{298}^{298}H_{298}^{\circ} = 16.197 \pm 0.2$  gibbs/mol $T_{11} = 903$  °K $T_{12} = 1268$  °K $T_m = 1850 \pm 2$  °K

## Heat of Formation

Torgeson et al. (1) report a  $\Delta H_{298}^{\circ} = -8.59 \pm 0.15$  kcal/mol for reaction (a). They used a hydrofluoric acid solution calorimeter and measured the heats of solution of each component. They appear to have made the water-absorption correction to the heat of solution of SiO<sub>2</sub>(c) in the wrong direction. We reverse the correction so that the new  $\Delta H_{298}^{\circ}$  almost overlaps the range observed by King (11). We derive  $\Delta H_{298}^{\circ}$  (MgSiO<sub>3</sub>, c) = -370.20 ± 1.0 kcal/mol using the  $\Delta H_{298}^{\circ}$  of MgO(c) and SiO<sub>2</sub> (c, low quartz) from the JANAF tables.

Reesman et al. (2) calculated a  $\Delta G_{298}^{\circ} = 23.72$  kcal/mol for reaction (b) using aqueous solubility data. We use the  $\Delta G_{298}^{\circ}$  of H<sub>2</sub>O(l) and OH<sup>-</sup>(aq) from sources 3,  $\Delta G_{298}^{\circ}$  of H<sub>4</sub>SiO<sub>4</sub>(aq) from source 4 and  $\Delta G_{298}^{\circ}$  of Mg<sup>++</sup>(aq) from source 6 and we obtain a  $\Delta G_{298}^{\circ}$  (MgSiO<sub>3</sub>, c) = -352.534 kcal/mol. We derive a  $\Delta H_{298}^{\circ}$  (MgSiO<sub>3</sub>, c) = -373.729 kcal/mol using the above  $\Delta G_{298}^{\circ}$  of MgSiO<sub>3</sub>(c) and the entropies of Mg(c), Si(c) and O<sub>2</sub>(g) from the JANAF tables.

We choose the heat of formation derived from the result of Torgeson et al. (1) which is considered to be better since it relates directly to the oxides. Also the  $\Delta G_{298}^{\circ}$  (MgSiO<sub>2</sub>, l) thus calculated is in very good agreement with that derived from the activities of SiO<sub>2</sub> and MgO (in the SiO<sub>2</sub>-MgO system) measured by Rein et al. (8). The  $\Delta H_{298}^{\circ}$  (MgSiO<sub>3</sub>, c) derived from the work of Reesman et al. is less accurate and involves uncertainties in the auxiliary data used to calculate the value.

## Heat Capacity and Entropy

Low temperature heat capacities are from the data (53 - 295°K) of Kelley (7). Wagner (8) measured the average heat capacities in the temperature range 80 - 1570°K. Using his data we derive the high temperature heat capacities which are joined smoothly with the low temperature values by a constrained fitting technique. The Cp values at 903 - 1268°K and above 1258°K are derived as 28.762 and 29.262 gibbs/mol, respectively, by assuming that the data of Wagner (8) pertain to the stable phase in these regions. The entropy is based on S<sub>298</sub><sup>o</sup> = 0.49 eu.

## Transition Data

$T_{11} = 903$ °K is obtained from Boyd et al. (9). The authors determined the phase diagram boundary at high pressures and extrapolated to one atmosphere.  $T_{12} = 1268$ °K is taken from Atlas (10). Below 903°K the phase is known as clinonastite. Between 903° and 1268°K it is rhombic enstatite and above 1268°K it is protoenstatite. We calculate  $\Delta H_{11}^{\circ}$  and  $\Delta H_{12}^{\circ}$  from  $\Delta H_{298}^{\circ}$  (slopes of the Invernal) = 2.6°/kbar and 84°/kbar reported by Boyd et al. (9, 13) and from the densities of clinonastite (3.210 gm/cc) and rhombic enstatite (3.208 gm/cc) reported by Stephenson et al. (11) and the density of protoenstatite (3.110 gm/cc) reported by Smith (12).

S<sub>298.15</sub> = [22.112] gibbs/mol

T<sub>1</sub> = 903 °K

T<sub>2</sub> = 1286 °K

T<sub>m</sub> = 1850 ± 2 °K

Heat of Formation

The heat of formation is obtained from ΔH<sub>f,298</sub><sup>o</sup>(c) by adding ΔH<sub>m</sub><sup>o</sup> and the difference between H<sub>m</sub><sup>o</sup> - H<sub>298</sub><sup>o</sup> for crystal and liquid.

Heat Capacity and Entropy

A glass transition is assumed at 900°K. Below 900°K the heat capacity is obtained from the heat capacity of the crystal.

Above 900°K the heat capacity is assumed constant and estimated as 35 gibbs/mol or 7 gibbs/g-atom. The entropy is obtained in a manner analogous to that of the heat of formation.

Transition Data

See crystal table.

Melting Data

T<sub>m</sub> is taken from N. L. Bowen and O. Andersen, Ann. J. Sci. 37, 487 (1914). MgSiO<sub>3</sub>(c) melts incongruently in the temperature range 1830 - 1850°K at atmospheric pressure. ΔH<sub>m</sub><sup>o</sup> is estimated from the phase diagrams of the MgSiO<sub>3</sub> - TiO<sub>2</sub> system reported by I. D. MacGregor, Ann. Rept. Director of the Geophysical Laboratory, No. 1455, 135-9 (1965). The phase diagrams were determined at 10 and 20 kbars pressure where MgSiO<sub>3</sub>(c) melts congruently.

$$\Delta H_f^0 = -373.63 \pm 1.5 \text{ kcal/mol}$$

$$\Delta H_f^{298,15} = -375.85 \pm 1.5 \text{ kcal/mol}$$

$$\Delta H_m^0 = [21.6] \text{ kcal/mol}$$

$$S_{298,15} = 17.82 \pm 0.1 \text{ gibbs/mol}$$

$$T_m = 1963 \pm 20^\circ \text{K}$$

#### Heat of Formation

The adopted heat of formation is calculated from  $\Delta H_f^{298,15} = -6.35 \pm 0.25 \text{ kcal/mol}$  for the reaction  $\text{MgO}(c) + \text{TiO}_2(\text{rutile}) + \text{MgTiO}_3(c)$  measured by K. K. Kelley, S. S. Todd and E. G. King, U. S. Bur. Mines RI 5059, 1954, using a solution calorimetric method. For the same reaction a value of  $\Delta H_f^{298,15} = -5.5 \pm 0.1 \text{ kcal/mol}$  was obtained with a calorimetric bomb method by B. I. Ronfilov and N. N. Feodos'ev, Russ. J. Inorg. Chem. (English Transl.) 3, 1452 (1958). These authors used the oxidation of lampblack in order to initiate the formation of the titanate from the oxides. Unfortunately the desired heat of reaction was only 1.2 to 1.5 percent of the total measured heat, and consequently this result appears to be more uncertain than that measured by the solution calorimetric method.

#### Heat Capacity and Entropy

Low temperature heat capacities are from the data ( $52 - 796^\circ \text{K}$ ) of C. H. Shomate, J. Am. Chem. Soc. 62, 984 (1946). High temperature enthalpies have been measured ( $107 - 1720^\circ \text{K}$ ) by B. F. Naylor and O. A. Cook, J. Am. Chem. Soc. 88, 1003 (1966). High temperature heat capacities are derived from the enthalpies by a fitting technique which constrains the curves to join smoothly with the low temperature values. The entropy is based on  $S_{298}^0 = 0.45 \text{ eu}$ .

#### Melting Data

See liquid table.

GFW = 120.2102

(LIQUID)

MAGNESIUM METATITANATE (MgTiO<sub>3</sub>)

$$\Delta H_f^{\circ}_{298.15} = [-357.942 \pm 1.5] \text{ kcal/mol}$$

$$\Delta H_m^{\circ} = [21.6] \text{ kcal/mol}$$

$$S^{\circ}_{298.15} = [26.549] \text{ gibbs/mol}$$

$$T_m = 1983 \pm 20^{\circ}\text{K}$$

Heat of Formation

$\Delta H_f^{\circ}_{298}$  is obtained from  $\Delta H_f^{\circ}_{298}(c)$  by adding  $\Delta H_m^{\circ}$  and the difference between  $H_m^{\circ}$  -  $H_{298}^{\circ}$  for crystal and liquid.

Heat Capacity and Entropy

A glass transition is assumed at 1300°K. The heat capacity below 1300°K is obtained from the heat capacity of the crystal. Above 1300°K the heat capacity is assumed constant and estimated as 39 gibbs/mol or 7.8 gibbs/g-atom. The entropy is obtained in a manner analogous to that of the heat of formation.

Melting Data

The incongruent melting point is obtained from Masazza (1). Previous work by Coughanour (2) indicates congruent melting point at 1903°K. The  $\Delta H_m^{\circ}$  is estimated from those of Na<sub>2</sub>O·2TiO<sub>2</sub> and Na<sub>2</sub>O·TiO<sub>2</sub> observed by Naylor (3) and CaO·TiO<sub>2</sub>·SiO<sub>2</sub> observed by King (4).

ΔH<sub>f</sub><sup>o</sup> 0 = -288.8 ± 5 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> 298.15 = -301.6 ± 5 kcal. mole<sup>-1</sup>  
 ΔH<sub>m</sub><sup>o</sup> = 3.5 kcal. mole<sup>-1</sup>

S<sub>298.15</sub><sup>o</sup> = 21.844 ± 0.2 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 T<sub>m</sub> = 1400°K.

Heat of Formation.

The adopted ΔH<sub>f</sub><sup>o</sup> 298.15 = -301.6 ± 5 kcal. mole<sup>-1</sup> was calculated from the ΔH<sub>f</sub><sup>o</sup> 298.15 = 63.3 ± 5 kcal. mole<sup>-1</sup> for the reaction MgO(c) + SO<sub>3</sub>(g) = MgSO<sub>4</sub>(c). The value of ΔH<sub>f</sub><sup>o</sup> 298.15 was calculated by the third law method using the equilibrium data obtained from a transpiration study by Knopf and Staude.<sup>1</sup> In addition Marchal<sup>2</sup> measured the total pressure of SO<sub>2</sub>(g), SO<sub>3</sub>(g) and O<sub>2</sub>(g) above MgSO<sub>4</sub>(c) and partial pressures were obtained by application of the SO<sub>2</sub>-SO<sub>3</sub> equilibrium data. Another value of ΔH<sub>f</sub><sup>o</sup> 298.15 (MgSO<sub>4</sub>, c) may be derived from the measured heat of solution of MgSO<sub>4</sub>(c) by Thomsen<sup>3a</sup> and the measured heats of mixing of MgCl<sub>2</sub>(200 H<sub>2</sub>O) with H<sub>2</sub>SO<sub>4</sub>(200 H<sub>2</sub>O) and MgSO<sub>4</sub>(200 H<sub>2</sub>O) with 2HCl(100 H<sub>2</sub>O) by Thomsen.<sup>3b</sup>

Heat Capacity and Entropy.

