Bond Lengths and Angles C-H = 1.12 ± 0.01 Å C-O = 1.21 ± 0.01 Å ∠H-C-H = 118 ± 2°

Moments of Inertia I<sub>A</sub> = 2.975 X 10<sup>-40</sup> g. cm.<sup>2</sup> I<sub>B</sub> = 2.161 X 10<sup>-39</sup> g. cm.<sup>2</sup> I<sub>C</sub> = 2.468 X 10<sup>-39</sup> g. cm.<sup>2</sup>

σ = 2

Heats of Formation

M. Delepine and M. Badoche, Compt. rend. 211, 777 (1942), measured the heat of combustion of a formaldehyde polymer. Their value is revised to ΔH<sub>f</sub> 298.15 = -25.0 kcal. mole<sup>-1</sup> based on the following thermochemical cycle:  
 I C<sub>(c)</sub> + 1/2O<sub>2</sub>(g) + H<sub>2</sub>(g) = 1/2 (CH<sub>2</sub>O)<sub>n</sub>(c) -42.3 kcal.  
 II 1/2 (CH<sub>2</sub>O)<sub>n</sub>(c) + H<sub>2</sub>O = CH<sub>2</sub>O(aq) 2.4  
 III CH<sub>2</sub>O(g) = CH<sub>2</sub>O(aq) 14.9

Equation I and II are based upon data listed by Delepine and Badoche. For reaction III Delepine and Badoche obtained 15 kcal. mole<sup>-1</sup>. Whores, F. Walker, J. Am. Chem. Soc. 55, 2821 (1933) obtained 14.8 kcal. mole<sup>-1</sup>. A value of -27.7 kcal. mole<sup>-1</sup> is obtained from the combustion experiments of H. von Wartenberg and B. Lerner-Steinberg, Z. anorg. Chem. 39, 591 (1925). Corrections of -0.6 and 0.1 kcal. mole<sup>-1</sup> were applied to obtain a heat of reaction at constant pressure and at 298.15°K.

Equilibrium constant determinations of reaction (IV) by R. H. Newton and B. F. Dodge, J. Am. Chem. Soc. 55, 4747 (1933), lead to a ΔH<sub>f</sub> 298.15 = -28.0 kcal. mole<sup>-1</sup>.

IV H<sub>2</sub>(g) + CO(g) = H<sub>2</sub>CO(g)

The value obtained from the measurements of Wartenberg and Lerner-Steinberg is believed to be the most reliable.

Heat Capacities and Entropies

Frequencies were measured by H. H. Blau and H. H. Nielsen, J. Molec. Spectr., 1, 124 (1957) in the I. R. Microwave determinations of R. B. Lawrence and M. F. W. Strandberg, Phys. Rev. 82, 365 (1951), and those of G. Eriandson, J. Chem. Phys. 25, 579 (1956) are in essential agreement.

Heat of Formation

W. A. Chupka (1) has measured the photoionization spectrum of methane and from the onset of CH<sub>3</sub><sup>+</sup> production has reported D<sub>0</sub>(CH<sub>3</sub>-H) = 103.244 ± 0.12 kcal. This value was corrected for the thermal rotation energy of the fragment ions and is the value adopted here.

V. H. Dibeler et al. (2) had earlier reported D<sub>0</sub>(CH<sub>3</sub>-H) = 101.7 ± 0.5 kcal but they did not apply the rotational energy correction, which would bring them closer to Chupka.

The photoionization values are in good agreement with earlier electron impact determinations as summarized by Stevenson (3) who gives D<sub>0</sub>(CH<sub>3</sub>-H) = 101.9 ± 1 kcal. Kinetic determinations have been recently reviewed by Kerr (4) and yield D<sub>0</sub>(CH<sub>3</sub>-H) = 102.5 ± 1 kcal again in excellent agreement.

Heat Capacity and Entropy

The structure, bond length, angles and electronic levels are those reported by Herzberg (5). A set of vibrational frequencies have been reported by Andrews and Pimentel (6) in an argon matrix, of which only two were observed. Milligan and Jacox (7) observed ν<sub>2</sub> = 611 cm<sup>-1</sup> in an argon matrix and disagreed with Andrews and Pimentel who reported 730 cm<sup>-1</sup>. Later Tan and Pimentel (8) agreed that the earlier values were for a methyl radical interacting with an alkali halide molecule. This would affect the ν<sub>2</sub> mode strongest, thus, we adopt the remaining in plane frequencies which appear to be of the correct magnitudes. The ν<sub>2</sub> mode is taken from the analysis of Herzberg (5) since this represents the gas phase molecule and is in reasonable agreement with the matrix value of Milligan and Jacox. The uncertainty in the entropy reflects the uncertainties in the vibrational frequencies.

The individual moments of inertia are I<sub>A</sub> = I<sub>B</sub> = 2.923 × 10<sup>-40</sup> g cm<sup>2</sup>, I<sub>C</sub> = 5.846 × 10<sup>-40</sup> g cm<sup>2</sup>.

Bond Distances: C-H = 1.0959 Å C-Cl = 1.7812 Å

Bond Angle: H-C-H = 108° H-C-Cl = 110°54'

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 21.460 X 10<sup>-117</sup> g.<sup>3</sup> cm.<sup>6</sup>

σ = 3

Heat of Formation.

The heat of formation was measured using hydrogenation to give methane and hydrogen chloride, by J. R. Lacher, E. Emery, E. Bohmalk and J. D. Park, J. Phys. Chem. **60**, 492 (1956). The value adopted was recalculated using JANAF auxiliary data for methane and HCl.

Heat Capacity and Entropy.

The vibrational frequencies were tabulated by E. K. Plyler and W. S. Benedict, J. Research Natl. Bur. Standards **47**, 202 (1951). C. C. Costain, J. Chem. Phys. **29**, 864 (1958) has calculated the bond distances and angles based on an isotopic substitution method. From these the individual moments of inertia were calculated to be I<sub>A</sub> = 0.5262 X 10<sup>-39</sup> g.<sup>2</sup> cm.<sup>2</sup> and I<sub>B</sub> = I<sub>C</sub> = 6.3863 X 10<sup>-39</sup> g.<sup>2</sup> cm.<sup>2</sup>

Bond Distances: C-F = 1.391 ± 0.005 Å C-H = 1.095 ± 0.010 Å

Bond Angles: H-C-H = 109.5° ± 2°

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 5.96 X 10<sup>-117</sup> g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation.

Appearance potentials for CH<sub>3</sub><sup>+</sup> from CH<sub>4</sub><sup>o</sup> and CH<sub>3</sub>F reported by P. P. Lossing, K. V. Ingold, and I. H. S. Henderson, J. Chem. Phys. 22, 1489 (1954), the heats of dissociation of hydrogen (104.20 kcal.) and fluorine (37.72 kcal.), and the heat of formation of Methane (-17.90 kcal.) were used to calculate the heat of formation of gaseous CH<sub>3</sub>F. These authors measured an appearance potential for CH<sub>3</sub><sup>+</sup> from CH<sub>3</sub>F of 14.6 ± 0.6 e.v., which would give an uncertainty of about ±15 kcal. mole<sup>-1</sup> in the heat of formation of methyl fluoride. However, a correlation of the heats of formation from the atoms of the methyl fluorides and methyl chlorides indicates that the uncertainty can be reduced to ± 7 kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy.

Fundamental vibrational frequencies were taken from the summary reported by W. L. Smith and I. M. Mills, J. Mol. Spect. 11, 11 (1963). Moments of inertia from the microwave results of O. R. Gilliam, H. D. Edwards, and W. Gordy, Phys. Rev. 75, 1014 (1949) are: I<sub>A</sub> = 5.52 X 10<sup>-40</sup> g. cm.<sup>2</sup>, I<sub>B</sub> = I<sub>C</sub> = 32.854 X 10<sup>-40</sup> g. cm.<sup>2</sup>. Bond parameters are the values of L. O. Brockway, C. O. Thornton, and L. S. Bartell, whose electron diffraction results are given in the Annual Review of Physical Chemistry 5, 397 (1954). These values are in close agreement with the microwave parameters reported by Gilliam, Edwards, and Gordy (loc. cit.).

Trifluoromethylsilane (Si(CH<sub>3</sub>)F<sub>3</sub>) (Ideal Gas)

Mol. Wt. = 100.125

ΔH<sub>f</sub><sup>o</sup> 298.15 = [-294.625] kcal. mole<sup>-1</sup>

S<sub>298.15</sub><sup>o</sup> = 75.07 cal. deg<sup>-1</sup> mole<sup>-1</sup>

Heat of Formation. ΔH<sub>f</sub><sup>o</sup> 298.15 was estimated.

Heat Capacity and Entropy. C<sub>p</sub> and S<sub>298.15</sub><sup>o</sup> were taken from O. Janz, Y. Miawa, and P. Behnke, private communication, March 16, 1960.

## Heat of Formation

P. D. Rossini, J. Research Nat. Bur. Standards 5, 37 (1951) measured the heat of combustion of methane gas. His value at 298.15°K was corrected to the presently accepted molecular weight of water. The heat of formation was calculated using -68.3174 and -94.0540 kcal. mole<sup>-1</sup> for the heat of formation of H<sub>2</sub>O(l) and CO<sub>2</sub>(g) respectively.

## Heat Capacities and Entropies

D. P. Stevenson and J. A. Ibers, J. Chem. Phys. 33, 762 (1960), calculated the bond distance from an analysis of available spectroscopic data. Vibrational frequencies listed by L. H. Jones and R. S. McDowell, J. Mol. Spect. 3, 632 (1959), are consistent with their results of a force constant calculation.

Cyanogen Iodide (ICN)

(Ideal Gas)

GFW = 152.92225

CYANOGEN IODIDE (ICN)

(IDEAL GAS)

GFW = 152.92225

Point Group  $C_{\infty v}$

$\Delta H_f^\circ = 54.1 \pm 1.5$  kcal/mol

CIN

Bond Distance: C-I =  $1.994 \text{ \AA}$  C-N =  $1.159 \text{ \AA}$   
 Bond Angle: I-C-N =  $180^\circ$   
 Rotational Constant:  $B_0 = 0.1076 \text{ cm}^{-1}$   
 $\sigma = 1$

Heat of Formation

The heat of formation is calculated from  $\Delta H_f^\circ(\text{ICN}, g) = 39.71 \text{ kcal/mol}$  (1) and  $\Delta H_f^\circ(\text{I}_2, g) = 14.29 \pm 0.15 \text{ kcal/mol}$ . This latter value is obtained from a 2nd and 3rd law analysis of the vapor pressure data of Yost and Stone (2) and Ketelaar and Kruyer (3), which are in good agreement after dropping the lowest point in the first set and the lowest 3 points in the second set.

The heat of formation of the crystal is calculated from  $\Delta H_f^\circ = -46.3 \pm 0.08 \text{ kcal}$  obtained by Lord and Woolf (4) for the reaction  $\text{ICN}(c) + 2 \text{NaOH}(56 \text{ H}_2\text{O}) = \text{NaCNO}(2800 \text{ H}_2\text{O}) + \text{H}_2\text{O}(l)$ . The auxiliary data used were  $\Delta H_f^\circ(\text{NaOH} \cdot 56 \text{ H}_2\text{O}) = -112.26 \text{ kcal/mol}$  (1, 5);  $\Delta H_f^\circ(\text{NaCNO} \cdot 2800 \text{ H}_2\text{O}) = -92.25 \text{ kcal/mol}$  (1, 5) and  $\Delta H_f^\circ(\text{H}_2\text{O}, l) = -70.54 \text{ kcal/mol}$  (1, 5). The uncertainty in the final value reflects the uncertainty in  $\Delta H_f^\circ(\text{NaCNO} \cdot 2800 \text{ H}_2\text{O})$  which was determined by Lord and Woolf to be  $-93.6 \text{ kcal/mol}$  in excess  $\text{NaOH} \cdot 56 \text{ H}_2\text{O}$ .

Heat Capacity and Entropy

The molecular structure, bond distances and angle were determined using microwave spectroscopy by Tyler and Sheridan (5). The infrared spectrum of the gas has been reported by Hemple and Nixon (2) using a 10m folded path cell. The fundamentals have been confirmed by the Raman data of West and Farnsworth (6) on a solution in methanol; and by the infrared data of Freitag and Nixon (9) on solid ICN.

June 30, 1962; Mar. 31, 1966

$\Delta H_f^o = -28.28 \pm 0.2 \text{ kcal. mole}^{-1}$   
 $\Delta H_f^o(298.15) = -27.12 \pm 0.2 \text{ kcal. mole}^{-1}$   
 $\Delta H_c^o = 0.279 \text{ kcal. mole}^{-1}$   
 $\Delta H_m^o = 3.5 \text{ kcal. mole}^{-1}$   
 $\Delta H_g^o(298.15(\text{to dimer})) = 52 \pm 10 \text{ kcal. mole}^{-1}$   
 $\Delta H_g^o(298.15(\text{to monomer})) = 46 \pm 5 \text{ kcal. mole}^{-1}$

Heat of Formation.

The enthalpy change,  $\Delta H_f^o(298.15) = 2.80 \pm 0.10 \text{ kcal. mole}^{-1}$ , for the reaction  $\text{KCN}(c) \rightarrow \text{KCN}(\infty \text{H}_2\text{O})$  was reported by V. B. Parker, "Thermal Properties of Aqueous Uni-univalent Electrolytes," NSRDS-NBS 2, National Bureau of Standards, April 1, 1965. Incorporating this data with the heat of formation for  $\text{K}^+(\infty \text{H}_2\text{O})$  and  $\text{CN}^-(\infty \text{H}_2\text{O})$ , reported by D. D. Wagman, M. H. Evans, I. Halow, V. B. Parker, S. M. Bailey, and R. H. Schumm, "Selected Values of Chemical Thermodynamic Properties," Part 1, Technical Note 270-1, October 1, 1965, National Bureau of Standards, the value of  $\Delta H_f^o(298.15)$  for  $\text{KCN}(c)$  was evaluated to be  $-27.12 \pm 0.2 \text{ kcal. mole}^{-1}$ .

Heat Capacity and Entropy.

The heat capacity for  $\text{KCN}(c)$  has been measured with a heat conduction method by C. E. Measer and W. T. Ziegler, J. Am. Chem. Soc. 65, 2703 (1941), 101.6-345.8°K, and adiabatically by H. Suga, T. Metauo and S. Seki, Bull. Chem. Soc. Japan, 39, 1115 (1965), 14.23-309.5°K. The data of Suga, Metauo and Seki were adopted after correction for curvature. The anomalous region between 50-105°K. has been treated as second order by inclusion of the enthalpy in the heat capacity. The  $C_p$  values above 310°K. were estimated by graphical extrapolation. The value of  $\Delta H_g^o(298.15)$  was evaluated based on  $S_{15}^o = 0.193 \text{ cal. deg}^{-1} \text{ mole}^{-1}$ . This extrapolated value appears more reasonable than the value,  $S_{15}^o = 0.307 \text{ cal. deg}^{-1} \text{ mole}^{-1}$  reported by Suga, Metauo and Seki.

Transition Data.

$T_t$  was taken from Suga, Metauo and Seki, loc. cit.  $\Delta H_t^o$  was calculated as the difference between the total enthalpy change,  $H_{173.80}^o - H_{159.02}^o = 0.533 \text{ kcal. mole}^{-1}$  obtained from  $C_p$  values measured by Measer and Ziegler, loc. cit., and the enthalpy change,  $0.254 \text{ kcal. mole}^{-1}$ , calculated from the arbitrarily smoothed  $C_p$  curve. Suga, et al. reported  $\Delta H_t^o = 0.339 \text{ kcal. mole}^{-1}$ ; however, their  $C_p$  data do not adequately define the total enthalpy change through the transition region. The values of  $T_t$  and  $\Delta H_t^o$  reported by Measer and Ziegler, loc. cit., were  $168.3 \pm 0.4^\circ\text{K}$ . and  $0.30 \text{ kcal. mole}^{-1}$ , respectively. The lower transition,  $T = 82.9 \pm 0.2^\circ\text{K}$ . and  $\Delta H_t^o = 0.095 \pm 0.001 \text{ kcal. mole}^{-1}$  reported by Suga, et al., was treated as second order by inclusion of the enthalpy in the heat capacity.

Melting Data.

See KCN(1) table.

Heat of Sublimation.

The difference between  $\Delta H_f^o(298.15)$  for  $(\text{KCN})_2(c)$  and  $2\text{KCN}(c)$  is  $\Delta H_g^o(298.15)$  (to dimer) and for  $\text{KCN}(g)$  and  $\text{KCN}(c)$  is  $\Delta H_g^o(298.15)$  (to monomer).

$\Delta H_f^{298.15} = -24.891$  kcal. mole<sup>-1</sup>  
 $\Delta H_m^{298.15} = 3.5$  kcal. mole<sup>-1</sup>  
 $\Delta H_v^{298.15} = [37.55]$  kcal. mole<sup>-1</sup>

$S_{298.15}^{\circ} = 32.104$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 $T_m = 895 \pm 2^{\circ}$  K.  
 $T_b = [1898]^{\circ}$  K.

Heat of Formation.

$\Delta H_f^{298.15}(l)$  was obtained from  $\Delta H_f^{298.15}(c)$  by adding  $\Delta H_m^{298.15}$  and the difference between  $H_{298.15}^{298.15}$  for crystal and liquid.

Heat Capacity and Entropy.

Heat capacity was estimated and assumed constant in the temperature range 298.15-3000°K. The entropy was obtained in a manner analogous to that of the heat of formation.

Melting Data.

The melting temperature was reported by W. Truthe, Z. anorg. Chem. 76, 129 (1912). The value of  $\Delta H_m^{298.15}$  was taken from K. K. Kelley, U. S. Bur. Mines Bull. 383, 1936, based on phase diagrams of the systems KCN-AGCN, KCN-Cu<sub>2</sub>(CN)<sub>2</sub>, KCN-KCl, KCN-NaCN, and KCN-Zn(CN)<sub>2</sub> reported by W. Truthe, loc. cit.

Vaporization Data.

$T_b$  is the temperature at which the free energy change for the reaction KCN(l) = KCN(g) becomes zero. The difference between  $\Delta H_f^{298.15}$  for KCN(g) and KCN(l) at  $T_b$  is  $\Delta H_v^{298.15}$ .

Heat of Formation.

The vapor pressure of KCN(g) at 870°C. was estimated to be 1-10 mm. Hg by D. S. Willars, J. Am. Chem. Soc. 53, 405 (1931). Assuming the vapor pressure at this temperature to be 1 mm. Hg, the heat of vaporization (ΔH<sub>v</sub><sup>o</sup>, 298.15) for KCN(l) was evaluated as 44 kcal. mole<sup>-1</sup>. Based on ΔH<sub>f</sub><sup>o</sup>, 298.15 = -24.89 kcal. mole<sup>-1</sup> for KCN(l), the value of ΔH<sub>f</sub><sup>o</sup>, 298.15 for KCN(g) was calculated to be 19 ± 5 kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy.

The molecular structure of KCN(g) has not been determined. It was assumed to be linear by comparison with that for HCN(g). The C-N bond distance was determined by N. Elliott and J. Hastings, Acta Cryst. 1, 1018 (1961) by use of neutron diffraction measurements. The K-C bond distance was taken from G. E. Leroi, Ph. D. Thesis, Harvard University, 1961, which was estimated. The vibrational frequencies, 2/2 and 2/3, were obtained from G. E. Leroi and W. Klemperer, J. Chem. Phys. 35, 774 (1961). The value of 2/1 was calculated by valence force method described by O. Herzberg, "Infrared and Raman Spectra," D. Van Nostrand, Inc., New York, 1945, using appropriate force constants. The principal moment of inertia is 2.3540 X 10<sup>-38</sup> g. cm.<sup>2</sup>

POTASSIUM CARBONATE (K<sub>2</sub>CO<sub>3</sub>)

(CRYSTAL)

MOL. WT. = 138.21335

CK<sub>2</sub>O<sub>3</sub>

ΔH<sub>f</sub><sup>o</sup> 0 = -273.57 ± 0.5 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> 298.15 = -274.9 ± 0.5 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> = 6.6 ± 0.1 kcal. mole<sup>-1</sup>

S<sub>298.15</sub><sup>o</sup> = 37.17 ± 0.1 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 T<sub>m</sub> = 1174 ± 1°K.

Heat of Formation.

The heat of formation was obtained from the heat of solution ΔH<sub>f</sub><sup>o</sup> = -7.6 ± 0.5 kcal. mole<sup>-1</sup> and the heats of formation for K<sup>+</sup>(aq) and CO<sub>3</sub><sup>2-</sup>(aq), -60.32 and -161.84 kcal. mole<sup>-1</sup>, respectively. The standard heat of solution, ΔH<sub>f</sub><sup>o</sup> = -7.6 ± 0.5 kcal. mole<sup>-1</sup>, was calculated by extrapolation to infinite dilution of the calorimetric data of L. Benjamen, J. Chem. Eng. Data **7**, 239-40 (1962), using the methods suggested by J. P. Rupert, H. P. Hopkins, Jr., and C. A. Wilff, J. Phys. Chem. **69**, 3059-62 (1965). The equilibrium constant for the hydrolysis CO<sub>3</sub><sup>2-</sup>(∞H<sub>2</sub>O) + OH<sup>-</sup>(∞H<sub>2</sub>O) → HCO<sub>3</sub><sup>-</sup>(∞H<sub>2</sub>O) + H<sub>2</sub>O(l) was taken as K = 2.1 X 10<sup>-4</sup> based on the selected values of D. D. Wagman, W. H. Evans, I. Halow, V. B. Parker, S. M. Bailey and R. H. Schumm, "Selected Values of Chemical Thermodynamic Properties", NBS Technical Note 270-1, October 1, 1965. The resulting extrapolations were not so consistent as those of Rupert et al. (loc. cit.). The ionic heats of formation were taken from Wagman et al. (loc. cit.). This procedure was adopted even though it may involve an inconsistency between the extrapolations for ΔH<sub>f</sub><sup>o</sup> and CO<sub>3</sub><sup>2-</sup>(∞H<sub>2</sub>O). The alternative evaluation of ΔH<sub>f</sub><sup>o</sup> 298.15 for K<sub>2</sub>CO<sub>3</sub>(~1900 H<sub>2</sub>O) from the heats of mixing given by J. A. Muller, Ann. chim. phys. (6), **15**, 517 (1868) and M. Berthelot, Ann. chim. phys. (4) **25**, 433 (1873) may be subject to significant error if dissolved CO<sub>2</sub> was not excluded from the solutions. Presumably, this path was used by D. D. Wagman, NBS Report 8628, January 1965, in the selection of ΔH<sub>f</sub><sup>o</sup> 298.15 = -274.3 kcal. mole<sup>-1</sup>. This value is 0.6 kcal. mole<sup>-1</sup> less negative than the value adopted here.

Heat Capacity and Entropy.

The low temperature heat capacity, 14.0-315°K. was measured by F. L. Oetting, unpublished data, Thermal Research Laboratory, Dow Chemical Company, Midland, Michigan, 1963. G. I. Janz, E. Neuenchwander and P. J. Kelly, Trans. Faraday Soc. **53**, 841 (1963) measured the heat content by drop calorimetry in the temperature range 650-1250°K., and gave enthalpy and heat capacity equations based on their measurements. The above information was used in a Shomate analysis in order to smooth the enthalpy and calculate heat capacity above 298°K. The values from the low and high temperature sources join smoothly at 298°K. The heat capacity was graphically extrapolated above the melting point. The entropy at 14.0°K. was calculated from the extrapolated low temperature C<sub>p</sub> data, using the cubic law. The value of S<sub>14.0</sub><sup>o</sup> = 0.109 cal. deg.<sup>-1</sup> mole<sup>-1</sup>.

Melting Data.

T<sub>m</sub> was obtained from A. Reisman, J. Am. Chem. Soc. **80**, 3558 (1958) and ΔH<sub>m</sub><sup>o</sup> was taken from Janz et al. (loc. cit.).

POTASSIUM CARBONATE (K<sub>2</sub>CO<sub>3</sub>) (LIQUID) MOL. WT. = 138.21335

S°<sub>298.15</sub> = 40.719 ± 0.1 cal. deg.<sup>-1</sup> mole<sup>-1</sup> ΔH<sub>f</sub><sup>o</sup> 298.15 = -270.22 ± 0.5 kcal. mole<sup>-1</sup>

F<sub>m</sub> = 1174 ± 1°K. ΔC<sub>p</sub><sup>o</sup> = 0.60 ± 0.1 kcal. mole<sup>-1</sup>

Heat of Formation.

The ΔH<sub>f</sub><sup>o</sup> 298.15 was obtained from ΔH<sub>f</sub><sup>o</sup> 298.15(c) by adding ΔH<sub>m</sub><sup>o</sup> and the difference between H<sub>m</sub><sup>o</sup> - H<sub>l</sub><sup>o</sup> 298.15 for crystal and liquid.

Heat Capacity and Entropy.

A glass transition was assumed at 800°K. The heat capacity below 800°K. was obtained from the heat capacity of the crystal. Above 800°K. the heat capacity was adopted as 50.0 cal. deg.<sup>-1</sup> mole<sup>-1</sup>, based on the enthalpy measurements in the range 1189-1250°K. reported by O. J. Janz, E. Neuenchwander and F. J. Kelly, Trans. Faraday Soc. 59, 841 (1963). The entropy was obtained in a manner analogous to that of the heat of formation.

Melting Data.

See K<sub>2</sub>CO<sub>3</sub>(c) table.

MOL. WT. = 73.88735

CLi<sub>2</sub>O<sub>3</sub>

$\Delta H_f^0 = -288.69 \pm 0.04$  kcal. mole<sup>-1</sup>  
 $\Delta H_f^{298.15} = -290.64 \pm 0.04$  kcal. mole<sup>-1</sup>  
 $\Delta H_{T_1}^0 = [0.134]$  kcal. mole<sup>-1</sup>  
 $\Delta H_{T_2}^0 = [0.535]$  kcal. mole<sup>-1</sup>  
 $\Delta H_m^0 = 10.70 \pm 0.1$  kcal. mole<sup>-1</sup>

$S_{298.15}^0 = 21.551 \pm 0.05$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 $T_1 = 623^\circ\text{K.}$   
 $T_2 = 683 \pm 3^\circ\text{K.}$   
 $T_m = 985 \pm 1^\circ\text{K.}$

Heat of Formation.

The heat of formation was derived from the enthalpy change of the following reactions:

Summation of these two reactions gives

Using  $\Delta H_f^0$  of  $\text{H}_2\text{O}(\text{l})$ ,  $\text{CO}_3^{2-}(\infty\text{H}_2\text{O})$  and  $\text{OH}^-(\infty\text{H}_2\text{O})$  from Ref. 6 yields  $\Delta H_f^0 \text{Li}_2\text{CO}_3 = -290.64$  kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy.

The low temperature heat capacity, 16.68-300.20°K., was measured by O. L. I. Brown and W. M. Latimer, J. Am. Chem. Soc. **58**, 2228 (1936). O. I. Janz, E. Neuenchwander and P. J. Kelly, Trans. Faraday Soc. **59**, 841 (1963) measured the heat content by drop calorimetry in the temperature range 560-1150°K., and gave enthalpy and heat capacity equations based on their measurement. The above information was used in a Shomate analysis in order to smooth the enthalpy and calculate heat capacity. The values from the low and high temperature sources join smoothly at 298°K. The heat capacity was graphically extrapolated above the melting point. The entropy at 16.68°K. was calculated from the extrapolated low temperature  $C_p$  data, using the cubic law. The value of  $S_{16.68}^0 = 0.053$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>.

Transition Data.

$T_m$  were taken from A. Reisman, J. Am. Chem. Soc. **80**, 3558 (1958). The enthalpies of transition were estimated from the relative areas of the transitions and the heat of fusion of the differential analysis curve reported by Reisman loc. cit.

Melting Data.

$T_m$  was obtained from Reisman loc. cit. and  $\Delta H_m^0$  was taken from Janz et. al. (loc. cit.).

LITHIUM CARBONATE (Li<sub>2</sub>CO<sub>3</sub>) (LIQUID) MOL. WT. = 73.88735

$$S_{298.15}^{\circ} = 30.423 \pm 0.05 \text{ cal. deg.}^{-1} \text{ mole}^{-1} \quad \Delta H_f^{\circ} 298.15 = -281.63 \pm 0.04 \text{ kcal. mole}^{-1}$$

$$T_m = 993.15 \pm 1^{\circ}\text{K.} \quad \Delta H_m^{\circ} = 10.7 \pm 0.1 \text{ kcal. mole}^{-1}$$

## Heat of Formation.

The  $\Delta H_f^{\circ} 298.15$  was obtained from  $\Delta H_f^{\circ} 298.15(c)$  by adding  $\Delta H_m^{\circ}$  and the difference between  $H_m^{\circ} - H_m^{\circ} 298.15$  for crystal and liquid.

## Heat Capacity and Entropy.

A glass transition was assumed at 683.15°K. The heat capacity below 683.15°K. was obtained from the heat capacity of the crystal. Above 683.15°K. the heat capacity was adopted as 44.32 cal. deg.<sup>-1</sup> mole<sup>-1</sup>, based on the enthalpy measurements in the range 996-1150°K. reported by G. J. Janz, E. Neuenachwander and F. J. Kelly, Trans. Faraday Soc. 59, 841 (1963). The entropy was obtained in a manner analogous to that of the heat of formation.

**Heat of Formation.**  
 $S_{298.15}^{\circ} = 15.74$  gibbs/mol  
 $\Delta H_{298.15}^{\circ} = -265.7 \pm 2$  kcal/mol  
 $\Delta H_{f,0}^{\circ} = -263.9 \pm 2$  kcal/mol  
 $T_d = 875^{\circ}\text{K}$

The adopted  $\Delta H_{f,298.15}^{\circ} = -265.7 \pm 2$  kcal/mol is the average value derived from the dissociation pressures of MgCO<sub>3</sub>(c) in the temperature range 671-782°K measured by Marc and from the  $\Delta H_{f,923}^{\circ} = 25.9 \pm 0.6$  kcal/mol determined by Thomsson using a high temperature differential calorimeter. The decomposition of MgCO<sub>3</sub> has been studied in a bomb calorimeter by Roth; this yields  $\Delta H_{f,293}^{\circ} = 23.8$  kcal/mol when corrected to constant pressure. The value is derived from the small difference between two large heats of combustion, so the uncertainty is probably large. Roth also reported  $\Delta H_{f,365}^{\circ} = 26.15$  kcal/mol from calorimetric data on the heat of solution in HCl. Berthelot measured the heat of solution of MgSO<sub>4</sub>(aq) with K<sub>2</sub>CO<sub>3</sub>(aq). Analyzing his data we find  $\Delta H_{f,298.15}^{\circ} = -268.6$  kcal/mol.

Discrepancies are apparent in the wide range of the calorimetric results and in the third law drift of the equilibrium data. Possible sources for the drift include lack of true equilibrium (e.g., excess surface energy for MgO) and uncertainty in the high temperature entropy of MgCO<sub>3</sub> (see entropy write-up). Non-standard state behavior of the crystal phases may also be a problem in the calorimetric studies. The data of Thomsson and Cunningham, based on a high temperature differential thermal analysis technique, are probably the most reliable of the calorimetric values; however, there are uncertainties in the absolute energy calibration. The first result of Roth may be dismissed as too discrepant and the remaining two calorimetric values are within  $\pm 3$  kcal of the selected heat of formation.

**Heat Capacity and Entropy.**  
 Low temperature heat capacities (56.3 - 291.6°K) were measured by C. T. Anderson, J. Am. Chem. Soc. **56**, 849 (1934). The high temperature heat capacities are derived by a Shomate analysis of smoothed enthalpies reported by K. K. Kelley, Bulletin 584, p. 114, U.S. Bureau of Mines, Washington, D.C. 1960. Kelley obtained the smoothed values from unpublished high temperature (400-743°K) enthalpy measurements by C. H. Shomate, Berkeley Thermodynamics Laboratory, Region II, Bureau of Mines, Berkeley, California. The data were joined smoothly at 298°K and extrapolated graphically above 743°K. The entropy was obtained from the heat capacities using  $S_{56.2}^{\circ} = 0.57$  eu.

Because of the drift in the decomposition pressure data, it is pertinent to assess the uncertainty in the functions. The greatest potential source for error is in the values above room temperature where the increment of entropy is about 20 eu between 298 and 700°K. Unfortunately, no evaluation of the unpublished enthalpies is possible, but an increase of 10% in the entropy increment would reduce the drift to a tolerable level.

**Decomposition Data.**  
 Td is calculated as the temperature at which  $\Delta G^{\circ}$  equals zero for MgCO<sub>3</sub>(c) = MgO(c) + CO<sub>2</sub>(g).

 $\omega_e = 0.0172 \text{ cm}^{-1}$

**Heat of Formation**  
 The heat of formation of CN has been the subject of considerable uncertainty for many years. J. Berkowitz (1) has reviewed the earlier work and he concludes that  $\Delta H_f^\circ(\text{CN}, g) = 109$  kcal/mol. Since this review a considerable body of work has emerged which supports a value near 100 kcal/mol.  
 Tsang et al. (2) obtained  $\Delta H_f^\circ(\text{CN}, g) = 100 \pm 4$  kcal/mol from shock tube studies of the decomposition of cyanogen.  
 Dibeler and Liston (3, 4) have studied a series of cyanogen compounds and obtained their heats of dissociation from photoionization threshold measurements. The values below are obtained from the halogen ion threshold measurements using JAMAF auxiliary data, except for HCN which is from the  $\text{CN}^+$  threshold measurements. The value below is calculated using the ionization potential from CNCI measurements (3).  
 Davis and Okabe (5) employed a direct photodissociation technique to obtain dissociation energies for many of the same molecules. The method determines the disappearance threshold for fluorescence due to decay of excited molecules  $\text{CN } B^2\Sigma^- - X^2\Sigma^+$ . This corresponds to the energy needed to just break the bond and form excited cyanogen in the  $B^2\Sigma^+$  state, whose energy above ground is well known.  
 Setser and Steadman (6) used metastable excited argon atoms with a maximum electronic energy of 270 kcal/mol to break the bonds in HCN and  $(\text{CN})_2$ . From the emission spectra of the excited  $B^2\Sigma^+$  CN they were able to calculate the highest populated vibrational level and thus a maximum limit to the dissociation energy.  
 Berkowitz et al. (7) have recently examined the photoionization spectrum of HCN using the  $\text{H}^+$  ion threshold. They also determined the threshold for the  $\text{CN}^+$  ion which agrees exactly with that of Dibeler and Liston (4) when the latter is corrected for rotational energy contributions (0.7 kcal). Berkowitz et al. (7) suggest that the HCN limit of Setser and Steadman (6) should be  $\pm 105$  due to neglect of the significant vibrational population of the first harmonic of the bending mode. However, if the same allowance is made for the  $\text{C}_2\text{N}_2$  data the limit is only  $\pm 104$  and this presumes significant occupation of the third harmonic of the bending mode of  $\text{C}_2\text{N}_2$ .  
 It is apparent from the data that considerable scatter still exists and several sources of error are probable. HCN and the cyanogen halides all have significant uncertainties in their heats of formation, and the effects of rotational and vibrational contributions at 300°K are uncertain, but could be eliminated by using refrigerated gases. We choose to adopt a median value within the range of almost all determinations of  $\Delta H_f^\circ(\text{CN}, g) = 103.2 \pm 2.5$  kcal/mol.

X    Reference     $\Delta H_f^\circ(\text{CNH} + \text{CN} + \text{X})$  kcal     $\Delta H_f^\circ(\text{CN}, g)$  kcal/mole

**Heat Capacity and Entropy**  
 The thermodynamic functions are taken from Johnston et al. (8) calculated based on the direct summation of the energy levels. All the electronic levels and molecular constants listed above are from Carroll (9). Johnston et al. used only the first two excited electronic states but the contribution of the higher levels is negligible.

$\omega_e x_e = (12.5) \text{ cm}^{-1}$   
 $\alpha_e = (0.017) \text{ cm}^{-1}$   
 $r_e = 1.29 \text{ \AA}$   
 $\sigma = 1$

Heat of Formation

Dibeler and Liston (1) have measured the photoionization thresholds for the processes:  
 ClCN + hv → Cl<sup>+</sup> + CN + e<sup>-</sup>    ΔH<sub>f</sub><sup>0</sup> = 399.44 ± 0.5 kcal  
 ClCN + hv → Cl + CN<sup>+</sup> + e<sup>-</sup>    ΔH<sub>f</sub><sup>0</sup> = 426.65 ± 0.5 kcal

By subtraction we obtain  
 Cl + CN<sup>+</sup> → Cl<sup>+</sup> + CN

Using JANAF values for Cl, Cl<sup>+</sup> and CN we obtain ΔH<sub>f</sub><sup>0</sup>(CN<sup>+</sup>) = 430.6 ± 3.0 kcal/mol and the ionization potential of CN, g = 327.42 ± 0.7 kcal/mol.

Berkowitz et al. (2) have measured the photoionization thresholds for the processes:  
 HCN + hv → H<sup>+</sup> + CN + e<sup>-</sup>    ΔH<sub>f</sub><sup>0</sup> = 438.18 ± 0.3 kcal  
 HCN + hv → H + CN<sup>+</sup>        ΔH<sub>f</sub><sup>0</sup> = 448.09 ± 0.3 kcal

By subtraction we obtain  
 H + CN<sup>+</sup> → H<sup>+</sup> + CN

Using JANAF values for H, H<sup>+</sup> and CN we obtain ΔH<sub>f</sub><sup>0</sup>(CN<sup>+</sup>) = 426.7 ± 3.0 kcal/mol, and the ionization potential of CN, g = 323.51 ± 0.4 kcal/mol.

We adopt a median value for ΔH<sub>f</sub><sup>0</sup>(CN<sup>+</sup>) = 428.6 ± 3.0 kcal/mol and 325.4 ± 2 kcal/mol for the ionization potential of CN.

Heat Capacity and Entropy

The molecule has eight valence electrons and thus we expect that its molecular constants should fall between those for C<sub>2</sub> and BN. The ground electronic state is either 1Σ<sup>+</sup> or 1Π and the two levels are likely to be very close. As a consequence the thermodynamic functions are dominated by the Π contribution and so we choose this to be the ground state. The other levels are estimated based on the values of Fougere and Nesbet (3) for C<sub>2</sub> and of Verhaegen et al. (4) for BN. The vibrational constants and bond length are estimated between those for the Π states of BN and C<sub>2</sub>. The rotational constants B<sub>e</sub> is obtained from the estimated bond length and α<sub>e</sub> is calculated from the other constants assuming a Morse potential function. The enthalpy at 0°K is -2.076 kcal/mol.

Heat of Formation

Barkowitz et al. (1) have recently obtained  $88 \pm 0.5$  kcal for the electron affinity of CN from the photoionization thresholds of the reactions  $\text{HCN} + \text{H}^+ + \text{CN}^-$  and  $\text{HCN} + \text{H}^+ + \text{CN} + e^-$ .

Other values have been reported by Page (2), who reinterpreted his earlier data (3), to yield  $73 \pm 1$  kcal/mol; Bakulina and Ionov (4) in conjunction with the data of Branscomb and Smith (5) reported  $78 \pm 5$  kcal/mol and Inoue (6) who obtained  $83 \pm 7$  kcal/mol.

We adopt the value given by Barkowitz et al. (1) as being the most well defined in terms of both the precision of measurements and the reactions being studied. This leads to  $\Delta H_f^0(\text{CN}^-, g) = 15.2 \pm 3$  kcal/mol or  $\Delta H_f^0(\text{CN}^-, g) = 16 \pm 3$  kcal/mol.

Heat Capacity and Entropy

The electronic structure and molecular constants are estimated by analogy with the isoelectronic species CO and N<sub>2</sub>. The uncertainties in the constants are generally small since N<sub>2</sub> and CO are quite similar, thus the entropy has an uncertainty of only 0.5 eu. The enthalpy at 0°K is  $-2.072$  kcal/mol.

SODIUM CYANIDE (NaCN)

(CRYSTAL)

MOL. WT. = 49.00765

$S_{298.15}^0 = [28.32 \pm 0.5] \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $T_m = 835^\circ \text{ K.}$

$\Delta H_f^0 = -23.49 \pm 0.3 \text{ kcal. mole}^{-1}$   
 $\Delta H_f^0 298.15 = -21.68 \pm 0.3 \text{ kcal. mole}^{-1}$   
 $\Delta H_g^0 = [2.1] \text{ kcal. mole}^{-1}$   
 $\Delta H_g^0 298.15 (\text{to dimer}) = [41.3] \text{ kcal. mole}^{-1}$   
 $\Delta H_g^0 298.15 (\text{to monomer}) = 44.21 \text{ kcal. mole}^{-1}$

Heat of Formation.

The enthalpy change for the reaction  $\text{NaCN}(c) \rightarrow \text{NaCN}(\infty \text{ H}_2\text{O})$  was reported to be  $0.29 \pm 0.20 \text{ kcal. mole}^{-1}$  by April 1, 1965. Incorporating this data with the heats of formation for  $\text{Na}^+(\infty \text{ H}_2\text{O})$ ,  $-57.39$ , and  $\text{CN}^-(\infty \text{ H}_2\text{O})$ ,  $36.0 \text{ kcal. mole}^{-1}$ , reported by D. D. Wagman, W. H. Evans, I. Halow, V. B. Parker, S. M. Bailey, and R. H. Schumm, "Selected Values of Chemical Thermodynamic Properties," Part 1, Technical Note 270-1, October 1, 1965, National Bureau of Standards, the value of  $\Delta H_f^0 298.15$  for  $\text{NaCN}(c)$  was derived and adopted.

G. Lord and A. A. Woolf, J. Chem. Soc. 2546 (1954), determined the value,  $\Delta H_f^0 298.15(\text{NaCN}, c) = -21.4 \text{ kcal. mole}^{-1}$ , by solution calorimetry. This value is in agreement with the adopted one.

Heat Capacity and Entropy.

The low temperature heat capacities,  $101.6\text{--}345.6^\circ \text{ K.}$ , were reported by C. E. Messer and W. T. Ziegler, J. Am. Chem. Soc. 63, 2703 (1941). The  $C_p$  values above  $345.6^\circ \text{ K.}$  were estimated by graphical extrapolation.  $S_{298.15}$  was derived from low temperature heat capacities, based on  $S_{100}^0 = 8.4 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$  which was estimated by comparison with the  $S_{298.15}$  values for NaCl, KCl, and KCN crystals.

Transition Data.

The transition temperatures,  $T_{t2}$  and  $T_{t1}$ , were determined by C. E. Messer and W. T. Ziegler, loc. cit. The corresponding enthalpies of transition were reported to be  $0.15$  and  $0.70 \text{ kcal. mole}^{-1}$ , respectively. However, these quantities were incorporated with  $C_p$  values used to evaluate  $H^\circ - H_{298.15}^\circ$ . Therefore  $\Delta H_f^0$ 's are not listed.

Listing Data.

see NaCN(1) table for details.

Heat Sublimation.

The difference between  $\Delta H_f^0 298.15$  for  $(\text{NaCN})_2(g)$  and  $2\text{NaCN}(c)$  is  $\Delta H_g^0 298.15$  (to dimer) and for  $\text{NaCN}(g)$  and  $\text{NaCN}(c)$  is  $\Delta H_g^0 298.15$  (to monomer).

$S_{298.15}^{\circ} = [29.996] \text{ cal. deg.}^{-1} \text{ mole}^{-1}$

$\Delta H_f^{\circ} 298.15 = [-20.160] \text{ kcal. mole}^{-1}$

$\Delta H_m^{\circ} = [2.1] \text{ kcal. mole}^{-1}$

$\Delta H_v^{\circ} = [35.39] \text{ kcal. mole}^{-1}$

$T_m = 835^{\circ} \text{ K.}$

$T_b = [1803]^{\circ} \text{ K.}$

## Heat of Formation.

$\Delta H_f^{\circ} 298.15(1)$  was obtained from  $\Delta H_f^{\circ} 298.15(c)$  by adding  $\Delta H_m^{\circ}$  and the difference between  $H_{8.35}^{\circ}$  and  $H_{298.15}^{\circ}$  for crystal and liquid.

## Heat Capacity and Entropy.

The heat capacity was estimated by comparison with those for NaCN(c), KCN(c) and KCN(l). A glass transition temperature is assumed at 600°K. The entropy was obtained in a manner analogous to that of the heat of formation.

## Melting Data.

The melting temperature was reported by M. Truette, Z. anorg. Chem. 76, 129 (1912).  $\Delta H_m^{\circ}$  was estimated such that the derived third law value for  $\Delta H_v^{\circ}$  (NaCN, l) agrees with the second law value. See NaCN(g) table for details.

## Vaporization Data.

$T_b$  is the temperature at which the free energy change for the reaction  $\text{NaCN}(l) = \text{NaCN}(g)$  becomes zero. The difference between  $\Delta H_f^{\circ}$  for NaCN(c) and NaCN(l) at  $T_b$  is  $\Delta H_v^{\circ}$ .

Bond Distance: Na-C = [1.992] Å C-N = [1.16] Å

Bond Angle: Na-C-N = [180]°

Rotational Constant: B = [0.18272] cm<sup>-1</sup>

σ = 1

Heat of Formation.

The vapor pressures of NaCN(l) at temperatures 805-1353°K. were measured by C. K. Ingold, J. Chem. Soc. 123, 865 (1923). According to the investigation reported by R. P. Porter, J. Chem. Phys. 35, 318 (1961), the vapor consists of NaCN and (NaCN)<sub>2</sub>. Based on his data the dimer/monomer ratios at temperatures 805-1353°K. (1078.2-1628.2°K.) were calculated to be 0.29-0.09. Hence the respective partial pressures for NaCN(g) and (NaCN)<sub>2</sub>(g) were derived. By the second and third law methods, the values of ΔH<sub>f</sub><sup>0</sup> 298.15 (1 → monomer) were evaluated to be 43.43 and 42.69 kcal. mole<sup>-1</sup>, respectively. The heat of formation (ΔH<sub>f</sub><sup>0</sup> 298.15) for NaCN(g) was calculated from ΔH<sub>f</sub><sup>0</sup> 298.15 (NaCN, c) and the third law value for ΔH<sub>f</sub><sup>0</sup>.

Heat Capacity and Entropy.

The molecular structure of NaCN(g) has not been determined. It was assumed to be linear by comparison with that for HCN(g). The C-N bond distance was assumed to be the same as that in KCN(g) and the Na-C bond distance was taken from G. E. Lerol, Ph. D. Dissertation, Harvard University, 1961, which was calculated. The vibrational frequencies,  $\nu_2$  and  $\nu_3$  were measured by G. E. Lerol and M. Klumperer, J. Chem. Phys. 35, 774 (1961) from infrared absorption spectra. The value of  $\nu_1$  was calculated by valence force method described by G. Herzberg, "Infrared and Raman Spectra," D. Van Nostrand, Inc., New York, 1945, using appropriate force constants. The principal moment of inertia is 1.53187 x 10<sup>-38</sup> g. cm.<sup>2</sup>

Point Group C<sub>∞v</sub> ΔHf<sub>0</sub><sup>o</sup> = [139.5 ± 30] kcal/mol

S<sub>298.15</sub><sup>o</sup> = 55.35 gibbs/mol ΔHf<sub>298.15</sub><sup>o</sup> = [139.7 ± 30] kcal/mol

Round State Quantum Weight = 3

Bond Distance: C-N = [1.15] Å N-N = [1.25] Å

Bond Angle: C-N-N = 180°

Rotational Constant: B<sub>0</sub> = [0.450368] cm<sup>-1</sup>

σ = 1

Heat of Formation.

The heat of formation is calculated from the estimated heat of reaction ΔHf<sub>0</sub><sup>o</sup> = 255 ± 30 kcal/mol for CNN(g) → C(g) + 2N(g). Since CNN radical can dissociate to give C + N<sub>2</sub> or CN + N, the molecule must have more energy than either CN or N<sub>2</sub>. It is assumed that the extra bond will be quite weak, for this we estimate 30 ± 30 kcal/mol which gives ΔHf<sub>0</sub><sup>o</sup> = 255 ± 30 kcal/mol for the first path and ΔHf<sub>0</sub><sup>o</sup> = 204 ± 30 kcal/mol for the second. We adopt the former value.

Heat Capacity and Entropy.

D. E. Milligan and M. E. Jacox, J. Chem. Phys. 44, 2850 (1966), have measured three fundamental vibrational frequencies for CNN radical (g) in the infrared and ultraviolet spectra by matrix-isolation, and proposed a linear molecular configuration with a <sup>3</sup>Σ<sub>g</sub> ground state which has been confirmed by E. Messerlin, L. Beresh and W. A. Yager, J. Am. Chem. Soc. 81, 2075 (1959), in the electron paramagnetic resonance observations. Also Milligan and Jacox suggested a <sup>1</sup>CN-NH<sup>+</sup> bond structure, based on the agreement between the C-N and N-N stretching force constants (calculated from observed vibrational frequencies in the CNN radical) and the typical C-N and N-N stretching force constants. In addition, they estimated the bond distances r<sub>C-N</sub> = 1.15 Å and r<sub>N-N</sub> = 1.25 Å from the proposed structure. The principal moment of inertia is 6.2148 × 10<sup>-39</sup> g cm<sup>2</sup>.

Bond Distance: C-N = 1.232 Å  
Bond Angle: N-C-N = 180°

Rotational Constant: P<sub>0</sub> = 0.5968 cm<sup>-1</sup>

C = 2

Heat of Formation

The heat of formation of NCN radical (g), ΔHf<sup>o</sup>298 = 102.8 ± 25 kcal/mol, was calculated from the heat of reaction ΔHr<sup>o</sup>298 = 294 ± 25 kcal/mol for N≡C-N → 2N(g) + C(g) which was estimated as twice the C-N bond dissociation energy (147 kcal/mol). The value of C-N bond dissociation energy was derived from the heat of combustion for n-butyl-isobutyridine amine, determined by G. E. Costes and L. E. Sutton, J. Chem. Soc. 1187 (1948).

Heat Capacity and Entropy

G. Herzberg and D. N. Travis, Can. J. Phys. 42, 1658 (1964), have found NCN radical (g) is a linear symmetric molecule with a  $\sum g$  ground state in the rotational spectra by a flash photolysis technique, and determined the bond distance r<sub>C-N</sub> = 1.232 Å and rotational constant P<sub>0</sub> = 0.5968 cm<sup>-1</sup> which have been adopted in the tabulation. Also the structure "N≡C-N" has been suggested by Herzberg and Travis, based on the bond distance of 1.232 Å, which is in good agreement with the C-N bond length observed in the HNCO, HNCS and CH<sub>3</sub>NCS. The principal moment of inertia is 7.060 x 10<sup>-39</sup> g cm<sup>2</sup>.

D. E. Milligan, M. E. Jacox and A. M. Basa, J. Chem. Phys. 43, 3149 (1965), have found two infrared-active vibrational fundamentals of NCN(g) at 423 and 1475 cm<sup>-1</sup> in the infrared and ultraviolet spectra by a matrix-isolation method. They also estimated the symmetric stretching frequency (ν<sub>1</sub> = 808 cm<sup>-1</sup>) by valence force calculation.

E. Weeserman, L. Barash and W. A. Yeager, J. Am. Chem. Soc. 87, 2075 (1965), have confirmed the NCN radical (g) is a linear molecule with a triplet ground state by electron paramagnetic resonance.

Dec. 31, 1960; Mar. 31, 1966

$S_{298.15}^0 = 33.17 \pm 0.2$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 $T_m = 723.15^\circ\text{K.}$   
 $T_m = 1123.15^\circ\text{K.}$   
 $\Delta H_f^0 = -268.79 \pm 0.05$  kcal. mole<sup>-1</sup>  
 $\Delta H_f^0 = -270.26 \pm 0.05$  kcal. mole<sup>-1</sup>  
 $\Delta H_f^0 = 0.185$  kcal. mole<sup>-1</sup>  
 $\Delta H_m^0 = 7.090$  kcal. mole<sup>-1</sup>

**Heat of Formation.**  
 The heat of formation was obtained from the heat of solution  $\Delta H_{\infty}^0 = -6.35$  kcal. mole<sup>-1</sup> and the heats of formation for Na<sup>+</sup>(aq) and CO<sub>3</sub><sup>2-</sup>(aq), -57.39 and -161.84 kcal. mole<sup>-1</sup>, respectively. The heat of solution was taken from J. P. Rupert, H. P. Hopkins, Jr., and C. A. Wulff, J. Phys. Chem. 59, 3059-62 (1955). The ionic heats of formation were taken from D. W. Gmehlin, V. B. Parker, S. M. Bailey, and R. H. Schumm "Selected Values of Chemical Thermodynamic Properties" NBS Technical Note 270-1, October 1, 1965.  
 A value of  $\Delta H_f^0 = -270.9$  kcal. mole<sup>-1</sup> has been selected by D. D. Wagman, Natl. Bur. Std. Rept. No. 8628, 87, Jan. 1965.

**Heat Capacity and Entropy.**  
 The low temperature heat capacities, 54.6-292.1°K., were measured by C. T. Anderson, J. Am. Chem. Soc. 55, 3621 (1933). In the temperature range 473.15-873.15°K. Popov and Galchenko (Source 1) measured the heat capacities (by heat conduction calorimetry) and observed two transformations, one at about 623°K. and the other at about 750°K. In the range 476-872°K. Ginzburg (Source 2) measured enthalpies in the temperature range 480-1350°K. and tabulated their data only and has tabulated thermodynamic functions in the range 500-1500°K. There appear to be inconsistencies among the data, equations and functions. Rolin and Recapet (Source 4) also measured the enthalpy in the temperature range 645-1322°K. Janz, Neunschwender and Kelly (Source 5) have given an enthalpy equation based on their heat content measured data in the range 707-1127°K. May (Source 6) has tabulated smoothed measured enthalpy values in the range 400-1500°K. All the above information was used in a Shomate analysis in order to smooth the enthalpies and calculate heat capacities. The values from the low and high temperature sources join smoothly at 298°K. The heat capacity was graphically extrapolated above the melting point.

The entropy was calculated at 54.60° using the Debye and Einstein function  $D(\frac{138}{T}) + 2E(\frac{2865}{T}) + 2D(\frac{737}{T})$  given by Anderson, loc. cit. The value of  $S_{54.6}^0 = 3.943$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>.

**Transition Data.**

$T_m$  was taken from Ginzburg loc. cit. and  $\Delta H_m^0$  was obtained from the above reported enthalpy measurements by means of Shomate function analysis. The heat of transition at 593.15°K. has been incorporated in the heat capacity.

**Melting Data.**

$T_m$  was taken from Ginzburg loc. cit. and  $\Delta H_m^0$  was obtained from the above reported enthalpy measurements by means of Shomate function analysis.

S<sub>298.15</sub>° = 37.14 ± 0.2 cal. deg.<sup>-1</sup> mole<sup>-1</sup>

ΔH<sub>f</sub><sup>o</sup> 298.15 = -285.21 ± 0.05 kcal. mole<sup>-1</sup>

H<sub>m</sub><sup>o</sup> = 1123.15°K.

ΔH<sub>m</sub><sup>o</sup> = 7.090 kcal. mole<sup>-1</sup>

Heat of Formation.

The ΔH<sub>f</sub><sup>o</sup> 298.15 was obtained from ΔH<sub>f</sub><sup>o</sup> 298.15(c) by adding ΔH<sub>m</sub><sup>o</sup> and the difference between H<sub>m</sub><sup>o</sup> - H<sub>m</sub><sup>o</sup> 298.15 for crystal and liquid.

Heat Capacity and Entropy.

A glass transition was assumed at 723.15°K. The heat capacity below 723.15°K. was obtained from the heat capacity of the crystal. Above 723.15°K. the heat capacity was adopted as 45.30 cal. deg.<sup>-1</sup> mole<sup>-1</sup>, based on the enthalpy measurements in the range 1127-1210°K. reported by G. J. Janz, E. Neuenchwander and F. J. Kelly, Trans. Faraday Soc. 59, 841 (1963). The entropy was obtained in a manner analogous to that of the heat of formation.

Melting Data.

See Ne<sub>2</sub>CO<sub>3</sub>(c) table.

CARBON MONOXIDE (CO)

(IDEAL GAS)

MOL. WT. = 28.01055

Around State Configuration 1 Σ<sup>+</sup>

ΔH<sub>f</sub><sup>0</sup> = 47.21 ± 0.01 cal. deg<sup>-1</sup> mole<sup>-1</sup>

ΔH<sub>f</sub><sup>0</sup> 298.15 = -28.42 ± 0.04 kcal. mole<sup>-1</sup>

ω<sub>e</sub> = 2169.52 cm<sup>-1</sup>

B<sub>0</sub> = 1.9302 cm<sup>-1</sup>

ω<sub>e</sub>x<sub>e</sub> = 13.453 cm<sup>-1</sup>

ω<sub>e</sub>y<sub>e</sub> = 0.01746 cm<sup>-1</sup>

σ = 1

r<sub>e</sub> = 1.1281 Å

Heat of Formation.

The enthalpy change (ΔH<sub>f</sub><sup>0</sup> 298.15) for the reaction: CO(g) + 1/2 O<sub>2</sub>(g) = CO<sub>2</sub>(g) was reported to be -87.636 ± 0.029 kcal. mole<sup>-1</sup>, based on molecular weight of CO<sub>2</sub> = 44.010, by F. D. Rossini, J. Research Nat. Bur. Standards 22, 407 (1933). It was recalculated to be -87.638 ± 0.03 kcal. mole<sup>-1</sup>, using molecular weight of CO<sub>2</sub> = 44.011, for internal consistency. From the value of ΔH<sub>f</sub><sup>0</sup> 298.15, the heat of formation (ΔH<sub>f</sub><sup>0</sup> 298.15) for CO(g) was derived to be -26.417 ± 0.04 kcal. mole<sup>-1</sup>, which yields D<sub>0</sub>(CO) = 11.09 e.v.

The D<sub>0</sub>(CO) value has been proposed to be 6.92 to 11.11 e.v. in the past few decades in order to explain data collected from spectroscopic, flame, shock-wave, detonation, and electron-impact studies. Recent evaluations by L. Brewer and A. Searcy, Ann. Rev. Phys. Chem. 7, 259 (1956); M. A. Fineman and A. W. Peurocelli, J. Chem. Phys. 36, 25 (1962); and C. P. Oatene and W. B. Water II, J. Chem. Phys. 39, 197 (1963) favored the value 11.11 e.v., reported by A. O. Geydon, "Dissociation Energies", Chapman and Hall Ltd., 1953.

The heat of combustion of CO(g) was also determined by J. H. Abery and E. Oriffitha, Proc. Roy. Soc. (London) [A] 143, 1 (1933), R. W. Fenning and F. T. Cotton, ibid., [A] 143, 17 (1933), and W. A. Roth and H. Banse, Arch. Eisenhütten 9, 43 (1932-33).

Heat Capacity and Entropy.

The functions adopted here were obtained from J. Belzer, L. O. Svedoff and H. L. Johnston, Ohio State University, TR 316-6, May 1, 1953, assuming the thermodynamic functions for the naturally occurring isotopic mixture to be the same as those for C<sup>12</sup>O<sup>16</sup>(g). The spectroscopic constants employed for calculation were reported by O. Herzberg, "Spectre of Diatomic Molecules", D. Van Nostrand Company, Inc., 1950. The tabulated functions include the second order corrections to the rigid-rotator and harmonic-oscillator molecular model for vibrational anharmonicity, rotational stretching and rotational-vibrational interaction.

The spectroscopic constants listed above are for the naturally occurring isotopic composition given by D. Strominger, J. M. Hollander and O. T. Searberg, Rev. Mod. Phys. 30, 585 (1958).

Thermodynamic properties for CO from 70 to 300°K., with pressures to 300 atmospheres were reported by J. O. Hunt and R. B. Stewart, NBS-TN-202, National Bureau of Standards, 1963. Calculations of the vapor pressure and heats of vaporization and sublimation of CO and CO<sub>2</sub> below one atmosphere were reported by J. C. Mullins, B. S. Kirk and W. T. Ziegler, U. S. Atomic Energy Commission NP-13662 (1963).

Heat of Formation

E. Ferrer and H. Wesemann, *Angew. Chem.* **45**, 795 (1932), report equilibrium constants from 623° to 873°K for the reaction CO<sub>2</sub>(g) + H<sub>2</sub>O(g) = COS(g) + H<sub>2</sub>O(g). These yield ΔH<sub>f</sub><sup>°</sup> 700 = 8.19 ± 0.23 kcal, whence ΔH<sub>f</sub><sup>°</sup> 298.15 for COS is -33.08 ± 0.25 kcal. mole<sup>-1</sup>. The same authors report equilibrium constants for the reaction COS(g) + H<sub>2</sub>S(g) = CS<sub>2</sub>(g) + H<sub>2</sub>O(g), but regard these as less reliable than the others. The resulting value of -26.39 kcal. mole<sup>-1</sup> for ΔH<sub>f</sub><sup>°</sup> 298.15 of COS has been disregarded.

Heat Capacity and Entropy

J. S. Gordon (private communication, February 1961) has used the constants listed above to calculate C<sub>p</sub> from 298.15° to 6000°K by the method of R. E. Pennington and K. A. Kobe, *J. Chem. Phys.* **22**, 1442 (1954), which takes anharmonicity, vibration-rotation interaction, and centrifugal stretching into account. The constants have been taken from C. A. Burrus and W. Gordy, *Phys. Rev.* **52**, 897 (1954), H. J. Callomon, D. C. McKean, and H. W. Thompson, *Proc. Roy. Soc. (London)* **A208**, 341 (1951), **A222**, 431 (1954), M. W. P. Strandberg, T. Wentink, and R. L. Kyhl, *Phys. Rev.* **75**, 270 (1949), C. H. Townes, A. N. Holden, and P. R. Merritt, *Phys. Rev.* **74**, 1113 (1948), and T. Wentink, *J. Chem. Phys.* **30**, 105 (1959). The thermodynamic functions below 298.15°K have been calculated for the rigidly rotating harmonic oscillator.

Point Group D<sub>∞h</sub>  
S<sub>298.15</sub> = 51.07 ± 0.03 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
ΔH<sub>f</sub><sup>0</sup> = -93.965 ± 0.011 kcal. mole<sup>-1</sup>  
ΔH<sub>f</sub><sup>0</sup> 298.15 = -94.054 ± 0.011 kcal. mole<sup>-1</sup>

Vibrational Frequencies and Degeneracies

| $\lambda$ , cm. <sup>-1</sup> | Deg. |
|-------------------------------|------|
| 1342.86 (1)                   |      |

| 2349.50 (1)                   |      |

Bond Distance: C-O = 1.16 Å  
Bond Angle: O-C-O = 180°  
Rotational Constant: B<sub>0</sub> = 0.39038 cm.<sup>-1</sup>  
σ = 2

Heat of Formation.

The enthalpy change (ΔH<sub>f</sub><sup>0</sup> 298.15) of the reaction C(c, graphite) + O<sub>2</sub>(g) = CO<sub>2</sub>(g) has been measured by P. H. Dewey and D. R. Harper, J. Res. Natl. Bur. Std. 21, 457 (1956), R. S. Jessup, *ibid.*, 21, 491 (1956), and E. J. Prosen and F. D. Rossini, *ibid.*, 33, 439 (1944). Based on these data, the heat of formation (ΔH<sub>f</sub><sup>0</sup> 298.15) for CO<sub>2</sub>(g) was reported to be -94.0518 ± 0.0108 kcal. mole<sup>-1</sup>, using molecular weight of CO<sub>2</sub> = 44.010, by E. J. Prosen, R. S. Jessup and F. D. Rossini, J. Research Natl. Bur. Standards 33, 447 (1944). This value was recalculated to be -94.054 ± 0.011 kcal. mole<sup>-1</sup>, based on molecular weight of CO<sub>2</sub> = 44.011, for internal consistency.

Heat Capacity and Entropy.

The functions adopted here were obtained from H. W. Woolley, J. Research Nat. Bur. Standards 52, 289 (1954) who calculated the thermodynamic functions by means of a direct summation for the naturally occurring isotopic composition. The spectroscopic constants used are essentially those selected by T. Wentnik, Jr., J. Chem. Phys. 30, 105 (1959). Slightly different sets of spectroscopic constants were obtained by C. P. Courtney, Mem. soc. roy. Liège 18, 496 (1957) and V. R. Stull, P. J. Wyatt and O. N. Pless, J. Chem. Phys. 37, 1442 (1962). The high-resolution infrared spectrum of 0.18 - enriched CO<sub>2</sub> was examined in the region 5400-1620 cm.<sup>-1</sup>, using an Ebert grating Spectrometer with spectral slit widths ranging from 0.4 to 0.2 cm.<sup>-1</sup> by G. V. Barney, Ph. D. Thesis, University of Washington, 1962.

The molecular structure was reported by G. Herzberg, "Infrared and Raman Spectra", D. Van Nostrand Company, Inc. 1945. The rotational constant, B<sub>0</sub>, was obtained from H. W. Woolley, loc. cit. The value of bond distance, r<sub>e</sub>, was calculated from B<sub>0</sub> which was derived from B<sub>0</sub> using B<sub>e</sub>-B<sub>0</sub> = 0.0011 cm.<sup>-1</sup> given in G. Herzberg, loc. cit. The principal moment of inertia is I = 7.1495 X 10<sup>-39</sup> g. cm.<sup>2</sup>

Heat capacities of CO<sub>2</sub>(g) at high pressures were reported by M. F. Vukalovich, V. V. Aitunin and A. N. Gureev, Teploenergetika, 12 (7), 56 (1965); K. Krueger, Ver. Daut. Ingr. Z., 106 (32) 1620 (1964), and M. F. Vukalovich and A. N. Gureev, Teploenergetika, 11 (8), 80 (1964).

COS

CARBON OXIDE SULFIDE (COS)

(IDEAL GAS)

MOL. WT. = 60.077

ΔH<sub>f</sub><sup>o</sup> = -33.11 ± 0.25 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> 298.15 = -33.08 ± 0.25 kcal. mole<sup>-1</sup>  
 S<sub>298.15</sub><sup>o</sup> = 55.323 cal. deg.<sup>-1</sup> mole<sup>-1</sup>

Point Group C<sub>∞v</sub>

Vibrational Levels and Multiplicities

| (ω), cm. <sup>-1</sup> | (g) |
|------------------------|-----|
| 859 (1)                | 1   |
| 524 (2)                | 2   |
| 2064 (1)               | 1   |

Rotational constant, B<sub>000</sub> = 0.20287 cm.<sup>-1</sup>  
 Ground State Multiplicity = 1  
 σ = 1

Spectroscopic constants used in calculating corrections to rigid rotator-harmonic oscillator approximation (cm.<sup>-1</sup>):  
 C<sub>1</sub> = 0.0006044 X<sub>1</sub> = -4.0  
 C<sub>2</sub> = 0.0003539 X<sub>2</sub> = -11.5  
 C<sub>3</sub> = 0.001838 X<sub>3</sub> = -7.0  
 D<sub>000</sub> = 4.37 x 10<sup>-6</sup>  
 A<sub>000</sub> = 0  
 C<sub>000</sub> = 0

Heat of Formation

E. Terres and H. Wesemann, Angew. Chem. 45, 795 (1932), report equilibrium constants from 623° to 873°K for the reaction CO<sub>2</sub>(g) + H<sub>2</sub>S(g) ⇌ COS(g) + H<sub>2</sub>O(g). These yield ΔH<sub>f</sub> 700 = 8.13 ± 0.23 kcal, whence ΔH<sub>f</sub> 298.15 for COS is -33.08 ± 0.25 kcal. mole<sup>-1</sup>. The same authors report equilibrium constants for the reaction COS(g) + H<sub>2</sub>S(g) ⇌ CS<sub>2</sub>(g) + H<sub>2</sub>O(g), but regard these as less reliable than the others. The resulting value of -26.39 kcal. mole<sup>-1</sup> for ΔH<sub>f</sub> 298.15 of COS has been disregarded.

Heat Capacity and Entropy

J. S. Gordon (private communication, February 1961) has used the constants listed above to calculate C<sub>p</sub> from 298.15° to 6000°K by the method of R. E. Pennington and K. A. Kobe, J. Chem. Phys. 22, 1442 (1954), which takes anharmonicity, vibration-rotation interaction, and centrifugal stretching into account. The constants have been taken from C. A. Burrus and W. Gordy, Phys. Rev. 93, 897 (1954), H. J. Callomon, D. C. McKean, and H. W. Thompson, Proc. Roy. Soc. (London) A208, 341 (1951), A222, 431 (1954), M. W. P. Strandberg, T. Wentink, and R. L. Kohn, Phys. Rev. 75, 270 (1949), C. H. Townes, A. N. Holden, and F. R. Merritt, Phys. Rev. 74, 1113 (1948), and T. Wentink, J. Chem. Phys. 30, 105 (1959). The thermodynamic functions below 298.15°K have been calculated for the rigidly rotating harmonic oscillator.

CARBON DIOXIDE (CO<sub>2</sub>) (IDEAL GAS)

MOL. WT. = 44.00995

Point Group D<sub>∞h</sub>  
 $\Delta H_f^0 = -85.865 \pm 0.011 \text{ kcal. mole}^{-1}$   
 $\Delta H_f^{298.15} = -94.054 \pm 0.011 \text{ kcal. mole}^{-1}$

$S_{298.15}^0 = 51.07 \pm 0.03 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$

Vibrational Frequencies and Degeneracies

|                                |

| 667.30 (2)                     |
| 2349.30 (1)                    |

Bond Distance: C-O = 1.16 Å  
 Bond Angle: O-C-O = 180°  
 Rotational Constant: B<sub>0</sub> = 0.38038 cm<sup>-1</sup>  
 σ = 2

Heat of Formation.  
 The enthalpy change ( $\Delta H_f^{298.15}$ ) of the reaction C(c, graphite) + O<sub>2</sub>(g) = CO<sub>2</sub>(g) has been measured by P. H. Dewey and D. R. Harper, *J. Res. Natl. Bur. Std.* **21**, 457 (1956), R. S. Jessup, *ibid.* **21**, 491 (1956), and E. J. Frosen and F. D. Rossini, *ibid.* **33**, 439 (1944). Based on these data, the heat of formation ( $\Delta H_f^{298.15}$ ) for CO<sub>2</sub>(g) was reported to be -94.0518 ± 0.0108 kcal. mole<sup>-1</sup>, using molecular weight of CO<sub>2</sub> = 44.010, by E. J. Frosen, R. S. Jessup and F. D. Rossini, *J. Research Natl. Bur. Standards* **33**, 447 (1944). This value was recalculated to be -94.054 ± 0.011 kcal. mole<sup>-1</sup>, based on molecular weight of CO<sub>2</sub> = 44.011, for internal consistency.

Heat Capacity and Entropy.

The functions adopted here were obtained from H. W. Woolley, *J. Research Nat. Bur. Standards* **52**, 289 (1954) who calculated the thermodynamic functions by means of a direct summation for the naturally occurring isotopic composition. The spectroscopic constants used are essentially those selected by T. Wentink, Jr., *J. Chem. Phys.* **30**, 105 (1959). Slightly different sets of spectroscopic constants were obtained by C. P. Courtney, *Mem. acc. roy. Liège* **18**, 496 (1957) and V. R. Stull, P. J. Wyatt and O. N. Plass, *J. Chem. Phys.* **37**, 1442 (1962). The high-resolution infrared spectrum of O<sup>18</sup>-enriched CO<sub>2</sub> was examined in the region 5400-1620 cm<sup>-1</sup>, using an Ebert grating Spectrometer with spectral slit widths ranging from 0.4 to 0.2 cm<sup>-1</sup> by C. V. Barney, Ph. D. Thesis, University of Washington, 1962.

The molecular structure was reported by O. Herzberg, "Infrared and Raman Spectra", D. Van Nostrand Company, Inc. 1945. The rotational constant, B<sub>0</sub>, was obtained from H. W. Woolley, loc. cit. The value of bond distance, r<sub>e</sub>, was calculated from B<sub>0</sub> which was derived from B<sub>0</sub>, using B<sub>0</sub>-B<sub>0</sub> = 0.0011 cm<sup>-1</sup> given in G. Herzberg, loc. cit. The principal moment of inertia is I = 7.1495 × 10<sup>-39</sup> g. cm<sup>2</sup>.

Heat capacities of CO<sub>2</sub>(g) at high pressures were reported by M. P. Vukelovich, V. V. Altunin and A. N. Ourshev, *Teploenergetika*, **12** (7), 56 (1965); K. Krueger, *Ver. Daut. Ingr. Z.*, **106** (32) 1620 (1964), and M. P. Vukelovich and A. N. Ourshev, *Teploenergetika*, **11** (8), 60 (1964).

Bond Distance: C-O = [1.25] Å

Bond Angle: O-C-O = [127 ± 8]°

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [2.1296] × 10<sup>-116</sup> g<sup>3</sup> cm<sup>6</sup>

$$\sigma = [2]$$

Heat of Formation.