The low temperature heat capacities 53.3-295.4°K. were measured by G. E. Moore and K. K. Kelley, J. Am. Chem. Soc. **54**, 2949 (1942). The heat capacities in the temperature range 298-1400°K. were estimated from the equation MgSO<sub>4</sub>(c) = CaSO<sub>4</sub>(c) + MgO(c) - CaO(c). CaSO<sub>4</sub>(c) and CaO(c) C<sub>p</sub> were calculated using the equations C<sub>p</sub> = 16.78 + 23.60 X 10<sup>-3</sup>T and C<sub>p</sub> = 11.67 + 1.08 X 10<sup>-3</sup>T - 1.56 X 10<sup>-6</sup>T<sup>2</sup> respectively, K. K. Kelley, U. S. Bur. Mines Bull. **584** (1960). The heat capacity of MgO(c) was calculated from the correlation of the low temperature heat capacities and high temperature heat content using the Shomate functions to back calculate the heat capacities. The values from the two sources join smoothly at 298°K. Above the melting point (1400°K.) the heat capacity was graphically extrapolated. The entropy was calculated at 50.12°K. using the Debye and Einstein function  $D(\frac{h\nu}{kT}) + 2E(\frac{h\nu}{kT}) + E(\frac{h\nu}{kT})$  given by G. E. Moore and K. K. Kelley loc. cit. The value of S<sub>50.12</sub><sup>o</sup> = 1.08 cal. deg.<sup>-1</sup> mole<sup>-1</sup>.

S<sub>298.15</sub><sup>o</sup> = 24.464 ± 0.2 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> 298.15 = -297.9 ± 5 kcal. mole<sup>-1</sup>  
 ΔH<sub>m</sub><sup>o</sup> = 3.5 kcal. mole<sup>-1</sup>  
 T<sub>m</sub> = 1400°K.

Heat of Formation.

The ΔH<sub>f</sub><sup>o</sup> 298.15 was obtained from ΔH<sub>f</sub><sup>o</sup> 298.15(c) by adding ΔH<sub>m</sub><sup>o</sup> and the difference between H<sub>m</sub><sup>o</sup> and H<sub>l</sub><sup>o</sup> 298.15 for crystal and liquid.

Heat Capacity and Entropy.

A glass transition was assumed at 1000°K. The heat capacity below 1000°K. was obtained from the heat capacity of the crystal. Above 1000°K. the heat capacity was assumed constant and estimated as 39.0 cal. deg.<sup>-1</sup> mole<sup>-1</sup> by comparison with those for MgCl<sub>2</sub>(l), KCl(l) and K<sub>2</sub>SO<sub>4</sub>(l). The entropy was obtained in a manner analogous to that of the heat of formation.

Melting Data.

See MgSO<sub>4</sub>(c) table.

Heat of Formation.

T. N. Rezukhina and V. A. Levitskii<sup>1</sup> measured the emf, E = 0.2453 - 0.0001264T, for the cell reaction MgO(c) + W(c) + 3FeO<sub>0.95</sub>O(c) → MgWO<sub>4</sub>(c) + 2.85 Fe(c), in the temperature range 1220° - 1370°K. Incorporating the results with auxiliary thermal data, the authors obtained ΔH<sub>298</sub><sup>o</sup> = -224,370 + 65.67T (cal/mol) for MgO(c) + W(c) + 3/2O<sub>2</sub>(g) → MgWO<sub>4</sub>(c). Third law analysis of the ΔH<sub>r</sub><sup>o</sup> equation gives ΔH<sub>r</sub><sup>o</sup><sub>298</sub> = -218.6 kcal/mol, from which the adopted ΔH<sub>r</sub><sup>o</sup><sub>298</sub>(MgWO<sub>4</sub>,c), -362.3 kcal/mol, is calculated. The second law analysis gives ΔH<sub>r</sub><sup>o</sup><sub>298</sub>(MgWO<sub>4</sub>,c) = -372.7 kcal/mol. The drift in the third law analysis is 8.0 eu.

T. N. Rezukhina, Ya. I. Gerasimov and Yu. P. Simanov<sup>2</sup> determined the Gibbs energy changes ΔG<sub>r</sub><sup>o</sup> = 51,300 - 27.67T (cal/mol) for the reaction MgWO<sub>4</sub>(c) + 3H<sub>2</sub>(g) → MgO(c) + W(c) + 3H<sub>2</sub>O(g) in the temperature range 1073°K - 1273°K by a circulation method. This leads to heats of formation of -366.1 kcal/mol by the third law method and -377.2 kcal/mol by the second law method. Both determinations were performed by Rezukhina and his co-workers, but they considered the data obtained by the emf method to be more reliable than that derived from heterogeneous equilibria.

Heat Capacity and Entropy.

Low temperature heat capacities, 52.92° - 296.09°K, were measured calorimetrically by E. G. King and W. W. Weiler<sup>3</sup>. The heat capacities above 300°K are estimated by comparison with those of CaWO<sub>4</sub>(c)<sup>4</sup>, CaO(c)<sup>5</sup>, and MgO(c)<sup>6</sup>. These two sets of data are joined smoothly at 298°K by a graphical method.

The entropy, S<sub>298</sub><sup>o</sup> = 21.184 eu, is taken from King and Weiler<sup>3</sup>, based on an extrapolation of S<sub>0</sub><sup>o</sup> = 1.27 eu. No spin-magnetic entropy is predicted below 51°K based on the diamagnetism observed by Ya. I. Gerasimov<sup>7</sup>.

MAGNESIUM DITITANATE (MgTi<sub>2</sub>O<sub>5</sub>) (CRYSTAL)

GFW = 200.109

ΔH<sub>f</sub><sup>0</sup> = -596.43 ± 2.5 kcal/mol

ΔH<sub>f</sub><sup>298.15</sup> = -599.75 ± 2.5 kcal/mol

Δh<sub>m</sub><sup>0</sup> = [35] kcal/mol

S<sub>298.15</sub><sup>0</sup> = 32.41 ± 1.5 gibbs/mol

T<sub>m</sub> = 1963 ± 20°K

Heat of Formation

ΔH<sub>f</sub><sup>298</sup> is calculated from ΔH<sub>f</sub><sup>298</sup> = -4.45 ± 0.45 kcal/mol for the reaction MgO(c) + 2TiO<sub>2</sub>(rutile) = MgTi<sub>2</sub>O<sub>5</sub>(c) measured by K. K. Kelley, S. S. Todd and E. G. King, U. S. Bur. Mines RI 5059, 1954, using a solution calorimetric method. The uncertainty of ±2.5 kcal/mol assigned to the heat of formation is due primarily to TiO<sub>2</sub>(rutile).

Heat Capacity and Entropy

Low temperature heat capacities are from the data (52 - 298°K) of S. S. Todd, J. Am. Chem. Soc. 74, 4669 (1952). High temperature enthalpies have been measured (397 - 1812°K) by R. L. Orr and J. P. Coughlin, J. Am. Chem. Soc. 74, 3186 (1952). High temperature heat capacities are derived from the enthalpies by a fitting technique which constrains the curve to join smoothly with the low temperature values. The entropy is based on S<sub>51</sub><sup>0</sup> - S<sub>0</sub><sup>0</sup> = 1.11 eu.

Kelley et al., loc. cit., suggested that there may be a zero-point entropy due to randomness of the cations. The authors estimated S<sub>0</sub><sup>0</sup> from the following alternative assumptions: (a) all the Mg and Ti ions are randomly distributed among the lattice sites giving 3.79 eu and (b) all the Mg and one-half of the Ti ions are randomly distributed giving 2.75 eu. These assumptions were proposed in order to make MgTi<sub>2</sub>O<sub>5</sub> stable relative to MgTiO<sub>3</sub> at high temperatures. Phase data of F. Massazza and E. Sirchia, 16th Int. Congress of Pure and Appl. Chem., Inorg. Sect., Paris (1957), pp. 161-8, Butterworths Scientific Publications, London, 1959, indicate that MgTi<sub>2</sub>O<sub>5</sub> melts congruently at 1963±20°K and that there is a eutectic with MgTiO<sub>3</sub> at 1873±20°K. These data require that ΔG<sup>0</sup> < 0 for MgTiO<sub>3</sub>(c) + TiO<sub>2</sub>(rutile) → MgTi<sub>2</sub>O<sub>5</sub>(c) in this temperature range. To make ΔG<sup>0</sup> < 0 would require that S<sub>298.15</sub><sup>0</sup> > 0.35 eu. We adopt a compromise zero-point entropy of 2 eu between the upper (3.79 eu) and the lower (0.35 eu) limits.

Melting Data

See liquid table.

Heat of Formation

The heat of formation is obtained from ΔH<sub>298</sub><sup>a</sup>(c) by adding ΔH<sup>m</sup> and the difference between H<sub>Tm</sub><sup>a</sup> - H<sub>298</sub><sup>a</sup> for crystal and liquid.

Heat Capacity and Entropy

A glass transition is assumed at 1300°K. Below 1300°K the heat capacity is obtained from the heat capacity of the crystal. Above 1300°K the heat capacity is assumed constant and estimated as 62/4 gibbs/mol or 7.8 gibbs/g-atom. The entropy is obtained in a manner analogous to that of the heat of formation.

Melting Data

The congruent melting point is obtained from Massazza (1). Previous work by Coughanour (2) indicates congruent melting at 1925°K. The ΔH<sup>m</sup> is estimated from those of Na<sub>2</sub>O·2TiO<sub>2</sub> and Na<sub>2</sub>O·TiO<sub>2</sub> observed by Naylor (3) and CaO·TiO<sub>2</sub>·SiO<sub>2</sub> observed by King (4).