The heat of formation, ΔH<sub>f</sub><sup>298</sup>(CO<sub>2</sub><sup>-</sup>, g) = -105.5 ± 2.7 kcal/mol, is estimated from ΔH<sub>f</sub><sup>298</sup>(H<sub>2</sub>O, g) = -88.6 ± 1.0 kcal/mol for HCO<sub>2</sub><sup>-</sup>(g) → H(g) + CO<sub>2</sub><sup>-</sup>(g), using the ΔH<sub>f</sub><sup>298</sup>(HCO<sub>2</sub><sup>-</sup>, g) = -142 ± 17 kcal/mol and ΔH<sub>f</sub><sup>298</sup>(H, g) = 52.1 kcal/mol. The value of ΔH<sub>f</sub><sup>298</sup> is assumed to be the same as that for HCOOH(g) → H(g) + COOH(g). The values of ΔH<sub>f</sub><sup>298</sup>(HCOOH, g) and ΔH<sub>f</sub><sup>298</sup>(H, g), -90.5 and 52.1 kcal/mol, respectively, are from "Selected Values of Chemical Thermodynamic Properties," Natl. Bur. Std. Tech. Note 270-1, Washington, D. C., Oct. 1965, and the value of ΔH<sub>f</sub><sup>298</sup>(COOH, g), -54 ± 3 kcal/mol, is from S. W. Benson, J. Chem. Ed. 42, 502 (1965). The value of ΔH<sub>f</sub><sup>298</sup>(HCO<sub>2</sub><sup>-</sup>, g) is estimated from an approximate lattice energy calculation for sodium formate. The derived electron affinity of CO<sub>2</sub>(g) is 11.5 kcal/mol (0.5 eV) with an estimated uncertainty range of 0-40 kcal/mol.

Heat Capacity and Entropy.

The correlations of A. D. Walsh, J. Chem. Soc. 1953, 2266, predict a bent molecular structure for CO<sub>2</sub><sup>-</sup> based on its 17 valence electrons. K. O. Harman and I. C. Hisatsune, J. Chem. Phys. 44, 1913 (1966), measured the asymmetric C-O stretching frequency and derived the bond angle of 127 ± 8° from the infrared spectrum of matrix-isolated CO<sub>2</sub><sup>-</sup>. They also estimated the bond distance C-O and the symmetric stretching and the bending vibrational frequencies by the valence force method. These molecular constants are adopted in the tabulation. The three principal moments of inertia are I<sub>A</sub> = 0.4511 × 10<sup>-39</sup>, I<sub>B</sub> = 6.6491 × 10<sup>-39</sup> and I<sub>C</sub> = 7.1002 × 10<sup>-39</sup> g cm<sup>2</sup>.

D. W. Ovenall and D. H. Whiffen, Mol. Phys. 4, 135 (1961), have derived a bond angle of 134° which is in good agreement with the value selected. This result was obtained from electron spin resonance for the CO<sub>2</sub><sup>-</sup> radical trapped in sodium formate.

Heat of Formation.

$\Delta H_f^{298.15}$  was calculated from the dissociation energy ( $D_0^0$ ) given by A. G. Gaydon, "Dissociation Energies and Spectra of Diatomic Molecules," 2nd Ed., Chapman and Hall (1953). H. Barwald, G. Herzberg, and L. Herzberg, Ann. Physik 20, 569 (1934) reported a  $D_0^0 = 6.9$  e.v. A. G. Gaydon (loc. cit.) reports that a linear Birge-Sponer extrapolation for  $\sum \epsilon_i^2 (\nu_i - 0.9)$  gives a  $D_0^0 = 6.9$  e.v. and that a linear Birge-Sponer extrapolation of the excited states  $A^1\Pi$  and  $B^1\Sigma$  favored a similar value. Using the spectral data of H. Barwald et al. (loc. cit.), Gaydon concludes that  $D_0^0$  is  $6 \pm 1$  e.v. The uncertainty reported by Gaydon (loc. cit.)  $\pm 1$  e.v. corresponds to an uncertainty of  $\pm 23.1$  kcal. mole<sup>-1</sup> for the  $\Delta H_f^{298.15}$ . The 6.9 e.v. of H. Barwald et al. (loc. cit.) would give a  $\Delta H_f^{298.15} = 90.6$  kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy.

The molecular constants were taken from G. Herzberg, "Spectra of Diatomic Molecules," D. Van Nostrand Company, Inc., New York (1950).

CS

CARBON MONOSULPHIDE (CS)

(IDEAL GAS)

MOL. WT. = 44.077

$$\Delta H_f^0 = 54.2 \pm 5 \text{ kcal. mole}^{-1}$$

$$\Delta H_{298.15}^0 = 55.0 \pm 5 \text{ kcal. mole}^{-1}$$

$$S_{298.15}^0 = 50.3 \pm 0.01 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$$

Electronic Level and Multiplicity

$$\frac{E_1}{0} = 1$$

$$\lambda_e = 1285.08 \text{ cm.}^{-1}$$

$$\alpha_e = 0.82005 \text{ cm.}^{-1}$$

$$r_e = 1.535 \text{ \AA}$$

Heat of Formation.

A. Lagerqvist, H. Westerlund, C. V. Wright and R. F. Barrow, Arkiv for Fysik 14, 387 (1958) examined the UV band system of CS and made a new extrapolation of the ground state vibrational levels to find  $D_0^0 = 7.85 \text{ e.v.}$ , which leads to  $\Delta H_f^0 \text{ CS} = 55 \pm 5.0 \text{ kcal. mole}^{-1}$ . H. Scharfer and H. Wiedemeyer, Paper presented at the XVIIIth IUPAC Congress Montreal (1961). have measured  $\Delta H_f^0 \text{ CS} = 55 \pm 3 \text{ kcal. mole}^{-1}$  by an equilibrium method and found  $58 \pm 3 \text{ kcal. mole}^{-1}$ . E. Gallegos and R. W. Kiser, J. Phys. Chem. 65, 1177 (1961) obtained a value of  $\Delta H_f^0 \text{ CS(g)} = 55.0 \text{ kcal. mole}^{-1}$  from the heat of formation of CS<sup>+</sup> and the ionization potential of CS. C. J. Fincham and R. A. Bergman, J. Metals, 9, 680 (1957) measured the equilibrium between CS<sub>2</sub> and sulphur containing ore. Combining these with smaller experiments for H<sub>2</sub>S the heat of formation of CS at 298 K is calculated to be 69.0 kcal. mole<sup>-1</sup>. The gases assumed are CS<sub>2</sub>, CS, S, S<sub>2</sub>, H<sub>2</sub>, H<sub>2</sub>S, and HS - because of the complex equilibria and the use of outside data for the H<sub>2</sub>S equilibrium, the assumption of P<sub>H<sub>2</sub></sub> = 1 atm. and the uncertainty in HS values, this value was given no weight.

Heat Capacity and Entropy.

A. Lagerqvist, et al., loc. cit., give the vibrational constants. The rotational constants are from the microwave measurements of R. C. Mockler and R. Bird, Phys. Rev. 98, 1837 (1955).

## Heat of Formation

W. Good and J. P. McCullough, private communication, September 21, 1960, report  $\Delta H_f^\circ$  298.15 from an analysis of combustion calorimetry data of CS<sub>2</sub>.

## Heat Capacity and Entropy

Functions at 100° and 200°K were calculated by the RHO approximation using the fundamental vibrational levels of T. Wentink, Jr., J. Chem. Phys. 29, 168 (1958) calculated from zero order levels reported by B. P. Stoicheff, Can. J. Phys. 36, 218 (1958).  $S_{298.15}^\circ$  and  $C_p$  from 298.15° to 6000°K taken from J. S. Gordon, private communication, February 7, 1961. In addition to the fundamental levels listed above, Gordon, in his calculation of this function, used the anharmonic constants derived from high resolution Raman spectra by Stoicheff, and the vibration-rotation interaction constants reported by A. H. Quenther, T. A. Wiggins and D. H. Rank, J. Chem. Phys. 28, 682 (1958).

J. P. McCullough, private communication, February 17, 1961, has correlated and summarized the experimental thermodynamic data for CS<sub>2</sub> by a set of empirical equations. The result for  $C_p$  is

$$C_p (\pm 0.5\%) = 6.478 + 1.8931 \times 10^{-2} T - 1.3873 \times 10^{-5} T^2 \text{ cal. deg.}^{-1} \text{ mole}^{-1} \text{ (325-502°K.)}$$

The experimental values of  $C_p$  were then fit within 0.08% by a given set of molecular parameters different from that used by Gordon. However, in the temperature range given above, Gordon's calculation is within the uncertainty indicated by McCullough.

Since no method of calculating anharmonic corrections for polystomonic molecules has been programmed, Gordon's values were employed.

OPW = 40.09715

$$\Delta H_{f0}^{\circ} = -16.9 \pm 1.5 \text{ kcal/mol}$$

$$\Delta H_{f298.15}^{\circ} = -17.1 \pm 1.5 \text{ kcal/mol}$$

$$S_{298.15}^{\circ} = 3.94 \pm 0.03 \text{ gibbs/mol}$$

$$T_d = [3245] \text{ }^{\circ}\text{K}$$

Heat of Formation.

The heat of formation is calculated from  $\Delta H_{f298}^{\circ} = -591.9 \text{ kcal/mol}$  for  $\text{SiC}(\alpha) + 4\text{F}_2(\text{g}) \rightarrow \text{SiF}_4(\text{g}) + \text{CF}_4(\text{g})$  based on the tentative value of  $\Delta H_{f298}^{\circ} = -223.1 \text{ kcal/mol}$  for  $\text{CF}_4(\text{g})$ . Greenberg<sup>1</sup> determined the enthalpy of reaction by fluorine bomb calorimetry. Data of Humphrey<sup>2</sup> obtained by oxygen bomb calorimetry yield a  $\Delta H_{f1}^{\circ}$  which is over 2 kcal more negative; however, this difference is probably within the uncertainty due to use of large amounts of Ti as a kindling agent and to corrections for incomplete combustion. Decomposition pressure data obtained mass spectrometrically by Drowart<sup>3</sup> are in close agreement with the selected  $\Delta H_{f1}^{\circ}$ , but Knudsen weight loss data of Orievason<sup>4</sup> and solubility-activity data of Kirkwood<sup>5</sup> yield values less negative by 2 and 3 kcal, respectively. The results are summarized below.

The data of Drowart show a significant drift while those of Orievason do not, but the latter should be corrected for  $\text{C}_2\text{Si}(\text{g})$  and  $\text{CSi}_2(\text{g})$  which are present in amounts of about 4 and 3%, respectively, at 2000°K. Silicon carbide may have a small vaporization coefficient, since rates of free evaporation reported by Voronin<sup>6</sup> and Ghoahatagore<sup>7</sup> yield apparent pressures which are smaller by factors of 1/50 to 1/10000.

 B)  $\text{SiC}(\alpha) + 2\text{O}_2(\text{g}) \rightarrow \text{SiO}_2(\text{low-qtz}) + \text{CO}_2(\text{g})$   
 \*Value in parentheses is based on authors' data for Si(1)  $\rightarrow$  Si(g) rather than JANAF value.

Heat Capacity and Entropy.

Low temperature heat capacities are from data (54-296°K) of Humphrey<sup>2</sup> and are in good agreement with earlier data (54-295°K) of Kelley<sup>8</sup>. The entropy is obtained from Cp using  $S_{50}^{\circ} = 0.038 \text{ eu}$ . Cp<sup>9</sup> above room temperature of the data enthalpy data of Humphrey<sup>2</sup> [389-1789°K], Walker<sup>9</sup> [373-1073°K] and Magna<sup>10</sup> [372-1172°K]. Maximum deviations of the data from the selected values are 1.4, 2 and -1.7%, respectively; these occur in the range 370-621°K. Kirillin<sup>11</sup> obtained enthalpy data (13114-2843°K) for SiC mixed with 12% free carbon. When corrected for free carbon but not for 0.73% iron impurity, these data deviate by -1.1-5.6 from the selected values. Enthalpies (793-1790°K) of Fieldhouse<sup>12</sup> are high by 1-8% while those of Makalmenko<sup>13</sup> were not available for analysis.

Transition Data.

SiC( $\alpha$ ), also called hexagonal II or 6H, is one of the more common of many hexagonal forms which arise from various possible stacking sequences of the hexagonal SiC layers<sup>14</sup>. The properties of these phases are so similar that they have not been adequately differentiated thermodynamically. It has frequently been assumed that cubic SiC( $\beta$ ) transforms to alpha at about 2300°K, but this seems unlikely since both phases have been prepared over temperature ranges of 1700-3000°K<sup>14</sup>. Heat of formation and equilibrium data indicate that alpha is less stable up to 2000°K. The adopted functions suggest that this is the case at all temperatures; however, the stability difference is small.

Decomposition Data.

The decomposition temperature is calculated as the value at which the total pressure reaches one atm for vapor content of  $\text{C}_2\text{Si}(44.3 \text{ mol } \%), \text{Si}(32.0\%), \text{CSi}_2(21.2\%), \text{Si}_2(1.9\%), \text{CSi}(0.27\%),$  and  $\text{Si}(0.25\%)$ . The tables predict decomposition to graphite and pure liquid silicon at about 3280°K; however, Seese<sup>15</sup> observed peritectic decomposition to graphite and solution containing 19 atom percent of carbon at 3103±40°K. In contrast, Dolloff<sup>16</sup> reported the peritectic at 2813±40°K and 27 percent carbon. Badami<sup>17</sup> has shown that decomposition in vacuum at lower temperatures (2400°K) leads to graphite.

Heat of Formation:

$S_{298.15}^{\circ} = 3.97 \pm 0.03$  gibbs/mol  
 $Td = [3259] \text{ } ^{\circ}K$

$\Delta H_f^{\circ} = -17.3 \pm 1.5$  kcal/mol  
 $\Delta H_f^{\circ} = -17.5 \pm 1.5$  kcal/mol

The heat of formation is calculated from  $\Delta H_f^{\circ} = -591.5$  kcal/mol for  $SiC(\beta) + 4F_2(g) \rightarrow SiF_4(g) + CF_4(g)$ , based on the tentative value of  $\Delta H_f^{\circ} = -223 \pm 1$  kcal/mol for  $CF_4(g)$ . Greenberg<sup>1</sup> determined the enthalpy of reaction by fluorine bomb calorimetry. Data of Humphrey<sup>2</sup> obtained by oxygen bomb calorimetry yield a  $\Delta H_f^{\circ}$  which is over 3 kcal more negative; however, this difference is probably within the uncertainties due to use of large amounts of Ti as a kindling agent and to corrections for incomplete combustion. Decomposition pressure data obtained with the Knudsen weight loss method by Davis<sup>3</sup> are in good agreement with the selected  $\Delta H_f^{\circ}$ , but similar data of Orieverson<sup>4</sup> and solubility-activity data of Rein<sup>5</sup> and d'Entremont<sup>6</sup> yield values less negative by 1.6 to 2.5 kcal. The results are summarized below. Other equilibrium data<sup>5</sup> relating SiC and SiO<sub>2</sub> are not included, pending the revision of tables for SiO<sub>2</sub>.

The date of Davis show a serious drift, while those of Orieverson do not; but the latter should be corrected for  $C_2Si(g)$  and  $CSi_2(g)$  which are present in amounts of about 4 and 3%, respectively, at 2000°K. Silicon carbide may have a small vaporization coefficient, since rates of free evaporation reported by Voronin<sup>7</sup> and Ohoatagore<sup>8</sup> yield apparent pressures which are smaller by factors of 1/30 to 1/10000.

A)  $SiC(\beta) + 4F_2(g) \rightarrow SiF_4(g) + CF_4(g)$  C)  $SiC(\beta) \rightarrow C(\text{graph}) + Si(g)$   
 B)  $SiC(\beta) + 2O_2(g) \rightarrow SiO_2(\text{low quartz}) + CO_2(g)$  D)  $SiC(\beta) \rightarrow C(\text{graph}) + Si(l)$

\*Value in parentheses is based on author's data for Si(l)  $\rightarrow$  Si(g) rather than JANAF value.

Heat Capacity and Entropy.

Low temperature heat capacities are from data (54-296°K) of Humphrey<sup>2</sup>. The entropy is obtained from  $Op^*$  using  $S_{298}^{\circ} = 0.041$  eu.  $Op^*$  above room temperature is based on Humphrey's enthalpy data (389-1693°K), which show a maximum deviation of  $\pm 1.6\%$  from the selected functions. Humphrey's sample contained about 1% of  $\alpha$ -SiC and about 0.6% of other impurities. Kirillin<sup>9</sup> obtained enthalpy data (1114-2843°K) for SiC mixed with 12% free carbon. When corrected for free carbon but not for 0.7% iron impurity, these data deviate by -1±2% from the selected values.

Transition Data.

SiC( $\beta$ ), also called cubic or 3C, has a structure of the diamond or zinc blende type<sup>10</sup>. The cubic phase differs from the many hexagonal forms only in the order of the stacking sequence of the hexagonal SiC layers. It has frequently been assumed that  $\beta$  transforms into  $\alpha$  at about 2300°K, but this seems unlikely, since both phases have been prepared over temperature ranges of 1700-3000°K. Heat of formation and equilibrium data indicate that  $\beta$  is more stable up to 2000°K. The adopted functions suggest that this is the case at all temperatures; however, the stability difference is small.

Decomposition Data.

The decomposition temperature is calculated as the value at which the total pressure reaches one atm for vapor consisting of  $C_2Si(45.4 \text{ mol } \%)$ ,  $Si(32.1\%)$ ,  $CSi_2(20.1\%)$ ,  $Si_2(1.8\%)$ ,  $CSi(0.28\%)$  and  $Si_3(0.23\%)$ . The tables predict decomposition to graphite and pure liquid silicon at about 3337°K; however, Seacel<sup>11</sup> observed peritectic decomposition to graphite and solution containing 19 atom percent of carbon at 3103±40°K. In contrast, Dollof<sup>12</sup> reported the peritectic at 2813±40°K and 27 percent carbon.

Heat of Formation.

Drowart and co-workers have used the Knudsen effusion-mass spectrometric technique to determine the vapor equilibrium over the systems SiC-graphite and boron-silicon-graphite. Third law analysis of the partial pressures of Si and SiC yields the results summarized below. The adopted value,  $\Delta H^{\circ}_{298} = 172 \pm 8$ , is the mean of the two results and the uncertainty reflects the possible effect of an error of up to 4 eu in the functions. The corresponding dissociation energy is  $D^{\circ}_0 = 106.5 \pm 8 \text{ kcal/mol}$ .

Drift (eu) 3rd Law

Heat Capacity and Entropy.

The ground state is assumed to be  $1^1S$ , as suggested by Weltner and McLeod<sup>3</sup>. By analogy with  $C_2$ , there should be a low-lying  $3^1\Pi$  excited state; this would assume the thermodynamic functions at temperatures above 2000°K if the level lies below 5000  $\text{cm}^{-1}$ . The  $3^1\Pi$  level is assumed to lie at 1000  $\text{cm}^{-1}$ , intermediate between the value<sup>4</sup> observed for  $C_2$  and that estimated for  $Si_2$  (see JANAF table). Additional excited states,  $3^1\Sigma$ ,  $1^1\Pi$ ,  $1^1\Delta$  and  $1^1Z$ , are estimated by comparison with those observed or predicted<sup>5</sup> for  $C_2$ . The estimates for the electronic levels are relatively uncertain and probably yield an upper limit for the entropy at temperatures where SiC(g) is significant. A probable lower limit for the electronic contribution may be obtained by increasing the  $3^1\Pi$  level to 7000  $\text{cm}^{-1}$  and omitting the other excited states. This would reduce the entropy by 3.5 and 2.0 eu at 2000 and 4000°K.

The vibrational frequency is that estimated by Weltner<sup>3</sup> from a valence bond calculation using  $k = 7.44 \times 10^5 \text{ dyn/cm}$  obtained from  $C_2Si$ . The constants  $w_{e^*}$ ,  $o$  and  $r_e$  are estimated by interpolation between those  $6,4$  for the  $3^1\Pi_u$  state of  $Si_2$  and  $C_2$ . Use of constants based on the  $3^1\Pi$  state is consistent with the assumption that this state dominates the electronic partition function at high temperatures.  $B_e$  is calculated from  $r_e$ .

Bond Distance: C-Si = [1.75] Å  
 Bond Angle: C-Si-Si = [180°]  
 Rotational Constant: B<sub>0</sub> = [0.0980] cm<sup>-1</sup>

Heat of Formation

The selected value is an average based on the equilibrium data summarized below. Drowart and co-workers have used the Knudsen effusion-mass spectrometric technique to determine the vapor species over the SiC-graphite<sup>1</sup>, SiC-silicon<sup>2</sup> and boron-carbon-silicon<sup>3</sup> systems. Third law analysis of the partial pressures of CSi<sub>2</sub> and Si yields the concordant values 127.4, 127.9 and 128.6 kcal/mol. Two of the drifts are rather large, but they are opposite in sign so that no consistent entropy difference is apparent between the data and the tabulated functions. The drifts may be related to the low condensation coefficient for CSi<sub>2</sub> suggested by Drowart<sup>1</sup>. Rates of free evaporation reported by Voronin<sup>4</sup> yield apparent pressures which are lower by a factor of 1/30, thus confirming the existence of a low evaporation coefficient. The adopted value of  $\Delta H_f^\circ_{298} = 128 \pm 6 \text{ kcal/mol}$  includes allowance for an error in the entropy of up to 3 eu.

| Source           | Method     | Reaction | Range, T°K | No. of Points | $\Delta H_f^\circ_{298}$ (kcal/mol) | Drift <sup>5</sup> (kcal/mol) |

A) C(graph) + 2 Si(g) = CSi<sub>2</sub>(g)  
 B) SiC(α) + Si(l) = CSi<sub>2</sub>(g)

Heat Capacity and Entropy

Weltner and McLeod<sup>5</sup> observed a band system in absorption at 5300 Å in matrix isolation and assigned this tentatively to the transition  $^1\Pi_u - X^1\Sigma_g^+$  of CSi<sub>2</sub>. This assignment is adopted, although the evidence is not at all conclusive. A  $^3\Pi_u$  excited state is assumed to lie at 12000 cm<sup>-1</sup>, presumably arising from the same molecular orbital configuration as the  $^1\Pi_u$  state. A linear, symmetric structure is assumed, as suggested by Weltner. The bond distance is estimated by comparison with Si<sub>2</sub>, C<sub>2</sub> and C<sub>3</sub>. Vibrational frequencies are estimated from a valence bond calculation using  $k_1 = 7.46 \times 10^5$  and  $k_2/k_1^2 = 0.11 \times 10^5 \text{ dyn/cm}$ . The stretching force constant is taken from C<sub>2</sub>Si<sub>2</sub>, while the bending force constant is from C<sub>2</sub>Si and the  $^1\Pi_u$  excited state of C<sub>3</sub>. The moment of inertia is  $28.56 \times 10^{-39} \text{ g cm}^2$ .

TITANIUM CARBIDE (TiC)

(CRYSTAL)

GFW = 59.91115

ΔHf<sup>o</sup> = -43.7 ± 1 kcal/mol  
 ΔHf<sup>o</sup><sub>298.15</sub> = -44.0 ± 1 kcal/mol  
 ΔHm<sup>o</sup> = [17] kcal/mol

S<sup>o</sup><sub>298.15</sub> = 5.79 ± 0.05 gibbs/mol  
 Tm = 3290 ± 15°K

Heat of Formation

The adopted ΔHf<sup>o</sup><sub>298</sub> = -44.0 kcal/mol is derived from ΔHf<sup>o</sup><sub>298</sub> = -275.72 kcal/mol for reaction (a) determined by Humphrey (1) who burned TiC(c) in an oxygen bomb calorimeter. The author reported that the combustion product TiO<sub>2</sub> was >95 per cent rutile and <5 per cent anatase, the heat of formation is calculated assuming the above distribution. The uncertainty adopted is due mainly to the uncertainty in TiO<sub>2</sub>(rutile).

Using atomic absorption spectroscopy Vidale (2) determined that the pressure (Log P<sub>Ti</sub> = -7.269) of Ti(g) at 1666°K was equal to the pressure of TiC(c) at 2220°K. Using this data for reaction (b) we obtain a ΔHf<sup>o</sup><sub>298</sub> = -43.02 kcal/mol. Lowell and Williams (3) measured the ΔHf<sup>o</sup><sub>2028</sub> = -43.3 ± 4 kcal/mol of TiC(c) directly using a high temperature calorimeter, which reduces to ΔHf<sup>o</sup><sub>298</sub> = -37.7 ± 4 kcal/mol.

Fujishiro and Gokcen (4) determined the equilibrium pressure of Ti(g) in reaction (d) in the temperature range 2383-2593°K. Third law analysis of the data yields a ΔHf<sup>o</sup><sub>298</sub> = -31.6 kcal/mol. Brantley and Beckman (5) measured equilibrium pressures of CO for reaction (e) in the temperature range 1276 - 1428°K. Third law analysis of the data yields a ΔHf<sup>o</sup><sub>298</sub> = -61.9 kcal/mol.

Heat Capacity and Entropy

Low temperature heat capacities (55 - 295°K) have been taken from Kelley (6). Naylor (7) measured heat contents from 360 to 1738°K and Levinson (8) from 1274 to 2799°K. High temperature heat capacities are derived from the enthalpies by a fitting technique which constrains the curve to join smoothly with the low temperature values. Above 2799°K the heat capacity is graphically extrapolated. The entropy is based on S<sup>o</sup><sub>298</sub> = 5.79 ± 0.05 eu.

Melting Data

See liquid table.

## TITANIUM CARBIDE (TiC)

(LIQUID)

GFW = 59.91115

 $S_{298.15}^\circ = [11.329]$  gibbs/mol $T_m = 3290 \pm 15^\circ K$  $\Delta H_f^\circ_{298.15} = [-25.892 \pm 1]$  kcal/mol $\Delta H_m^\circ = [17]$  kcal/mol

## Heat of Formation

The heat of formation is obtained from  $\Delta H_f^\circ_{298}(c)$  by adding  $\Delta H_m^\circ$  and the differences between  $H_m^\circ - H_{298}^\circ$  for crystal and liquid.

## Heat Capacity and Entropy

A glass transition is assumed at 2200°K the heat capacity is obtained from that of the crystal, above 2200°K it is assumed constant and estimated as 15 gibbs/mol or 7.5 gibbs/g-atom. The entropy is obtained in a manner analogous to that of the heat of formation.

## Melting Data

The adopted  $T_m$  is taken from the phase diagram of the system Ti-C, at the composition 50% Ti and 50% C, reported by E. Rudy and D. P. Harmon, Aerojet-General Corporation, BSP No. 64-6699-735001, Contract AF-33(6115), April 1, 1965. Earlier reports by E. Friederich and L. Sittig, Z. Anorg. Chem. 144, 171(1925) and C. Agte and K. Moers, Z. Anorg. Chem. 195, 233 (1931), gave a  $T_m$  of 3430  $\pm$  100°K and 3410  $\pm$  90°K, respectively.  $\Delta H_m^\circ$  is derived from an estimated  $\Delta S_m = 2.5$  gibbs/g-atom, as suggested by O. Kubaschewski, E. L. Evans and C. B. Alcock, "Metallurgical Thermochemistry," Pergamon Press, New York, 1957.

MOL. WT. = 103.231

(CRYSTAL)

ZIRCONIUM CARBIDE (ZrC)

ΔH<sub>f</sub><sup>o</sup> = -46.8 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> 298.15 = -47.0 ± 3 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> = [19] kcal. mole<sup>-1</sup>

S<sub>298.15</sub> = 7.964 cal. deg<sup>-1</sup> mole<sup>-1</sup>  
 T<sub>m</sub> = 3605 ± 125°K

Heat of Formation.

ΔH<sub>f</sub><sup>o</sup> 298.15 = -47.16 ± 1.5 kcal. mole<sup>-1</sup> was calculated from the standard free energy of formation of -38.9 ± 1.5 kcal. mole<sup>-1</sup> at 2675°K. reported by B. D. Pollock, J. Phys. Chem. **65**, 733 (1961). Using spectrophotometric data reported by G. L. Vidale, Missile and Space Vehicle Department, General Electric R61SD147, August, 1961, we calculated ΔH<sub>f</sub><sup>o</sup> 298.15 = -46.9 ± 1 kcal. mole<sup>-1</sup>. These values were averaged with ΔH<sub>f</sub><sup>o</sup> 298.15 = 47.0 ± 0.6 kcal. mole<sup>-1</sup> reported by A. D. Wah, U. S. Bureau of Mines R16518 (1964). The equilibria data reported by G. H. Prescott Jr., J. Am. Chem. Soc. **49**, 2534 (1926) and V. S. Kutsev, E. P. Omont, and V. A. Epel'baum, Doklady Akad. Nauk SSSR **104**, 567 (1955) were considered but not used.

Heat Capacity and Entropy.

Heat content data over the range 470.8° to 1,174.4°K. were taken from a preliminary report by R. Mezaki, T. F. Jambois, A. K. Gangopadhyay, and J. L. Margrave, Univ. of Wisconsin, Madison, Wisconsin, "Thermodynamic Properties of Inorganic Substances VIII. The High Temperature Heat Contents of Zirconium Carbide and Tantalum Carbide". These data were smoothed by means of the Shomate plot into low temperature data reported by E. F. Westrum Jr. and G. Peick, J. Chem. Eng. Data, **6**, 176 (1963). High temperature data reported by D. S. Neel, C. D. Peers, S. Ogleby Jr., Southern Research Institute, Birmingham, Alabama, Technical Documentary Report No. MADD 60-924, p. 134, February 1962, and R. A. McDonald, F. L. Oettinger, and H. Prophet, CPFA Publication No. 44(u), p. 213, February 1964 were then used to obtain the heat capacity above 1174°K.

Melting Data.

Melting points were measured by C. Agte and H. Albertshum, Z. tech. Physik **11**, 182 (1930) and E. Friederich and L. Sittig, Z. Anorg. Chem., **144**, 169 (1925). The value of 3605 ± 125°K. by Agte and Albertshum was chosen. Friederich and Sittig obtained a measurement of 3300°K. but estimated 3500°K. because of the clouding formation of Zr<sub>2</sub>O<sub>3</sub>. Wayne L. Worrell, J. Phys. Chem., **68**, 954(1964) quoted a value of 3480°K. taken from E. K. Storms, Los Alamos Scientific Lab Report LAMS-2674, (1962). The heat of melting is derived from an estimated ΔS<sub>m</sub> = 2.5 cal. deg<sup>-1</sup> gm. atom<sup>-1</sup>.

Mar. 31, 1962; June 30, 1964; Dec. 31, 1964

$$S_{298.15}^{\circ} = [12.815] \text{ cal. deg.}^{-1} \text{ mole}^{-1}$$

$$T_m = 3805 \pm 125^{\circ}\text{K.}$$

Heat of Formation.

$\Delta H_f^{\circ} 298.15$  (l) was obtained from  $\Delta H_f^{\circ} 298.15$ (c) by adding  $\Delta H_m^{\circ}$  and the difference between  $\Delta H_{Tm}^{\circ}$  -  $H_{298.15}^{\circ}$  for crystal and liquid.

Heat Capacity and Entropy.

$C_p$  (l) at and below 2500°K. were assumed to be equal to those of ZrC(c). Above 2500°K. the heat capacity was estimated to be constant.  $S_{298.15}^{\circ}$ (l) is calculated based on  $S_{298.15}^{\circ}$ (c) and an estimated  $\Delta S_m^{\circ} = 2.5 \text{ cal. deg.}^{-1} \text{ g. atom}^{-1}$ .

Melting Data.

See ZrC(c) table for details.

Heat of Formation

Messerle and Kraus (1) have reported the dissociation energy as 49300 ± 300 cm<sup>-1</sup> from the variation of the rotational structure cut-off with vibrational level in the c<sup>1</sup><sub>g</sub><sup>+</sup> state. This state dissociates into C<sup>3</sup>P + C<sup>3</sup>P, due to an avoided crossing (2), these dissociation products are those of the ground state. The uncertainty in the determination is generous and thus we adopt D<sub>0</sub> = 140.98 ± 0.9 kcal or ΔHf<sub>0</sub><sup>o</sup>(C<sub>2</sub>, g) = 198.2 ± 0.9 kcal/mol, using ΔHf<sub>0</sub><sup>o</sup>(C, g) = 169.576 kcal/mol (3). Brewer et al. (4) have reviewed several other earlier determinations which confirm ΔHf<sub>0</sub><sup>o</sup> = 195 ± 5 kcal/mol. The extensive mass spectrometric data of Drowart et al. (5) yield a 3rd law ΔHf<sub>0</sub><sup>o</sup> = 199.2 ± 1.4 kcal/mol in excellent agreement with the adopted value.

Heat Capacity and Entropy

The observed molecular constants and electronic levels were taken from Bailik and Ramsay (2). The estimated parameters are from the correlation calculations of Fougere and Nesbet (E) and Clementi (Z), the electronic levels are T<sub>0</sub> values. Not all predicted states were included since the contribution of levels above 40000 cm<sup>-1</sup> is negligible. The functions were calculated from the partition function  $Q = \sum_i g_i \exp(-C_2 \epsilon_i / T)$ , the values for Q<sub>v</sub> and Q<sub>r</sub> were calculated with first order anharmonic corrections. The functions are similar to those reported by Altman (8) and Clementi (Z) but include several additional states.

Heat of Formation

The electron affinity of C<sub>2</sub> has been obtained by Honig (1) as 4 ± 0.8 ev from the difference in heats of sublimation of neutral C<sub>2</sub> and C<sub>2</sub><sup>-</sup> and the work function of graphite. Thus, we have the reaction

C<sub>2</sub>(g) + e<sup>-</sup> → C<sub>2</sub><sup>-</sup>(g) ΔH<sub>0</sub> = -92.2 ± 20 kcal.

Using ΔHf<sub>0</sub>(C<sub>2</sub>, g) = 198.2 kcal/mol (2), we obtain ΔHf<sub>0</sub>(C<sub>2</sub><sup>-</sup>, g) = 106 ± 20 kcal/mol, which is adopted. A value for the heat of formation may be obtained from a linear Birge-Sponer extrapolation of the ground state vibrational levels, which gives 195.8 kcal for the reaction

C<sub>2</sub><sup>-</sup>(g) → C(g) + C<sup>-</sup>(g).

With auxiliary data (2) this yields ΔHf<sub>0</sub>(C<sub>2</sub><sup>-</sup>, g) = 114.5 kcal/mol, in good agreement with the adopted value.

Heat Capacity and Entropy

The molecular constants and electronic levels are from Herzberg and Lagerqvist (3). The values are not definitely ascribed to C<sub>2</sub><sup>-</sup> by Herzberg and Lagerqvist, but there is a good deal of evidence to support this assignment. Recently Milligan and Jacox (4) have shown that matrix isolated bands previously attributed to C<sub>2</sub>(g) are enhanced in the presence of a photoelectron source. The matrix spectra correspond to the gas system reported by Herzberg and Lagerqvist (3) and leave little doubt that the species is C<sub>2</sub><sup>-</sup>.

The estimated electronic level is assumed to be a <sup>2</sup>Π state and is obtained from the isoelectronic CN(g) (2).

 $\sigma = 1$

Heat of Formation.

$\Delta H_f^\circ 298.15$  was estimated as a lower positive limit by National Bureau of Standards Report No. 6645, "Preliminary Report on the Thermodynamic Properties of Light-Element Compounds," January, 1960.

Heat Capacity and Entropy.

The vibrational frequencies, bond angle, configuration and moment of inertia,  $5.82 \times 10^{-39}$  g. cm.<sup>2</sup>, were estimated by Chupka, Berkowitz, Olesse, and Inghram, J. Phys. Chem. 62, 611 (1958). Bond distances were calculated assuming the C-C bond distance was the same as in acetylene.

Bond Distances: C-C = 1.395 Å C-Cl = 1.64 Å

Bond Angle: Cl-C-C = 180°

Rotational Constant: B<sub>0</sub> = 0.046368 cm<sup>-1</sup>

Heat of Formation

The heat of formation of dichloroacetylene is calculated from the estimated ΔH<sub>f298</sub><sup>o</sup> = -53 ± 10 kcal/mol for ClCCl(g) + Cl<sub>2</sub>(g) + Cl<sub>2</sub>(g), using ΔH<sub>f298</sub><sup>o</sup>(C<sub>2</sub>H<sub>2</sub>, g) = -2.9 kcal/mol (1). The value of ΔH<sub>f298</sub><sup>o</sup> is assumed to be the same as that for the reaction HCCH(g) + Cl<sub>2</sub>(g) → CHCl=CHCl(g), using ΔH<sub>f298</sub><sup>o</sup>(CHCl=CHCl, g) = 1.2 kcal/mol (2).

Heat Capacity and Entropy

The linear molecular structure and bond distances were determined from electron diffraction studies by Hassel and Vierwoll (3). The principal moment of inertia is 6.03668 × 10<sup>-38</sup> g cm<sup>2</sup>.