MAGNESIUM ORTHOSILICATE (Mg<sub>2</sub>SiO<sub>4</sub>)

GFW = 140.7076  
(CRYSTAL)  
ΔHf° = -517.12 ± 1.0 kcal/mol  
ΔHf°<sub>298.15</sub> = -520.30 ± 1.0 kcal/mol  
ΔHm° = [17 ± 5] kcal/mol

S°<sub>298.15</sub> = 22.739 ± 0.2 gibbs/mol  
Tm = 2171 ± 11 °K

Heat of Formation

Torgeson et al. (1) have reported a ΔHf°<sub>298</sub> = -15.1 ± 0.2 kcal/mol for reaction (a). They used an HF solution calorimeter and measured the heats of solution of each component. We derive ΔHf°<sub>298</sub>(Mg<sub>2</sub>SiO<sub>4</sub>, c) = -520.30 ± 1.0 kcal/mol using the ΔHf°<sub>298</sub> of MgO(c) and SiO<sub>2</sub>(c, low quartz) from JANAF tables.

Kapustinikii et al. (2) used the same method but measured only ΔHf°<sub>298</sub> = 95.00 ± 0.47 kcal/mol for reaction (b). We calculate ΔHf°<sub>298</sub>(Mg<sub>2</sub>SiO<sub>4</sub>, c) = -522.27 kcal/mol using the ΔHf°<sub>298</sub> of H<sub>2</sub>SiF<sub>6</sub>(aq) from source 3 and the ΔHf°<sub>298</sub> of H<sub>2</sub>O(l) and HF(aq) from source 4.

Reesman et al. (3) calculated a ΔGf°<sub>298</sub> = 42.46 kcal/mol for reaction (c) using aqueous solubility data. We use the ΔGf°<sub>298</sub> of H<sub>2</sub>O(l) and OH<sup>-</sup>(aq) from source 4, ΔGf°<sub>298</sub> of H<sub>2</sub>SiO<sub>4</sub>(aq) from source 3 and ΔGf°<sub>298</sub> of Mg<sup>2+</sup>(aq) from source 6 and we obtain a ΔGf°<sub>298</sub>(Mg<sub>2</sub>SiO<sub>4</sub>, c) = -498.764 kcal/mol. We derive a ΔHf°<sub>298</sub>(Mg<sub>2</sub>SiO<sub>4</sub>, c) = -524.848 kcal/mol using the above ΔGf°<sub>298</sub> of Mg<sub>2</sub>SiO<sub>4</sub>(c) and the entropies of Mg(c), Si(c) and O<sub>2</sub>(g) from the JANAF tables.

The adopted value is from the work of Torgeson et al. (1) which is considered to be the most reliable since it relates directly to the oxides. The other reported values are less accurate and involve uncertainties in the auxiliary data used to derive the heat of formation.

Heat Capacity and Entropy

Low temperature heat capacities are from the data (53-295°K) of Kelley (7). High temperature enthalpies have been measured (398-1808 °K) by Orr (8). High temperature heat capacities are derived from the enthalpies by a fitting technique which constrains the curve to join smoothly with the low temperature values. The entropy is based on S°<sub>0</sub> = 0.60 au.

Melting Data

Tm is obtained from Davis et al. (9). ΔHm° is estimated from MacGregor's (10) phase diagrams of the Mg<sub>2</sub>SiO<sub>4</sub>-TiO<sub>2</sub> system. The phase diagrams were determined at 10 and 20 kbars pressure.

Heat of Formation

The heat of formation is obtained from ΔHf<sup>o</sup><sub>298</sub>(c) by adding ΔH<sub>m</sub><sup>o</sup> and the difference between H<sub>298</sub><sup>o</sup> and H<sup>o</sup><sub>298</sub> for crystal and liquid.

Heat Capacity and Entropy

A glass transition is assumed at 1400°K. Below 1400°K the heat capacity is obtained from the heat capacity of the crystal. Above 1400°K the heat capacity is assumed constant and estimated as 49 gibbs/mol or 7 gibbs/g-atom. The entropy is obtained in a manner analogous to that of the heat of formation.

Melting Data

See crystal table.

Heat of Formation

The heat of formation is calculated from ΔH<sup>o</sup><sub>298</sub> = -4.1 ± 0.25 kcal/mol for the reaction 2 MgO(c) + TiO<sub>2</sub>(rutile) + Mg<sub>2</sub>TiO<sub>4</sub>(c) measured by Kelley (1), using a solution calorimetric method. The uncertainty of ± 1.5 kcal/mol assigned to the heat of formation is due primarily to TiO<sub>2</sub>(rutile).

Heat Capacity and Entropy

Low temperature heat capacities are from the data (52 - 296°K) of Todd (2). High temperature heat capacities are derived from the enthalpies have been measured (182 - 1817°K) by Orr (3). High temperature heat capacities are values.

The entropy is based on S<sup>o</sup><sub>298</sub> = 0.66 + 2.75 = 3.41 eu, where the first term is a lattice contribution and the second term is a zero-point entropy of 2Rln2 corresponding to random distribution of Ti and Mg on the octahedral sites of the spinel lattice. The adopted value is S<sup>o</sup><sub>298</sub> = 27.51 ± 1.5 eu instead of 24.76 ± 0.15 eu as given by Todd.

Barth (4) showed from intensities of the X-ray diffraction lines that Mg<sub>2</sub>TiO<sub>4</sub> is a spinel of the inverse (or variate) class. Thus, half of the Mg ions occupy the tetrahedral interstices in the oxygen lattice, while the remaining Mg ions and the Ti ions are (presumably) randomly located in the octahedral interstices. This conclusion was confirmed by Romeijn (5).

King and Kelley (3) suggested that the degree of structural randomness is not established and that it may vary with the sample of Mg<sub>2</sub>TiO<sub>4</sub>; thus, they recommended an intermediate value of Rln2 for the zero-point entropy. In a previous review, however, Kelley (1) used the theoretical value of 2Rln2 in order to make Mg<sub>2</sub>TiO<sub>4</sub> stable relative to MgTiO<sub>3</sub> at high temperatures. We choose to adopt 2Rln2, although the evidence is not conclusive. Recent studies of solid state reactions by Bartsch and Werner (7) indicate that ΔG<sup>o</sup> is negative for MgTiO<sub>3</sub>(c) + MgO(c) + Mg<sub>2</sub>TiO<sub>4</sub>(c) at temperatures of 1673°K and above. Both Rln2 and 2Rln2 are consistent with this evidence.

Melting Data

See liquid table.

$\Delta H_f^{\circ} = [-489.084 \pm 1.5] \text{ kcal/mol}$

$\Delta H_m^{\circ} = [31] \text{ kcal/mol}$

$S_{298.15}^{\circ} = [41.208] \text{ gibbs/mol}$

$T_m = 2013 \pm 20^{\circ}\text{K}$

Heat of Formation

$\Delta H_f^{\circ}$  is obtained from  $\Delta H_f^{\circ}(c)$  by adding  $\Delta H_m^{\circ}$  and the difference between  $H_m^{\circ} - H_{298}^{\circ}$  for crystal and liquid.

Heat Capacity and Entropy

A glass transition is assumed at 1400°K. Below 1400°K the heat capacity is obtained from the heat capacity of the crystal. Above 1400°K the heat capacity is assumed constant and estimated as 54.6 gibbs/mol or 7.8 gibbs/g-atom. The entropy is obtained in a manner analogous to that of the heat of formation.

Melting Data

The incongruent melting point is obtained from Massazza (1). Previous work by Coughanour (2) suggested congruent melting at 2005°K. The  $\Delta H_m^{\circ}$  is estimated from those of Na<sub>2</sub>O·2TiO<sub>2</sub> and Na<sub>2</sub>O·TiO<sub>2</sub> observed by Naylor (3) and CaO·TiO<sub>2</sub>·SiO<sub>2</sub> observed by King (4).

DIMAGNESIUM SILICIDE (Mg<sub>2</sub>Si) (Crystal)

Mol. Wt. = 76.73

ΔH<sub>f</sub><sup>o</sup> 298.15 = -18.6 kcal. mole<sup>-1</sup>

S<sub>298.15</sub><sup>o</sup> = [19.5] cal. deg.<sup>-1</sup> mole<sup>-1</sup>

T<sub>m</sub> = 1375°K

ΔH<sub>m</sub><sup>o</sup> = [15.33] kcal. mole<sup>-1</sup>

Heat of Formation. ΔH<sub>f</sub><sup>o</sup> 298.15 was found in the National Bureau of Standards Circular 500 (1952).

Heat Capacity and Entropy. C<sub>p</sub> taken from Kubaschewski and Evans, "Metallurgical Thermochemistry," 3rd Edition, Pergamon Press Ltd., New York, (1958). S<sub>298.15</sub> was estimated.

Melting Data. T<sub>m</sub> was taken from NES Circular 500 (1952). ΔH<sub>m</sub><sup>o</sup> found in Wilson, Beahm, and Cooper, "Determination and Analysis of the Potentials of Thermal Energy Storage Materials," Callery Chemical Co., Callery, Pa., June 30, 1961.

DIMAGNESIUM SILICIDE (Mg<sub>2</sub>Si) (Liquid)

Mol. Wt. = 76.73  
 ΔH<sub>f</sub><sup>o</sup> 298.15 = -3,749 kcal. mole<sup>-1</sup>  
 S<sub>298.15</sub><sup>o</sup> = [30.2] cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 T<sub>m</sub> = 1375°K  
 ΔH<sub>m</sub> = [15.33] kcal. mole<sup>-1</sup>

Heat of Formation, ΔH<sub>f</sub><sup>o</sup> 298.15 was based on ΔH<sub>f</sub><sup>o</sup> 298.15 of the crystal and the heat of melting.

Heat Capacity and Entropy, C<sub>p</sub> was estimated. A glass transition was assumed at 916°K. S<sub>298.15</sub><sup>o</sup> was calculated from the entropy of the crystal and the entropy of melting.

Mg<sub>2</sub>Si

Trimagnesium Dinitride ( $Mg_3N_2$ )  
(Solid) Mol. Wt. = 100.98

MAGNESIUM ORTHOPHOSPHATE (Mg<sub>3</sub>P<sub>2</sub>O<sub>8</sub>)  
(CRYSTAL) MOL. WT. = 262.91

ΔH<sub>f</sub><sup>o</sup> O = Unknown  
 ΔH<sub>f</sub><sup>o</sup> 298.15 = -895.1 ± 2.5 kcal. mole<sup>-1</sup>  
 ΔH<sub>m</sub><sup>o</sup> = [29 ± 10] kcal. mole<sup>-1</sup>  
 T<sub>m</sub> = 1621 °K.

Heat of Formation.

The selected ΔH<sub>f</sub><sup>o</sup> 298.15 is a weighted average of a revised calorimetric determination and a third law calculation using equilibrium data.

A calorimetric determination of the heat of formation reported by C. G. Stevens and E. T. Turkdogan, Trans. Faraday Soc. 50, 370 (1954) was revised three ways:

1. The heat of reaction for the reaction 3MgO(c) + P<sub>2</sub>O<sub>5</sub>(orthorhombic) → Mg<sub>3</sub>P<sub>2</sub>O<sub>8</sub>(c) had been evaluated at 348°K. A small temperature correction to 298.15 was made with thermal data not available to Stevens and Turkdogan (loc. cit.) on MgO (W. F. Glauque, J. Am. Chem. Soc. 71, 3192 (1949)), P<sub>2</sub>O<sub>5</sub> (JANAF Table, Dec. 31, 1962) and Mg<sub>3</sub>P<sub>2</sub>O<sub>8</sub> (this table).
2. A new ΔH<sub>f</sub><sup>o</sup> 298.15 for P<sub>2</sub>O<sub>5</sub>(hexagonal) as reported by W. S. Holmen, Trans. Faraday Soc. 58, 1916 (1962) was combined with the heat of reaction, -6.85 ± 1.0 kcal. mole<sup>-1</sup>, for the reaction: P<sub>2</sub>O<sub>5</sub>(hexagonal) → P<sub>2</sub>O<sub>5</sub>(orthorhombic) as reported by W. L. Hill, G. T. Faust, and S. B. Hendricks, J. Am. Chem. Soc. 65, 794 (1943).
3. A correction of +9.35 kcal. mole<sup>-1</sup> was made for the change in phosphorus reference state from white (α) → red (V). (The correction is +6.35 kcal./mole of Mg<sub>3</sub>P<sub>2</sub>O<sub>8</sub> or +4.173 kcal. mole<sup>-1</sup> of P.)

This revised ΔH<sub>f</sub><sup>o</sup> 298.15, -897.60 ± 2.0 kcal. mole<sup>-1</sup>, would appear to be more reliable than the original value reported by Stevens and Turkdogan (loc. cit.).

For the Reaction

the third law treatment of the equilibrium data of J. B. Bookley, J. Iron Steel Institute (London) 172, 66 (1952) and the JANAF Table free energy functions gave a ΔH<sub>f</sub><sup>o</sup> 298.15 = -893.11 kcal. mole<sup>-1</sup>.

The quantity, -895.10 ± 2.50 kcal. mole<sup>-1</sup>, is taken as the most probable value for the heat of formation of magnesium orthophosphate.

Heat Capacity and Entropy.

The entropy at 298.15 was estimated by considering the additive entropy constants of K. K. Kelley, private communication, June 1960, and E. L. Evans and O. Kubachewski, "Metallurgical Thermochemistry, 1958. The heat capacity was estimated in a similar manner by considering the heat capacities of the constituent elements and related compounds such as Mg, O<sub>2</sub>, MgO, P, P<sub>2</sub>O<sub>5</sub>, Cr<sub>2</sub>P<sub>2</sub>O<sub>7</sub>, and Ca<sub>3</sub>P<sub>2</sub>O<sub>8</sub>.

Melting Data.

The melting point, 1621°K, as reported by Stevens and Turkdogan (loc. cit.) was selected. There is disagreement on the melting point in the literature. From the work of H. Winter, Diss. Universitäts zu Leipzig 1913, K. K. Kelley, U. S. Bureau of Mines Bulletin 393, (1936) has quoted a melting point of 1457°K and has calculated a "rather uncertain value" of 11,300 kcal./mole for the heat of fusion. J. B. Bookley (loc. cit.) has found a melting point of 1703°K. J. Berež, Roczniki Chim. 32, 17 (1951) gives 1630°K as the melting point.

ΔH<sub>f</sub><sup>o</sup> 298.15 = [-877 ± 10] kcal. mole<sup>-1</sup>  
 ΔH<sub>m</sub><sup>o</sup> = [29 ± 10] kcal. mole<sup>-1</sup>  
 ΔH<sub>v</sub><sup>o</sup> = Unknown

S<sub>298.15</sub> = [54.8] cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 T<sub>m</sub> = 1621°K  
 T<sub>b</sub> = Unknown

Heat of Formation.  
 The ΔH<sub>f</sub><sup>o</sup> 298.15 was calculated from the estimated ΔH<sub>m</sub> and the ΔH<sub>f</sub><sup>o</sup> 298.15 of the crystal.

Heat Capacity and Entropy.  
 The heat capacity was estimated as 13/11 of the corresponding heat capacity of Ca<sub>2</sub>P<sub>2</sub>O<sub>7</sub> as given in K. K. Kelley, U. S. Bur. Mines Bull. 564 (1960).

Melting Data.  
 The heat of melting was estimated by taking 13/11 of the ΔH<sub>m</sub> of Ca<sub>2</sub>P<sub>2</sub>O<sub>7</sub> as given in K. K. Kelley (loc. cit.).

Mg<sub>3</sub>O<sub>8</sub>P<sub>2</sub>

Molybdenum (Mo)  
(Reference State)

GF<sub>W</sub> = 95.94

Heat of Formation.

Zero by definition.

Heat Capacity and Entropy.

Below 20°K several investigators 1,2,3,4,5,6 have determined the heat capacity, and an average of these determinations was used to obtain a Debye theta = 440 and an electronic gamma =  $4.7 \times 10^{-4}$  gibbs/mol-deg. From these the entropy at 20°K was calculated as 0.024 gibbs/mol and the enthalpy as 0.265 cal. Between 20°K and 271°K the data of Clausius and Franzosini<sup>7</sup> are the adopted heat capacities. The data of Simon and Zeldner<sup>5</sup> are as much as 2-5% high below 78°K and as much as 1% low above this.

Both the high temperature enthalpies and heat capacity have been measured by several investigators and there is generally good agreement in the 1000-2000°K range. A smooth curve was drawn through the high temperature enthalpy data of several investigators 7,8,9,10,11,12, which was also joined smoothly to the integrated low temperature data of Clausius and Franzosini. The heat capacity was obtained by fitting the smoothed enthalpy data with a polynomial and differentiating. The heat capacity obtained agreed satisfactorily with that reported in several investigations 15,14,15,16,17,18,19.

(LIQUID)

MOLYBDENUM (Mo)

$$\Delta H_f^{298.15} = [7.076] \text{ kcal/mol}$$

$$\Delta H_m^\circ = [6652 + 600] \text{ kcal/mol}$$

$$\Delta H_v^\circ = [140.812] \text{ kcal/mol}$$

$$S_{298.15}^\circ = [9.261] \text{ gibbs/mol}$$

$$T_m = 2892 \pm 10^\circ \text{K}$$

$$T_b = [4919^\circ \text{K}]$$

Heat of Formation.

The  $\Delta H_f^{298}$  was obtained from that of the crystal plus  $\Delta H_m^\circ$  and the difference between  $H_{2982} - H_{298}$  for crystal and liquid.

Heat Capacity and Entropy.

The heat capacity was estimated as 10 gibbs/mol in the real range in order to be comparable with the value in the crystal below the melting point. Below the melting point the heat capacity was assumed constant to a glass transition, assumed to be 2000°K, below which the heat capacity was that of the crystal. The entropy was obtained in a manner analogous to the heat of formation.

Melting Data.

The heat of melting was obtained from an entropy of melting of 2.3 eu, assumed by comparison with Fe, Cu, Mg and Al. The melting point was reported by E. Rudy and S. Windisch, Aerojet-General Corporation, Report No. AFML-TR-65-2, Part 1, Vol. III, July 1965. A. G. Worthing, Phys. Rev. 25, 846 (1925), reports a melting point of 2895°K which, corrected to the 1948 International Temperature Scale, is 2882°K.

Vaporization Data.

The boiling point and heat of vaporization were calculated from the adopted functions and heat of sublimation in order to maintain proper thermodynamic consistency.

Heat of Formation

The heat of formation is simply the heat of sublimation at 298°K; this is obtained by second and third law analysis of several vapor pressure sets. A comparison of the results is tabulated below.

| Reference      | Method     | Points | Range °K   | 2nd law<br>$\Delta H_{298}$ kcal/mol | 3rd law<br>Drift in 3rd law |
|----------------|------------|--------|------------|--------------------------------------|-----------------------------|
| 1. Vozella     | Langmuir   | 12     | 2140-2533* | 156.4 ± 2.9                          | 157.8 ± 0.9                 |
| 2. Edwards     | Langmuir   | 9      | 2150-2460* | 146.7 ± 1.5                          | 158.2 ± 1.2                 |
| 3. Fries       | Langmuir   | 12     | 2086-2489* | 156.5 ± 1.6                          | 156.7 ± 0.7                 |
| 4. Jones       | Langmuir   | 9*     | 2113-2496* | 161.6 ± 3.8                          | 156.0 ± 1.4                 |
| 5. Norris      | Langmuir   | Equn.  | 2000-2600* | 131.1                                | 148.6 ± 4.3                 |
| 6. Zwakker     | Langmuir   | Equn.  | 1200-2500* | 159.1                                | 158.2 ± 0.8                 |
| 7. Babeliewsky | Mass Spec. |        | 2220-2603* | 149.6 ± 2.2                          |                             |

\* One point rejected due to failure of statistical test

The data of references 1 and 3 show no drift and thus indicate that the accommodation coefficient is essentially unity. A median value of the 3rd law heat is adopted as 157.3 ± 0.5 kcal/mol.

Heat Capacity and Entropy

The electronic energy levels are those listed by C. E. Moore, U. S. Natl. Bur. Std. Circular 467, Washington D. C. (1958). Several individual lines missing from given terms were estimated by analogy with the observed lines in the term. In addition, an estimate of the values of completely missing terms, arising out of low lying multiplets, was made as follows: The  $^1D$  and  $^3S_1$   $^3D$  end  $^1G_4$  and  $^3P$  and  $^3P$  terms of the  $[Kr] 4d^5s^2$  multiplet were estimated at 25000, 30000, 34000 and 36000  $\text{cm}^{-1}$ . The triplet P,D,F and G levels and the singlet S,D,F and G levels of the  $[Kr] 4d^5$  configuration were estimated at 30000  $\text{cm}^{-1}$  and 40000  $\text{cm}^{-1}$  respectively.

Higher configurations such as  $[Kr] 4d^4s^2(6p) 5d$  which have many septuplet and quintuplet terms were thought to lie close to the ionization limit. However, upon calculating a table which contains an extra 100 levels at 35000  $\text{cm}^{-1}$  and 200 levels each at 40000 and 45000  $\text{cm}^{-1}$ , the difference in free energy function at 6000°K is a negligible 0.008 gibbs/mol.