All five fundamental vibrational frequencies are calculated by the modified valence force method (4) from estimated force constants which are interpolated from those of C<sub>2</sub>F<sub>2</sub> (5), C<sub>2</sub>H<sub>2</sub> (6), CH<sub>2</sub>Cl<sub>2</sub> (7), CH<sub>2</sub>Br (8), and C<sub>2</sub>D<sub>2</sub> (9).

Heat of Formation

The heat of combustion (ΔE<sub>298</sub>) of C<sub>2</sub>Cl<sub>4</sub>(g) has been determined by the "Quartz Wool" method by L. Smith, L. Bjelleup, S. Krook and H. Westermarck, Acta Chem. Scand. Z, 65 (1953). The free chlorine produced from combustion was reduced to hydrogen chloride by a quartz spiral moistened with a solution of arsenious acid in the combustion bomb. Based on the reported results, the enthalpy change at 298°K for the reaction C<sub>2</sub>Cl<sub>4</sub>(g) + 2H<sub>2</sub>O(l) = 2CO<sub>2</sub>(g) + 4HCl(600H<sub>2</sub>O) is evaluated as -198.40 kcal/mol, using recent auxiliary data from U. S. Natl. Bur. Std. Tech. Note 270-1, 1965 and V. B. Parker, U. S. Natl. Bur. Std. NBSRS-NBS 2, 1965, and Cp for C<sub>2</sub>Cl<sub>4</sub>(l) from V. Y. Kurbatov, J. Gen. Chem. USSR(Eng. Transl.) 16, 372 (1948). Employing ΔH<sub>f298</sub> = -94.054, -39.823 and -68.315 kcal/mol for CO<sub>2</sub>(g), HCl(600H<sub>2</sub>O) and H<sub>2</sub>O(l), respectively, we calculate the heat of formation for C<sub>2</sub>Cl<sub>4</sub>(g) as -12.367 kcal/mol. Incorporating this value with the value ΔH<sub>v298</sub> = 9.4 kcal/mol obtained from E. Efring, Ph.D. Thesis, University of Lund, 1938, we derive ΔH<sub>f298</sub> = -2.97±0.7 kcal/mol for C<sub>2</sub>Cl<sub>4</sub>(g).

Heat Capacity and Entropy

The molecular structure of C<sub>2</sub>Cl<sub>4</sub>(g) was investigated by the sector-visual method of electron diffraction by C. H. Ramachandra and R. L. Livingston, Current Sci. 27, 330 (1958). The reported bond distances and angle are in agreement with those measured by I. L. Karle and J. Karle, J. Chem. Phys. 20, 63 (1952), using the sector-microphotometer method, and W. N. Lipscomb, Ph.D. Thesis, California Institute of Technology, 1946. The molecular structure has also been determined by L. O. Brockway, J. Y. Beach and L. Pauling, J. Am. Chem. Soc. 57, 2693 (1935), H. de Laszlo, Nature 135, 474 (1935), and R. W. Dornte, J. Chem. Phys. 1, 566 (1933), by use of electron diffraction. The values reported by Ramachandra and Livingston, loc. cit., are adopted.

The vibrational spectra of tetrachloroethylene have been studied by numerous investigators. The vibrational frequencies also reviewed the results of earlier investigations in detail.

The electronic levels and quantum weights are obtained from G. Herzberg, "Electronic Spectra of Polyatomic Molecules," D. Van Nostrand Co., Inc., New York, 1966.

The three principal moments of inertia are: I<sub>A</sub> = 4.88344 × 10<sup>-36</sup>, I<sub>B</sub> = 6.28884 × 10<sup>-36</sup> and I<sub>C</sub> = 1.11723 × 10<sup>-37</sup> g cm<sup>2</sup>.

Internal rotation  
 Bond Distances: Cl-C = 1.74 Å  
 Bond Angles: Cl-C-Cl = 110°  
 Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 1.2358 × 10<sup>-111</sup> g<sup>3</sup> cm<sup>6</sup>  
 C-C = 1.55 Å  
 Cl-C-C = 109°  
 σ = 6

Heat of Formation

Smith et al. (1) determined the heat of combustion of C<sub>2</sub>Cl<sub>6</sub>(g) to be ΔH<sub>293</sub><sup>o</sup> = -718.7 ± 2 cal/g (uncorrected) by use of the 'Quartz Wool' method. The free chlorine produced was reduced to HCl by employing the quartz spiral moistened with a solution of arsenious acid in the combustion bomb. Adopting the reported results and recent auxiliary data (2, 3, 4), we evaluate the values ΔH<sub>298</sub><sup>o</sup> = -171.925 and ΔH<sub>f298</sub><sup>o</sup> = -48.58 kcal/mol for C<sub>2</sub>Cl<sub>6</sub>(g). Kirkbride (5) measured the enthalpy changes as -32.0 and 4.7 kcal/mol for the following two reactions by solution calorimetry: C<sub>2</sub>Cl<sub>6</sub>(l) + Cl<sub>2</sub>(g) = C<sub>2</sub>Cl<sub>4</sub>(aq) and C<sub>2</sub>Cl<sub>6</sub>(g) = C<sub>2</sub>Cl<sub>4</sub>(aq). Hence we obtain ΔH<sub>f298</sub><sup>o</sup> = -49.07 kcal/mol for C<sub>2</sub>Cl<sub>6</sub>(g), using ΔH<sub>f298</sub><sup>o</sup> (C<sub>2</sub>Cl<sub>4</sub>, l) = -12.37 kcal/mol. This value is in reasonable agreement with the adopted value -48.58 kcal/mol.

Hexachloroethane (c) has three modifications, namely triclinic, monoclinic and cubic, with transition temperatures of 318 and 345°K (4). The sublimation pressures over the different phases have been measured by Irvin (8), Lee (7), and Mitta (29). Based on these data, values for ΔH<sub>f298</sub><sup>o</sup> (triclinic) are derived by a modified second law method to be 16.5, 17.1 and 14.8 kcal/mol, respectively. The analysis depends on the Cp and ΔH<sup>o</sup> data determined by (4). The order of magnitude of the two ΔH<sup>o</sup> values is confirmed by R. A. McDonald, private communication, Thermal Research Laboratory, The Dow Chemical Company, Midland, Michigan. Pressures reported by Nelson (6) are systematically lower than the above data by about 10 per cent; therefore, his data are not used. Third law analysis is not applicable to the pressure data due to lack of S<sub>298</sub><sup>o</sup> (triclinic). Adopting ΔH<sub>f298</sub><sup>o</sup> = 16.5 and ΔH<sub>f298</sub><sup>o</sup> = -48.58 kcal/mol for C<sub>2</sub>Cl<sub>6</sub> (triclinic), we obtain ΔH<sub>f298</sub><sup>o</sup> = -32.08 kcal/mol for C<sub>2</sub>Cl<sub>6</sub>(g).

The equilibrium constant at 776°K for the reaction C<sub>2</sub>Cl<sub>6</sub>(g) = C<sub>2</sub>Cl<sub>4</sub>(g) + Cl<sub>2</sub>(g) was reported as 0.8 ± 0.1 (atm) by Puyo et al. (9). The corresponding enthalpy change at 298°K is evaluated to be 30.8 kcal/mol by the third law method, yielding ΔH<sub>f298</sub><sup>o</sup>(C<sub>2</sub>Cl<sub>6</sub>, g) = -33.77 kcal/mol which is in fair agreement with the adopted one.

Heat Capacity and Entropy

The molecular structure of C<sub>2</sub>Cl<sub>6</sub> has been studied previously by means of infrared and Raman spectroscopy (10), X-ray (11), and electron diffraction (12-18). The molecule was found to be in the staggered position in the vapor and solid states. The bond distances and angles adopted here are those reported by Swick et al. (18).

Incomplete assignments of vibrational frequencies for C<sub>2</sub>Cl<sub>6</sub>(g) were reported by many investigators (21-24). The adopted frequencies, except the torsional mode ν<sub>1</sub>, are obtained from Carney et al. (19). The torsional mode is treated as a hindered internal rotation, and thermodynamic properties are calculated (25) from the barrier height of V<sub>0</sub> = 12.6 kcal/mol which was evaluated by Karle (20) from electron diffraction data. The value of S<sub>298</sub><sup>o</sup> is calculated based on S<sub>298</sub><sup>o</sup> = 105.355 eu which is derived from the free rotor value S<sub>298</sub><sup>o</sup> = 104.121 eu by subtraction of the entropy difference between a free rotor and hindered rotor at 400°K. Internal rotation contributions to Cp at temperatures below 350°K could not be calculated since they are beyond the range of the values tabulated by Pitzer (25). These Cp contributions are estimated by graphical interpolation between internal rotation values above 350°K and the corresponding harmonic oscillator values (ν<sub>1</sub> = 67 cm<sup>-1</sup>, below 150°K. This calculation presumes that the internal rotation approaches harmonic oscillation as V/RT >> 1.

The three principal moments of inertia are: I<sub>A</sub> = I<sub>C</sub> = 1.1367 × 10<sup>-37</sup> and I<sub>B</sub> = 9.5648 × 10<sup>-38</sup> g cm<sup>2</sup>.

Bond Distance: C-F = [1.28] Å

C-C = [1.20] Å

Bond Angle: F-C-C = [180°]

Rotational Constant: B<sub>0</sub> = [0.1179] cm<sup>-1</sup>

Heat of Formation

M. Farber, M. A. Greenbaum, M. A. Frisch, H. C. Ko, G. Grenier and E. Graper, Rocket Power Inc., 3rd Quarterly Report, AFRL-TR-67-147, Contract F04611-67-C-0010, May 1967, have obtained equilibrium-weight-change data over the C-CF<sub>4</sub> system. Our reanalysis of these data assumes that the equilibrium constants for CF<sub>4</sub>, CF<sub>3</sub> and CF<sub>2</sub> are those in the JANAF Tables, and that C<sub>2</sub>F<sub>2</sub> was the only other C-F species present at equilibrium. This gives maximum possible concentrations of C<sub>2</sub>F<sub>2</sub> and places a lower limit on the heat of formation. The ΔH<sub>f,298</sub><sup>o</sup>(C<sub>2</sub>F<sub>2</sub>, g) values so obtained range from +10 kcal/mol from data at 2023°K to -10 kcal/mol from data at 2373°K; we adopt a weighted mean of +5.5 kcal/mol. This value still predicts complete dimerization of CF at 1 atmosphere pressure below about 2200°K, but only CF would exist under experimental conditions such as the study by Farber.

Farber et al, also investigated the mass spectrum of the vapor over the C-CF<sub>4</sub> system and did not detect any ion ascribable to C<sub>2</sub>F<sub>2</sub>. This is additional support for the value adopted. The C-C bond dissociation energy in C<sub>2</sub>F<sub>2</sub> is 113 kcal/mol, using the JANAF CF(g) table (Dec. 31st, 1967). This value is 115 kcal weaker than the bond dissociation energy of acetylene. In order to explain such a large decrease, a crossing of the repulsive approach of two <sup>2</sup>H CF molecules with an attractive approach of two <sup>1</sup>F CF molecules may be postulated. This follows the reasoning used by J. P. Simons, Nature 205, 1308 (1965), to explain the bond dissociation energy of C<sub>2</sub>F<sub>4</sub>.

Heat Capacity and Entropy

The molecular structure is assumed to be the same as that for C<sub>2</sub>H<sub>2</sub>(g). The C-F and C-C bond distances are estimated from those in HC = CF reported by J. K. Tyler and J. Sheridan, Trans. Faraday Soc. 59, 2661, 1966. The asymmetric stretching frequency, ν<sub>3</sub> = 1149 cm<sup>-1</sup>, was observed by J. Heicklen and V. Knight, J. Phys. Chem. 69, 2484 (1965). The other vibrational frequencies were estimated by comparison with those for C<sub>2</sub>H<sub>2</sub>(g) and C<sub>2</sub>H<sub>2</sub>F(g) reported by G. Herzberg, "Infrared and Raman Spectra," D. Van Nostrand Company, Inc., New York, 1945, G. R. Hunt and M. K. Wilson, J. Chem. Phys. 34, 1301 (1961), and J. K. Brown and J. K. Tyler, Proc. Chem. Soc. 1961, 13 (1961). The moment of inertia is 2.3735 x 10<sup>-38</sup> g cm<sup>2</sup>.

Point Group C<sub>3v</sub>  
 $\Delta H_f^\circ = -117.5 \pm 0.7$  kcal/mol  
 $\Delta H_f^\circ(298.15) = -118.4 \pm 0.7$  kcal/mol  
 $S^\circ(298.15) = 71.32 \pm 0.1$  gibbs/mol  
 Ground State Quantum Weight = 1

 Bond Distance: C-F = 1.335 Å C-C = 1.461 Å CN = 1.153 Å  
 Bond Angle: F-C-F = 107.5° F-C-C = 111.38°  
 Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 1.18645 × 10<sup>-113</sup> g<sup>3</sup> cm<sup>6</sup>  
 $\sigma = 3$

Heat of Formation

The selected value is obtained from least squares, simultaneous adjustment of the heats of formation of CF<sub>3</sub>, C<sub>2</sub>F<sub>4</sub>, and CF<sub>3</sub>X (X = H, Cl, Br, I, CN). Details of the input data and adjustment are given in (1). Input included a calorimetric link to NF<sub>3</sub>(g) and CF<sub>4</sub>(g) plus an equilibrium link to C<sub>2</sub>F<sub>6</sub>(g) and C<sub>2</sub>N<sub>2</sub>(g). The calorimetric study (2) gave  $\Delta H_f^\circ = -824.4 \pm 0.6$  kcal/mol at 298.15 K for the reaction 3CF<sub>3</sub>CN(g) + 5HF<sub>3</sub>(g) + 4H<sub>2</sub>(g). Equilibrium data (3) in the range 865-925 K gave  $\Delta H_f^\circ$  (3rd law) = 10.59 ± 0.20 kcal/mol at 298.15 K for the reaction C<sub>2</sub>F<sub>6</sub>(g) + C<sub>2</sub>N<sub>2</sub>(g) + 2CF<sub>3</sub>CN(g). The entropy difference,  $\Delta S_f^\circ$  (2nd law) = 48.8° (3rd law), is 0.0 ± 1.5 gibbs/mol. Deviations between the selected  $\Delta H_f^\circ$  and the two observations are 1.37 and 0.15 kcal/mol, respectively, both considerably less than the overall uncertainties including those in auxiliary values of  $\Delta H_f^\circ$ . Subsequent to the adjustment, Curtutt and Sinke (4) reported  $\Delta H_f^\circ = -197.6 \pm 0.9$  kcal/mol from a calorimetric study of CF<sub>3</sub>CN(g) + 1.25 O<sub>2</sub>(g) + 1.5 H<sub>2</sub>O(g) + 2 CO<sub>2</sub>(g) + 0.5 N<sub>2</sub>(g) + 3 HF(120 H<sub>2</sub>O). Their result of  $\Delta H_f^\circ = -118.4 \pm 1.2$  kcal/mol is confirmation of the selected value.

Heat Capacity and Entropy

The molecular structure has been derived from electron-diffraction data by Danford and Livingston (5) and from microwave data by Sheridan and Gordy (6) and Thomas et al. (7). These studies are in substantial agreement except for a difference of about 0.04 Å in the C-C bond distance. We adopt the results of Thomas et al. (7) since they are based on data for several isotopic species. Principal moments of inertia are I<sub>A</sub> = 14.676 × 10<sup>-39</sup> and I<sub>B</sub> = I<sub>C</sub> = 28.482 × 10<sup>-39</sup> g cm<sup>2</sup>. Vibrational frequencies are taken from the assignments of Edgell and Potter (8). All values except  $\nu_9$  are from infrared spectra of the vapor phase. Raman spectra of the liquid provide  $\nu_9$  and confirm the infrared data. Similar assignments have been given by Janz and Wait (9) based on spectra of Wait and Jenz (10).

Face and Bobka (11) used low temperature calorimetric data to derive the entropy of the ideal gas at the normal boiling point of 205.47 K. The experimental value of 65.01 ± 0.2 gibbs/mol is in good agreement with 65.03 gibbs/mol obtained from this table. The largest uncertainty in Cp° and S° probably arises from neglect of anharmonicity and rotational distortion. Uncertainty in the entropy is estimated to vary from 0.1 to 0.5 gibbs/mol over the range 300 to 1000°K. Discussions of the neglect of anharmonicity are given on the tables for CClF<sub>3</sub>(g) and C<sub>2</sub>F<sub>4</sub>(g).

TETRAFLUOROETHYLENE (C<sub>2</sub>F<sub>4</sub>)

(IDEAL GAS)

GFW = 100.0159

Tetrafluoroethylene (C<sub>2</sub>F<sub>4</sub>)

(Ideal Gas) GFW = 100.0159

Point Group D<sub>2h</sub>

$\Delta H_f^\circ = -156.6 \pm 0.7$  kcal/mol

S<sup>298.15</sup> = 71.678 ± 0.1 gibbs/mol

$\Delta H_f^{298.15} = -157.4 \pm 0.7$  kcal/mol

Ground State Quantum Weight = 1

C<sub>2</sub>F<sub>4</sub>

Bond Distance: C-F = 1.313 Å C-C = 1.313 Å  
 Bond Angle: F-C-F = 114°  
 Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 1.5877 × 10<sup>-113</sup> g<sup>3</sup> cm<sup>6</sup> σ = 4

Heat of Formation

The selected value is obtained from least squares, simultaneous adjustment of the heats of formation of CF<sub>4</sub>, CF<sub>3</sub>X (X = H, Cl, Br, I, CF<sub>3</sub>) and C<sub>2</sub>F<sub>4</sub>. Details of the input data and the adjustment are given in (1). In this case, the selected ΔH<sup>0</sup> corresponds to the weighted average of three calorimetric studies (2, 3) which may be reduced to the following:

| Reference | Reaction  | ΔH <sup>0</sup> <sub>298.15</sub> kcal/mol | ΔH <sup>0</sup> <sub>298.15</sub> kcal/mol |
|-----------|---|--|--|
| (2)       | C <sub>2</sub> F <sub>4</sub> (g) + CF <sub>4</sub> (g) + C(graphite)                             | -65.4 ± 0.5                                | -157.6 ± 0.6                               |
| (2)       | C <sub>2</sub> F <sub>4</sub> (g) + 2H <sub>2</sub> (g) + 4HF(50 H <sub>2</sub> O) + 2C(graphite) | -150.9 ± 1.2                               | -156.2 ± 1.3                               |
| (3)       | C <sub>2</sub> F <sub>4</sub> (g) + 4Na(c) + 4NaF(c) + 2C(graphite)                               | -392.9 ± 1.3                               | -157.2 ± 1.4                               |

Amorphous carbon was formed in all three calorimetric reactions and separate combustions were made to refer the observed product to the standard state of graphite. Other calorimetric studies (4, 5, 6) are omitted because of apparent uncertainties in the reductions to the standard-state reactions.

Heat Capacity and Entropy

The molecular structure has been derived from electron-diffraction data by Karle (7), Broun (8) and Young (9). The resulting structures differ in minor respects, particularly in the exact location of the two carbons. Values from Karle (7) are adopted since they are intermediate between the others. Values from Young (9) and Broun (8) correspond to changes of ± 2.2% in the product of the moments of inertia. Principal moments of inertia for the adopted structure are I<sub>A</sub> = 15.30 × 10<sup>-39</sup>, I<sub>B</sub> = 25.46 × 10<sup>-39</sup> and I<sub>C</sub> = 40.76 × 10<sup>-39</sup> cm<sup>2</sup>. Vibrational fundamentals are those selected by Shimanouchi (10) from the data of Mann (11), Nonfils (12) and Nielsen (13).

Furukawa (14) reported low-temperature calorimetric data from which the ideal gas entropy may be derived as 64.54 ± 0.09 gibbs/mol at 197.53°K. The calculated entropy from this table is also 64.54 eu. The range in values of I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> corresponds to an entropy change of ± 0.022 eu.

**Heat of Formation**  
The selected value is obtained from least squares, simultaneous adjustment of the heats of formation of CF<sub>4</sub>, CF<sub>3</sub>X (X = H, Cl, Br, I, C<sub>2</sub>H<sub>5</sub>) and C<sub>2</sub>F<sub>4</sub>. Details of the input data and the adjustment are given in (1). Data pertinent to C<sub>2</sub>F<sub>6</sub> are summarized below. Calorimetric data (2) for the reaction of C<sub>2</sub>F<sub>6</sub> with potassium were omitted from the adjustment due to insufficient characterization of the products.

**Heat Capacity and Entropy**  
The adopted molecular structure was derived from electron-diffraction data by Swick and Karle (8). The vibrational frequencies are from the assignment of Carney et al. (9), who reviewed the extensive spectral data. Shimomochi (10) has selected the same frequencies. Low-temperature calorimetric data were used by Pace and Aeton (11) to derive a value for the entropy of the ideal gas of 69.88 ± 0.20 gibbs/mol at 194.87°K. This value is used to fix the barrier to internal rotation at 3960 cal/mol. Thermodynamic functions are calculated from these parameters, using hindered internal rotation in place of a torsional vibration.  
An uncertainty of ±0.2 gibbs/mol in the third-law entropy corresponds to a variation in the barrier to internal rotation of about ±700 cal/mol. This range easily includes the barrier of 4300 cal/mol derived by Karle (12) from analysis of the electron-diffraction data (8). Uncertainty in the entropy of this table should not exceed 0.5 gibbs at 1000°K.

Heat of Formation

The heat of formation of C<sub>2</sub>H(g) is not well established; however, we can place reliable upper and lower limits on the value.

Heat of Formation

The heat of formation of C<sub>2</sub>H(g) is not well established; however, we can place reliable upper and lower limits on the value.

T. L. Cottrell, "The Strengths of Chemical Bonds," 2nd Ed., Academic Press, New York, 1958, gives an upper limit for the C-H bond dissociation energy in acetylene, D(HCC-H) < 121 kcal. This was obtained from the fact that ultraviolet light of 121 kcal/mol energy causes acetylene to form diacetylene and hydrogen; assuming that this process occurs through the CCH radical, the light energy is equated with D(HCC-H). This value of D(HCC-H) gives an upper limit for ΔHf°<sub>298</sub>(CCH,g) < 123 kcal/mol.

A lower limit for D(HCC-H) is obtained from a consideration of the C-H bond dissociation energies in ethylene and ethane, D(C<sub>2</sub>H<sub>3</sub>-H) = 103 kcal and D(C<sub>2</sub>H<sub>5</sub>-H) = 98 kcal. The heats of formation of the C<sub>2</sub>H<sub>3</sub> and C<sub>2</sub>H<sub>5</sub> radicals and their parent compounds are taken from S. W. Benson, J. Chem. Educ. 42, 502 (1965). The vibrational frequency of the C-H stretch increases steadily from ethane to ethylene and acetylene. Similarly we expect the bond strength to increase, and so D(HCC-H) > 103 kcal; this yields ΔHf°<sub>298</sub>(CCH,g) > 105 kcal/mol.

F. H. Coats and R. C. Anderson, J. Am. Chem. Soc. 79, 1340 (1957), obtained several values for ΔHf°<sub>298</sub>(CCH,g) from mass-spectroscopic measurements; their values range from 110 kcal/mol to 153 kcal/mol, but they chose to adopt 112 ± 3 kcal/mol.

Our adopted value of ΔHf°<sub>298</sub>(CCH,g), 114 ± 7 kcal/mol, is 2 kcal smaller than that estimated by W. Tsang, S. H. Bauer and M. Comperthwaite, J. Chem. Phys. 35, 1768 (1962).

Heat Capacity and Entropy

The molecule is assumed to be linear; the bond lengths are assumed to be the same as in acetylene and were taken from L. E. Sutton, "Interatomic Distances Supplement," Special Publication No. 18, The Chemical Society, London, 1965.

The vibrational frequencies are those estimated by M. N. Flooster and T. B. Reed, J. Chem. Phys. 31, 66 (1959). It should be noted that the values of the free energy function given by Flooster and Reed are incorrect due to the neglect of the electronic contributions.

The electronic levels, X<sup>2</sup>Σ<sup>+</sup> and A<sup>2</sup>Π, were estimated by analogy with those of CN(g) which is isoelectronic; this assumption holds very well in the parent molecules HCC and HCN (G. Herzberg, "Electronic Spectra and Electronic Structure of Polyatomic Molecules," D. Van Nostrand Co., New York, 1966). The molecule C<sub>2</sub>H<sub>2</sub>, which is also isoelectronic with CCH, is predicted to have a <sup>2</sup>Π ground state by Herzberg, loc. cit.

Bond Distances: C-C = 1.204 Å C-H = 1.055 Å C-Cl = 1.637 Å  
 Bond Angles: Cl-C-C = 180° C-C-H = 180°  
 Rotational Constant: B<sub>0</sub> = 0.188641 cm<sup>-1</sup>

Heat of Formation

The value of  $\Delta H_f^\circ(298) = 51.1 \text{ kcal/mol}$  is calculated from the estimated  $\Delta H_f^\circ(298) = -53 \pm 1.0 \text{ kcal/mol}$  for  $\text{HCl}(\text{g}) + \text{Cl}_2(\text{g}) \rightarrow \text{CHCl}(\text{g}) + \text{CHCl}_2(\text{g})$ , using  $\Delta H_f^\circ(298)(\text{CHCl}=\text{CCl}_2, \text{g}) = -1.86 \text{ kcal/mol}$  (1). The value of  $\Delta H_f^\circ(298)$  is assumed to be the same as that for the reaction  $\text{HCl}(\text{g}) + \text{Cl}_2(\text{g}) \rightarrow \text{CHCl}(\text{g}) + \text{CHCl}_2(\text{g})$ , using  $\Delta H_f^\circ(298)(\text{C}_2\text{H}_2, \text{g}) = 54.19 \text{ kcal/mol}$  (2) and  $\Delta H_f^\circ(298)(\text{CHCl}=\text{CHCl}, \text{g}) = 1.2 \text{ kcal/mol}$  (3).

Heat Capacity and Entropy

The linear molecular structure and bond distances were determined from the microwave spectrometrical studies by Tyler and Sheridan (3). Their results are in good agreement with those of Westenberg, Goldstein and Wilson (4). The principal moment of inertia is  $1.48381 \times 10^{-38} \text{ g cm}^2$ .

The vibrational frequencies were observed in the infrared spectra by Hunt and Wilson (5), and Richardson and Goldstein (6).

C-C = 1.198 Å  
C-H = 1.053 Å  
C-C-H = 180°  
σ = 1

Bond Distances: C-F = 1.279 Å  
Bond Angles: F-C-C = 180°  
Rotational Constant: B<sub>0</sub> = 0.323571 cm<sup>-1</sup>

Heat of Formation

The heat of formation is estimated by assuming that the C-C bond strength is the average of those in C<sub>2</sub>F<sub>2</sub> (113 kcal) and C<sub>2</sub>H<sub>2</sub> (229 kcal). Combining the average value (171 kcal) with the heats of formation of CF and CH from the JANAF Tables, yields ΔH<sub>f</sub><sup>o</sup> = 30 ± 15 kcal/mol.

Heat Capacity and Entropy

G. R. Hunt and M. K. Wilson, J. Chem. Phys. 34, 1301 (1961), and J. K. Brown and J. K. Tyler, Proc. Chem. Soc. (London) 1961, 13 (1961), have reported the infrared spectrum and have assigned the fundamental frequencies. The frequencies used in the present table are median values of the two sets and are generally within 5 cm<sup>-1</sup> of each set.

The molecule has been shown to be linear by J. K. Tyler and J. Sheridan, Trans. Faraday Soc. 59, 2661 (1963), who reported the rotational constant B<sub>0</sub>.

The electronic ground state is assumed to be <sup>1</sup>Σ<sup>+</sup> by analogy with C<sub>2</sub>H<sub>2</sub>.

Acetylene (C<sub>2</sub>H<sub>2</sub>)

(Ideal Gas) Mol. Wt. = 26.038

Value of ω<sub>i</sub> not available.

Heat of Formation

Taken from D. D. Wegman, J. E. Kilpatrick, K. S. Pitzer, and P. D. Rossini, J. Research Natl. Bureau Standards 55, 467 (1945).

Heat Capacity and Entropy

J. S. Gordon (private communication, February, 1961) has used the constants listed above to calculate C<sub>p</sub> from 298.15° to 6000°K by the method of R. E. Pennington and K. A. Kobe, J. Chem. Phys. 22, 1442 (1954). The constants are from E. E. Ball and H. H. Nielsen, J. Chem. Phys. 18, 1382 (1950) and H. C. Allen, E. D. Tidwell, and E. K. Plyler, J. Research Natl. Bureau Standards 57, 213 (1956). Heat capacities below 298.15°K have been calculated for a rigidly rotating harmonic oscillator.

Dec. 31, 1960; Sept. 30, 1965

C<sub>2</sub>H<sub>4</sub>

ETHYLENE (C<sub>2</sub>H<sub>4</sub>) (IDEAL GAS)

MOL. WT. = 28.05418

Point Group D<sub>2h</sub>

ΔH<sub>f</sub>° = 14.58 ± 0.07 kcal. mole<sup>-1</sup>

ΔH<sub>f</sub>° 298.15 = 12.54 ± 0.07 kcal. mole<sup>-1</sup>

S° 298.15 = 52.396 cal. deg.<sup>-1</sup> mole<sup>-1</sup>

Ground State Quantum Weight = [1]

Vibrational Frequencies and Degeneracies

Bond Distance: H-C = 1.086 Å C-C = 1.337 Å

Bond Angle: H-C-H = 117° 22' H-C-C = 121° 19'

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 5.4466 × 10<sup>-117</sup> g.<sup>3</sup> cm.<sup>6</sup>

σ = 4

Heat of Formation.

The heat of combustion of ethylene was measured by F. D. Rossini and J. W. Knowlton, J. Res. Natl. Bur. Std. 19, 249 (1937). From the value, ΔH<sub>f</sub>° 298.15 = -357.28 ± 0.07 kcal. mole<sup>-1</sup> for the reaction C<sub>2</sub>H<sub>4</sub>(g) + 3 O<sub>2</sub>(g) = 2 CO<sub>2</sub>(g) + 2 H<sub>2</sub>O(l), the heat of formation (ΔH<sub>f</sub>° 298.15) for C<sub>2</sub>H<sub>4</sub>(g) was derived to be 12.54 ± 0.07 kcal. mole<sup>-1</sup>. The values of ΔH<sub>f</sub>° 298.15 for CO<sub>2</sub>(g) and H<sub>2</sub>O(l) used for calculation were obtained from F. D. Rossini, D. D. Wagman, W. H. Evans, S. Levine, and Irving Jaffe, "Selected Values of Chemical Thermodynamic Properties", Circular of the National Bureau of Standards 500, 1952.

Heat Capacity and Entropy.

The molecular structure, bond distances and angles were obtained from H. C. Allen, Jr. and E. K. Plyler, J. Am. Chem. Soc. 80, 2673 (1958). The vibrational frequencies were taken from W. L. Smith and I. M. Mills, J. Chem. Phys. 40, 2095 (1964). Eight of the twelve frequencies were reported by R. L. Arnett and B. L. Crawford, J. Chem. Phys. 19, 118 (1950); B. L. Crawford, J. E. Lancaster and R. Inatkeep, J. Chem. Phys. 21, 678 (1953); B. F. Stoicheff, J. Chem. Phys. 21, 755 (1953); T. Feldman, J. Romanko and H. L. Welsh, Can. J. Phys. 34, 737 (1956); and H. C. Allen and E. K. Plyler, loc. cit. O. Herzberg, "Infrared and Raman Spectra", D. Van Nostrand Company, Inc., New York, 1945, also reported the vibrational frequencies for ethylenes as 3019.3 (1), 1623.3 (1), 1342.4 (1), 825.0 (1), 3272.3 (1), 1050 (1), 949.2 (1), 943 (1), 3105.5 (1), 2989.5 (1) and 1443.5 (1) which are very close to the values adopted. The infrared and Raman spectra of ethylene before 1945 have been summarized by O. Herzberg, loc. cit. The molecular structure of ethylene was also determined by L. S. Bartell and R. A. Bonham, J. Chem. Phys. 27, 1414 (1957). Their results, r<sub>C-H</sub> = 1.085 Å, r<sub>C-C</sub> = 1.334 Å and X<sub>H-C-H</sub> = 116° are in excellent agreement with the values adopted. The three principal moments of inertia are I<sub>A</sub> = 0.5762 × 10<sup>-39</sup>, I<sub>B</sub> = 2.7999 × 10<sup>-39</sup> and I<sub>C</sub> = 3.3761 × 10<sup>-39</sup> g. cm.<sup>2</sup>

Bond Distances: C-H = 1.0802 Å C-O = 1.4353 Å C-C = 1.4726 Å  
 Bond Angle: H-C-H = 116° 51' H<sub>2</sub>C-C = 156° 51'  
 Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 7.42336 X 10<sup>-116</sup> g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation.  
 The heat of combustion of ethylene oxide (g) was determined by A. S. Fell and O. Fitcher, Trans. Faraday Soc., 51, 71 (1965) and R. S. Clegg and H. Hunt, J. Phys. Chem., 46, 1162 (1942), as -312.15 ± 0.14 and -312.55 ± 0.20 kcal. mole<sup>-1</sup>, respectively. The corresponding value of ΔH<sub>f</sub><sup>o</sup> (C<sub>2</sub>H<sub>4</sub>O, g) was evaluated to be -12.58 ± 0.15 and -12.19 ± 0.22 kcal. mole<sup>-1</sup>. The former value is adopted.

Heat Capacity and Entropy.  
 The vibrational frequencies were taken from R. C. Lord and B. Nollin, J. Chem. Phys., 24, 656 (1956). The infrared and Raman spectra of ethylene oxide have also been examined by J. W. Linnett, J. Chem. Phys., 6, 692 (1938) and H. W. Thompson and W. T. Cave, Trans. Faraday Soc., 47, 946 (1951). The vibrational frequencies assigned were slightly different from the ones reported by R. C. Lord and B. Nollin, loc. cit. As a result of analogies between ethylene oxide and ethylene imine, small changes of R. C. Lord and B. Nollin's assignment have been made by W. J. Potts, Spectrochim. Acta, 21, 511 (1965). The bond distances and angles were obtained from O. L. Cunningham, A. W. Boyd and W. D. Omlinn, J. Chem. Phys., 17, 211 (1949). The investigation of the structure of ethylene oxide by electron diffraction was reported by P. C. Ackermann and J. E. Mayer, J. Chem. Phys., 4, 377 (1936) and M. Igarashi, Bull. Chem. Soc. Japan, 28, 330 (1953). The three principal moments of inertia are: I<sub>A</sub> = 3.8052 X 10<sup>-39</sup>, I<sub>B</sub> = 3.2788 X 10<sup>-39</sup> and I<sub>C</sub> = 5.9499 X 10<sup>-39</sup> g. cm.<sup>2</sup>

The calculated heat capacities (307.2 - 371.2°K.) are in good agreement with the experimentally measured ones reported by O. B. Katiakowky and M. W. Rice, J. Chem. Phys., 9, 616 (1940).

 Product of the Moments of Inertia:  $I_A I_B I_C = [2.94818 \times 10^{-11}] \text{ g.}^3 \text{ cm.}^6$

Heat of Formation

$\Delta H_f^\circ$  288.15 ((KCN)<sub>2</sub>, g) was calculated based on an estimated heat of dissociation, 40 kcal. mole<sup>-1</sup> for the reaction (KCN)<sub>2</sub>(g) → 2KCN(g), which was obtained by comparison with that for (NaCN)<sub>2</sub>(g).

Heat Capacity and Entropy

The molecular structure and bond angles were assumed to be the same as those for KCN(g), reported by J. M. Bijvoet and J. A. Lely, Rec. trav. chim. 52, 908 (1940). The C-N bond distance was assumed to be the same as that for KCN(g), and the K-C bond distance was assumed to be 10% longer than that in KCN(g). The vibrational frequencies were estimated by comparison with those for K<sub>2</sub>F<sub>2</sub>(g). The last six frequencies were adopted from the bending and asymmetric stretching frequencies for KCN(g). The three principal moments of inertia are:  $I_A = 4.05745 \times 10^{-38}$ ,  $I_B = 6.75351 \times 10^{-38}$  and  $I_C = 1.079098 \times 10^{-37}$  g. cm.<sup>2</sup>

Bond Distance: C-N = 1.245 Å  
 Bond Angle: C-N-C = 180°  
 Rotational Constant: B<sub>0</sub> = 0.4535 cm<sup>-1</sup>  
 σ = 2

Heat of Formation

A. J. Merer and D. N. Trevia, Can. J. Phys. 44, 353 (1966), state that the observed bond length in CNC(g) indicates a double-bonded CN link. The value of the C-N dissociation energy is derived as 147 kcal from the heat of combustion of n-butyl-isobutylidene emine determined by G. E. Coates and L. E. Sutton, J. Chem. Soc. 1187, (1948). However, due to possible extra binding energy from the unpaired electron, we assume here a slightly higher value of 160 kcal. This yields a  $\Delta H_f^{\circ}(\text{CNC,g}) = 133$  kcal/mol. It is also possible to calculate another value by assuming that the ratio of the heat of atomization ( $\Delta H_a$ ) of Si<sub>2</sub>N to that of C<sub>2</sub>N is equal to the ratio of the dissociation energies of SiN(g) and CN(g) by this method  $\Delta H_f^{\circ}(\text{CNC,g}) = 144$  kcal/mol.