Heat of Formation.

The heat of formation is obtained by adding the heat of ionization to the heat of formation of the gas at 0°K. The heat of ionization, 163.742 kcal/mol (7.10 eV), is obtained from C. E. Moore, Natl. Bur. Std. Circular 467, Vol. III, Washington, D. C. (1958).

Heat Capacity and Entropy.

The electronic energy levels are taken from C. E. Moore, loc. cit. The configuration [Kr] 4d<sup>5</sup>s<sup>2</sup> is completely missing in Mo<sup>+</sup>, while in the isoelectronic Nb(g) this is a very low lying configuration. However, a comparison of Cr<sup>+</sup> with Mo<sup>+</sup> and V(g) with Nb(g) indicates that the similarities are much closer down a given group than across a row to an isoelectronic neighbor. Thus, by analogy with Cr<sup>+</sup>, the missing configuration is expected to lie >50,000 cm<sup>-1</sup> and thus be negligible.

The enthalpy at 0°K is calculated to be -1.481 kcal/mol.

r<sub>e</sub> = [ 1.80 ] Å

σ = 1

Heat of Formation

The heat of formation, ΔHf°<sub>298</sub>(MoO,g) = 92.5 ± 15 kcal/mol, is derived from the heat of reaction, ΔHr°<sub>298</sub> = 32.9 kcal/mol for Mo(c) + O(g) + MoO(g) with all JANAF auxiliary data. The value of ΔHr°<sub>298</sub> is calculated by the third law method from the partial pressure data determined mass-spectrometrically in the temperature range from 2262 to 2466°K by G. DeMaría, et al. (1). The drift in the third law analysis is -14 ± 11 eu.

Heat Capacity and Entropy

The ground state configuration and the probable electronic levels are assumed to be similar to those for WO(g) (see JANAF WO(g) table of Sept. 30, 1966). T. M. Swaminathan and S. G. Krishnamurthy (2) observed ten band systems attributed to molybdenum oxide with lower state values of ω<sub>e</sub> = 950 ± 10 cm<sup>-1</sup>. T. V. Iorns and F. E. Stafford (3) also observed a band with a peak at 969 cm<sup>-1</sup> in the vapor above MoO<sub>3</sub>(c). It is surprising that the observed vibrational frequency of MoO(g) is lower than 1055 cm<sup>-1</sup> observed for WO(g). The latter comes not only from electronic spectra of the gas but also from infrared observation in matrix isolation; the former comes only from tentative assignments of electronic spectra presumably arising from MoO(g). It is possible that the observed states could be low lying excited states. We tentatively assume the fundamental vibrational frequency to be 955 cm<sup>-1</sup>. The bond distance is then calculated by Guggenheimer's relation (4) for multiple bond molecules from the estimated vibrational frequency. The anharmonicity correction X<sub>e</sub> is estimated from the relation X<sub>e</sub><sup>1/2</sup> = 0.014 given by R. F. Barrow and A. D. Caunt (5). The constant (0.014) is assumed to be the same as that for WO(g). The value of r<sub>e</sub> is calculated from the Morse potential function. The rotational constant B<sub>e</sub> is calculated from the estimated bond distance.

\*\*Third law value used in the calculation.  
 \*\*\*Auxiliary data for MoO<sub>2</sub>(c) are taken from corresponding measurements of the same authors. See JANAF MoO<sub>3</sub>(c) table for details.  
 Reaction: A. MoO<sub>2</sub>(c) + 1/2 O<sub>2</sub>(g) = MoO<sub>3</sub>(c).  
 B. 2Fe<sub>3</sub>O<sub>4</sub>(c) + Mo(c) = MoO<sub>2</sub>(c) + 2XFe(c).  
 C. 2NiO(c) + Mo(c) = MoO<sub>2</sub>(c) + 2Ni(c).  
 D. Mo(c) + 2CO<sub>2</sub>(g) = MoO<sub>2</sub>(c) + 2CO(g).  
 E. Mo(c) + 2H<sub>2</sub>O(g) = MoO<sub>2</sub>(c) + 2H<sub>2</sub>(g).  
 F. Mo(c) + O<sub>2</sub>(g) = MoO<sub>2</sub>(c) derived by the author from the cell reaction 2Fe<sub>3</sub>O<sub>4</sub>(c) + Mo(c) = MoO<sub>2</sub>(c) + 2XFe(c) using ΔG<sup>o</sup> data for Fe<sub>3</sub>O<sub>4</sub>(c).

**Heat Capacity and Entropy**  
 E. G. King, *J. Am. Chem. Soc.* **80**, 1799 (1958), measured the low temperature heat capacities from 53.3° to 296°K.  
 E. G. King, W. M. Weller and A. U. Christensen, U. S. Bur. Mines RI 5684, 1960, measured the high temperature enthalpy changes from 399° to 1801°K by drop calorimetry. The adopted heat capacities are derived from these two sets of data, subject to the constraint that there be a smooth joint at 298°K. Deviations of the enthalpy data from the adopted values are -1.3 to +0.7 percent, excluding the point at 1801°K. This point at the highest temperature deviates by +2.3 percent, which suggests that the apparent heat capacity is rising very rapidly. No explanation for this rapid rise is available. The entropy S<sub>298</sub><sup>o</sup> = 11.054 eu is obtained from the low temperature heat capacity data, based on S<sub>298</sub><sup>o</sup> = 0.31 eu.  
 B. M. Figgis and J. Lewis, *Progress in Inorg. Chem.*, Vol. 5, page 123, Interscience Publishers, New York, 1964, indicated that MoO<sub>2</sub> is probably antiferromagnetic. Its small susceptibility is presumably due to Mo-Mo interactions. It is possible that at temperatures below 50°K entropy due to spin interactions of the d<sup>2</sup> electrons will appear, contributing up to 2.2 eu. The drifts in the equilibrium data do suggest that additional entropy may be appropriate; however, only the EMF data of Rapp appear to be sufficiently precise to influence the decision. These data suggest addition of 0.8±0.1 eu and 0.9±0.1 eu based on auxiliary data for Wüstite and NiO(c), respectively. We select the entropy of 11.954 eu from equilibrium data for NiO.

Molybdenum Dioxide (MoO<sub>2</sub>)

(Ideal Gas) GFW = 127.9388

MOLYBDENUM DIOXIDE (MoO<sub>2</sub>)

(IDEAL GAS)

GFW = 127.9388

Point Group [C<sub>2v</sub>]

June 30, 1968

Heat of Formation

Burns et al. (1) have investigated mass-spectrometrically the vapor in equilibrium with powdered MoO<sub>2</sub>(s) and also reported the partial pressures of MoO<sub>2</sub>(g), MoO(g), (MoO<sub>2</sub>)<sub>2</sub>(g), and (MoO<sub>2</sub>)<sub>3</sub>(g). Second and third analyses of their partial pressure data are given in the table below. The adopted value, ΔH<sub>f</sub><sup>298</sup>(MoO<sub>2</sub>, g) = -3.1 kcal/mol, is calculated from their 3rd law value of ΔH<sub>f</sub><sup>298</sup> = 137.4 kcal/mol for MoO<sub>2</sub>(s) + MoO<sub>2</sub>(g), using all JANAF functions.

DeMaría et al. (2) have measured the partial pressures of gaseous oxides MoO, MoO<sub>2</sub>, MoO<sub>3</sub> and O(g) in the Mo-Al<sub>2</sub>O<sub>3</sub> system by mass spectrometry. Blackburn et al. (3) and Plante (4) have studied the vapor pressures above molybdenum dioxide(s) by the Knudsen effusion method. Second and third law analyses of these three sets of partial pressure data are reported in the following table.

| Investigator        | Reaction                                    | Temp. °K  | No. of Points | ΔH <sup>0</sup> <sub>f</sub> <sup>298</sup> , kcal/mol |         | Drift, eu  |

Heat Capacity and Entropy

The MoO<sub>2</sub>(g) is assumed to have a C<sub>2v</sub> symmetry similar to that of TaO<sub>2</sub> reported by Weltner and McLeod (5). The bond angle O-Mo-O is estimated to be 110°. The bond distance Mo-O is estimated to be 1.80 Å, the same as that in MoO(g). The symmetric and asymmetric stretching frequencies were obtained from the infrared spectra of gaseous MoO<sub>2</sub>Cl<sub>2</sub> and MoO<sub>2</sub>Br<sub>2</sub>, reported by Iorns and Stafford (6). The bending vibrational frequency (300 cm<sup>-1</sup>) is estimated by comparison with other transition metal dioxides.

The three principal moments of inertia are: I<sub>A</sub> = 4.2470 × 10<sup>-39</sup>, I<sub>B</sub> = 11.5512 × 10<sup>-39</sup> and I<sub>C</sub> = 15.7982 × 10<sup>-39</sup> g cm<sup>2</sup>. The electronic level and quantum weights are estimated from the data reported by Weltner and McLeod (7) on MoO<sub>2</sub>. The ground state is assumed to be <sup>3</sup>A<sub>1</sub> and the first excited level is assumed to lie close to the observed transitions at 7890 Å and 7806 Å in Mo<sub>2</sub>. Since both these states are presumed to be triplet, we have assigned a total degeneracy of 6. In addition, we expect from the at 25000 cm<sup>-1</sup>.

ΔH<sub>f</sub><sup>o</sup> = -176.9 ± 0.1 kcal/molΔH<sub>f</sub><sup>o</sup> = -176.1 ± 0.1 kcal/molΔH<sub>m</sub><sup>o</sup> = 11.60 kcal/molS<sub>298</sub><sup>o</sup> = 18.585 ± 0.15 gibbs/molT<sub>m</sub> = 1074°KHeat of Formation

The adopted heat of formation, -176.1 kcal/mol, is the weighted average of two recent calorimetric determinations. The results are given below.

Staekiewicz et al. (2) found that oxidation was only about 80 per cent complete and tentatively attributed this to formation of MoO<sub>3</sub>(c). The table for MoO<sub>3</sub>(c) details the analytical methods applied to the combustion products and the heat of combustion of the dioxide which is necessary for reduction of the trioxide. Combination of these investigations gives ΔH<sub>f</sub><sup>o</sup>(MoO<sub>3</sub>, c) = -177.98 kcal/mol. Subsequent discovery of oxides intermediate between MoO<sub>2</sub> and MoO<sub>3</sub> raises a possible uncertainty concerning the incomplete oxidation. Mah (1) also reported that completion of the combustion of Mo(c) samples ranged from 84 to 93 per cent, as determined only by weight gain of the total combustion products upon prolonged low temperature ignition. In contrast, the earlier workers reported almost complete combustion. Neumann et al. (3) found about 97 per cent completion using a wet analysis involving aqua regia. Moose and Parr (4) found that in several combustions, they obtained over 99 per cent completion, based on the weight of the oxide formed.

| Investigator          | Year | Method       | Reaction   | ΔH <sub>f</sub> <sup>o</sup> (kcal/mol) |
|-----------------------|------|--------------|--|---|
| 1. Mah                | 1957 | Calorimetric | Mo(c) + 3/2O <sub>2</sub> (g) + MoO <sub>3</sub> (c) | -178.16                                 |

Heat Capacity and Entropy

Smith et al. (5) measured low temperature heat capacities from 18.3 to 299.8°K. King et al. (6) measured high temperature enthalpy data from 399.3° to 1063.9°K by drop calorimetry. The adopted heat capacities are derived from these two sets of data, subject to the constraint that there be a smooth joint at 298°K. Deviations of the enthalpy data from the adopted values are -0.65 percent to +0.17 percent. Seitz et al. (7) have also measured low temperature heat capacities from 70° to 288.7°K which are not in agreement with the values adopted. (The discrepancy has been discussed by Smith.) Cosgrove and Snyder (8) have also measured high temperature enthalpy data from 273° to 1068°K by drop calorimetry. Their smooth values are about 2 percent higher than the values adopted in the tabulation.

The entropy, S<sub>298</sub><sup>o</sup> = 18.585 eu, is obtained from the low temperature heat capacity data of Smith (5), based on S<sub>0</sub><sup>o</sup> = 0.197 eu. This starting entropy was obtained by the authors from a T<sup>o</sup> extrapolation of the data. It is surprising that the entropy of MoO<sub>3</sub>(c) is larger than that of WO<sub>3</sub>(c) by about 0.4 eu. This may be due to the difference in the crystal structures, MoO<sub>3</sub> being orthorhombic and WO<sub>3</sub> monoclinic, and also to uncertainty in the entropy extrapolation below 60°K for WO<sub>3</sub>(c).

Melting Data

The adopted melting point is obtained from King (6), and the heat of melting is calculated from the adopted enthalpies of the crystal and liquid based on the enthalpy data of King. Cosgrove and Snyder (8) found the melting point 1068°K by the cooling curve method, and derived ΔH<sub>m</sub><sup>o</sup> = 12.54 kcal/mol from their smooth enthalpy values at the melting point.

Bond Distance: Mo-O = [1.80] Å

Bond Angle: O-Mo-O = [120°]

Product of the Moments of Inertia:  $I_A I_B I_C = [4.304 \times 10^{-114}] \text{ g}^3 \text{ cm}^6$ 

## Heat of Formation

Burns et al. (1) have determined the partial pressures of gaseous oxides MoO<sub>2</sub>, MoO<sub>3</sub>, (MoO<sub>3</sub>)<sub>2</sub> and (MoO<sub>3</sub>)<sub>3</sub> in equilibrium with powdered MoO<sub>3</sub>(c) by mass spectrometry. Plante (2) and Blackburn et al. (3) have also investigated the vapor pressures above molybdenum dioxide (c) by the Knudsen effusion method. They all involve the disproportionation

Nitrogen, Monatomic (N)  
(Ideal Gas) At. Wt. = 14.008

Heat of Formation

The dissociation energy of N<sub>2</sub> has been the subject of considerable controversy and is presented by A. G. Gaydon, "Dissociation Energies", Chapman and Hall, London, 1953. L. Brewer and A. W. Searcy, Ann. Rev. Phys. Chem., 7, 259 (1956), discuss extensive and varied experiments which have now fixed the value of 9.76 e.v. as being highly probable. Additional support for this value is afforded by the recently observed predissociation in the x  $\Sigma_g^+$  state by A. Loftus, Nature 168, 302 (1960).

Heat Capacities and Entropies

The electronic levels noted above are listed by C. E. Moore, Nat. Bur. Standards (U.S.) Circ. 467, Vol. I (1949), Vol. III (1968).

$$B_e = 1.7042 \text{ cm.}^{-1}$$

## Heat of Formation.

O. Herzberg, Molecular Spectra and Molecular Structure, I. Spectra of Diatomic Molecules, D. van Nostrand Co., Inc., New York, 1950, lists two  $D_0(\text{NO})$  values, 5.236 and 6.487 e.v. A. O. Onydon, Dissociation Energies and Spectra of Diatomic Molecules, Chapman and Hall, Ltd., London, 1953, lists  $D_0(\text{NO}) = 6.49 \pm 0.05$  e.v. A Birge-Sponer extrapolation of the vibrational levels, up to  $v = 19$ , of the ground state leads to a  $D_0$  of about 6.5 e.v. Onydon's, loc. cit., analysis on the predissociation of NO also leads to the higher value for  $D_0(\text{NO})$ .

Y. Tanaka, J. Chem. Phys. 22, 2045 (1954), has observed and analyzed the emission bands of NO in the vacuum ultraviolet region. Tanaka's, loc. cit., observation and interpretation of the abrupt cutoff (predissociation) of certain  $v'$  values in the  $\beta$ ,  $\delta$ , and  $\delta'$  bands and of the complete non appearance of  $\epsilon$  and  $\beta'$  bands strongly favors a  $D_0(\text{NO}) = 6.48$  e.v.  $\Delta H_f^\circ 298.15(\text{NO})$  was calculated on this basis to be  $22.033 \pm 1$  kcal. mole $^{-1}$ .

More recently M. A. Frisch, Diss. Abstr. 23, 1940 (1961), Thesis, University of Wisconsin, Madison, Wisconsin, 1962, has calorimetrically determined the heat of reaction for

at  $298.15^\circ\text{K}$ , from which the author derives a  $\Delta H_f^\circ 298.15 \text{ NO}(g) = 21.58 \pm 0.04$  kcal. mole $^{-1}$ . The auxiliary values used by Frisch to calculate the heat of formation of nitric oxide were based upon the 1961 atomic weight scale. Recalculating  $\Delta H_f^\circ 298.15 \text{ NO}(g)$  using auxiliary functions based on the 1966 atomic weight scale had a negligible effect on the final result.

The calorimetrically determined heat of formation for nitric oxide,  $21.58 \pm 0.04$  kcal. mole $^{-1}$ , was selected as the best value.

## Heat Capacity and Entropy.

The spectroscopic constants were taken from R. H. Gillette and E. H. Eyster, Phys. Revs. 56, 1113 (1939), who measured and analyzed the fundamental rotation-vibration band of nitric oxide using a grating spectrometer. The constants used in this calculation were adjusted to correspond to the naturally occurring isotopic mixture.

June 30, 1966

NITRIC OXIDE UNIPosITIVE ION (NO<sup>+</sup>)      (IDEAL GAS)      GFW = 30.00555

Ground State  $1\Sigma^+$   
 $S^{\circ}_{298.15} = 47.35 \text{ gibbs/mol}$   
 $\Delta H^\circ_{f,298.15} = 235.18 \pm 0.2 \text{ kcal/mol}$   
 $\Delta H^\circ_{f,298.15} = 236.66 \pm 0.2 \text{ kcal/mol}$

Electronic Levels and Quantum Weights  
 $\frac{\epsilon_1}{\epsilon_2}, \text{ cm}^{-1} \frac{\epsilon_1}{\epsilon_2}$   
 $0 \quad 1$   
 $\omega_e X_e = 16.35 \text{ cm}^{-1}$   
 $\sigma = 1$   
 $\alpha'_e = 0.0202 \text{ cm}^{-1}$   
 $r_e = 1.0619 \text{ \AA}$

Heat of Formation.

K. Watanabe, J. Chem. Phys. **22**, 1564 (1954), and W. C. Walker and O. L. Weisler, J. Chem. Phys. **23**, 1962 (1955), have measured the ionization potential of NO(g) by photoionization, yielding I.P. =  $9.25 \pm 0.02$  and  $9.20 \pm 0.03$  eV, respectively. H. D. Hagstrum, J. Chem. Phys. **23**, 1178 (1955), reported I.P. =  $9.4 \pm 0.2$  eV by electron impact. K. P. Huber, Helv. Phys. Acta **34**, 929 (1961), determined spectroscopically the ionization potential for NO(g), I.P. =  $9.267 \pm 0.005$  eV ( $213.72 \pm 0.1$  kcal/mol). The last value has been selected, and yields the heat of formation of NO<sup>+</sup>(g),  $\Delta H^\circ_{f,298.15}(\text{NO}^+, \text{g}) = 235.18 \text{ kcal/mol}$ , using  $\Delta H^\circ_{f,298.15}(\text{NO}, \text{g}) = 21.46 \pm 0.04$  kcal/mol.

Heat Capacity and Entropy.

The selected molecular constants were obtained from the ultraviolet spectra by E. Miescher, Can. J. Phys. **33**, 355 (1955), Helv. Phys. Acta **28**, 135 (1956).

The tabulated thermodynamic functions are in reasonable agreement with those calculated by J. Hilsenrath and Carla G. Measins, NBS Report 8504, July 1, 1964, who have used slightly different molecular constants.

Bond Distance: N-O = 1.197 Å

Bond Angle: O-N-O = 134° 15'

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 15.3993 X 10<sup>-117</sup> g.<sup>3</sup> cm.<sup>6</sup>

σ = 2

Heat of Formation.

The equilibrium constants for NO(g) + 1/2 O<sub>2</sub> → NO<sub>2</sub>(g) of Bodenstein and Lindner, Zeits. fur physik. Chem. 100, 82 (1922) as given by W. F. Glauque and J. D. Kemp, J. Chem. Phys. 5, 40 (1938) were subjected to 2nd and 3rd law analysis. Third law analysis gave ΔH<sub>298</sub> = -13.67 kcal. and 2nd law ΔH<sub>298</sub> = -13.52 ± 0.01 kcal. The third law value had a very slight trend with temperature which was consistent with an entropy error of 0.25 cal. deg.<sup>-1</sup> mole<sup>-1</sup>, the second law entropy was also consistent with an entropy error of 0.25 cal. deg.<sup>-1</sup> mole<sup>-1</sup>. However the functions for all three gases are well established to about 0.03 cal. deg.<sup>-1</sup> mole<sup>-1</sup> or better and so this must be interpreted as due to errors in the data. On this basis the 3rd law value of the heat was chosen and combined with JANAF auxiliary data to give ΔH<sub>f</sub> 298 = 7.91 ± 0.2 kcal. mole<sup>-1</sup>, where the uncertainty includes that due to the possible error in the equilibrium constants.