Heat Capacity and Entropy

Merer and Trevia, loc. cit., have observed the ultraviolet absorption spectrum of the CNC radical. They have assigned the configuration, bond distance, and the electronic levels. In addition, they have derived  $w_2$ , the remaining frequencies are estimated by comparison with the T<sub>1</sub> state of C<sub>2</sub>N, which has been assigned by N. Weitzner and D. J. McLeod, J. Chem. Phys. 40, 1305 (1964), and J. Chem. Phys. 45, 3096 (1966).

 Rotational constant  $B_0 = 0.15752 \pm 0.00015 \text{ cm.}^{-1}$  CN distance = 1.157 Å CC distance = 1.380 Å  $\sigma = 2$ 

 Moment of inertia =  $1.776(\sigma) \times 10^{-38} \text{ g. cm.}^2$ 

## Heat of Formation

 J. W. Knowlton and E. J. Prosen, J. Research Natl. Bur. Standards 45, 489 (1951), report  $\Delta H_{298.15}^\circ = -261.94 \pm 0.43 \text{ kcal.}$  for the reaction  $C_2N_2(g) + 2 O_2(g) \rightarrow 2 CO_2(g) + N_2(g)$ . When corrected for a change in the atomic weight of carbon, this becomes  $\Delta H_{298.15}^\circ = -261.95 \pm 0.43 \text{ kcal.}$ , whence  $\Delta H_f^\circ$  for  $C_2N_2(g)$  is found to be  $73.87 \pm 0.43 \text{ kcal. mole}^{-1}$ .

## Heat Capacity and Entropy

 A. Langaeth and C. K. Møller, Acta Chem. Scand. 4, 725 (1950), determined the vibrational frequencies by Raman spectroscopy. C. K. Møller and B. P. Stoicheff, Can. J. Phys. 32, 625 (1954), determined  $B_0$  by Raman spectroscopy and calculated the bond lengths listed above. These agree with lengths found from electron-diffraction measurements by Langaeth and Møller, loc. cit., (CN distance = 1.15 Å, CC distance = 1.38 Å) and L. Pauling, H. D. Springall, and K. J. Palmer, J. Am. Chem. Soc. 61, 927 (1939) (CN distance = 1.15 ± 0.02 Å, CC distance = 1.37 ± 0.02 Å). From measurements reported by R. A. Ruehrwein and W. F. Glauque, J. Am. Chem. Soc. 61, 2940 (1939),  $S_{298.15}^\circ$  is calculated by the third law to be 57.63 cal. deg.  $^{-1} \text{ mole}^{-1}$ , in satisfactory agreement with the value calculated here.

Sodium Cyanide, Dimeric ((NaCN)<sub>2</sub>)

Mol. Wt. = 98.0153

Heat of Formation.

The mass spectra of vapors from samples of NaCN have been observed by R. F. Porter, J. Chem. Phys. 35, 318 (1961), at temperatures around 1000°K. The results indicate that the compound evaporates as NaCN(g) and Na<sub>2</sub>(CN)<sub>2</sub>(g). A comparison of relative ion currents produced by electron bombardment of NaCN vapors effusing from single- and double-oven-type Knudsen cells, yielded information on the partial pressures of monomer and dimer. Based on the partial pressures for NaCN(g) and (NaCN)<sub>2</sub>(g) reported at temperatures, 903-1049°K., the vapor pressures of (NaCN)<sub>2</sub>(g) over NaCN(l), 1078.2-1266.2°K., were calculated from the total vapor pressure measurements reported by C. K. Ingold, J. Chem. Soc. 123, 885 (1923). By the second and third law methods, the values of ΔH<sub>f</sub>°<sub>298.15</sub>(l → dimer) were evaluated to be 38.89 and 38.21 kcal. mole<sup>-1</sup>, respectively. Using the third law value, the heat of formation for (NaCN)<sub>2</sub>(g) was evaluated.

Heat Capacity and Entropy.

The molecular structure, bond distances and C-Na-C bond angle were estimated by R. F. Porter, loc. cit. The vibrational frequencies were estimated by comparison with those for NaCl(g). The last six frequencies were the bending and asymmetric stretching frequencies for NaCN(g). The three principal moments of inertia are: I<sub>A</sub> = 1.3570 X 10<sup>-38</sup>, I<sub>B</sub> = 5.1090 X 10<sup>-38</sup> and I<sub>C</sub> = 6.4660 X 10<sup>-38</sup> g. cm.<sup>2</sup>

Bond Distance: C-C = [1.160] Å  
Bond Angle: C-C-O = [180]°  
Rotational Constant: B<sub>0</sub> = [0.408475] cm<sup>-1</sup>

Heat of Formation

The adopted heat of formation, ΔHf°<sub>298.15</sub> (C<sub>2</sub>O,g) = 68.5 kcal/mol, was calculated from the heat of reaction ΔHf°<sub>298</sub> = 65.5 kcal/mol for C<sub>2</sub>O<sub>2</sub>(g) = C<sub>2</sub>O(g) + CO(g) using all JANAF functions (dated Sept. 30, 1965). The value of ΔHf° was obtained from the third law calculation of the equilibrium constant (Kp = 3.3 x 10<sup>-6</sup> atm at 1060°K) which was determined in the studies of decomposition rate of C<sub>3</sub>O<sub>2</sub>(g) by H. B. Palmer and W. D. Cross, Carbon 3, 475 (1966).

M. E. Jacox, D. E. Milligen, N. G. Moll, and W. E. Thompson, J. Chem. Phys. 45, 3745 (1965), have observed the photo-dissociation of C<sub>2</sub>O near 5000Å, which corresponds to a minimum of 57 kcal/mol for C<sub>2</sub>O(g) → C(g) + CO(g). This yields ΔHf°<sub>298</sub>(C<sub>2</sub>O,g) ≤ 87 kcal/mol, which was not adopted because the irradiation was not monochromatic and thus possibly contained all wavelengths below 5000Å.

Jacox et al., loc. cit., have observed three vibrational fundamentals in the infrared spectrum by matrix isolation, and suggested a linear structure with <sup>3</sup>Σ<sub>g</sub> ground state for the CCO radical (g). They also estimated the bond distances C-C = 1.160 Å and C-O = 1.279 Å based on the structural analogy between the carbon suboxide and the CCO radical. The principal moment of inertia is 8.825 x 10<sup>-39</sup> g cm<sup>2</sup>. K. D. Bayes, J. Am. Chem. Soc. 85, 1750 (1963), has predicted that the <sup>2</sup>Δ and <sup>1</sup>Σ states lie respectively 0.5 and 0.8 eV above the ground state. These two electronic states have been included in the tabulation.

Heat of Formation.

The selected value is an average based on the equilibrium data summarized below. Drowart and co-workers have used the Knudsen effusion-mass spectrometric technique to determine the vapor equilibria over the systems SiC-graphite<sup>1</sup>, SiC-silicon<sup>2</sup> and boron-carbon-silicon<sup>3</sup>. Third law analysis of the partial pressures of C<sub>2</sub>Si and Si lead to the concordant values 146.7, 149.0 and 146.0 kcal/mol. Although the drifts all suggest that the entropy of C<sub>2</sub>Si may be about 3.5 eu less than tabulated, this is of doubtful significance because the uncertainty bands are so large. The low condensation coefficient suggested by Drowart<sup>1</sup> may also be involved. Rates of free evaporation reported by Voronin<sup>4</sup> lead to apparent pressures which are smaller by a factor of 1/30, thus confirming the existence of a low evaporation coefficient. The adopted value of  $\Delta H_f^\circ_{298} = 147 \pm 7 \text{ kcal/mol}$  includes allowance for the unlikely possibility that the entropy may be in error by up to 3.5 eu.

 B) 2SiC(s) = Si(l) + C<sub>2</sub>Si(g)

Heat Capacity and Entropy.

The known molecular constants are from the assignments of Welter and McLeod<sup>5</sup>. These authors observed the infrared spectrum, emission spectrum and visible absorption spectrum of C<sub>2</sub>Si in matrix isolation. The matrix data allowed more certain assignment of the A-X band system of the gas as observed by Klemm<sup>6</sup> and McKellar<sup>7</sup>. Welter concluded that this system probably involves transitions between a <sup>1</sup>Σ<sup>+</sup> ground state and a <sup>1</sup>Π excited state. The two stretching frequencies were observed in the matrix infrared spectrum, whereas the bending mode, 300 cm<sup>-1</sup>, was derived solely from the analysis of the A-X band system. The analysis presumed a linear unsymmetrical structure for the molecule.

A <sup>3</sup>Π excited state is assumed to lie 7000 cm<sup>-1</sup> below the <sup>1</sup>Π state, which presumably arises from the same molecular orbital configuration. The effect of the estimated level is to increase the entropy by about 0.2 and 1.8 eu at 3000 and 6000°K. Bond distances are estimated by comparison with those in Si<sub>2</sub>, C<sub>2</sub> and C<sub>3</sub>. The moment of inertia is 13.91 x 10<sup>-39</sup> g cm<sup>2</sup>.

Carbon, Triatomic (C<sub>3</sub>)

(Ideal Gas) GFV = 36.03345

Point Group D<sub>3h</sub>  
 $S_{298.15}^{\circ} = 56.7 \pm 3$  gibbs/mol  
 $\Delta H_f^{\circ} = 194 \pm 4$  kcal/mol  
 $\Delta H_f^{\circ} = 196 \pm 4$  kcal/mol

Ground State Quantum Weight = [1]

Vibrational Frequencies and Degeneracies

| $\omega_i, \text{cm}^{-1}$ | $g_i$ |
|----------------------------|-------|
| 1225 (1)                   |       |
| 615 (2)                    |       |
| 200 (1)                    |       |

The contribution of the doubly degenerate bending frequency was approximated by direct summation of the following levels ( $\text{cm}^{-1}$ ): 0, 63.5, 132.7, 207.4, 286.5, 370.5, 458.2, and 650 x n where n = 1 to 76. The contribution to each function due to these levels was doubled to account for the degeneracy.

Bond Distance: C-C = 1.277 Å  
 Bond Angle: C-C-C = 180°  
 Rotational Constant: B<sub>0</sub> = 0.4305  $\text{cm}^{-1}$

Heat of Formation

Drowart et al. (1) have measured mass spectrometrically the ion intensity ratio  $C_3^+/C^+$  as a function of temperature from 1800 to 2700°K. We derive from a 2nd law analysis of their data  $\Delta H_{f,2000}^{\circ} = 185.2 \pm 3.3$  kcal, and  $S_{2000}^{\circ} = 74.9 \pm 2.8$  eu by calculation of the absolute pressure from the vapor pressure of monatomic carbon and a relative ionization cross-section ratio of 2-3. The entropy uncertainty includes 1.3 eu for uncertainty in the absolute pressure. Several earlier mass-spectrometric determinations (2, 3, 4) are in reasonable agreement. The absolute magnitude of the pressure is also confirmed by the work of Thorn and Winslow (5) who measured the total pressure of all species over graphite as 1.2 to 4.8 x 10<sup>-7</sup> atm. at 2400°K.

Subtracting the JANAF values for C and C<sub>2</sub> we obtain  $C_3 = 5.4 \times 10^{-8}$  to  $2.2 \times 10^{-7}$  atm., which compares with Drowart's value of  $3.3 \times 10^{-8}$  to  $1.3 \times 10^{-7}$  atm. The 2nd law heat of formation is reported (3) to be  $\Delta H_{2400}^{\circ} = 184.4$  but the range is only 80°K. It does, however, confirm the magnitude of the mass-spectrometric values for both heat and entropy. We have adopted a heat of formation within the uncertainty limits of Drowart's measurements which with the adopted functions yields pressures in the 2000-3000°K range consistent with the measurements. We were not able to generate functions which agree exactly with the 2nd law entropies, since even direct summation over only the observed levels of the bending frequency gives an entropy which is already too large.

Heat Capacity and Entropy

The stretching frequencies are from Merer (6), Weltner et al. (7) and Weltner and McLeod (8). The bending frequency and its harmonics are from Gausset et al. (9) and Merer (6). The rotational constant and bond distance are from Gausset et al. (9).

As indicated briefly above, the calculated entropy of C<sub>3</sub> gas is higher than the experimental value even when a summation is performed only over the observed first six levels of the bending frequency. Treatment of the vibration as a harmonic oscillator or as an anharmonic oscillator gives values considerably higher. Strauss and Thiele (10) have also calculated functions based on a quartic potential function which still yields values several units higher than the experiments. In order to reduce the entropy to the approximate range of the measurements we have made the assumption that the potential function is of an unusual form above the sixth vibrational level. We assume that the large amplitude of the bending vibration causes a drastic change in the function, possibly due to the increasing repulsion between and carbons, as the amplitude increases. Thus, we assume a very steeply rising potential above the sixth vibrational level. We have chosen to represent this part of the potential by a harmonic oscillator of 650  $\text{cm}^{-1}$ . The choice of 650  $\text{cm}^{-1}$  is arbitrary, but is not unreasonable for a bending vibration, and yields functions which approximate the experimental data.

In order to explain the observed spectrum of C<sub>3</sub>O, a molecule with a bending frequency of 63  $\text{cm}^{-1}$ , Smith and Barrett (11) have proposed that potential maxima occur in the bending potential away from linearity. Thus, the adoption of an unusual potential function for C<sub>3</sub> bending may be justifiable. We do not claim that our functions are necessarily correct but only that they include all known facts and satisfy the experimental equilibrium observations. Further investigation of the carbon vapor pressure and of the higher vibrational levels of C<sub>3</sub> is desirable.

Dec. 31, 1960; June 30, 1962; Sept. 30, 1965

ΔH<sub>f</sub><sup>o</sup> 0 = -50.35 ± 1.6 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> 298.15 = -51.55 ± 1.6 kcal. mole<sup>-1</sup>  
 ΔH<sub>m</sub><sup>o</sup> = Unknown

S<sub>298.15</sub> = 21.26 ± 0.3 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 T<sub>m</sub> = [2500]°K.

Heat of Formation.

The ΔH<sub>f</sub><sup>o</sup> 298.15 = -51.55 ± 1.6 kcal. mole<sup>-1</sup> is the average value of ΔH<sub>f</sub><sup>o</sup> 298.15 = -49.7 ± 1.2 kcal. mole<sup>-1</sup> by R. C. King and G. T. Armstrong, National Bureau of Standards Report No. 8504 (1964) and that of ΔH<sub>f</sub><sup>o</sup> 298.15 = -53.4 ± 2.0 kcal. mole<sup>-1</sup> by A. D. Mah, United States Bureau of Mines, Report No. 6415 (1964). Both measured the heat of reaction Al<sub>4</sub>C<sub>3</sub>(c) + 6O<sub>2</sub>(g) → 2Al<sub>2</sub>O<sub>3</sub>(c,∞) + 3CO<sub>2</sub>(g) and used their ΔH<sub>f</sub><sup>o</sup> 298.15 and the ΔH<sub>f</sub><sup>o</sup> 298.15 of Al<sub>2</sub>O<sub>3</sub>(c) and CO<sub>2</sub>(g) to calculate the ΔH<sub>f</sub><sup>o</sup> 298.15 of Al<sub>4</sub>C<sub>3</sub>(c). The ΔH<sub>f</sub><sup>o</sup> 298.15 measured by King and Armstrong was -1033.3 ± 1.1 kcal. mole<sup>-1</sup>, the ΔH<sub>f</sub><sup>o</sup> 298.15 measured by Mah was -1029.6 ± 1.9 kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy.

The low temperature heat capacities, 18-390°K., were measured by W. G. Saba and G. T. Furukawa, National Bureau of Standards Report 7587, July 1, 1962. The high temperature heat capacities, 275-1173°K., were measured by A. C. Victor, W. R. Thumber, and T. B. Douglas, National Bureau of Standards Report 7437, January 1, 1962. These two sets of heat capacity data were joined smoothly and extrapolated to 2000°K. by W. G. Saba and G. T. Furukawa, loc. cit. The values of C<sub>p</sub> above 2000°K were estimated by extrapolation graphically. S<sub>298.15</sub> was reported by W. G. Saba and G. T. Furukawa, loc. cit., using S<sub>298.15</sub>(extrap.) = 0.013 cal. deg.<sup>-1</sup> mole<sup>-1</sup>.

Melting Temperature.

T<sub>m</sub> was estimated by O. Ruff and E. Jellinek, Z. anorg. u. allgem. Chem. 97, 312 (1916).

Dimagnesium Tricarbide (Mg<sub>2</sub>C<sub>3</sub>)

(Solid) Mol. Wt. = 84.67

DIMAGNESIUM TRICARBIDE (Mg<sub>2</sub>C<sub>3</sub>)

(Solid)

Mol. Wt. = 84.67

ΔH<sub>f</sub><sup>o</sup> 298.15 = 19 ± 6 kcal. mole<sup>-1</sup>

S° 298.15 = 24 ± 3 cal. deg.<sup>-1</sup> mole<sup>-1</sup>

Data from National Bureau of Standards Report No. 6928, "Preliminary Report on the Thermodynamic Properties of Selected Light-Element Compounds", July, 1960.

C<sub>3</sub>Mg<sub>2</sub>

(Ideal Gas) GFW = 68.03225

CARBON SUBOXIDE (C<sub>3</sub>O<sub>2</sub>) (IDEAL GAS)

GFM = 68.03225

Bond Distances: C-C = 1.28 Å C-O = 1.16 Å  
 Bond Angles: C-C-C = 180° O-C-C = 180°  
 Rotational Constant: B<sub>0</sub> = 0.073206 cm<sup>-1</sup> σ = 2

Heat of Formation

Kybett et al. (1) have determined the heat of combustion of the liquid form under its own pressure using the sample from the heat capacity determinations (2).

The average of four determinations gave  $\Delta H_f^{\circ}(\text{g}) = -28.03 \pm 0.24$  kcal/mol; the authors report  $-29.03$  due to an arithmetic error. The sample was 99.98 mole percent pure. McDougall et al. (4) measured  $\Delta H_f^{\circ}(\text{g}) = 6.421 \pm 0.012$  kcal/mol from which we calculate  $\Delta H_f^{\circ}(\text{g}) = 5.65 \pm 0.2$  kcal/mol. Thus the heat of formation of the gas is found to be  $-22.38 \pm 0.44$  kcal/mol.

Heat Capacity and Entropy

There has been considerable controversy as to the configuration of this molecule and the assignment of its vibrational frequencies. However, the evidence seems fairly conclusive for the linearity of the molecule from the work of Lafferty et al. (3) and Miller et al. (4). The rotational constant adopted here is that found by Lafferty et al. (3) and the vibrational frequencies are those reported by Miller et al. (4), except for  $\nu_7$  which is taken from Miller et al. (5) and Borgers (7). The low frequency  $\nu_u$  mode is confirmed by the work of McDougall et al. (2), who measured the low temperature entropy of C<sub>3</sub>O<sub>2</sub>(c) and (l) and also the heat of vaporization. From a comparison of the entropy calculated statistically and that measured, they conclude  $\nu_7 = 63.2$  cm<sup>-1</sup>. The values adopted are confirmed by third law analysis of the vapor pressure data of McDougall et al. (5) which indicate a heat of vaporization in fair agreement with their calorimetric value. The drift in the third law analysis indicates that the entropy of the solid is too low or that of the gas is too high by 1 eu. Alternatively as systematic error in the pressure measurements could have caused this deviation.

The bond distances are taken from the electron diffraction experiments of Livingston et al. (6) and are in good accord with the adopted rotational constant.

Bond distance: C-C = [1.28] Å

Bond angle: C-C-C = [180°]

Rotational constant: B<sub>0</sub> = [0.17132] cm<sup>-1</sup>

Heat of Formation

The heat of formation is obtained from the mass-spectrometric results of Drowart et al. (1) who obtained  $\Delta H_f^\circ_{2400} = 226 \pm 7$  kcal/mol. This was obtained from a 2nd law analysis of the ion intensity ratio C<sub>4</sub><sup>+</sup>/C<sup>+</sup> over a temperature range of 2200-2700°K. The absolute pressure, obtained from a knowledge of the monatomic carbon vapor pressure and an estimated ionization cross-section ratio of 4.86, yields a 2nd law entropy at 2400°K of 90.5 ± 3 eu. The uncertainty in the ionization cross-section ratio is probably no more than a factor of two which gives an overall entropy uncertainty of 4.5 eu. The heats of formation at temperatures other than 2400°K depend on the functions adopted, for a discussion of these see below.

Heat Capacity and Entropy

The molecular properties of C<sub>4</sub> are all estimated. We have chosen a set of functions which is consistent with the mass-spectrometric observations of Drowart et al. (1). The thermodynamic functions of C<sub>4</sub> were first estimated by Pitzer and Clementi (2) but the basis for this estimate has completely changed. Originally they were calculated by analogy with C<sub>3</sub>, C<sub>2</sub> and CO<sub>2</sub>, but the discovery of very low bending frequencies in C<sub>3</sub> and C<sub>2</sub> complicated the picture by raising the calculated entropies significantly. Sandborn (3) has correlated the bending force constants in several related triatomics and has estimated the vibrational frequencies in C<sub>4</sub> and C<sub>3</sub>. These vibrational frequencies yield high entropies outside the limits of the second law determination. Since these frequencies are estimates based on a basically triatomic correlation we have chosen to adopt two bending frequencies of 550 cm<sup>-1</sup> rather than the 200 cm<sup>-1</sup> and 440 cm<sup>-1</sup> estimated by Sandborn. In addition we have assumed that the ground state arising from a π<sup>2</sup> term is <sup>1</sup>Σ and not <sup>3</sup>Σ as assumed by Pitzer and Clementi. The basis for both these changes is to make the functions conform to the only available measured data. Use of the present table will yield values for the vapor pressure of C<sub>4</sub> in excellent agreement with the measurements in the 2000-3000°K range. Outside this range they provide only a general indication of the variation since they may not correspond to the real situation.

The stretching frequencies are from Sandborn (3) and the bond length is estimated from C<sub>3</sub>.

Heat of Formation  
 G. T. Armstrong and S. Marantz, J. Phys. Chem. 64, 1776 (1960), measured the heat of combustion of the liquid for which they obtain a ΔH<sub>f</sub><sup>0</sup> 298.15 of 120.6 kcal. mole<sup>-1</sup> using 94.05 kcal. mole<sup>-1</sup> for ΔH<sub>f</sub><sup>0</sup> 298.15 of CO<sub>2</sub>(g). They calculate the ΔH<sub>f</sub><sup>0</sup> 298.15 of C<sub>4</sub>N<sub>2</sub>(g) with a ΔH<sub>vap</sub> taken from A. J. Saggione, J. Org. Chem. 22, 1171 (1957).

Heat Capacities and Entropies  
 Bond lengths determined by P. A. Miller and R. B. Hamman Jr., J. Chem. Phys. 21, 110 (1953) from X-ray diffraction measurements on the solid. The vibrational frequencies were observed in the infra red and Raman by F. A. Miller, R. B. Hamman Jr., and L. R. Cousins, J. Chem. Phys. 23, 2127 (1955).

## Heat of Formation

The heat of formation is obtained from the mass-spectrometric results of Drowart et al. (1) who obtained  $\Delta H_f^{\circ} = 230 \pm 5$  kcal/mol. This was obtained from a 2nd law analysis of the ion intensity ratio C<sub>5</sub><sup>+</sup>/C<sup>+</sup> over a temperature range of 2200-2700°K. The absolute pressure, obtained from a knowledge of the monatomic carbon vapor pressure and an estimated ionization cross-section ratio of 6:3, yields a 2nd law entropy at 2400°K of 103.7 ± 2 eu. The uncertainty in the ionization cross-section ratio is probably no more than a factor of two which gives an overall entropy uncertainty of ±3.5 eu. The heats of formation at temperatures other than 2400°K depend on the functions adopted, for a discussion of these see below.

## Heat Capacity and Entropy

The molecular properties of C<sub>5</sub> are all estimated. We have chosen a set of functions which is consistent with the mass-spectrometric observations of Drowart et al. (1). The thermodynamic functions of C<sub>5</sub> were first estimated by Pitzer and Clementi (2) but the basis for this estimate has completely changed. Originally they were calculated by analogy with C<sub>3</sub>, C<sub>3</sub>O<sub>2</sub>, and CO<sub>2</sub>, but the discovery of very low bending frequencies in C<sub>4</sub> and C<sub>5</sub>O<sub>2</sub> complicated the picture by raising the calculated entropies significantly. Sandborn (3) has correlated the bending force constants in several related triatomics and has estimated the vibrational frequencies in C<sub>4</sub> and C<sub>5</sub>. These vibrational frequencies yield high entropies outside the limits of the second law determination. Since these frequencies are estimates, based on a basically triatomic correlation we have chosen to adopt three doubly degenerate bending frequencies of 550 cm<sup>-1</sup> in place of the 130 cm<sup>-1</sup>, 330 cm<sup>-1</sup> and 520 cm<sup>-1</sup> frequencies estimated by Sandborn. The basis for this change is to make the functions conform to the only available measured data. Use of the present tables will yield values for the vapor pressures of C<sub>4</sub> in excellent agreement with the measurements in the 2000-3000°K range. Outside this range they provide only a general indication of the variation since they may not correspond to the real situation.

The stretching frequencies are from Sandborn (3) and the bond length is estimated equal to that in C<sub>3</sub>.

Caesium, Alpha (Ca,  $\alpha$ )  
(Crystal) GFW = 40.08

$\Delta H_f^\circ = 0$  kcal/mol

$\Delta H_{298.15} = 0.220 \pm 0.05$  kcal/mol

$\Delta H_t^\circ = 0.220 \pm 0.05$  kcal/mol

$\Delta H_{298.15} = 42.85 \pm 0.3$  kcal/mol

$S_{298.15} = 9.93 \pm 0.06$  gibbs/mol

$T_t = 721 \pm 2^\circ K$

Heat of Formation

Zero by definition.

Heat Capacity and Entropy

The low temperature heat capacity data of Griffel et al. (1), 1.8° to 4.2°K, Roberts (2), 1.5° to 20°K, and Clusius and Vaughan (3), 10° to 200°K, were fit with polynomial expressions. Up to 20°K the three sets fit the adopted curve within  $\pm 61$  with a maximum deviation of 14%. This is considered excellent agreement since the heat capacity is only 0.35 gibbs/mol at 20°K. From 20° to 200°K the data of Clusius were within  $\pm 1\%$  of the adopted polynomial. The data of Gunther (4), 22° to 62°K, generally deviated from the adopted curve by 10%. The polynomial fit of the data of Clusius was arranged to be linear in temperature at high temperatures and was extrapolated to 298°K. The data of Eastman et al. (5), 67° to 293°K, were consistently high by 5.8 to 9% over the whole range. The extrapolation of the heat capacity to 6.28 gibbs/mol at 298°K is further justified by comparison with the heat capacity of magnesium, which is almost identical to that of calcium over the whole range, if its temperature scale is multiplied by 0.75.

The heat capacity between 298° and 721°K was obtained by forcing a polynomial of the type  $H = ai^2 + bi + c + d/T$  through 298° with a slope of 6.28 and also through a value of  $H_{721} = 2736$  cal, and making a good fit of the adopted low temperature enthalpies. The choice of  $H_{721} = 2736$  cal was made, since Zalesinski and Zulinsky (6), Jauch (7), and Eastman et al. (8) were in essential agreement in the beta-phase at this temperature. The enthalpy of transition was subtracted to give the adopted value. The individual measurements of Jauch (7) were not available, but the value at 720°K could be read from a small plot with reasonable accuracy; Eastman et al. (8) gave only an equation for their data. There is no question that reliable measurements of the heat capacity and enthalpy are needed in the range 200° to 700°K.

Transition Data

The temperature of transition was that reported by Peterson and Fattore (9) and confirmed by Chiotti et al. (10). Earlier reports on impure specimens ranged from 718° to 737°K and were not considered. The heat of transition was measured by Chiotti et al. (10) using an adiabatic high temperature calorimeter, and is in agreement with that reported by Kubaschewski (11) of  $0.24 \pm 0.04$  kcal from enthalpy data.

Sublimation Data

See Ca(g) for details.

CALCIUM, BETA (Ca)

(CRYSTAL)

GFW = 40.08

Calcium, Beta (Ca,  $\beta$ )

$\Delta H_f^0$  = unknown

Ca

(Crystal)

$S_{298.15}^0 = 10.15$  gibbs/mol

$\Delta H_f_{298.15} = 0.117 \pm 0.05$  kcal/mol

$T_m = 721 \pm 2^\circ K$

$\Delta H_m^0 = 0.220 \pm 0.05$  kcal/mol

$T_m = 1112 \pm 2^\circ K$

$\Delta H_m^0 = 2.04 \pm 0.10$  kcal/mol

Heat of Formation

Obtained from that of  $\alpha$ -Ca by adding  $\Delta H_t$  and the difference in  $H_{721} - H_{298}$  for  $\alpha$ - and  $\beta$ -Ca.

Heat Capacity and Entropy

The enthalpy at  $721^\circ K$  was fixed as described on the  $\alpha$ -Ca table. The data of Jauch (1), and Zalesinski and Zulinski (2), and Eastman et al. (3) were then fitted by an equation of the form  $H = a + bT + cT^2$  where  $a = -1315$ ,  $b = 4.014$  and  $c = 0.00285$ . The values of Jauch, read from a small graph, fit within 1% generally and within 2% maximum deviation; those of Zalesinski and Zulinski fit within 0.7% with the exception of the highest point which differed by 1.8%. The data of Eastman et al. vary from 3.6% high to 0.4% low. The entropy was obtained in a manner analogous to the heat of formation.

Transition Data

See the  $\alpha$ -Ca table for details.

Melting Data

The melting point is that reported by Peterson and Fattore (4) and confirmed by Chiotti et al. (5). Earlier reports on less pure specimens ranged from  $1083^\circ$  to  $1127^\circ K$ . The heat of melting was measured by Chiotti et al. (5) using an adiabatic high temperature calorimeter, and is in agreement with that reported by Kubaschewski (6) of  $2.07 \pm 0.1$  kcal/mol from enthalpy data.

GFW = 40.08  
 $\Delta H_f^{298.15} = 2.606 \pm 0.1$  kcal/mol  
 $\Delta H_m^* = 2.04 \pm 0.10$  kcal/mol  
 $\Delta H_v^* = 36.9668$  kcal/mol

$S_{298.15}^{\circ} = 12.105$  gibbs/mol  
 $T_m = 1112 \pm 2^{\circ}K$   
 $T_b = 1767.4 \pm 15^{\circ}K$

Heat of Formation  
 Obtained from that of  $\beta$ -Ca by adding  $\Delta H_m^*$  and the difference between  $H_{1112} - H_{298}$  for  $\beta$ -Ca and liquid.

Heat Capacity and Entropy  
 The heat capacity was derived as constant from the enthalpy values of R. Jauch, Diplomarbeit, Techn. Hochschule Stuttgart, 1946, quoted by O. Kubaschewski, Z. Elektrochem. 51, 275 (1950). The entropy was obtained in a manner analogous to the heat of formation.

Melting Data  
 See the  $\beta$ -Ca table for details.

Vaporization Data  
 $T_b$  is calculated from the free energy crossovers of the Ca(l) and Ca(g) tables, and  $\Delta H_v^*$  is the difference between  $\Delta H_f^{1767.4}$  for liquid and gas.

**Heat of Formation**  
 The vapor pressure over solid and liquid calcium has been reported by several authors. The results of our analysis of their data are presented in the following table. By using free energy functions based on the α crystal at 298°K all the data yield ΔH<sub>298.15</sub><sup>o</sup> (Ca, α) which is ΔH<sub>298.15</sub><sup>o</sup> (Ca, g).

With the exception of sets 2, 4 and 10, all the results for the third law value fall in the range 42 - 43 kcal/mol. The drifts are both positive and negative over solid and liquid, indicating the reliability of the functions within the experimental accuracies. The adopted heat of sublimation, 42.85 ± 0.3 kcal/mol, is taken as the weighted average of sets 9, 11 and 12 which have drifts less than 1 eu. Note that sets 8 and 9 are in fact the same data but the values in set 8 were read from a graph and initially contained three extra points.

**Heat Capacity and Entropy**  
 The electronic levels and quantum weights were obtained from Moore (13), and were cut off at 45000 cm<sup>-1</sup>, which is approximately the ionization limit minus kT for the maximum temperature. All of the unobserved terms in the spectrum are estimated to occur between 47000 cm<sup>-1</sup> and the ionization limit.

$\omega_e x_e = 369.8 \text{ cm}^{-1}$

$\omega_e = 0.1516 \text{ cm}^{-1}$

$a_e = 1.31 \text{ cm}^{-1}$

$a_e = 1.00071 \text{ cm}^{-1}$

$\sigma = 1$

$r_e = 2.439 \text{ \AA}$

Heat of Formation

N. D. Potter (1) investigated mass spectrometrically the gaseous equilibria among Ca, CaCl, and CaCl<sub>2</sub>. Ion intensities were measured 2.5 eV above the ionization threshold. Using the equilibrium constants  $K = I(\text{CaCl})^2 / I(\text{Ca})I(\text{CaCl}_2)$  which we calculated from the reported ion intensities for the reaction  $\text{Ca(g)} + \text{CaCl}_2(\text{g}) \rightleftharpoons 2\text{CaCl(g)}$  in the temperature range 1252-1557°K, we obtain  $\Delta H_f^\circ_{298} = 15.61 \text{ kcal/mol}$  by the third law method. The third law drift is  $-2.8 \pm 3.5 \text{ eu}$ . The heat of formation is derived as  $\Delta H_f^\circ_{298}(\text{CaCl, g}) = -27.0 \text{ kcal/mol}$ .

K. F. Zmbov (2) determined by mass spectrometry the heat of the above reaction as  $24.4 \pm 1.3 \text{ kcal/mol}$  with a drift of  $12.5 \pm 9.4 \text{ eu}$ . This yields the heat of formation,  $\Delta H_f^\circ_{298}(\text{CaCl, g}) = -22.7 \text{ kcal/mol}$ .

D. L. Hildenbrand (2) also determined the equilibrium constants for the reaction (a)  $\text{Ca(g)} + \text{CaCl}_2(\text{g}) \rightleftharpoons 2\text{CaCl(g)}$  and the reaction (b)  $\text{Ca(g)} + \text{AlCl}_3(\text{g}) \rightleftharpoons \text{CaCl(g)} + \text{Al(g)}$  by mass spectrometry in the temperature range 1219-1353°K. Third law analysis of the reported equilibrium constants gives  $\Delta H_f^\circ_{298} = 21.08 \text{ kcal/mol}$  and drift =  $-1.4 \pm 1.8 \text{ eu}$  for reaction (a); and  $\Delta H_f^\circ_{298} = 24.20 \text{ kcal/mol}$  and drift =  $0.5 \pm 1.3 \text{ eu}$  for reaction (b). From third law  $\Delta H_f^\circ_{298}$  of (a) and (b), we derived  $\Delta H_f^\circ_{298}(\text{CaCl, g})$  as  $-24.4$  and  $-23.3 \text{ kcal/mol}$ , respectively, using all JANAF functions. Hildenbrand has also derived a corrected  $D_0(\text{Ca-Cl}) = 95.0 \text{ kcal/mol}$  from a linear Birge-Sponer extrapolation of the ground state vibrational levels with correction for its ionicity. This corrected  $D_0(\text{Ca-Cl})$  yields the heat of formation,  $\Delta H_f^\circ_{298}(\text{CaCl, g}) = -23.9 \text{ kcal/mol}$ .

Ryabova and Gurvich (3) reported  $D_0(\text{Ca-Cl}) = 102 \pm 6 \text{ kcal/mol}$  from flame spectra studies. This leads to  $\Delta H_f^\circ_{298}(\text{CaCl, g}) = -30.9 \text{ kcal/mol}$ .

D. L. Hildenbrand (3) determined the dissociation energy of CaCl<sub>2</sub>(g) by electron impact as  $D_0(\text{CaCl-Cl}) = 5.04 \pm 0.02 \text{ eV}$  which, combined with JANAF  $\Delta H_f^\circ_{298}$  of CaCl<sub>2</sub>(g) and Cl(g) gives  $\Delta H_f^\circ_{298}(\text{CaCl, g}) = -23.1 \text{ kcal/mol}$ .

A weighted average,  $\Delta H_f^\circ_{298}(\text{CaCl, g}) = -25 \pm 3 \text{ kcal/mol}$ , is adopted in the tabulation.

Heat Capacity and Entropy

The vibrational constants ( $\omega_e$  and  $\omega_e x_e$ ), electronic levels and ground state configuration were taken from Herzberg (4). Morgan and Barrow (5) made rotational analysis of the  $C^2\Pi-X^2\Sigma$  system and reported  $B_e = 0.1516 \text{ cm}^{-1}$  and  $r_e = 2.439 \text{ \AA}$  for the ground state. The value of  $q_e$  is calculated from the Morse potential function. The F and G states were reported by Schutte (3).

GFW = 110.986  
 $\Delta H_f^{\circ} 298.15 = -185.013 \pm 0.5 \text{ kcal/mol}$   
 $\Delta H_m^{\circ} = 6.822 \pm 0.2 \text{ kcal/mol}$   
 $\Delta H_v^{\circ} = 56.2 \text{ kcal/mol}$

$S^{\circ} 298.15 = 29.608 \pm 1.2 \text{ gibbs/mol}$   
 $T_m = 1045^{\circ}\text{K}$   
 $T_b = 2208.6^{\circ}\text{K}$

GFW = 110.986

CaCl<sub>2</sub> (LIQUID)

**Heat of Formation**  
 The heat of formation is calculated from that of the crystal by adding the heat of melting and the difference between  $H_{1045}^{\circ}$  and  $H_{298}^{\circ}$  for the crystal and the liquid.

**Heat Capacity and Entropy**  
 The constant heat capacity above the assumed glass transition at 700°K is derived from high temperature enthalpy data in a drop calorimeter from the melting point up to 1667°K by G. E. Moore, J. Amer. Chem. Soc. 65, 1700 (1943). Below the glass transition point, the heat capacity is assumed to be the same as that of the crystal. A. S. Dworkin and M. A. Bredig, J. Phys. Chem. 67, 697 (1963), reported  $C_p(\ell) = 23.6 \text{ gibbs/mol}$  from enthalpy measurements in a short temperature range by drop calorimetry.

The entropy  $S_{298.15}^{\circ} = 29.608 \text{ gibbs/mol}$  is calculated in a manner analogous to that of the heat of formation.

**Melting Data**  
 See the crystal table for details.

**Vaporization Data**

The boiling point is calculated as the temperature at which  $\Delta G = 0$  for  $\text{CaCl}_2(\ell) + \text{CaCl}_2(g)$ . The heat of vaporization is the difference in  $\Delta H_{T_b}^{\circ}$  between liquid and gas.

σ = 2

Bond Distance: Ca-Cl = 2.51 Å  
Bond Angle: Cl-Ca-Cl = 180°  
Rotational Constant: B<sub>0</sub> = 0.0377 cm<sup>-1</sup>

Heat of Formation

Second and third law analyses of vapor pressure data are given below. The selected third law heat of vaporization is taken from Novikov's measurement (1) as  $\Delta H_v^\circ = 72.30$  kcal/mol which is combined with  $\Delta H_f^\circ$  of the liquid to give  $\Delta H_f^\circ$  (CaCl<sub>2</sub>, g) = -112.7 ± 1 kcal/mol.

Third law analyses indicate zero drift for Novikov's data, positive and negative drifts for Hildenbrand's (2) and Bautista's (3) data, respectively. Their heats are in agreement within ±1 kcal. Wartenberg (4) reported there was no boiling at 1819°K at 62 mm Hg pressure, and his value ( $\Delta H_v^\circ = 71.1 \pm 0.7$  kcal/mol) serves as a guide for the minimum heat of vaporization.

| Investigator                 | Method                         | Temperature Range, °K | Number of Points | $\Delta H_v^\circ$ , kcal/mol | Drift    |

\*Value in parentheses is the heat of sublimation.

Heat Capacity and Entropy

The linear structure and vibrational frequencies were determined by D. White and co-workers (E) in the matrix-infrared-spectrometric studies. The linear structure is consistent within experimental error with the electric-quadrupole-deflection studies (Z), and electron-diffraction data (S). Hayes (G) has qualitatively rationalized the linear structure through molecular orbital theory.

The bond length was measured by Akishin and Spiridonov (B). The moment of inertia is  $74.174 \times 10^{-39}$  g cm<sup>2</sup>.

Heat of Formation  
 Hastie and Hargrave (1) have recently reviewed the dissociation energy of CaF and conclude that it is 127.5 ± 2.5 kcal/mol. The analysis below considers basically the same data except that all values are JANAF.  
 Hildenbrand and Murad (2) in a mass spectrometric determination of the equilibria among BF, BF<sub>2</sub>, Ca, CaF and CaF<sub>2</sub> reported equilibrium constants for the reaction  
 (A) Ca(g) + CaF<sub>2</sub>(g) + 2CaF(g).  
 Blue et al. (3) have also examined several equilibria mass-spectrometrically and report equilibrium constants for reaction  
 (B) Ca(g) + CaF<sub>2</sub>(g) + 2CaF(g) and reaction  
 (C) Ca(g) + AlF(g) + Al(g) + CaF(g).  
 Ryabova and Gurvich (4) give a heat of dissociation from flame studies for the reaction  
 (D) CaF(g) + Ca(g) + F(g).  
 The remaining reactions considered by Hastie and Hargrave (1) were not included since they involved subtracting reactions not performed simultaneously, or involve species such as SiF<sub>2</sub> whose heat of formation is dependent on that of CaF and CaF<sub>2</sub>.

| Reference       | Range °K    | Reaction | Points | ΔHf°298 kcal/mol | Drift kcal/mol |
|-----------------|-------------|----------|--------|------------------|----------------|
| Hildenbrand (2) | 1593 - 1734 | A        | 15     | 11.5 ± 6.8       | 14.70 ± 1.27   |
| Blue (3)        | 1271 - 1351 | B        | 9      | 146.9 ± 8.0      | 121.08 ± 1.65  |

| Hildenbrand (5) | 1423 - 1443 | A        | 2      |                  | 32.97          |

\* 1 point rejected due to failure of a statistical test  
 \*\* Calculated from third law value when available  
 The auxiliary heats of formation used were, in kcal/mol, AlF, g = -63.4, Al, g = 78, CaF<sub>2</sub>, g = -187.5, CaF<sub>2</sub>, c = -293.0 and Ca, g = 42.85.

We adopt a median value of ΔHf°298.15(CaF, g) = -65 ± 2 kcal/mol which corresponds to a heat of dissociation of 126.7 ± 2 kcal/mol.

Heat Capacity and Entropy  
 Herzberg (6) gives the vibrational constants and electronic levels, Harvey (7) has reported a value for B<sub>0</sub> which corresponds to a bond length of 2.02 Å. The Morse potential function was used to calculate α<sub>e</sub>.

Heat of Formation

Torgeson and Sahara (1) measured the heat of solution of CaO in aqueous 20.1% HF as -54.96 ± 0.02 kcal/mol. Using ΔHf°298 (CaO, c) = -151.79 kcal/mol (2), ΔHf°298 (H2O, l) = -68.317 kcal/mol (3) and ΔHf°298 (HF, 4.4% H2O, l) = -76.60 kcal/mol (4), we obtain ΔHf°298 (CaF2, c) = -293.6 ± 0.6 kcal/mol.
Smyslyayev and Edelava (5) report the solubility product of CaF2 as 2.7 ± 0.27 × 10^-11 in dilute HCl, which yields ΔG°298 = 14.42 kcal/mol for the reaction CaF2(c) + Ca^2+(aq) + 2F^-(aq). Using ΔG°298 (Ca^2+, aq.) = -132.30 kcal/mol (2) and ΔG°298 (F^-, aq.) = -66.95 kcal/mol (4) we obtain ΔG°298 (CaF2, c) = -280.84 ± 0.6 kcal/mol, which using the adopted functions yields ΔHf°298 (CaF2, c) = -293.1 ± 0.6 kcal/mol.
Vecher and Vecher (11) have measured the emf of a high temperature solid state cell and report ΔG°298 = -17.6 ± 0.2 kcal/mol for the reaction CaO(c) + HgF2(c) + CaF2(c) + MgO(c). This reduces to ΔHf°298 = -17.6 kcal/mol which, using JANAF values for HgO and HgF2 and CaO from reference 2, yields ΔHf°298 (CaF2, c) = -294.4 ± 1.3 kcal/mol.
Kohlrausch (12) reported the solubility of CaF2 and fluorapatite, which yield solubility products of 3.6 × 10^-11 and 2.8 × 10^-11. From these we obtain, as above, ΔHf°298 (CaF2, c) = -292.9 and -293.1 kcal/mol.
Guntz (13) made measurements on the neutralization of Ca(OH)2(aq) and HF(aq) which yield ΔHf°298 (CaF2, c) = -293.1 kcal/mol, according to Parker (2).
A median value of ΔHf°298 (CaF2, c) = -293 ± 1.5 kcal/mol is adopted.

Heat Capacity and Entropy

Huffman and Norwood (6) have measured the low temperature heat capacity in the range 3.6° to 30°K. Eucken and Schwens (7) in the range 17° to 86°K and Todd (8) from 54° to 296.5°K. We have fitted a smooth polynomial curve through the data of references 6 and 8 and the yields S°298 = 16.39 ± 0.08 eu based on S°3.6 = 0.0002 eu. The values of reference 7 deviate considerably at the lowest temperatures but are in reasonable agreement at higher temperatures.
The high temperature enthalpy of calcium fluoride has been reported by Naylor (9) to 1789°K, Krestnikov and Karetnikov (10) to 1273°K, and Lyashenko (11) to 1490°K. All the data are in approximate agreement and the more extensive results of Naylor on a very pure sample are adopted. The heat capacities, below 1424°K were derived from a polynomial fit of the enthalpy data of the form H = at^4 + bt^3 + ct^2 + d/T + e/T^2.

Transition Data

The temperature of transition is that reported by Naylor (9), the large uncertainty has been assigned since at 1424°K the enthalpies indicate complete conversion to β-CaF2, and the next lower point is at 1402°K. Evidence in support of a transition in this region comes from Lyashenko (11) whose plot indicates a break between 1273° and 1413°K. In addition, SrCl2 which has the fluorite structure has a transition near the melting point. The enthalpy of transition is that reported by Naylor (9).

Melting Data

McCreary (12) reports the melting point of a 99.1% pure sample as 1687 ± 5°K. Porter and Brown (13) report 1675 ± 5°K as the melting point of 99.81 pure CaF2 and Rogers et al. (14) obtained 1594°K as the melting point. The adopted melting point 1691 ± 5°K, for a sample of natural fluorite of high purity, was reported by Naylor (9). The heat of melting, 7100 cal, is that measured by Naylor (9). Three determinations from high temperature phase diagrams give 7250 ± 350 cal (15), 5500 cal (16) and 9800 cal (14).

Sublimation Data

See the CaF2(g) table for details.

Calcium Difluoride (CaF2) (Crystal) GFW = 78.0768

Table with 7 columns: T, K; Cp; S°; -(Cp°-H°298)/T; H°-H°298; kcal/mol; ΔHf°; ΔGf°. Rows range from 0 to 2600 K.

CaF<sub>2</sub> (LIQUID)  
 GFW = 78.0768  
 $\Delta H_f^{298,15} = -283.477 \pm 1.5$  kcal/mol  
 $\Delta H_m^* = 7.10 \pm 0.1$  kcal/mol  
 $\Delta H_v^* = 73.76 \pm 0.8$  kcal/mol

CaF<sub>2</sub> (LIQUID)  
 $S_{298,15}^0 = 22.125$  gibbs/mol  
 $T_m = 1691 \pm 5^\circ K$   
 $T_b = 2806.5 \pm 30^\circ K$

**Heat of Formation**  
 The heat of formation is obtained from that of the crystal by adding the heat of melting and the difference between  $H_{1691} - H_{298}$  for crystal and liquid.

**Heat Capacity and Entropy**  
 The heat capacity is derived from the heat content measurements of B. F. Naylor, J. Am. Chem. Soc. 57, 150 (1943). The heat capacity is constant in the real liquid range but at 1000°K a glass transition is assumed below which it follows that of the crystal. The entropy is obtained in a manner analogous to that of the heat of formation.

**Melting Data**  
 See the crystal table for details.

**Vaporization Data**  
 The boiling point is calculated as the temperature at which  $\Delta G = 0$  for the vaporization process. The heat of vaporization is the difference in  $\Delta H_{T_b}^*$  between liquid and gas.

Heat of Formation

The heat of formation is obtained from that of the crystal by adding  $\Delta H_{298.15}^\circ$ . The vapor pressure data of five authors was analysed by 2nd and 3rd law methods to give  $\Delta H_{298.15}^\circ$  as listed below. Note that the drifts are small and both positive and negative confirming the correctness of the functions used.

| Reference              | Range °K    | Points | 2nd Law $\Delta H_{298.15}^\circ$ kcal/mol | 3rd Law $\Delta H_{298.15}^\circ$ kcal/mol | Drift eu   |

\* This set was not analysed by the third law since the absolute pressures were adjusted by the authors to match their weight loss values.

A median value of 105.5 ± 0.5 kcal/mol is adopted for the heat of sublimation which yields  $\Delta H_{298.15}^\circ$  (CaF<sub>2</sub>, g) = -187.5 ± 2 kcal/mol.

Heat Capacity and Entropy

The bond length was measured by Akishin and Spiridonov (6), but the diffraction patterns were interpreted as indicating a linear molecule. The vibrational frequencies and bond angle are those reported by Calder (7) using matrix isolation spectroscopy and isotopically enriched materials.

The individual moments are I<sub>A</sub> = 2.092 × 10<sup>-39</sup>, I<sub>B</sub> = 2.3749 × 10<sup>-38</sup>, and I<sub>C</sub> = 2.5840 × 10<sup>-38</sup> g cm<sup>2</sup>.

Heat of Formation

D. E. Jensen (1) determined the heat of reaction  $\Delta H_f^\circ = 35 \pm 10$  kcal/mol for  $\text{Ca(g)} + \text{OH(g)} \rightarrow \text{CaOH}^+(\text{g}) + e^-$  in atmospheric pressure hydrogen-nitrogen-oxygen flames using the microwave cavity resonance method. This value was calculated assuming a bent model for CaOH; the value is not significantly changed, within the uncertainty, by the change in configuration. Combining  $\Delta H_f^\circ$  with JANAF heats of formation of Ca(g) and OH(g) and electron, we obtain  $\Delta H_f^\circ(\text{CaOH}^+, \text{g}) = 87.7$  kcal/mol, which is adopted in the table. This corresponds to an ionization potential of 6.11 eV.

Heat Capacity and Entropy

The molecular configuration is assumed to be linear, since experimental evidence indicates that gaseous NaOH, KOH, CaOH, RbOH are linear (2, 3, 4). This evidence also confirms the prediction of A. D. Walsh (5) that "HAB" molecules with 10 or less valence electrons (CaOH<sup>+</sup> has 8 valence electrons) will be linear in their ground state. The molecule of CaOH<sup>+</sup> has an isoelectronic structure of KOH.

The bond distances O-H and Ca-O are assumed to be the same as those in H<sub>2</sub>O(g) and CaO(g), respectively (6, 7). The moment of inertia is  $7.1294 \times 10^{-39}$  g cm<sup>2</sup>.

The Ca-O stretching frequency 733 cm<sup>-1</sup> is estimated from those of CaO(g) (2, 8) and CaF(g) (9). The O-H stretching frequency, 3600 cm<sup>-1</sup>, is estimated from those of H<sub>2</sub>O(g) (6) and Ca(OH)<sub>2</sub>(g) (10). The bending vibrational frequency, 370 cm<sup>-1</sup>, is estimated by comparison with those of NaOH, CaOH, RbOH (2, 4).  
 The enthalpy change between 0° and 298°K is 2.630 kcal/mol.

**Electronic Levels and Quantum Weights**

| $\bar{\nu}_i$ , cm <sup>-1</sup> | $g_i$ |
|----------------------------------|-------|
| 0                                | (2)   |
| (16000)                          | (2)   |
| (16100)                          | (2)   |

**Vibrational Frequencies and Degeneracies**

| $\omega_i$ , cm <sup>-1</sup> | (1) | (2) |
|-------------------------------|-----|-----|
| [733]                         | (1) | (2) |
| [320]                         | (2) | (1) |
| [3600]                        | (1) | (1) |

Bond Distance: Ca-O = [1.82] Å    O-H = [0.96] Å  
 Bond Angle: Ca-O-H = [180°]  
 Rotational Constant: B<sub>0</sub> = [0.3926] cm<sup>-1</sup>    σ = 1

**Heat of Formation**

Cotton and Jenkins (1) determined the equilibrium constants in the temperature range 1570°K-2030°K for the reaction  $\text{Ca}(g) + \text{H}_2\text{O}(g) \rightleftharpoons \text{CaOH}(g) + \text{H}(g)$  by atomic absorption spectroscopy in a fuel-rich hydrogen-nitrogen-oxygen flame. Using all JANAF functions, third law analyses of the data give  $\Delta H_f^\circ(298) = 13.6$  kcal/mol and the drift 1.9 ± 2.9 eu. This leads to the heat of formation,  $\Delta H_f^\circ(\text{CaOH}, g) = -53.3$  kcal/mol which is adopted in the tabulation. The bond dissociation energy, D<sub>0</sub><sup>0</sup>(Ca-OH), is 104.6 kcal/mol.

Ryabova and Gurvich (2) reported the bond dissociation energy D<sub>0</sub><sup>0</sup>(Ca-OH) as 100 kcal/mol. Schofield and Sugden (3) found D<sub>0</sub><sup>0</sup>(Ca-OH)<sub>2</sub> as 217 ± 12 kcal/mol. Using the relation D<sub>0</sub><sup>0</sup>(H-X)/D<sub>0</sub><sup>0</sup>(X-H-X) = 0.47 suggested by Kent, McDonald and Margrave (4), we obtain D<sub>0</sub><sup>0</sup>(Ca-OH) = 102 kcal/mol.

**Heat Capacity and Entropy**

The molecular configuration is assumed to be linear, since experimental evidence indicates that gaseous CaOH, KOH, CaOH and RbOH are linear (5, 6, 7). This evidence also confirms the prediction of A. D. Walsh (8) that "HAB" molecules with 10 or less valence electrons (CaOH has 9 valence electrons) will be linear in their ground state.

The ground state is assumed to be  $\Sigma$  by analogy with isoelectronic CaF (9). The electronic levels are estimated from band spectra of CaOH reported by Gaydon (14).

The bond distances O-H and Ca-O are assumed to be the same as those in H<sub>2</sub>O(g) and CaO(g), respectively (10, 11). The moment of inertia is  $7.1295 \times 10^{-39}$  g cm<sup>2</sup>.

The O-H stretching frequency, 3600 cm<sup>-1</sup>, is estimated from those of H<sub>2</sub>O(g) (10) and CaOH(g) (12). The bending frequency, 320 cm<sup>-1</sup>, is estimated by comparison with those of NaOH, CaOH and RbOH (5, 7). The Ca-O stretching frequency, 733 cm<sup>-1</sup>, is estimated to be the same as that of CaO(g) observed by Hultin and Lagerqvist (11) and Brewer and Hauge (13).

Heat of Formation

Bands in the visible for the  $\gamma^1 - \gamma^2$  transitions have been observed by A. Elliott, Proc. Roy. Soc. Soc. 32, 1517 (1936) have measured several lines in the same system. These data lead to a convergence limit of  $20,831 \pm 20 \text{ cm}^{-1}$ . From which the dissociation energy is obtained assuming excited and normal Cl atoms as the dissociation products of the A state. The assigned accuracy estimation reflects the uncertain knowledge of the products. The value in parenthesis is a precision measure and would apply if the dissociation products were those assumed. See R. G. Aldrin and H. S. Boylston, Trans. Far. Soc. 33, 1333 (1937) for further details on the dissociation products.

Heat Capacity and Entropy

The electronic energy levels are listed by C. E. Moore, Nat. Bur. Stands. Circ. 467, (1949).

| T, °K. | $C_p$ | $S^\circ$ | $-(F^\circ - H_{298}^\circ)/T$ | $H^\circ - H_{298}^\circ$ | $\Delta H_f^\circ$ | Log K <sub>p</sub> |

Heat of Formation.

The heat of formation was calculated from the equation: Cl(g) - e<sup>-</sup> → Cl<sup>+</sup>(g) with the JANAF auxiliary value for Cl(g) using an I.P. = 1.04991 X 10<sup>5</sup> cm.<sup>-1</sup> (300.206 kcal./mole) obtained from C. E. Moore, "Atomic Energy Levels", Vol. I, Circular of the National Bureau of Standards 467, June 15, 1949.

Heat Capacity and Entropy.

The electronic levels and quantum weights were obtained from C. E. Moore, loc. cit. The electronic levels above 1 X 10<sup>5</sup> cm.<sup>-1</sup> were omitted because their contribution is negligible below 6000°K. The H°-H°<sub>298</sub> value at 0°K. is -1.526 kcal./mole.

Ground State Configuration 1S<sub>0</sub>  
 $\Delta H_f^0 = -54.8 \pm .5$  kcal. mole<sup>-1</sup>  
 $\Delta H_f^{298.15} = 36.628$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 $\Delta H_f^{298.15} = -55.9 \pm .5$  kcal. mole<sup>-1</sup>

Heat of Formation.  
 The heat of formation was calculated from the equation: Cl(g) + e<sup>-</sup> → Cl<sup>-</sup>(g) with the JANAF auxiliary values for Cl(g); using the measured electron affinity = 3.613 e.v. (83.316 kcal/mole) obtained from R. S. Berry and C. W. Reimann, J. Chem. Phys. 39, 1540 (1963). Other calculated values for the electron affinity are: 3.70 e.v. reported by B. Edlen, J. Chem. Phys. 33, 98 (1960) and 3.56 e.v. reported by E. Clementi, A. D. McLean, D. L. Reinhardt and M. Yoshizawa, Phys. Rev. 133, A1274 (1964).

Heat Capacity and Entropy.

The electronic levels and quantum weights were obtained from C. E. Moore, "Atomic Energy Levels", Vol. I, Circular of the National Bureau of Standards 467, June 15, 1949, by assuming that the extra electron would produce an electronic configuration similar to that of the next higher atomic numbered element, in this case Argon. The electronic levels above 1 X 10<sup>5</sup> cm.<sup>-1</sup> were omitted because their contribution is negligible below 6000°K. The H<sup>0</sup>-H<sup>298</sup> value at 0°K. is -1.481 kcal/mole.

Cesium Chloride (CsCl)

(Crystal)

GFW = 168.358

GFW = 168.358

$\Delta H_f^0 = -105.84 \pm 0.2$  kcal/mol

$\Delta H_f^{298.15} = -105.84 \pm 0.2$  kcal/mol

$\Delta H_f^0 = 0.90$  kcal/mol

$\Delta H_m^0 = 3.8$  kcal/mol

$\Delta H_f^{298.15}(\text{to monomer}) = 48.74$  kcal/mol

(CRYSTAL)

CESIUM CHLORIDE (CSCL)

$S_{298.15}^0 = 24.183 \pm 0.005$  gibbs/mol

$T_f(\alpha-\beta) = 743^\circ\text{K}$

$T_m = 918^\circ\text{K}$

Heat of Formation

The heat of solution ( $\Delta H_{\text{soln}}$ ) of CsCl(c) in water has been measured by Forcrand (1, 2), Haigh (3), Samoilov (4, 5), and Rodnikova (6). Based on their results, Parker (7) derived the corresponding  $\Delta H_{\text{soln}}^{298.15}(\infty \text{H}_2\text{O})$  values as 4.30, 4.32, 4.08, 4.25, 4.18 and 4.18 kcal/mol. Borob'ev (8) determined the same quantity and reported  $\Delta H_{\text{soln}}^{298}(\text{CsCl}, \infty \text{H}_2\text{O}) = 4.20 \pm 0.04$  kcal/mol. Using this value, 4.20 kcal/mol, and  $\Delta H_f^0 = -61.69$  (9) and  $-39.952$  kcal/mol (10) for  $\text{Cs}^+(\infty \text{H}_2\text{O})$  and  $\text{Cl}^-(\infty \text{H}_2\text{O})$ , respectively, we evaluate  $\Delta H_f^{298}(\text{CsCl}, c) = -105.84 \pm 0.2$  kcal/mol, which is adopted.

Heat Capacity and Entropy

Taylor (11) measured the low temperature heat capacities, 7.19 - 299.38°K, with an adiabatic calorimeter; the sample purity was >99.95 per cent. Employing these data we derive the value  $S_{298}^0 = 24.183$  eu based on  $S_{19}^0 = 0.091$  eu. The high temperature enthalpies, 385.2 - 904.9°K, were measured by Kaylor (12, 13, 14), using a Bunsen ice calorimeter and a CsCl sample of 99.8 per cent purity. The heat capacities derived from the reported enthalpy data at temperatures 385.2 - 740.5°K appear too low (less than the adopted Cp's systematically by 0.9 gibbs/mol) to join smoothly with the low temperature data at 298°K. The Cp values derived from the measured enthalpy data in the temperature range 760 - 920°K increase rapidly from 14.46 to 16.3 gibbs/mol. In order to rationalize this situation, we adopt the high temperature heat capacities, 298 - 743°K, for CsCl(a) obtained by linear extrapolation of the low temperature data. The Cp values for CsCl(β) are adjusted such that the rate of increase in heat capacities is linear and less rapid than the original one, and the total enthalpy remains essentially unchanged. The discrepancy between the high and low temperature Cp for CsCl(a) may be caused by the incomplete β → α phase conversion involved. In order to resolve this discrepancy, independent enthalpy measurements using a high purity sample with composition well characterized before and after each drop experiment seem necessary.

Transition Data

The temperature of transition (in °K) has been reported by many investigators as 718 (15), 752 (16), 745 (16), 742 (21), 742.5 (12), 743 (20), and 733 (17), using different methods and samples of different purity. The value adopted is 743°K. The heat of transition (in kcal/mol) was reported to be 1.8 (14), 1.55 (18), 1.4 (19), 0.80 (21), 0.58 (12), 0.90 (13), and 1.1 (17). A median value 0.90 kcal/mol is tentatively adopted.

Melting Data

See CsCl(β) table for details.

Heat of Sublimation

$\Delta H_s^{298}$  is calculated as the difference between  $\Delta H_f^0$  for CsCl(g) and CsCl(c).

## CESIUM CHLORIDE (CsCl)

(LIQUID)

GFW = 168.358

$$S_{298.15}^{\circ} = 24.309 \text{ gibbs/mol}$$

$$\Delta H_{298.15}^{\circ} = -103.84 \pm 2.0 \text{ kcal/mol}$$

$$T_m = 918^{\circ}\text{K}$$

$$T_b = 1597.3^{\circ}\text{K}$$

$\Delta H_{298.15}^{\circ} = 27.52 \text{ kcal/mol}$  of liquid (to equilibrium mixture)

## Heat of Formation

$\Delta H_{298}^{\circ}(l)$  is obtained from  $\Delta H_{298}^{\circ}(c)$  by adding  $\Delta H_m^{\circ}$  and the difference between  $H_{318}^{\circ}$  -  $H_{298}^{\circ}$  for crystal and liquid.

## Heat Capacity and Entropy

The enthalpies of CsCl(*l*) at temperatures 923.6 - 1164.0°K were measured with a Bunsen ice calorimeter by Kaylor (1, 2). Dworkin (3) derived the heat capacity of CsCl(*l*) as 18.5 gibbs/mol from enthalpy data at temperatures 918 - 980°K. This value is adopted since it is in agreement with the enthalpy values reported by Kaylor et al. The heat capacity at temperatures above 1168 and below 923.6°K is assumed to be 18.5 gibbs/mol. The entropy is obtained in a manner analogous to that of the heat of formation.

## Melting Data

The melting temperature (in °K) of CsCl(*c*) has been determined by many investigators as 904 ± 3 (4), 918 (5), 912 (6), 911 (7), 918 (8), 916 (9), and 919 (13). The cause of the discrepancies is probably due to the difference in purity of the samples. The melting temperature adopted is 918°K.

The heat of melting (in kcal/mol) was reported to be 4.84 (14), 4.97 (15), 4.58 (16), 4.96 (17), and 4.78 (2), which were obtained calorimetrically. Using a modification of Kelley's method of obtaining heat of melting from freezing point data on binary systems involving CsCl (18), we derive the value of  $\Delta H_m^{\circ}$  as 3.6 - 4.0 kcal/mol, based on the following systems: CsCl-NaCl (3), CsCl-CuCl (8), CsCl-AgCl (9), CsCl-LiCl (5), and CsCl-Cs<sub>3</sub>PO<sub>3</sub> (12). The heat of melting for CsCl(*c*) is tentatively adopted as 3.8 kcal/mol. The  $\Delta H_m^{\circ}$  values obtained calorimetrically are not used due to the uncertainties of the state of the sample before and after the enthalpy measurements.

## Vaporization Data

$T_b$  is the temperature at which the calculated total pressures of CsCl(*g*) and Cs<sub>2</sub>Cl<sub>2</sub>(*g*) equal one atmosphere. The vapor composition at  $T_b$  is derived as CsCl 80.4 per cent and Cs<sub>2</sub>Cl<sub>2</sub> 19.6 per cent. The boiling point of CsCl(*l*) has been determined by several investigators as 1562 (17), 1572 (18), and 1576 (19). The heat required to vaporize one mole of liquid to the above vapor mixture at  $T_b$  is  $\Delta H_v^{\circ}$ .

Heat of Formation

The total pressures of CsCl(g) and Cs<sub>2</sub>Cl<sub>2</sub>(g) over CsCl(c) and CsCl(l) in the temperature range 605 - 1577°K have been determined by manometric, transpiration and Knudsen effusion methods by many investigators. Based on the reported results, the partial pressures of CsCl(g) and Cs<sub>2</sub>Cl<sub>2</sub>(g) are calculated using the derived free energy functions for CsCl(c), CsCl(l), CsCl(g) and Cs<sub>2</sub>Cl<sub>2</sub>(g), and the heats of sublimation and vaporization which are adjusted so that the sum of the calculated partial pressures of CsCl(g) and Cs<sub>2</sub>Cl<sub>2</sub>(g) approaches the measured total pressures, and the evaluated second and third law ΔH<sup>o</sup><sub>298</sub> values are in reasonable agreement. The results obtained are presented in the table below. The value of ΔH<sup>o</sup><sub>298</sub>(CsCl, g) adopted is -57.4 ± 1 kcal/mol.

Gaydon (10) reported D<sub>0</sub>(Cs-Cl) = 4.6 ± 0.2eV or 106.08 ± 4.61 kcal/mol. Using this D<sub>0</sub> value and ΔH<sup>o</sup><sub>f</sub> = 18.863 and 28.52 kcal/mol for Cs(g) and Cl(g), we evaluate ΔH<sup>o</sup><sub>f,298</sub> = -59.4 ± 4.6 kcal/mol for CsCl(g), which is in fair agreement with the adopted value.

\*1. CsCl(c) = CsCl(g); 2. CsCl(l) = CsCl(g); A = Knudsen effusion; B = transpiration; and C = manometric.  
 \*\*Calculation based on the third law ΔH<sup>o</sup><sub>298</sub> value.

Heat Capacity and Entropy

Clouser (11) studied the pure rotational spectra of CsCl(g) in the 0.36 - 3 mm range of the microwave region with the molecular-beam spectrometer, and derived the values of B<sub>e</sub>, σ<sub>e</sub>, ω<sub>e</sub>, ω<sub>e</sub>X<sub>e</sub> and T<sub>e</sub>, which are adopted and corrected to the average isotopic species.

The Cs-Cl bond distance was measured as 3.06 ± 0.03 Å by the electron diffraction method by Maxwell (12), which is not used. Similar values of B<sub>e</sub> and σ<sub>e</sub> were reported by Honig (13) and Rice (14), determined from microwave and infrared spectra, respectively. Barrow (15) gave ω<sub>e</sub> = 240 cm<sup>-1</sup> (CsCl<sub>35</sub>) which is significantly different from the adopted value 214.22 cm<sup>-1</sup> for CsCl<sub>35</sub> and the value 209 ± 6 cm<sup>-1</sup> reported by Rice (14). The moment of inertia is 3.924 × 10<sup>-38</sup> g cm<sup>2</sup>.

$\Delta H_f^0 =$  Unknown  
 $\Delta H_f^0 298.15 = -33.0 \pm 0.4$  kcal. mole<sup>-1</sup>  
 $\Delta H_m^0 = 2.445$  kcal. mole<sup>-1</sup>  
 $\Delta H_g^0 298.15 = 54.77 \pm 0.5$  kcal. mole<sup>-1</sup> of monomer  
 $\Delta H_g^0 298.15 = 37.2 \pm 0.2$  kcal. mole<sup>-1</sup> of trimer  
 $T_m = 703^\circ\text{K}$ .

## Heat of Formation.

There have been three calorimetric determinations of the heat of formation. Thomsen, "Thermochemische Untersuchungen", Barth, Leipzig (1882-1886) reported  $-32.675$  kcal. mole<sup>-1</sup>. Barthelot, Ann. Chim. Phys. 20, 504 (1880) reported  $-35.6$  kcal. mole<sup>-1</sup> and H. V. Wartenberg and H. Werth, Z. physik. Chem. A 151, 109 (1930) reported  $-32.1 \pm 0.4$  kcal. mole<sup>-1</sup>. In addition, values of the heat of formation have been derived from several sets of equilibrium data. A. A. Noyes and M. Chow, J. Am. Chem. Soc. 40, 739 (1918) from a study of cell potentials derived a  $\Delta H_f^0 = 7.19$  kcal. for the reaction  $\text{Cu}(c) + \text{HCl}(aq) \rightarrow \text{CuCl}(c) + 1/2 \text{H}_2(g)$  which yields  $\Delta H_f^0 298(\text{CuCl}) = -32.76$  kcal. mole<sup>-1</sup>. Several investigators have studied the reaction  $2\text{Cu}(c) + \text{H}_2(g) \rightarrow 2\text{Cu}(c) + 2\text{HCl}(g)$  and its reverse reaction. These include A. B. Beggles, Trans. Am. Electrochem. Soc. 51, 449 (1927) who reported equilibrium constants which result in 2nd and 3rd law heats of reaction of 24.3 and 23.2 kcal. mole<sup>-1</sup>; A. F. Kapustinsky, J. Am. Chem. Soc. 59, 460 (1936) who obtained similarly 20.1 and 21.8 kcal. mole<sup>-1</sup>; S. A. Shchukarev and M. A. Orenskaya, Z. Obshchei. Khim. 24, 1926 (1954) obtained 25.4 and 21.5 kcal. mole<sup>-1</sup> for the 2nd and 3rd law heat of reaction. These yield values for  $\Delta H_f^0 298(\text{CuCl})$  ranging from  $-32.1$  to  $-34.8$ . M. Watanabe, Bull. Inst. Phys. Chem. Res. 9, 94 (1929) from cell studies reports  $\Delta H_f^0 298(\text{CuCl}) = -34.6$  kcal. mole<sup>-1</sup>. A value of  $\Delta H_f^0 298$  can also be obtained from  $\Delta H_f^0(\text{CuCl}_2(g))$ , which is fixed independently and known with good precision. Using the 3rd law heat of sublimation of  $\text{CuCl}(c)$  to trimer determined by D. W. Magee, Doctoral Thesis, Ohio State University (1955) [See trimer table], we obtain  $\Delta H_f^0 298 \text{ CuCl}(c) = -33.01 \pm 0.3$  kcal. mole<sup>-1</sup>. A weighted average of  $-33.0 \pm 0.4$  kcal. mole<sup>-1</sup> was adopted.

## Heat Capacity and Entropy.

The entropy of CuCl was obtained from the several pieces of equilibrium data reported above and the adopted  $\Delta H_f^0 298$ . A weighted average of  $20.8 \pm 1$  cal/(mole-deg) was adopted for  $S_{298}^0 \text{ CuCl}(c)$ . The enthalpy and heat capacity above  $298^\circ\text{K}$ . have been reported by A. N. Krestovnikov and O. A. Karetnikov, Jour. Gen. Chem. (USSR) 6, 955 (1936). However these values were not adopted since they do not give reasonable heat capacities and other data by these workers is not in agreement with established values. Heat capacities equal to those of AgCl, as given by K. K. Kelley, U. S. Bureau of Mines Bulletin 584, Washington 1960, were adopted here above  $298^\circ\text{K}$ .

## Melting Data.

The temperature end heat of melting were those selected by K. K. Kelley, U. S. Bur. Mines Bulletin 393 (1936), from these studies. The heat of melting was reported by Krestovnikov and Karetnikov loc. cit. as  $2.54$  kcal. mole<sup>-1</sup>.