Heat Capacity and Entropy.

O. R. Bird, J. C. Baird, A. W. Jache, J. A. Hodgson, R. F. Curl Jr., A. C. Kunkle, J. W. Evansford, J. Rastrop-Anderesen and J. Rosenblat, J. Chem. Phys. 40, 3378 (1964) have given a complete review of the microwave spectrum of NO<sub>2</sub>. They also give a corrected infra-red vibrational assignment, adopted here, which is in excellent agreement with calculations from the microwave data. They report I<sub>A</sub> = 0.34981 X 10<sup>-39</sup> g. cm.<sup>2</sup> and I<sub>B</sub> = 6.45446 X 10<sup>-39</sup> g. cm.<sup>2</sup> and I<sub>C</sub> = 6.81994 X 10<sup>-39</sup> g. cm.<sup>2</sup>. The bond length and angle were chosen to give the best fit of the moments of inertia.

$\sigma = 2$

Bond Distances: N-O =  $[1.23]$  Å  
 Bond Angle: O-N-O =  $[116]^\circ$

Product of the Moments of Inertia:  $I_A I_B I_C = [25.6905] \times 10^{-117}$  g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation

The heat of formation of NO<sub>2</sub><sup>-</sup>(g) was calculated from the electron affinity of NO<sub>2</sub>(g) and the JANAF value of ΔH<sub>f</sub><sup>0</sup> for NO<sub>2</sub>(g), 4.0 ± 0.5 ev and 8.6 ± 0.2 kcal. mole<sup>-1</sup>, respectively. The former was obtained from the National Bureau of Standards Report 8628, "Preliminary Report on the Thermodynamic Properties of Selected Light Element and Some Related Compounds", January 1965.

Heat Capacity and Entropy

The bond distance N-O and the angle O-N-O of NO<sub>2</sub><sup>-</sup>(g) were estimated to be the same as those in NaNO<sub>2</sub>(c) which have been determined by G. B. Carpenter, Acta Cryst. 5, 132(1952). The three individual moments of inertia are  $I_A = [0.6872] \times 10^{-39}$  g.<sup>2</sup> cm.<sup>2</sup>,  $I_B = [5.7804] \times 10^{-39}$  g.<sup>2</sup> cm.<sup>2</sup> and  $I_C = [6.4676] \times 10^{-39}$  g.<sup>2</sup> cm.<sup>2</sup>

The vibrational frequencies of NO<sub>2</sub><sup>-</sup>(g) were assumed to be the same as those for nitrite ion in solution which have been measured by D. Williams, J. Am. Chem. Soc. 51, 298(1929). These measured frequencies in nitrite solution are comparable to those in NO<sub>2</sub>(g) (1357.8, 756.8 and 1665.5 cm.<sup>-1</sup>), reported by G. R. Bird et al., J. Chem. Phys. 40, 3378 (1964).

Heat of Formation.  
 The heat of formation is based on equilibrium constants for the reaction  $\text{N}_2\text{O}_5(\text{g}) \rightarrow \text{NO}_2(\text{g}) + \text{NO}_3(\text{g})$  obtained from shock wave studies by Schott and Davidson, J. Am. Chem. Soc. 80, 1941 (1958). These equilibria give a second law value of  $\Delta H_f^{\circ} 495 = 21.5 \pm 1.4 \text{ kcal.}$ , corresponding to  $\Delta H_f^{\circ} 298.15 = 22.2 \text{ kcal.}$ , and a third law value of  $\Delta H_f^{\circ} 298.15 = 22.2 \text{ kcal.}$  The resulting heat of formation is 17.0 kcal. mole<sup>-1</sup>.

Quillory and Johnston, J. Am. Chem. Soc. 85, 1695 (1963) report an equilibrium constant based on estimated Beer's law constants for NO<sub>3</sub> and attributed to the reaction  $\text{O}_2 + \text{NO} \rightarrow \text{NO}_3$ . This gives a third law heat of formation of  $12 \pm 2 \text{ kcal. mole}^{-1}$ , which was not considered. A tentative value of 23 kcal. mole<sup>-1</sup> (or greater) may be derived from the D<sub>0</sub> given by D. A. Ramsay, Proc. 10th Colloq. Spect. Intern. (1962), Univ. Maryland, pp. 583-596, 1963.

Heat Capacity and Entropy.  
 The structure and frequencies are those estimated by I. C. Haastaeme, J. Phys. Chem. 65, 2249 (1961). A symmetry of D<sub>3h</sub> was chosen on the basis of Walsh's correlation, J. Chem. Soc. 1953, 2301 (1953) and the bond distance was taken as 2% longer than in the nitrate ion. The planar mode frequencies were calculated from estimated Urey-Bradley force constants, while the out-of-plane wagging frequency (765 cm<sup>-1</sup>) was assumed the same as in HNO<sub>3</sub>(g).

There are several conflicting bits of information concerning NO<sub>3</sub> radicals. Chantry, Horaefteld, Horton and Whiffen, Mol. Phys. 5, 589 (1962) studied the electron resonance and optical absorption spectra of what appear to be NO<sub>3</sub> radicals trapped in crystals of urea nitrate. The authors suggest a planar structure without a threefold axis (thus C<sub>2v</sub> symmetry), at least for the trapped radicals. Quillory and Johnston, loc. cit., report for gaseous NO<sub>3</sub> radicals an infrared frequency at 1640 cm<sup>-1</sup> which they assign as the N-O stretch. The similarity of this frequency to those in N-O and X-N-O molecules led the authors to suggest an OONO structure (thus C<sub>2v</sub> symmetry) rather than the nitrate structure. The remaining frequencies for such a structure may be crudely estimated by analogy with those measured for (NO<sub>2</sub>) by Smith, Keller and Johnston, J. Chem. Phys. 19, 189 (1951). Based on such frequencies and reasonable bond distances, the room temperature entropy for the OONO structure would be 68-72 cal. deg<sup>-1</sup> mole<sup>-1</sup>. Such an entropy is quite inconsistent with the second law  $\Delta S_f^{\circ} 495 = 33.2 \pm 3 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$  for  $\text{N}_2\text{O}_5(\text{g}) \rightarrow \text{NO}_2(\text{g}) + \text{NO}_3(\text{g})$  obtained from the shock wave studies of Schott and Davidson. The Haastaeme functions based on the nitrate structure were selected because they are consistent with the experimental entropy. The principal moments of inertia for this structure are  $I_A = 6.427 \times 10^{-39}$ ,  $I_B = 6.427 \times 10^{-39}$  and  $I_C = 12.853 \times 10^{-39} \text{ g. cm.}^2$ . A structure of C<sub>2v</sub> symmetry would result if the nitrate structure were distorted to give one non-equivalent oxygen. Ramsay, loc. cit., suggests that such distortion can only be small, based on the high dispersion optical spectra of the gas phase.

$$\alpha_e = 0.00557 \text{ cm.}^{-1}$$

$$\tau_e = 1.4910 \text{ \AA}$$

$$\sigma = 1$$

Heat of Formation.

The selected  $\Delta H_f^o$  298.15 was calculated from the  $D_0^o = 165.8 \pm 1.2$  kcal. mole<sup>-1</sup> reported by R. L. Potter and V. N. DiStefano, *J. Phys. Chem.*, **65**, 849 (1961).  $A D_0^o = 163.7 \pm 1.2$  kcal. mole<sup>-1</sup> was experimentally determined by E. O. Huffman, G. Tarbuton, K. L. Elmore, W. E. Cate, H. K. Walters, Jr., and G. V. Elmore, *J. Am. Chem. Soc.*, **76**, 6239 (1954). The  $D_0^o$  reported by Huffman et. al is derived using a pressure-composition method i.e. measurement of equilibrium vapor pressure at 1173°K for the reaction  $PN(g) \rightarrow P_2(g) + N_2(g)$ . Potter and DiStefano (loc. cit.) recalculated Huffman's results to obtain their  $D_0^o$  value. A. G. Gaydon, "Dissociation Energies and Spectra of Diatomic Molecules", Chapman and Hall (1953), lists a  $D_0^o = 138.4 \pm 1.9$  kcal. mole<sup>-1</sup>. The corresponding heats of formation are:

| $\Delta H_f^o$ 298.15               | Source                           |
|-------------------------------------|----------------------------------|
| 25.0 ± 1.2 kcal. mole <sup>-1</sup> | Potter and DiStefano (loc. cit.) |
| 53 ± 1.9 kcal. mole <sup>-1</sup>   | Gaydon (loc. cit.).              |

Heat Capacity and Entropy.

The molecular constants are taken from G. Herzburg, "Diatomic Molecules," D. Van Nostrand Co., New York, N. Y., (1960) 2nd Ed.

 $\chi_0 = [0.7762] \text{ cm.}^{-1}$   $\chi_0 = 1.495(7) \text{ \AA}$   
 $\chi_0 = [0.0064] \text{ cm.}^{-1}$

Heat of Formation

The dissociation energy is listed by A. O. Daydon, "Dissociation Energies and Spectra of Diatomic Molecules", 2nd Edn., Chapman and Hall, London (1965).

Heat Capacity and Entropy

The spectroscopic constants other than  $B_0$  and  $\chi_0$  are from O. Herzberg "Spectra of Diatomic Molecules", 2nd Edn., D. Van Nostrand Company, New York (1950).  $r_0$  is from "Tables of Interatomic Distances and Configuration in Molecules and Ions", The Chemical Society, London (1958), and has been used, together with the equation to calculate  $B_0$  and  $\chi_0$ .

| T, °K | $C_p^\circ$ | $S^\circ - (F^\circ - H^\circ_{300})/T$ | $H^\circ - H^\circ_{300}$ | $\Delta H_f^\circ$ | $\Delta F_f^\circ$ | Log K <sub>p</sub> |

Heat of Formation

A linear Birge-Spencer extrapolation of the ground state gives a dissociation energy of 142.9 kcal. The ground state can correlate with normal atoms Si(<sup>3</sup>P) + N(<sup>2</sup>D) or with Si(<sup>1</sup>P) + N(<sup>2</sup>D); in this latter case D<sub>0</sub> would be 88 kcal. The uncertainty in the extrapolation is quite large, ± 30 kcal, since only 6 levels, of the estimated total of 87 levels, are observed.