## Sublimation Data.

The heat of sublimation was calculated from the adopted heats of formation at  $298^\circ$  for the reaction  $x \text{ CuCl}(c) \rightarrow (\text{CuCl})_x(g)$  where  $x = 1$  or  $3$ . See the respective gas tables for details.

MOL. WT. = 98.993

(LIQUID)

COPPER MONOCHLORIDE (CuCl)

$\Delta H_f^o 298.15 = -31.35 \pm 0.4 \text{ kcal. mole}^{-1}$   
 $\Delta H_m^o = 2.445 \text{ kcal. mole}^{-1}$   
 $\Delta H_v^o = [5.18] \text{ kcal. mole}^{-1}$  (to equilibrium mixture)

$S_{298.15}^o = 22.4 \pm 1 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $T_m = 703^\circ\text{K.}$   
 $T_b = [1485]^\circ\text{K.}$  (to equilibrium mixture)

Heat of Formation.  
Calculated from  $\Delta H_f^o 298$  of the crystal plus  $\Delta H_m^o$  and the difference between  $H_m - H_{298}$  for crystal and liquid.

Heat Capacity and Entropy.  
The heat capacity was estimated to be constant at 8 cal. deg.<sup>-1</sup> gm. atom<sup>-1</sup>. The entropy was calculated in a manner analogous to that of the heat of formation.

Boiling Data.  
The boiling point and heat of vaporization were calculated from the respective liquid, monomer and trimer gas tables. The boiling point was taken as the point where the total pressure reached 1 atm. At this point the partial pressures are 0.021 atm. of monomer and 0.979 atm. of trimer.

 $r_e = 2.050 \text{ \AA}$

Heat of Formation.

The heat of formation was obtained from the equilibrium data of L. Brewer and N. L. Lofgren, J. Am. Chem. Soc. 72, 3038 (1950). They studied the reaction  $\text{Cu}(c) + x \text{HCl}(g) \rightarrow \text{CuCl}_x(g) + x/2 \text{H}_2(g)$  by measuring the amount of CuCl formed when various ratios of HCl:H<sub>2</sub> were passed over heated copper. Brewer and Lofgren analyzed the data by a least squares fitting technique and deduced partial pressures of monomer and trimer. The monomer pressure were subjected to second and third law analysis and gave  $\Delta H_f^{\circ} 298 = 46.85 \pm 3.2$  and  $43.83 \pm 0.4 \text{ kcal. mole}^{-1}$  respectively. The 3rd law value yields  $\Delta H_f^{\circ} 298 \text{ CuCl}(g) = 21.77 \pm 0.4 \text{ kcal. mole}^{-1}$ , which was adopted.

Heat Capacity and Entropy.

The molecular constants were corrected for normal isotopic abundance of both copper and chlorine end were calculated from the values for  $^{65}\text{Cu}^{35}\text{Cl}$  given by R. K. Auandi, P. R. Reo and J. K. Brody, Nature 192, 444 (1961). The rotational constants were in good agreement with those reported by A. Lagerqvist and V. Lazerove-Giremov for  $\text{Cu}^{63}\text{Cl}^{35}$ , Naturwissenschaften 45, 68 (1961).

Heat of Formation.  
 $B_e = 0.51403 \text{ cm.}^{-1}$   
 $\Delta H_f^{\circ} 298.15 = -12.14 \text{ kcal. mole}^{-1}$  was calculated from the dissociation energy ( $D_0^{\circ} = 56.99$ ) obtained from the visible band spectra measured by H. Schmitz and H. J. Schumacher, Z. Naturforsch. 2B, 359 (1947) and A. L. Wahrhaftig, J. Chem. Phys. 10, 248 (1941). The convergence limit of  $21,512 \pm 20 \text{ cm.}^{-1}$  for the A state leads to the selected  $D_0^{\circ}$  assuming that the products are  $\text{Cl}(^2P_{1/2})$  and  $\text{F}(^2P_{3/2})$  or to  $D_0^{\circ} = 60.36$  assuming  $\text{Cl}(^2P_{3/2})$  and  $\text{F}(^2P_{1/2})$ . Calorimetric values bracket the two possibilities but more weight was given to the results of Wicke.

Method Reaction Observation  
 1 Spectroscopic  $\text{ClF} = \text{Cl}(^2P_{1/2}) + \text{F}(^2P_{3/2})$   $D_0^{\circ} = 56.99$   
 $\text{ClF} = \text{Cl}(^2P_{3/2}) + \text{F}(^2P_{1/2})$   $D_0^{\circ} = 60.36$   
 2 Spectroscopic  $1/2 \text{ Cl}_2 + 1/2 \text{ F}_2 = \text{ClF}$   $\Delta H_f^{\circ} 293 = -11.6 \pm 0.1$   
 3 Calorimetric  $1/2 \text{ Cl}_2 + 1/2 \text{ F}_2 = \text{ClF}$   $\Delta H_f^{\circ} 0 = -11.7 \pm 0.5$   
 4 Explosion method  $\text{NaCl} + \text{ClF} = \text{NaF} + \text{Cl}_2$   $\Delta H_{290}^{\circ} = -24.5 \pm 0.5$   
 5a Calorimetric  $\text{NaCl} + 0.5 \text{ F}_2 = \text{NaF} + 0.5 \text{ Cl}_2$   $\Delta H_{290}^{\circ} = -39.5 \pm 0.5$   
 5b Calorimetric  $\text{NaCl} + 0.5 \text{ F}_2 = \text{NaF} + 0.5 \text{ Cl}_2$   $\Delta H_{290}^{\circ} = -39.5 \pm 0.5$

 \*Based on  $\Delta H_f^{\circ} 298(\text{NaCl}(c)) = -98.26$  and  $\Delta H_f^{\circ} 298(\text{NaF}(c)) = -137.1$  kcal. mole $^{-1}$   
 \*\*Based on the difference between the two calorimetric reactions of reference 5a, 5b.

Heat Capacity and Entropy.  
 The rotational constants were obtained from the microwave spectrum by D. A. Gilbert, A. Roberts and P. A. Orlandow, Phys. Rev. 76, 1723 (1949) and by D. A. Gilbert and A. Roberts Phys. Rev. 77, 742 (1950). The vibrational constants were obtained from the analysis vibration-rotation fine structure in the infrared by A. H. Nielsen and E. A. Jones, J. Chem. Phys. 13, 1117 (1951).  
 The rotational and vibrational constants were adjusted to  $\text{Cl}^{35} = 75.4\%$  and  $\text{Cl}^{37} = 24.6\%$ .

DLITHIUM CHLORIDE FLUORIDE (Li<sub>2</sub>ClF) (Ideal Gas)

Mol. Wt. = 68.34

ΔH<sub>f</sub>° 298.15 = [-180.2] kcal. mole<sup>-1</sup>

S° 298.15 = [64.037] cal. deg.<sup>-1</sup> mole<sup>-1</sup>

ΔH<sub>f</sub>° 298.15 from National Bureau of Standards Report No. 6297, "Preliminary Report on the Thermodynamic Properties of Lithium, Beryllium, Magnesium, Aluminum, and their Compounds with Oxygen, Hydrogen, Fluorine, and Chlorine (Revised)", January, 1959. Cp from R. R. Koppang, C. M. Sherwood, and G. S. Bahn, Marquardt Corp., Van Nuys, Calif., "Some Provisional Tables of Species Thermodynamic Properties", October, 1959.

Magnesium Chloride Fluoride (MgClF)  
(Ideal Gas) Mol. wt. = 78.7634

Mg-Cl = [2.18] Å

Mg-F = [1.77] Å

Bond Angle: Cl-Mg-F = [170]°

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [1.5663 X 10<sup>-115</sup>] g.<sup>3</sup> cm.<sup>6</sup>

σ<sup>-</sup> = 2

Heat of Formation

The heat of formation is based on an estimated ΔH<sub>f</sub>° 298 = 0 for the reaction MgCl<sub>2</sub>(g) + MgF<sub>2</sub>(g) → 2MgClF(g).

using ΔH<sub>f</sub>° 298.15 = -95.85 and -176.2 kcal. mole<sup>-1</sup> for MgCl<sub>2</sub>(g) and MgF<sub>2</sub>(g), respectively.

Heat Capacity and Entropy

The bond angle is taken to be the value we have adopted for MgCl<sub>2</sub>(g). The Mg-Cl and Mg-F bond distances are assumed to be the same as those in MgCl<sub>2</sub>(g) and MgF<sub>2</sub>(g). The vibration frequencies are the averages of those for MgCl<sub>2</sub>(g) and MgF<sub>2</sub>(g). The three principal moments of inertia are: I<sub>A</sub> = 0.0977 X 10<sup>-33</sup>, I<sub>B</sub> = 38.958 X 10<sup>-33</sup> and I<sub>C</sub> = 40.054 X 10<sup>-33</sup> g. cm.<sup>2</sup>

Bond Lengths and Angles F-Cl = [1.63] Å O-Cl = [1.46] Å  
 F-Cl-O = [95° 10'] O-Cl-O = [119° 12']

Moments of Inertia I<sub>A</sub> = I<sub>B</sub> = 1.595 X 10<sup>-38</sup> gm. cm.<sup>2</sup> I<sub>C</sub> = [1.685 X 10<sup>-38</sup>] gm. cm.<sup>2</sup>

Heat of Formation C. A. Neugebauer and J. L. Margrave, J. Am. Chem. Soc. 79, 1338 (1957), measured the heat of reaction of perchloryl fluoride and hydrogen.

ClO<sub>3</sub>F (g) + 4H<sub>2</sub> (g) = HF (aq, 0.5M) + 3H<sub>2</sub>O (l)

The necessary additional thermal data for the calculation of the heat of formation was obtained by them from N. B. S., Circ. 500. V. H. Dibel, R. M. Reese and D. E. Mann, J. Chem. Phys. 27, 176 (1957) obtain a value of -5.3 ± 4 kcal. mole<sup>-1</sup> from the observed appearance potential of Cl<sup>+</sup>.

Heat Capacities and Entropies

The assignment of D. R. Lide and D. E. Mann, J. Chem. Phys. 25, 1129 (1956), based upon the infra red spectra of the gas is supported by the Raman measurements of F. X. Fowell and E. R. Lippincott, J. Chem. Phys. 32, 1883 (1960).

The value of the spectroscopic constant B was obtained by R. F. Madden and W. S. Benedict from a high resolution infra red spectrograph. The Cl-F bond distance was estimated assuming a single covalent bond with no ionic character as evidenced by the low dipole moment obtained by A. A. Maryott and S. J. Kreidler, J. Chem. Phys. 27, 1221 (1957). Electron spin resonance results are explained by S. Brownstein, Can. J. Chem. 36, 1597 (1958), on the basis of a low dipole moment. The Cl-O distance was estimated to be that found in the Chlorate ion, L. Pauling, "The Nature of the Chemical Bond", 3rd ed. Cornell Univ. Press, Ithaca, 1960. The resulting value of the bond angle and I<sub>C</sub> are consistent with the measured I<sub>B</sub> and the assumed bond lengths.

A calorimetric entropy of 60.17 cal. deg.<sup>-1</sup> mole<sup>-1</sup> at 226.48°K was obtained by J. K. Koehler and W. F. Glauque, J. Am. Chem. Soc. 80, 2659 (1958) for the ideal gas. If the lattice doesn't discriminate between F and O atoms then at 0°K a residual entropy of 2.75 cal. deg.<sup>-1</sup> mole<sup>-1</sup> exists and the third law entropy would be 62.92 cal. deg.<sup>-1</sup> mole<sup>-1</sup>. This value may be compared with 62.64 obtained statistically. The difference 0.3 cal. deg.<sup>-1</sup> mole<sup>-1</sup> is within the range found for other molecules and explained on the basis of some discrimination in the lattice, see Koehler and Glauque, loc. cit. for reference.

Bond Distances: P-Cl = 2.01 ± 0.04 Å      P-F = 1.51 ± 0.03 Å      P-O = 1.55 ± 0.03 Å

Bond Angle: F-P-F = P-P-Cl = 103°

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 4.2790825 X 10<sup>-113</sup> g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation.

The ΔH<sub>f</sub><sup>0</sup> 298.15 of POClF<sub>2</sub> was estimated to be -228 kcal. mole<sup>-1</sup> from the ΔH<sub>f</sub><sup>0</sup> 298.15 of POCl<sub>3</sub> by assuming bond energies of 120 kcal. for D(P-F) and 80 kcal. for D(P-Cl). The D(P-F) and D(P-Cl) values were taken from E. Neale and L. T. D. Williams, J. Chem. Soc., 2465 (1955) Part I and E. Neale, L. T. D. Williams and V. T. Moores, J. Chem. Soc., 422 (1956) Part II.

Essentially the same ΔH<sub>f</sub><sup>0</sup> 298.15 may be obtained by assuming a ΔH<sub>f</sub><sup>0</sup> = 0 for the following reaction:

The molecular constants were determined by L. O. Brockway and J. Y. Beach, J. Am. Chem. Soc., 50, 1856 (1938) and by Q. Williams, J. Sheridan, and W. Gordy, J. Chem. Phys., 20, 164 (1952). Brockway and Beach used electron diffraction. Q. Williams et al. measured microwave spectra. Brockway and Beach assumed that the P-F and P-Cl angles were equal in POCl<sub>2</sub>Cl and POCl<sub>2</sub>. An analysis of Brockway and Beach's data by Q. Williams et al., indicates that the angles in POCl<sub>2</sub>Cl, POCl<sub>2</sub>, and POCl<sub>2</sub> should be 103° rather than the reported 106° ± 3°. The principal moments of inertia calculated from these parameters were I<sub>A</sub> = 3.24319 X 10<sup>-36</sup> g. cm.<sup>2</sup>, I<sub>B</sub> = 1.87015 X 10<sup>-36</sup> g. cm.<sup>2</sup>, and I<sub>C</sub> = 3.13498 g. cm.<sup>2</sup> X 10<sup>-36</sup>.

The Raman spectra and vibrational frequencies for POCl<sub>2</sub>Cl were reported by M. L. Delwaulle and P. Francois, Compt. Rend. 222, 550 (1946). The frequencies were reassigned by M. L. Delwaulle and P. Francois in J. Chim. Phys. 45, 87 (1949).

Bond Distances: Cl-F<sub>1</sub> = Cl-F<sub>2</sub> = 1.688 Å, Cl-F<sub>3</sub> = 1.589 Å  
Bond Angle: F<sub>1</sub>-Cl-F<sub>2</sub> = F<sub>2</sub>-Cl-F<sub>3</sub> = 87° 29', F<sub>1</sub>-Cl-F<sub>3</sub> = 185° 02'  
Product of Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 2.6923061 X 10<sup>-114</sup> g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation

The ΔH<sub>f</sub> 298.15 = -37.97 kcal. mole<sup>-1</sup> was calculated from ΔH<sub>f</sub> 298 = 25.83 kcal. mole<sup>-1</sup> obtained by third law analysis of the equilibrium data of H. Schmitz and H. T. Schumacher, Z. Naturforsch. 2b, 362 (1947) for the reaction ClF<sub>3</sub>(g) = ClF(g) + F<sub>2</sub>(g). Similar values are obtained from the equilibrium data of K. Schifer and E. Wicke, Z. Elektrochemie 52, 205-209 (1948). Calorimetric values scatter widely, as summarized below; these were given little weight.

| Source | Method                     | Reaction  | Observation (kcal. mole <sup>-1</sup> ) | 3rd Law Drift (kcal. mole <sup>-1</sup> ) |

Heat Capacity and Entropy

The structural constants were obtained from the microwave study of D. P. Smith, J. Chem. Phys. 21, 609 (1953). The plener distorted "m" structure is similar to that derived from X-ray studies of the solid by R. D. Burbank and P. N. Bennet, J. Chem. Phys. 21, 602 (1953). Fundamental frequencies are taken from the infrared and Raman spectra of H. H. Cleessen, B. Weinstock and J. G. Meim, J. Chem. Phys. 28, 285 (1958). These data confirm the "m" structure as opposed to the pyramidal structure used in earlier spectral analyses.

Cleessen, et al., loc. cit., calculate thermodynamic functions virtually identical with the JANAF values. These authors also correct the third law entropy reported by J. W. Gaiser, H. A. Bernhardt and G. D. Oliver, J. Am. Chem. Soc. 73, 5725 (1951) from measurements of heat capacity (14-285°K.) and vapor pressure (226-303°K.). The entropy at the normal boiling point becomes S<sub>298.15</sub> = 67.04 cal. deg.<sup>-1</sup> mole<sup>-1</sup>, when a non-ideality correction consistent with the dimer-monomer vapor equilibrium is applied. The corresponding statistical entropy, S<sub>298.15</sub> = 66.59 cal. deg.<sup>-1</sup> mole<sup>-1</sup>, is consistent with the third law value within the probable error in the entropy of the liquid and the entropy of vaporization. The three principal moments of inertia are: I<sub>A</sub> = 6.1114 X 10<sup>-39</sup>, I<sub>B</sub> = 1.81945 X 10<sup>-38</sup> and I<sub>C</sub> = 2.42859 X 10<sup>-38</sup> g. cm.<sup>2</sup>

Chlorotrifluorosilane (ClSiF<sub>3</sub>)  
(Ideal Gas) Mol. Wt. = 120.547

Bond Distance (Cl-F)<sub>basal</sub> = 1.72 Å

Bond Angle: F-I-F = 90°

Product of Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 2.47289 x 10<sup>-113</sup> g<sup>3</sup> cm<sup>6</sup>

(Cl-F)<sub>axial</sub> = 1.82 Å

Heat of Formation

The heat of formation was estimated by assuming that the ratio [A-B.E.(ClF)<sub>3</sub>]/[A-B.E.(ClF)<sub>5</sub>] - A-B.E.(ClF<sub>5</sub>) was equal to [A-B.E.(BrF)<sub>3</sub>]/[A-B.E.(BrF)<sub>5</sub>] - A-B.E.(BrF<sub>5</sub>), where A-B.E. represents average bond energy. All values were taken from these tables. A-B.E.(ClF<sub>5</sub>) was thus calculated to be 36 kcal/mol which leads to ΔH<sub>f</sub>° = -57 ± 15 kcal/mol.

Heat Capacity and Entropy

O. M. Begun, W. H. Fletcher and D. P. Smith, J. Chem. Phys. 42, 2236 (1965), have reported the infrared spectra of the gas and the Raman spectra of the liquid. Their assignments have been adopted here, including one frequency 1/6 obtained from a volume force-field treatment. The values are consistent with those for IF<sub>5</sub>(g) and BrF<sub>5</sub>(g). D. P. Smith, Science 141, 1039 (1963), had previously reported three infrared bands. The structure of the molecule has not been determined but the spectra can only be interpreted assuming C<sub>4v</sub> symmetry; this is in accord with IF<sub>5</sub> and BrF<sub>5</sub>(g). Begun et al. assumed a square pyramidal structure with the chlorine in the base of the pyramid. There is some evidence that the chlorine may not lie in the basal plane but this would not appreciably affect the calculations. The structure adopted was that given by Begun et al. The individual moments of inertia are I<sub>A</sub> = I<sub>B</sub> = 25.7380 x 10<sup>-39</sup> g cm<sup>2</sup> and I<sub>C</sub> = 37.3298 x 10<sup>-39</sup> g cm<sup>2</sup>.

$\omega_e x_e = 1.19 \text{ cm.}^{-1}$   
 $\omega_e = 404.92 \text{ cm.}^{-1}$   
 $B_e = [0.17795] \text{ cm.}^{-1}$   
 $\alpha_e = [0.00075] \text{ cm.}^{-1}$   
 $r_e = [2.09]$

Heat of Formation.

The dissociation energy ( $D_0^{\circ}$ ) of FeCl(g) was reported as  $3 \pm 2 \text{ e.v.}$  ( $69 \pm 46 \text{ kcal. mole}^{-1}$ ) by A. O. Gaydon, "Dissociation Energies", Chapman and Hall Ltd., London, 1953. The corresponding  $\Delta H_f^{\circ} 298.15$  (FeCl, g) was evaluated to be  $56 \pm 46 \text{ kcal. mole}^{-1}$ . By comparing  $D(\text{Fe-O}) = 101 \text{ kcal. mole}^{-1}$  in FeO(g) with the coordinate bond energies obtained in organic complexes and iron carbonyl halides of  $E(\text{Fe-O}) = 59.4$  and  $E(\text{Fe-Cl}) = 37.3 \text{ kcal. mole}^{-1}$ , reported by M. M. Jones, B. J. Yow and M. R. May, Inorg. Chem. 1, 166 (1962), the  $D(\text{Fe-Cl})$  in FeCl(g) was estimated as  $101 \times (37.3/59.4) = 63.3 \text{ kcal. mole}^{-1}$ , yielding  $\Delta H_f^{\circ} 298.15$  (FeCl, g) =  $64 \text{ kcal. mole}^{-1}$ . The adopted value of  $\Delta H_f^{\circ} 298.15$  for FeCl(g) is  $60 \pm 20 \text{ kcal. mole}^{-1}$ .

Heat Capacity and Entropy.

The ground state configuration,  $\omega_e$  and  $\omega_e x_e$  (corrected to the average isotopic species) were obtained from O. Herzberg, "Spectra of Diatomic Molecules", D. Van Nostrand Company, Inc., New York, 1950. The Fe-Cl bond distance was assumed to be the same as that in FeCl<sub>2</sub>(g). Hence the values of  $B_e$  and  $\alpha_e$  were calculated. The electronic levels and quantum weights were estimated by comparison with the electronic levels in Fe<sup>2+</sup>(g) reported by C. E. Moore, "Atomic Energy Levels", Circular of the National Bureau of Standards 467, Vol. II, 1952, using the reasoning suggested by J. T. Hougen, O. E. Leroi and T. C. James, J. Chem. Phys. 34, 1670 (1961). The total 30 for the quantum weight was obtained from the ground multiplet of Fe<sup>2+</sup> and was split arbitrarily. The entropy values may be in error by a few entropy units due to the uncertainties in the low lying electronic levels. The principal moment of inertia is  $1.5728 \times 10^{-38} \text{ g. cm.}^2$ .

Ground State Configuration  $1\Sigma^+$   
 $\Delta H_f^0 = -22.019 \pm 0.05$  kcal. mole<sup>-1</sup>  
 $\Delta H_f^{298.15} = -22.063 \pm 0.05$  kcal. mole<sup>-1</sup>

 $\sigma = 1$   
 $r_e = 1.2746 \text{ \AA}$

Heat of Formation.

The selected value, Rossini's flow calorimetric measurement (1) of the direct combination of the elements, is essentially the same as that in the revised version (2) of NBS Circular 500. JANAF analyses of the more recent measurements are summarized below, while the earlier measurements have been reviewed by Rossini (1).

| Experimenters           | Date    | Method  | References                 |

| - - -                   | 1922-63 | $\Delta H_f^0$ from e.m.f. and $\Delta S_f^0$ from statistical mechanics  | 15, 16, 17, 18, 19, 20     |
| Lewis                   | 1906    | Equilibrium for reaction $\text{HCl}(g) + \frac{1}{4} \text{O}_2(g) = \frac{1}{2} \text{H}_2\text{O}(g) + \frac{1}{2} \text{Cl}_2(g)$ | 21                         |

The direct combination values of Roth-Richter (13) and von Wartenberg - Hanisch (14) are 0.7% less negative than that of Rossini; however, all of the other methods favor the more negative value. The Roth - Richter value may be affected by errors in the measurement of the extent of reaction by HCl titration (9,22), since a set of experiments based on determination of the amount of H<sub>2</sub> gave a value of  $-22.08$  kcal. mole<sup>-1</sup>.

Rossini's value is confirmed by a variety of independent methods. The solution calorimetry (3), though it is related through a complex reaction scheme, is based on species which are now quite well known. E.m.f. measurements (15,16,17,18, 19,20) give  $\Delta H_f^{298.15} = -22.735$ ; assuming an uncertainty of 1.0 mv. in E°, this leads to  $\Delta H_f^{298.15} = -22.02 \pm 0.03$  when combined with the statistical entropies. The equilibria of Lewis (625-692°K) give  $\Delta H_f^{298.15} = -22.20 \pm 0.44$  (second law) and  $-22.30 \pm 0.04$  (third law).

Heat Capacity and Entropy.

Spectroscopic constants for HCl<sup>35</sup> and HCl<sup>37</sup> were selected from the work of E. K. Flyler, E. D. Tidwell, Z. Elektrochem., 54, 717 (1960) and C. Haeuveler, P. Barchewitz, *Compt. rend.*, 246, 3040 (1958). The values were adjusted to 75.5% HCl<sup>35</sup>.

Heat of Formation

I. E. Fila, K. P. Miahchenko, and N. V. Pakhomova, Zhur. Neorg. Khim. **5**, 1772, 1761 (1958), report the following heats of reaction:

$\Delta H_f^{\circ} 298.15 = -5.84 \pm 0.05$  kcal.

$\Delta H_f^{\circ} 298.15 = -36.93 \pm 0.05$  kcal.

If the following auxiliary heats of formation are used:

$\Delta H_f^{\circ} 298.15 = -40.02$  kcal. mole<sup>-1</sup> (National Bureau of Standards Circ. 500, 1952)

$\Delta H_f^{\circ} 298.15 = -66.32$  kcal. mole<sup>-1</sup> (National Bureau of Standards Circ. 500, 1952)

$\Delta H_f^{\circ} 298.15 = -45.70 \pm 0.02$  kcal. mole<sup>-1</sup> (P. A. Giguère, B. G. Morissette, A. W. Olmos, and O. Knop, Can. J. Chem. **33**, 804 (1955), consistent with  $\Delta H_f^{\circ} 298.15$  of H<sub>2</sub>O<sub>2</sub>(g) in this compilation)

$\Delta H_f^{\circ} 298.15 = -45.70 \pm 0.02$  kcal. mole<sup>-1</sup> (National Bureau of Standards Circ. 500, 1952)

$\Delta H_f^{\circ} 298.15 = -45.70 \pm 0.02$  kcal. mole<sup>-1</sup> (P. A. Giguère, B. G. Morissette, A. W. Olmos, and O. Knop, Can. J. Chem. **33**, 804 (1955), consistent with  $\Delta H_f^{\circ} 298.15$  of H<sub>2</sub>O<sub>2</sub>(g) in this compilation)

$\Delta H_f^{\circ} 298.15 = -45.70 \pm 0.02$  kcal. mole<sup>-1</sup> (National Bureau of Standards Circ. 500, 1952)

$\Delta H_f^{\circ} 298.15 = -45.70 \pm 0.02$  kcal. mole<sup>-1</sup> (P. A. Giguère, B. G. Morissette, A. W. Olmos, and O. Knop, Can. J. Chem. **33**, 804 (1955), consistent with  $\Delta H_f^{\circ} 298.15$  of H<sub>2</sub>O<sub>2</sub>(g) in this compilation)

$\Delta H_f^{\circ} 298.15 = -45.70 \pm 0.02$  kcal. mole<sup>-1</sup> (National Bureau of Standards Circ. 500, 1952)

Moments of Inertia: I<sub>A</sub> = .9784 X 10<sup>-39</sup> g. cm.<sup>2</sup> I<sub>B</sub> = 12.6749 X 10<sup>-39</sup> g. cm.<sup>2</sup> I<sub>C</sub> = 12.6749 X 10<sup>-39</sup> g. cm.<sup>2</sup> σ = 3

Heat of Formation. ΔH<sub>f</sub><sup>o</sup> 298.15 was estimated in C. B. Henderson and R. S. Scheffee, Atlantic Research Corp., Alexandria, Va., "Survey of Thermochemical Data," January, 1950.

Heat Capacity and Entropy. Vibrational levels and multiplicities were found in C. B. Henderson and R. S. Scheffee, Atlantic Res. Corp., Alexandria, Va., "Survey of Thermochemical Data", January, 1950. Moments of Inertia were calculated using the constants found in C. Newman, J. K. O'Loane, S. R. Polo, and M. K. Wilson, J. Chem. Phys. 25, 855 (1956).

S<sub>298.15</sub><sup>o</sup> = 44.02 ± 0.04 cal. deg.<sup>-1</sup> mole<sup>-1</sup>

ΔH<sub>f</sub><sup>o</sup> = 2.3 ± 0.2 kcal. mole<sup>-1</sup>

ΔH<sub>f</sub><sup>o</sup> 298.15 = -70.69 ± 0.30 kcal. mole<sup>-1</sup>

T<sub>c</sub> = 513.15°K

T<sub>D</sub> = [513]°K.

Heat of Formation.

A. A. Gilliland and W. H. Johnson, J. Research Natl. Bur. Standards 65A, 67 (1961), and M. M. Birky and L. O. Hepler, J. Phys. Chem. 64, 686 (1960), have derived the heat of formation for NH<sub>4</sub>ClO<sub>4</sub>(c) from solution-calorimetric measurements. Their values are -70.74 ± 0.32 and -70.63 kcal. mole<sup>-1</sup>, respectively. The mean of these is adopted here.

Heat Capacity and Entropy.

B. H. Justice and E. F. Westrum, private communication, April 1961, have measured the heat capacity from 5° to 350°K. The C<sub>p</sub> values above 350°K were extrapolated. From the partial molar entropies of NH<sub>4</sub><sup>+</sup>(aq) and ClO<sub>4</sub><sup>-</sup>(aq) and the entropy of solution, Birky and Hepler, loc. cit., calculated a value of 43.6 cal. deg.<sup>-1</sup> mole<sup>-1</sup> for S<sub>298.15</sub><sup>o</sup>. The fair agreement of this value with that derived from C<sub>p</sub> suggests that there is no residual entropy at 0°K, as there would be if the NH<sub>4</sub><sup>+</sup> ion had a random orientation.

Transition and Decomposition Data.

T<sub>c</sub> and ΔH<sub>f</sub><sup>o</sup> were obtained (under a pressure of NH<sub>3</sub>) by M. M. Marlowitz, Foote Mineral Company, Exton, Pennsylvania (private communication, September 20, 1962). T<sub>D</sub> was estimated from the report by M. M. Marlowitz, loc. cit.

Heat of Formation

A. G. Gaydon, "Dissociation Energies and Spectra of Diatomic Molecules," 2nd Ed., Chapman and Hall, London 1953, gives 23 ± 2.3 kcal for the heat of dissociation into gaseous atoms.

Heat Capacity and Entropy

Vibrational constants from K. Wieland Zeits. f. Elektrochemie 54, 761 (1960) were weighted according to their natural isotopic abundances. Rotational constants were estimated using equation III, 123 P. 108, G. Herzberg, "Spectra of Diatomic Molecules," van Nostrand, New York 1950. Bond length given by G. Herzberg (loc. cit.).

Heat of Formation.

The heat of formation is that adopted by O. V. Calder and W. F. Oiaque, J. Phys. Chem. 69, 2443 (1965) from an analysis of the equilibrium data of J. Morrison and D. M. Yost, J. Am. Chem. Soc. 54, 2247 (1932) and C. M. Beeson and D. M. Yost, J. Chem. Phys. 7, 44 (1939). This yielded a heat of formation of ICl(g), from which the heat of formation of ICl(c) was calculated by using the heat of vaporization determined by Calder and Oiaque loc. cit.

Heat Capacity and Entropy.

The heat capacity has been measured by Calder and Oiaque loc. cit. from 17-322°K. The entropy was calculated based on S<sub>15</sub> = 0.592 cal. mole<sup>-1</sup> deg.<sup>-1</sup> Above 300° the heat capacity data was extrapolated smoothly.

Melting Data.

All data were measured by Calder and Oiaque loc. cit.

$$\Delta H_f^0 = -8.699 \pm 0.025 \text{ kcal. mole}^{-1}$$

$$\Delta H_f^0 298.15 = -8.466 \pm 0.025 \text{ kcal. mole}^{-1}$$

$$\Delta H_m^0 = 2.773 \pm 0.002 \text{ kcal. mole}^{-1}$$

$$\Delta H_g^0 298.15 = 12.650 \text{ kcal. mole}^{-1}$$

$$S_{298.15}^0 = 23.405 \text{ cal. mole}^{-1} \text{ deg.}^{-1}$$

$$T_m = 300.53^\circ\text{K.}$$

IODINE MONOCHLORIDE (GIL)

(LIQUID)

MOL. WT. = 162.3574

$$S_{298.15}^{\circ} = 32.544 \text{ cal. mole}^{-1} \text{ deg.}^{-1}$$

$$\Delta H_f^{\circ} 298.15 = -5.72 \pm 0.03 \text{ kcal. mole}^{-1}$$

$$T_m^{\circ} = 300.53^{\circ} \text{K.}$$

$$\Delta H_m^{\circ} = 2.773 \pm 0.002 \text{ kcal. mole}^{-1}$$

Heat of Formation.

The heat of formation was calculated from that of the crystal by adding  $\Delta H_m^{\circ}$  and the difference between  $H_{300.53}^{\circ} - H_{298.15}^{\circ}$  for crystal and liquid.

Heat Capacity and Entropy.

The heat capacity from 300.53 to 317.76°K. has been measured by G. V. Calder and W. F. Giauque, J. Phys. Chem. 69, 2443 (1965). Above 318°K. it was extrapolated in a smooth manner. The entropy was obtained in a manner analogous to the heat of formation.

$\omega_e x_e = 1.450 \text{ cm.}^{-1}$   
 $\sigma = 1$   
 $\nu_e = 2.327 \text{ \AA}$   
 $\alpha_4 = 0.0005275 \text{ cm.}^{-1}$

Heat of Formation.

The dissociation energy from spectroscopic measurements of ICl(g) has been summarized by W. H. Evans, T. R. Munson and D. D. Wegman, J. Res. Natl. Bur. Standards, 55, 147 (1955) from which they adopt  $D_0 = 49.64 \text{ kcal. mole}^{-1}$ . J. McMorris and D. M. Yost, J. Am. Chem. Soc. 54, 2247 (1932) and C. M. Beeson and D. M. Yost, J. Chem. Phys. 1, 44 (1933) studied the equilibria  $\text{NOCl} = \text{NO} + 1/2 \text{ Cl}_2$  and  $\text{NO} + \text{ICl} = \text{NOCl} + 1/2 \text{ I}_2(\text{g})$  from which the equilibrium constant of  $\text{ICl} = 1/2 \text{ Cl}_2 + 1/2 \text{ I}_2(\text{g})$  can be obtained. O. V. Calder and W. P. Olsouque, J. Phys. Chem. 69, 2443 (1965) have used 3rd law analysis to obtain  $D_0 = 49.578 \pm 0.025 \text{ kcal. mole}^{-1}$ . This value was adopted yielding  $\Delta H_f^{298} = 4.184 \pm 0.025 \text{ kcal. mole}^{-1}$ .

Heat Capacity and Entropy.

The molecular and vibrational contents were obtained from G. Herzberg "Spectra of Diatomic Molecules", D. Van Nostrand Co., New York 1950. The values were then adjusted for the normal isotopic abundance of chlorine.

$$\Delta H_f^0 = -104.30 \text{ kcal. mole}^{-1}$$

$$\Delta H_f^{298.15} = -104.37 \pm 0.06 \text{ kcal. mole}^{-1}$$

$$\Delta H_m^0 = 6.282 \text{ kcal. mole}^{-1}$$

$$S_{298.15}^0 = 19.75 \pm 0.04 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$$

$$T_m = 1044^\circ\text{K.}$$

Heat of Formation.

The heat of formation was calculated from the heat of hydrolysis of K(c), the heats of solution of HCl(g) and KCl(c), and the standard heat of neutralization of a strong acid and strong base. Extensive measurements are available for all these quantities. Values used in the calculation, in addition to the heat of formation for HCl(g), are summarized below.

| Source  | Reaction   | ΔH <sub>f</sub> ° 298.15 (kcal.) |
|---------|--|----------------------------------|
| 1,2,3,4 | K(c) + H <sub>2</sub> O(l) → KOH(∞H <sub>2</sub> O) + 1/2 H <sub>2</sub> (g)                   | -46.966 ± 0.05                   |
| 5,2,6   | HCl(g) → HCl(∞H <sub>2</sub> O)  | -17.88 ± 0.015                   |
| 7       | KCl(∞H <sub>2</sub> O) → KCl(c)  | -4.115 ± 0.010                   |
| 7       | KOH(∞H <sub>2</sub> O) + HCl(∞H <sub>2</sub> O) → KCl(∞H <sub>2</sub> O) + H <sub>2</sub> O(l) | -13.345 ± 0.025                  |

Heat Capacity and Entropy.

Low temperature heat capacities were obtained from the data (2.8-275°K.) of W. T. Berg and J. A. Morrison, *Proc. Roy. Soc. (London)* **A242**, 467 (1957). Previous measurements scatter around the selected values and are in good agreement. These include P. G. Stralkov, E. S. Itskovich, V. N. Kostryukov, and G. G. Mirskaya (12-298°K.), *Zhur. Fiz. Khim.* **29**, 845 (1954); K. Clusius, J. Ooldman, and A. Perlick (10-273°K.), *Z. Naturforsch.* **4a**, 429 (1949); and J. C. Southard and R. A. Nelson (17-285°K.), *J. Am. Chem. Soc.* **55**, 4865 (1933). For other less extensive data see the review by K. K. Kelley and E. G. King, *USM Bulletin* **592**, 1961. The entropy is based on the extrapolation  $S_{2.8}^0 = 0.0006 \text{ cal./deg.-mole}$ .

High temperature values are based on enthalpy data (373-1038°K.) from T. B. Douglas, private communication, U. S. Natl. Bur. Std., May 23, 1961. These values join smoothly with the low temperature values and are in excellent agreement with the enthalpy data (673-933°K.) of S. M. Skuratov and S. A. Lapushkin, *J. Gen. Chem. (USSR)* **21**, 2465 (1951) and the adiabatic heat capacities (334-721°K.) of A. Mustajoki, *Ann. Acad. Sci. Fennicae, Series A, I*, **28**, 7 (1951).

Melting Data.

The melting point and heat of melting are from Douglas, loc. cit. Values of  $T_m = 1043^\circ$  and  $1045^\circ\text{K.}$  have been reported by E. Aukrust, B. Bjorge, H. Flood, and T. Forland, *Ann. New York Acad. Sci.* **79**, 830 (1960) and J. W. Johnson and M. A. Bredig, *J. Phys. Chem.* **62**, 604 (1958), respectively. The heat of melting is confirmed by  $\Delta H_m^0 = 6.34 \text{ kcal./mole}$  obtained from enthalpy data by A. S. Dworkin and M. A. Bredig, *J. Phys. Chem.* **54**, 269 (1950) and  $\Delta H_m^0 = 6.4$  and  $6.5 \text{ kcal./mole}$  based on enthalpy and phase diagram studies of Aukrust et al., loc. cit., respectively.

 $\Delta H_m^* = 6.282$  kcal. mole<sup>-1</sup>  
 $\Delta H_v^* = 29.7$  kcal. mole<sup>-1</sup> (equilibrium vapor)  
 $\Delta H_v^* = [37.14]$  kcal. mole<sup>-1</sup> (monomer)

**Heat of Formation.**  
 The heat of formation was calculated from that of the crystal by adding  $\Delta H_m^*$  and the difference between  $(H_{1044}^* - H_{298}^*)$  for the crystal and liquid.

**Heat Capacity and Entropy.**  
 The constant heat capacity, 17.59 cal./deg.-mole, was derived from enthalpy data (1053-1173°K.) of T. B. Douglas, private communication, U. S. Natl. Bur. Std., May 25, 1961. This value was extrapolated above and below the experimental range. A lower value of 16.7 cal./deg.-mole was derived by A. S. Dworckin, private communication, Oak Ridge National Laboratory, Dec. 1, 1964, from enthalpy data (1050-1110°K.) obtained in a heat of melting study. The entropy of the liquid was obtained in a manner analogous to the heat of formation.

**Melting Data.**  
 The melting point and heat of melting are from Douglas, loc. cit. Values of  $T_m = 1043^{\circ}$  and  $1045^{\circ}\text{K.}$  have been reported by E. Ahkrust, B. Ejlorge, H. Flood, and T. Forland, Ann. New York Acad. Sci. 29, 830 (1960) and J. W. Johnson and M. A. Bredig, J. Phys. Chem. 52, 804 (1958), respectively. The heat of melting is confirmed by  $\Delta H_m^* = 6.34$  kcal./mole obtained from enthalpy data by A. S. Dworckin and M. A. Bredig, J. Phys. Chem. 84, 269 (1960) and  $\Delta H_m^* = 6.4$  and  $6.5$  kcal./mole based on enthalpy and phase diagram studies of Ahkrust et al., loc. cit., respectively.

**Vaporization Data.**  
 $T_b$  (to equilibrium vapor) is the temperature resulting in unit total pressure based on the calculated partial pressures of KCl(g) and K<sub>2</sub>Cl<sub>2</sub>(g). This value may be compared with boiling points of 1688° and 1680°K. observed respectively by G. Ruff and S. Muggan, Z. anorg. allgem. Chem. 117, 147 (1921), and H. von Wartenburg and F. Albrecht, Z. Elektrochem. 21, 162 (1921).  $\Delta H_v^*$  (equilibrium vapor) at the boiling point is calculated as the heat of vaporization of one mole of liquid to vapor containing 22.5 mole percent of dimer. According to the selected functions, the amount of dimer at lower temperatures increases gradually to about 32 mole percent at the melting point then decreases rapidly over the crystal.  $T_b$  (to monomer only) is taken as the temperature at which the calculated free energy change is zero for KCl(l) → KCl(g), while  $\Delta H_v^*$  (monomer) is the corresponding heat of reaction.

Data on vapor pressures and dimer-monomer equilibrium are reviewed on the tables for KCl(g) and K<sub>2</sub>Cl<sub>2</sub>(g), respectively.

Potassium Chloride (KCl)

(Ideal Gas) Mol. wt. = 74.555

 $\omega_e X_e = 1.157$  cm.<sup>-1</sup>  $\sigma = 1$   
 $\alpha_e = 0.0007799$   $r_e = 2.6667$  Å

Heat of Formation.

The heat of formation was calculated from that of the liquid based on  $\Delta H_f^\circ$  298.15 = 49.5 kcal./mole as selected from vapor pressure analyses summarized below. Partial pressures for the monomer were obtained from data of the first four sources by combination of total vapor pressures with PVT data or with transpiration data. Mass spectrometric values (source 5) are based on temperature variation of ion intensity. These same five studies were used in selection of  $\Delta H_f^\circ$  298.15 = 45.0 kcal./mole for the dimer-monomer equilibrium (see K<sub>2</sub>Cl<sub>2</sub>). The resulting tables were tested by comparison with total pressure data over the range 819-1691°K. Dimer-monomer ratios calculated from the tables were used to convert observed total pressures to the monomer pressures which are analyzed below (sources 6-11). The results are consistent except near the boiling point where the observed pressures (sources 10 and 11) are 6-18 percent larger than those calculated. Knudsen effusion and transpiration studies over the crystal were not analyzed since they are in essential agreement with the total effusion data of source 6.

| Source  | Method                        | No. of Points | Temp. Range °K. | $\Delta H_{vap}$ kcal./mole | Drift eu |

Heat Capacity and Entropy.

Rotational and vibrational constants are based on the microwave studies of P. L. Clouser and W. Oordy, Phys. Rev. 134, 4863 (1964). Earlier microwave data of A. Honig, M. Mandel, M. L. Stitch, and C. H. Townes, Phys. Rev. 95, 629 (1954) and electric resonance data of C. A. Lee, B. P. Fabricand, R. O. Carlson, and I. I. Rabi, Phys. Rev. 87, 1395 (1953) are in excellent agreement. Infrared spectra of S. A. Rice and W. Kiempfer, J. Chem. Phys. 21, 573 (1957) yield  $\omega_e = 281 \pm 6$  cm.<sup>-1</sup> which is also in good agreement. The constants were adjusted to a natural isotopic composition of 24.47% <sup>37</sup>Cl and 6.8% <sup>41</sup>K.

$\Delta H_f^o = -100.9$  kcal. mole<sup>-1</sup>  
 $\Delta H_f^o$  298.15 = -102.8 ± 1.0 kcal. mole<sup>-1</sup>  
 $\Delta H_f^o = 3.29$  kcal. mole<sup>-1</sup>  
 $T_t = 572.7^\circ\text{K.}$   
 $T_m = 798^\circ\text{K.}$   
 $\Delta H_m^o = \text{Unknown}$

Heat of Formation.

The heat of decomposition of KClO<sub>4</sub>(c) to KCl(c) and O<sub>2</sub>(g) was measured by W. H. Johnson and A. A. Gilliland, J. Res. Natl. Bur. Std. 55A, 65 (1961), yielding  $\Delta H_f^o$  298.15 = -103.22 ± 0.15 kcal. mole<sup>-1</sup>. K. A. Hofmann and P. H. Martin, Sitzber. preuss. Akad. Wiss. Physik. math. Kl. 448 (1932), burned a mixture of paraffin and potassium perchlorate and obtained  $\Delta H_f^o$  298.15 = -1.73 kcal. mole<sup>-1</sup> for the constant volume process corresponding to the reaction: KClO<sub>4</sub>(c) = KCl(c) + 2O<sub>2</sub>(g). Correction of their value for  $\Delta(PV)$  gives  $\Delta H_f^o$  298.15 = -0.55 kcal. mole<sup>-1</sup> which agrees reasonably well to the corresponding value, -0.96 ± 0.10 kcal. mole<sup>-1</sup>, reported by W. H. Johnson and A. A. Gilliland, loc. cit. However, for the same reaction,  $\Delta H_f^o$  298.15 = -2.55 ± 0.18 kcal. mole<sup>-1</sup> was determined by S. M. Skuratov, A. P. Vorob'ev and N. M. Privalova, Russ. J. Inorg. Chem., 7, 343 (1962). They measured this quantity by two different methods which gave concordant results. The value of  $\Delta H_f^o$  298.15 reported was -101.9 ± 0.2 kcal. mole<sup>-1</sup>. The value used here is the average of these four results. M. Berthelot and P. Vieille, Ann. chim. et phys. [5] 21, 225 (1862) determined the difference between the heat of explosion of ammonium picrate and that of an ammonium picrate-potassium perchlorate mixture, and also the difference between the heat of explosion of potassium picrate and that of a potassium picrate-potassium perchlorate mixture. They obtained  $\Delta H_f^o = 7.5$  kcal. mole<sup>-1</sup> for the reaction KClO<sub>4</sub>(c) = KCl(c) + 2O<sub>2</sub>(g). From that the value of  $\Delta H_f^o$  298.15 was calculated to be -111.9 kcal. mole<sup>-1</sup>. This value was not used.

Heat Capacity and Entropy.

The low temperature heat capacities (12.53-236.07°K.) were measured by W. M. Latimer and J. E. Ahlberg, J. Am. Chem. Soc. 52, 549 (1930). The heat capacities above 298°K. were estimated by comparison with those of NaClO<sub>4</sub>(c).  $S_{298.15}^o$  was reported by K. K. Kelley and E. G. King, U. S. Bur. Mines Bull. 592 (1961), based on the low temperature heat capacities measured by W. M. Latimer and J. E. Ahlberg, loc. cit., using  $S_{12.53}^o$  (extrap.) = 0.14 cal. deg.<sup>-1</sup> mole<sup>-1</sup>.

Transition Data.

$T_t$  and  $\Delta H_t^o$  were obtained from the National Bureau of Standards, Circ. 500, "Selected Values of Chemical Thermodynamic Properties," by F. D. Rossini, et al., 1952.

Temperature of Melting.

$T_m$  was taken from Bulletin of the National Research Council, No. 118, "Data on Chemicals for Ceramic Use," June 1949.

Lithium Chloride (LiCl)  
(Crystal) Mol. Wt. = 42.397

LITHIUM CHLORIDE (LiCl)

(CRYSTAL)

CIL I

MOL. WT. = 42.397

$$S_{298.15}^{\circ} = 14.173 \pm 0.015 \text{ cal deg}^{-1} \text{ mole}^{-1}$$

$$\Delta H_m^{\circ} = 4.74 \pm 0.10 \text{ kcal mole}^{-1}$$

$$\Delta H_f^{\circ} 298.15 = -97.578 \pm 0.273 \text{ kcal mole}^{-1}$$

$$T_m = 883 \pm 2^{\circ} \text{K}$$

Heat of Formation

The heat of formation was obtained as follows:

- (1)  $\text{LiOH} \cdot 100\text{H}_2\text{O} + \text{HCl} \cdot 100\text{H}_2\text{O} \rightarrow \text{LiCl} \cdot 20\text{H}_2\text{O}$   
T. W. Richards and A. W. Rowe, *J. Am. Chem. Soc.*, **44**, 684 (1922).
  - (2)  $\text{Li}(c) + 100\text{H}_2\text{O}(l) + \text{LiOH} \cdot 100\text{H}_2\text{O} + 1/2 \text{H}_2(g)$   
S. R. Gunn and L. G. Green, *J. Am. Chem. Soc.*, **80**, 4782 (1958).
  - (3)  $\text{LiOH} \cdot 100\text{H}_2\text{O} \rightarrow \text{LiOH} \cdot 100\text{H}_2\text{O} + 90\text{H}_2\text{O}(l)$   
T. W. Richards and A. W. Rowe, *J. Am. Chem. Soc.*, **43**, 770 (1921).
  - (4)  $1/2 \text{H}_2(g) + 1/2 \text{Cl}_2(g) \rightarrow \text{HCl}(g)$   
JANAF Tables.
  - (5)  $\text{HCl}(g) + 100\text{H}_2\text{O}(l) \rightarrow \text{HCl} \cdot 100\text{H}_2\text{O}$   
C. H. Slansky, *J. Am. Chem. Soc.*, **62**, 2430 (1940), and  
J. H. Sturtevant, *J. Am. Chem. Soc.*, **62**, 3265 (1940).
  - (6)  $\text{Li}(c) + 20\text{H}_2\text{O} \rightarrow \text{LiCl}(c) + 20\text{H}_2\text{O}(l)$   
E. Lange and F. Dürr, *Z. phys. Chem.*, **121**, 361 (1926).
- (1) + (2) + (3) + (4) + (5) + (6) gives  $\text{Li}(c) + 1/2 \text{Cl}_2(g) \rightarrow \text{LiCl}(c)$

A direct calorimetric determination by H. Siemensen and U. Siemensen, *Z. Electrochem.*, **56**, 643 (1952) gave  $-94.8 \pm 0.6$  kcal mole<sup>-1</sup>. However, the solution route was thought to be inherently more accurate and was adopted.

Heat Capacity and Entropy

The heat capacity between 15° and 375°K has been measured by D. A. Shirley, *J. Am. Chem. Soc.*, **82**, 3841 (1960) and by F. L. Oetting, W. E. Hutton and G. C. Sinke, unpublished work, Thermal Laboratory, Dow Chemical Company. The two sets of data are in substantial agreement and were plotted together and used to evaluate the entropy at 298°. The extrapolation to 0°K was done assuming a T<sup>3</sup> law and yielded S<sub>15</sub> = 0.019 e.u. Above 298° T. B. Douglas, J. L. Dever and A. W. Harman, quoted in Natl. Bur. Standards Report 6297, have made enthalpy measurements to 1200°K. E. N. Rodigina, K. Z. Gomeiski, and V. F. Luginina, *Zhur. Neorg. Khim.*, **1**, 975 (1959) also made enthalpy determinations to 1100°K. These two sets of measurements were averaged and joined smoothly to the low temperature values.

Melting and Transition Data

The melting point has been reported as follows: 880°K., Douglas et al., loc. cit.; 883°K., Rodigina et al., loc. cit.; 883°K., H. M. Haendler, P. S. Bennett, and C. M. Wheeler, *J. Electrochem. Soc.*, **106**, 264 (1959); 879°K., H. Flood, O. Fykse and S. Urnes, *Z. Electrochem.*, **59**, 364 (1955); 879°K., H. von Wartenberg and H. Schulz, *Z. Electrochem.*, **27**, 568 (1921). The highest value of 883°K. was taken as representing the most pure samples. At this temperature the enthalpy equations of Douglas et al. yield a heat of fusion of 4.718 kcal mole<sup>-1</sup>, those of Rodigina et al., 4.669 kcal mole<sup>-1</sup>. A. S. Dworkin and M. A. Bredig, *J. Phys. Chem.*, **64**, 263 (1960) report a value of 4.76 ± 0.10 kcal mole<sup>-1</sup> and quote 4.83 kcal mole<sup>-1</sup> from a private communication from D. F. Smith. The average value  $\Delta H_m^{\circ} = 4.74 \pm 0.10$  kcal mole<sup>-1</sup> was adopted.

A transition at 838°K has been reported by Kislova and Bergman, *Russ. J. Inorg. Chem.*, **5**, 1210 (1960) but is not supported by the enthalpy measurements quoted above.

## LITHIUM CHLORIDE (LiCl)

(LIQUID)

MOL. WT. = 42.397

$$\Delta H_f^{\circ} 298.15 = -93.394 \text{ kcal. mole}^{-1}$$

$$T_m = 883 \pm 2^{\circ}\text{K}$$

$$T_b(\text{equilibrium mixture}) = 1655^{\circ}\text{K}$$

$$S_{298.15}^{\circ} = 16.745 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$$

$$\Delta H_m^{\circ} = 4.74 \pm 0.10 \text{ kcal. mole}^{-1}$$

$$T_b(\text{monomeric gas}) = 1701^{\circ}\text{K}$$

## Heat of Formation.

Obtained from that of the crystal by adding  $\Delta H_m$  and  $H_{883-H_{298}}(c)$  and subtracting  $H_{883-H_{298}}(l)$ .

## Heat Capacity and Entropy.

The heat capacity from the melting point to 1100°K and 1200°K has been reported by E. N. Rodigins, K. Z. Gmelakli, and V. F. Luginins, Zhur. Neorg. Khim. **4**, 975 (1959) and T. B. Douglass, J. L. Dever, and A. W. Harman, quoted in Natl. Bur. of Standards Report 6297. The equation given by the former authors for the enthalpy of the liquid does not agree with their measurements and has been replaced by  $H_m-H_{298,15} = 16.000T - 1.5 \times 10^{-5}T^2 - 2279 \text{ cal. mole}^{-1}$ , which fits to  $\pm 0.5\%$ . The two sets of results were averaged and the equations were assumed to hold up to the normal boiling point. The entropy was calculated from that of the crystal in a manner analogous to the heat of formation.

## Melting.

See table for crystal.

## Boiling.

The equilibrium boiling point was taken from H. von Wartenburg and H. Schultz, Z. Electrochem. **27**, 568 (1921) and the boiling point of the monomeric gas is defined as the temperature at which it reaches 1 atm. pressure. This was obtained from the free energy crossover between liquid and monomeric gas. The heat of vaporization to the monomeric gas was found from the tables to be 39.8 kcal. mole<sup>-1</sup>.

LITHIUM CHLORIDE (LiCl)

(IDEAL GAS)

MOL. WT. = 42.397

LiCl

$$\Delta H_f^\circ = -46.742 \text{ kcal. mole}^{-1}$$

$$\Delta H_f^\circ = -46.778 \pm 3.0 \text{ kcal. mole}^{-1}$$

$$S_{298.15}^\circ = 50.864 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$$

Ground State Configuration  $1s^2$

$$\omega_{e^*} = 641.1 \pm 3.0 \text{ cm.}^{-1}$$

$$\omega_{e^*} = 4.2 \pm 0.3 \text{ cm.}^{-1}$$

$$\sigma = 1$$

$$r_e = 2.022 \text{ \AA}$$

$$\omega_e = 641.1 \pm 3.0 \text{ cm.}^{-1}$$

$$r_e = 0.7053 \text{ cm.}^{-1}$$

Heat of Formation.

W. Klemperer, M. G. Norris, A. Büchler and A. G. Emalle, *J. Chem. Phys.* **33**, 1534 (1960) quote a private communication from W. H. Evans at the National Bureau of Standards giving  $D_0 = 4.85 \text{ e.v.}$ , which corresponds to  $\Delta H_f^\circ = -45.3 \pm 2.4 \text{ kcal. mole}^{-1}$ . A third law analysis of the vapor pressure data of An. N. Nesmeyanov and L. A. Sazonov, *Zhur. Neorg. Khim.* **5**, 231 (1960) in conjunction with the relative concentration of monomer, dimer, and trimer at 870°K from the work of R. C. Miller and P. Kusch, *J. Chem. Phys.* **25**, 860 (1956) and **27**, 991 (1957) leads to a monomer heat of sublimation at 298° of 52.56 kcal. mole<sup>-1</sup>, this gives  $\Delta H_f^\circ = -45.02 \text{ kcal. mole}^{-1}$ . These values lead, however, to partial vapor pressures of the monomer which are less than half of the total vapor pressure near the boiling point. From the data of Miller and Kusch loc. cit. it would be expected that the monomer would be the predominant species near the boiling point, a fact also substantiated by the work of C. Beusman, AEC Report ORNL-2223 (1957), on the average molecular weight of the vapor. Thus it was decided to change the heat of sublimation so as to give the correct normal boiling point and vapor pressures in the region 1400-1600°K and to approximate the relative concentrations of monomer, dimer, and trimer as found by Miller and Kusch at 870°K. A monomer heat of sublimation at 298° of 50.8 kcal. mole<sup>-1</sup> was chosen, which gives  $\Delta H_f^\circ = -46.778 \text{ kcal. mole}^{-1}$ . The normal boiling point was taken as 1656°K as determined by H. von Wartenburg and H. Schulz, *Z. Electrochem* **27**, 568 (1921) and the boiling point of LiCl(g) was found as 1701°K from the free energy crossover between liquid and gas.

Heat Capacity and Entropy.

The spectroscopic constants were taken from Klemperer et al. loc. cit. The value of  $\alpha_e$  was calculated from the value of  $\omega_e$  given by the Rittner potential function and the equation given by Klemperer et al. The value of  $r_e$  was taken from the Natl. Bur. of Standards Report 6297 (1959).

## INTERIM TABLE

## LITHIUM HYPOCHLORITE (LiClO) (Ideal Gas)

Mol. Wt. = 58.397  
 $\Delta H_f^\circ 298.15 = [-3.4 \pm 20] \text{ kcal. mole}^{-1}$   
 $\Delta_f^\circ 298.15 = [61.264] \text{ cal. deg.}^{-1} \text{ mole}^{-1}$

## Vibrational Levels and Multiplicities

$$\frac{\omega}{\text{cm.}^{-1}} = \frac{[1150](1)}{[500](1)}$$

Li-O-Cl angle  $115^\circ$ , Li-O dist.  $1.82 \text{ \AA}$ , O-Cl dist.  $1.73 \text{ \AA}$   $\sigma = 1$ .

Data From D. L. Hildenbrand, Aeronutronic Division of Ford Motor Company, Newport Beach, Calif., "Tables of Thermodynamic Data for Performance Calculations", September, 1953.

ΔH<sub>f</sub>° = Unknown  
 S<sub>298.15</sub> = [30 ± 1] cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 ΔH<sub>f</sub>° 298.15 = -91.0 ± 0.7 kcal. mole<sup>-1</sup>  
 ΔH<sub>m</sub>° = [7] kcal. mole<sup>-1</sup>  
 T<sub>m</sub> = 509°K.

Heat of Formation.

The heats of reaction (ΔH<sub>f</sub>°) involving LiClO<sub>4</sub>(c) has been determined by several investigators as follows:

Chemical Reaction

| Investigator              | Chemical Reaction  | ΔH <sub>f</sub> ° 298.15, kcal. mole <sup>-1</sup> | ΔH <sub>f</sub> ° 298.15, kcal. mole <sup>-1</sup> |

(3) M. M. Birky and L. G. Hepler, J. Phys. Chem. 64, 686 (1960).

The adopted value, ΔH<sub>f</sub>° 298.15 = -91.0 kcal. mole<sup>-1</sup>, for LiClO<sub>4</sub>(c) is the weighted average of the three values listed.

Heat Capacity and Entropy.

Heat capacities and S<sub>298.15</sub> were estimated by comparison with those of KClO<sub>4</sub>(c).

Melting Data.

T<sub>m</sub> was obtained from T. W. Richards and H. H. Willard, J. Am. Chem. Soc., 32, 4 (1910). The value of ΔH<sub>m</sub>° 509 was estimated by comparison with the value, ΔH<sub>m</sub>° 528 = 5.4 kcal. mole<sup>-1</sup>, for KClO<sub>3</sub>(c) reported by K. K. Kelley, Contribution to the Data on Theoretical Metallurgy, XIII. High-Temperature Heat-Content, Heat-Capacity and Entropy Data for the Elements and Inorganic Compounds, U. S. Bur. Mines Bull. 584 (1960).

Dec. 31, 1960; Mar. 31, 1964

S<sub>298.15</sub><sup>o</sup> = [39.245] cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> 298.15 = [-85.574] cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 ΔH<sub>m</sub><sup>o</sup> = [7] kcal. mole<sup>-1</sup>  
 T<sub>m</sub> = 509°K.

Heat of Formation.

ΔH<sub>f</sub><sup>o</sup> 298.15(1) was obtained from ΔH<sub>f</sub><sup>o</sup> 298.15(c) by adding ΔH<sub>m</sub><sup>o</sup> and the difference between H<sub>370.6</sub><sup>o</sup> and H<sub>298.15</sub><sup>o</sup> for crystal and liquid.

Heat Capacity and Entropy.

C<sub>p</sub> for LiClO<sub>4</sub>(l) was estimated by comparison with that for NaClO<sub>3</sub>(l). The entropy was obtained in a manner analogous to that of the heat of formation.

Melting Data.

The melting temperature (T<sub>m</sub>) was obtained from T. W. Richards and H. H. Willard, J. Am. Chem. Soc., **32**, 4 (1910). The value of ΔH<sub>m</sub><sup>o</sup> 509 was estimated by comparison with the value, ΔH<sub>m</sub><sup>o</sup> 528 = 5.4 kcal. mole<sup>-1</sup>, for NaClO<sub>3</sub>(c) reported by K. K. Kelley, Contribution to the Data on Theoretical Metallurgy, XIII. High-Temperature Heat-Content, Heat-Capacity and Entropy Data for the Elements and Inorganic Compounds, U. S. Bur. Mines Bull. 584 (1960).

MAGNESIUM MONOCHLORIDE (MgCl) (IDEAL GAS) MOL. WT. = 59.765

Ground State Configuration  $2 \sum$   $\Delta H_f^\circ = -10.34 \pm 10$  kcal. mole<sup>-1</sup>

$S_{298.15}^\circ = 55.760$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>  $\Delta H_f^\circ = -10.4 \pm 10$  kcal. mole<sup>-1</sup>

Electronic Levels and Quantum Weights

$$\frac{\epsilon_i, \text{cm.}^{-1}}{0} \frac{g_i}{2}$$

$\omega_e = 462.4$  cm.<sup>-1</sup>  $\sigma = 1$

$P_e = [0.2417]$  cm.<sup>-1</sup>  $\alpha_e = [0.0014]$  cm.<sup>-1</sup>  $r_e = 2.199 \text{ \AA}$

Heat of Formation.

The heat of formation is calculated from  $D_0^\circ = 3.2$  e.v. reported by G. Herzberg, "Spectra of Diatomic Molecules", 2nd Edn., D. Van Nostrand Co., Inc., New York, 1950.  $D_0^\circ = 2.7 \pm 0.7$  e.v. reported by A. G. Gaydon, "Dissociation Energies and Spectra of Diatomic Molecules", 2nd Edn., Chapman and Hall, London, 1953, yields  $\Delta H_f^\circ = 298$  (MgCl, g) =  $1.0 \pm 16$  kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy.

Spectroscopic constants were reported by Herzberg loc. cit. and adjusted for natural isotopic abundance. The bond length was reported by E. Morgan and R. F. Barrow, Nature 192, 1182, (1961).  $P_e$  and  $\alpha_e$  were estimated by the method suggested by Herzberg loc. cit. The moment of inertia (I) is  $11.578 \times 10^{-59}$  g. cm.<sup>2</sup>

Ground State Configuration [1<sup>2</sup>] $\Delta H_f^\circ = 156 \pm 20$  kcal/mol $\Delta H_f^\circ_{298.15} = 156 \pm 20$  kcal/mol $S^\circ_{298.15} = (54.6 \pm 2)$  gibbs/mol

## Electronic Levels and Quantum Weights

| State                       | $\epsilon_i, \text{cm}^{-1}$ | Quantum Weights $g_i$ |
|-----------------------------|------------------------------|-----------------------|
| 1 <sub>g</sub> <sup>+</sup> | 0                            | 1                     |
| 3 <sub>u</sub> <sup>-</sup> | (9000)                       | 6                     |
| 1 <sub>u</sub> <sup>-</sup> | (11000)                      | 2                     |
| 3 <sub>g</sub> <sup>-</sup> | (20000)                      | 3                     |

$\omega_e x_e = (2) \text{ cm}^{-1}$   $\sigma = 1$   
 $\omega_e = (400) \text{ cm}^{-1}$   $\sigma_e = (0.00164) \text{ cm}^{-1}$   $r_e = (2.2) \text{ \AA}$

## Heat of Formation

The ionization potential of MgCl(g) was reported to be 7.2, 7.5 ± 0.5, and 7 ± 1 eV by Krasnov (1), Hildenbrand (2), and Beckett (2), respectively. The corresponding heats of formation at 298°K for MgCl(g) are derived as 156, 163, and 151 kcal/mol, using  $\Delta H_f^\circ(\text{MgCl}, g) = -10.34$  kcal/mol from the JANAF MgCl(g) table (March 31, 1966). The value of  $\Delta H_f^\circ$  for MgCl<sup>+</sup>(g) is tentatively selected as 156 ± 20 kcal/mol.

## Heat Capacity and Entropy

The ground state configuration is assumed to be the same as NaCl(g) which is isolectronic with MgCl<sup>+</sup>(g). The six electronic states are obtained from Fougere (3). The corresponding electronic levels are estimated by comparison with the isolectronic molecules BeS (4), BeO (5, 6), and HgO (5, 7). The bond distance is estimated by the method suggested by Krasnov (8). The values of  $\omega_e$  and  $\omega_e x_e$  are estimated by comparison with those for MgCl(g) and NaCl(g).  $B_e$  and  $\sigma_e$  are calculated by the method recommended by Herzberg (5). The moment of inertia is 1.159 × 10<sup>-38</sup> g cm<sup>2</sup>. The enthalpy at 0°K is -2.27 kcal/mol.

Bond Distances: N-Cl = 1.95 ± 0.06 Å  
 Bond Angle: Cl-N-O = 114 ± 3°  
 Product of the Moments of Inertia:  $I_A I_B I_C = 2.278778 \times 10^{-115}$  g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation.  
 The equilibrium constants for the reaction 2NOCl(g) = 2NO(g) + Cl<sub>2</sub>(g) have been measured in the temperature range from 372° to 491°K. by C. M. Beeson and D. M. Yost, J. Chem. Phys. 21, 44 (1956). Using the reported equilibrium constants, the heat of reaction ( $\Delta H_{f,298}^{\circ}$ ) has been calculated by both the second and the third law methods, as 18.33 ± 0.1 kcal. mole<sup>-1</sup> and 18.42 ± 0.1 kcal. mole<sup>-1</sup>, respectively. The third law value is adopted to calculate the heat of formation of nitrosyl chloride (g) as  $\Delta H_{f,298}^{\circ} = 12.37 \pm 0.2$  kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy.  
 The selected bond distances and angle were obtained from the microwave measurements by J. D. Rogers and D. Williams, J. Chem. Phys. 34, 2195 (1961). J. A. A. Ketelaar and K. J. Palmer, J. Am. Chem. Soc. 59, 2629 (1937), reported the bond distance N-Cl = 1.95 Å and the angle O-N-Cl = 116° by the electron diffraction method. These two are in good agreement. The three principal moments of inertia are  $I_A = 0.9995 \times 10^{-59}$ ,  $I_B = 14.6885 \times 10^{-59}$  and  $I_C = 15.6780 \times 10^{-59}$  g.<sup>2</sup> cm.<sup>2</sup>. The selected vibrational frequencies which were obtained from the infrared spectrum by L. Landau and W. H. Fletcher, J. Mol. Spectry, 4, 276 (1960), have been modified to natural isotopic mixture. W. G. Burns and J. J. Bernatain, J. Chem. Phys. 18, 1669 (1950), reported the vibrational frequencies as 1799, 592 and 332 cm.<sup>-1</sup>  
 J. S. Gordon, J. Chem. Eng. Data 7, 82 (1962), has calculated the thermodynamic functions from 298.15° to 6000°K. by the method of R. E. Fennington and K. A. Kobe, J. Chem. Phys. 22, 1442 (1954), which takes vibration-rotation interaction and anharmonicity into account. Gordon's data are from Landau and Fletcher, loc. cit., and J. D. Rogers, W. J. Pletenpol and D. Williams, Phys. Rev. 83, 431 (1951). These calculated functions have been adopted in the tabulation. Below 298°K. the rigid-rotator harmonic oscillator method was used to calculate the functions.

Bond Distances: N-Cl = 1.83 Å  
 Bond Angle: O-N-O = 129.5°  
 Product of Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 2.36688 X 10<sup>-114</sup> g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation.

The selected heat of formation was obtained from the recalculation of the heat of reaction CINO<sub>2</sub> + NO = CINO + NO<sub>2</sub> which has been measured calorimetrically as -9.27 kcal. mole<sup>-1</sup> by J. Ray and R. Ogg, Jr., J. Chem. Phys. 31, 168 (1959). Not only the thermal effects of 2NO<sub>2</sub> = N<sub>2</sub>O<sub>4</sub> but also NO + NO<sub>2</sub> = N<sub>2</sub>O<sub>3</sub> (a minor one) have been considered in calculation. Using all JANAP auxiliary data for CINO, NO, NO<sub>2</sub>, N<sub>2</sub>O<sub>3</sub> and N<sub>2</sub>O<sub>4</sub>, the recalculation gives  $\Delta H_f^0 = 2.90 \pm 0.4 \text{ kcal. mole}^{-1}$  for NO<sub>2</sub>Cl(g). For the reaction CINO + N<sub>2</sub>O<sub>3</sub> = CINO<sub>2</sub> + 2NO<sub>2</sub> also measured by Ray and Ogg, loc. cit., the recalculation gives  $\Delta H_f^0 = 2.56 \pm 0.4 \text{ kcal. mole}^{-1}$ .

H. Martin and E. Koehnlein, Z. physik. Chem. 17, 375 (1958), have determined kinetically the heat of reaction,  $\Delta H_f^0 = 2.75 \pm 0.15 = 3.10 \text{ kcal. mole}^{-1}$ , for the reaction NO<sub>2</sub> + NOCl = NO + NO<sub>2</sub>Cl which gives  $\Delta H_f^0 = 1.30 \pm 1 \text{ kcal. mole}^{-1}$  for NO<sub>2</sub>Cl(g). H. Cordas and H. Johnston, J. Am. Chem. Soc., 78, 4284 (1954), have also determined kinetically the  $\Delta H_f^0 = 29.5 \text{ kcal. mole}^{-1}$  for the reaction NO<sub>2</sub>Cl = NO<sub>2</sub> + Cl which gives  $\Delta H_f^0 = 6.3 \pm 0.3 \text{ kcal. mole}^{-1}$ .

Heat Capacity and Entropy.

The selected bond distances and bond angles were obtained from microwave spectrum studies by L. Clayton, Q. Williams and T. L. Westphal, J. Chem. Phys. 30, 1328 (1959). D. J. Millen and K. M. Sinnott, J. Chem. Soc. 350 (1958), reported bond distance N-Cl = 1.840 Å, N-O = 1.202 Å and angle ONO = 130° 35' from the microwave measurement. These two are in good agreement.

The selected vibrational frequencies were obtained from infrared and Raman spectrum measurements by R. Ryeason and M. K. Wilson, J. Chem. Phys. 22, 2000 (1954). However, the assignment of the fundamental frequencies has been revised by R. E. Dodd, J. A. Rolfe and L. A. Woodward, Trans. Faraday Soc. 52, 145 (1956), and Y. Morino and T. Tanaka, J. Mol. Spectry. 15, 179 (1965). Morino and Tanaka's assignment was adopted. The three principal moments of inertia are I<sub>A</sub> = 6.3658 X 10<sup>-39</sup>, I<sub>B</sub> = 16.3609 X 10<sup>-39</sup> and I<sub>C</sub> = 22.7267 X 10<sup>-39</sup> g.<sup>2</sup> cm.<sup>2</sup>

$$\Delta H_f^o = -98.16 \pm 0.08 \text{ kcal. mole}^{-1}$$

$$\Delta H_f^o 298.15 = -98.26 \pm 0.08 \text{ kcal. mole}^{-1}$$

$$\Delta H_m^o = 6.73 \pm 0.04 \text{ kcal. mole}^{-1}$$

$$S_{298.15} = 17.24 \pm 0.05 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$$

$$T_m = 1073.8 \pm 1.0^\circ \text{K.}$$

Heat of Formation.

The heat of formation is based on  $\Delta H_f^o 298.15 = -57.39$  and  $-39.95$  kcal. mole<sup>-1</sup> for  $\text{Na}^+(\infty \text{H}_2\text{O})$  and  $\text{Cl}^-(\infty \text{H}_2\text{O})$ , respectively, and on the heat of solution  $\Delta H_{sol}^o 298.15 = 0.922$  kcal. mole<sup>-1</sup> for NaCl. These values were reported in a private communication from D. D. Wagman, National Bureau of Standards, June, 1964.

Heat Capacity and