A dissociation energy can also be calculated from the B<sup>2</sup>Σ<sup>+</sup> state by a much shorter extrapolation. This extrapolation is done graphically since some curvature is evident in the first six levels. A value of D<sub>0</sub>(B<sup>2</sup>Σ<sup>+</sup>) = 50.4 kcal is obtained. This corresponds to D<sub>0</sub>(X<sup>2</sup>Σ) = 119.9 kcal for normal products or D<sub>0</sub>(X<sup>2</sup>Σ) = 85 kcal for excited nitrogen as a product. The uncertainty in this extrapolation is less than the ground state and is probably ± 20 kcal.

An estimate of D<sub>0</sub>(SiN) may be obtained by equating D<sub>0</sub>(SiN)/D<sub>0</sub>(SiO) = D<sub>0</sub>(CN)/D<sub>0</sub>(CO); this yields D<sub>0</sub>(SiN) = 135 kcal. A comparison of the isoelectronic molecules CP, BS and BeCl and the related molecules CN, BO, BeF indicates D<sub>0</sub>(SiN) > 115 kcal.

A value of D<sub>0</sub>(SiN) = 130 ± 15 kcal/mol is in agreement within the uncertainties of both ground state and B state extrapolations assuming normal atoms as products, and is in agreement with the other estimates. This value is adopted and yields ΔH<sub>f</sub><sup>o</sup> = 89 kcal/mol.

Heat Capacity and Entropy

The B-X transition has been reported by F. A. Jenkins and H. de Laet, Proc. Roy. Soc. (London) 122, 103 (1929). The rotational and vibrational constants are derived from their work and adjusted to normal isotopic abundance. The A<sup>2</sup>Π - G<sup>2</sup>Π transition has been observed by M. D. Shelton, Ph.D. Thesis, Univ. of California, Berkeley (1965). The height of the A state is estimated by correlation with CF(g). The level of the B state is taken from G. Herzberg, "Spectra of Diatomic Molecules," D. Van Nostrand Co., Inc., 2nd Edition, New York, 1950.

Heat of Formation.

K. P. Zmbov and J. L. Margrave, Rice University, private communication, March 1967, have identified Si<sub>2</sub>N(g) in a mass spectrometer. They also determined partial pressures of Si<sub>2</sub>N(g) in equilibrium with Si(g) and N<sub>2</sub>(g). From four of these measurements, in the temperature range 1742° - 1846°K, we obtain a second law ΔH<sub>f</sub><sup>0</sup><sub>298</sub> = 99.6 ± 6 kcal/mol for the reaction Si<sub>2</sub>N(g) = 2 Si(g) + 0.5 N<sub>2</sub>(g) and a third law ΔH<sub>f</sub><sup>0</sup><sub>298</sub> = 120.2 kcal/mol with a drift of -11.4 ± 3.4 eu. Considering the small temperature range and the uncertainties in the free energy functions, the data appear consistent. We adopt the 3rd law heat of reaction which yields ΔH<sub>f</sub><sup>0</sup><sub>298</sub>(Si<sub>2</sub>N(g)) = 95 kcal/mol.

Heat Capacity and Entropy.

Si<sub>2</sub>N(g) is considered to be closely related to C<sub>2</sub>N(g), and its structure and electronic configuration are adopted by analogy to this species. The bond length was obtained by adding the difference between the bond distances of SiN(g) and CN(g) to the bond length in CNC(g). The vibrational frequencies were estimated by comparison with several molecules, CNC(g); 1/3[ν(C-N) + ν(C-N)(g)] and SiC(g). It should be noted that there is a wide variation in observed frequencies for these molecules and ω<sub>1</sub> and ω<sub>3</sub> may be significantly different from the chosen values.

The electronic ground state is considered to be <sup>1</sup>Σ<sub>g</sub><sup>+</sup> with excited states of <sup>2</sup>Δ<sub>g</sub> and <sup>2</sup>Σ<sub>g</sub><sup>-</sup> as in the case of CNC(g). The levels are obtained from those in CNC(g) by use of the shift between C<sub>3</sub>(g) and SiCSi(g).

$S_{298.15}^{\circ} = 7.23 \pm 0.05$  gibbs/mol  
 $T_m = 3220 \pm 50^{\circ}K$

## Heat of Formation

Humphrey (1) and Neumann et al. (2) determined the heat of combustion of titanium nitride by burning the material in an oxygen bomb calorimeter. For reaction (a) Humphrey obtained  $\Delta H_{298}^{\circ} = -145.05 \pm 0.14$  kcal/mol and Neumann et al.  $\Delta H_{298}^{\circ} = -145.0$  kcal/mol. From an examination of the combustion products Humphrey reported that the  $TiO_2$  was >95 per cent rutile and <5 per cent anatase, but made no correction for the anatase. The adopted  $\Delta H_{298}^{\circ} = -80.7$  kcal/mol is the average of three values, two from Humphrey (-80.75, -80.61), one as reported, and one corrected for anatase, and one from Neumann et al. (-80.8). The uncertainty in the adopted heat is due mainly to the uncertainty in the heat of formation of rutile. Hoch et al. (3) determined the vapor pressure of reaction (b), in the temperature range 1987-2241°K, using a Knudsen effusion method. Third law analysis of the data yields a  $\Delta H_{298}^{\circ} = -79.5 \pm 9$  kcal/mol. Linevsky (4) obtained the titanium partial pressures of reaction (c) (2088-2141°K) at fixed nitrogen pressures using atomic absorption spectroscopy. Third law analysis of the data gives a  $\Delta H_{298}^{\circ} = -81 \pm 10$  kcal/mol. These equilibrium measurements were not considered in deriving the heat of formation due to their large uncertainties in comparison to the calorimetric data.

## Heat Capacity and Entropy

Low temperature heat capacities are from the data (52-296°K) of Shomate (5). Naylor (6) measured high temperature heat contents (388-1738°K). High temperature heat capacities are derived from the enthalpies by a fitting technique which constrains the curve to join smoothly with the low temperature values. Above 1738°K the heat capacity is graphically extrapolated. The entropy is based on  $S_{298}^{\circ} - S_0^{\circ} = 0.138$  eu.

## Melting Data

See liquid table.

(Liquid) GFW = 61.9067

TITANIUM NITRIDE (TiN) (LIQUID) GFW = 61.9067

 $S_{298.15}^{\circ} = [12.603] \text{ gibbs/mol}$  $\Delta H_f^{\circ}_{298.15} = [-63.531 \pm 1.1] \text{ kcal/mol}$  $\Delta H_m^{\circ} = [16] \text{ kcal/mol}$  $T_m = 3220 \pm 50^{\circ}\text{K}$ Heat of FormationThe heat of formation is obtained from  $\Delta H_f^{\circ}(c)$  by adding  $\Delta H_m^{\circ}$  and the difference between  $H_m^{\circ} = H_{298}^{\circ}$  for crystal and liquid.Heat Capacity and Entropy

A glass transition is assumed at 2200°K. Below 2200°K the heat capacity is obtained from the heat capacity of the crystal. Above 2200°K it is assumed constant and estimated as 15 gibbs/mol or 7.5 gibbs/g-atom. The entropy is obtained in a manner analogous to that of the heat of formation.

Melting Data $T_m$  is taken from C. Agte and K. Moers, Z. Anorg. Allgem. Chem. 198, 233-43 (1931).  $\Delta H_m^{\circ}$  is derived from an estimated  $\Delta S_m = 2.5 \text{ gibbs/g-atom}$  as suggested by O. Kubaschewski, E. L. Evans and C. B. Alcock, "Metallurgical Thermochemistry," Pergamon Press, New York, 1967.

MONOZIRCONIUM MONONITRIDE (ZrN) (Crystal)

Mol. Wt. = 105.228  
 $\Delta H_f^o = -86.5 \pm 2$  kcal. mole<sup>-1</sup>  
 $\Delta H_f^o$  298.15 =  $-87.3 \pm 2$  kcal. mole<sup>-1</sup>  
 $T_m = [3225^\circ K]$   
 $S_{298.15}^o = 9.29 \pm 0.05$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 $\Delta H_m^o = [16.1]$  kcal. mole<sup>-1</sup>

**Heat of Formation.** The heat of reaction I,  $-174.25 \pm 0.30$  kcal. mole<sup>-1</sup>, was measured by A. D. Mah and N. L. Gelbert. The  $\Delta H_f^o$  298.15 of ZrN was obtained using  $-261.5 \pm 0.2$  kcal. mole<sup>-1</sup> for  $\Delta H_f^o$  298.15 of ZrO<sub>2</sub>. For the same reaction B. Neumann, C. Kroger and H. Kunz, Z. anorg. Chem. 218, 379 (1934) obtain  $-176.0$  kcal. mole<sup>-1</sup> on a sample of unspecified purity. Vapor pressure measurements of M. Hoch, D. P. Dingley and H. L. Johnston, J. Am. Chem. Soc. 77, 304 (1955) lead to  $-81$  kcal. mole<sup>-1</sup> for the  $\Delta H_f^o$  298.15 of ZrN. However, this value is uncertain by 10% as evidenced by the work on ZrO<sub>2</sub> by W. A. Chupka, J. Berkowitz and M. G. Inghram, J. Chem. Phys. 25, 1207 (1957).

(I)  $ZrN(c) + O_2(g) = ZrO_2(c) + 1/2 N_2(g)$   
**Heat Capacity and Entropy.** Low temperature measurements, 53-297°K, of S. S. Todd, J. Am. Chem. Soc. 72, 2914 (1950), were smoothly joined to those of J. P. Coughlin and E. G. King, J. Am. Chem. Soc. 72, 2262 (1950), 298-1073°K.

**Melting.** Estimated by C. B. Henderson and R. S. Scheffer, Atlantic Research Corp., Alexandria, Va., "Survey of Thermochemical Data", January, 1960.

Monozirconium Mononitride (ZrN)

MONOZIRCONIUM MONONITRIDE (ZrN) (Liquid)

Mol. Wt. = 105.228  
 $\Delta H_f^\circ 298.15 = [-59.5] \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $T_m = [3225]^\circ\text{K}$   
 $\Delta H_m^\circ = [16.1] \text{ kcal. mole}^{-1}$

Heat of Formation. Calculated from the solid.

Entropy. Calculated from the solid.

Heat Capacity. The heat capacity function of the solid was assumed to approximate those of the liquid up to the estimated glass point of 2150°K. Above the glass point the heat capacity was estimated.

Monozirconium Mononitride (ZrN)  
(Ideal Gas) Mol. Wt. = 105.228

MOL. WT. = 105.228
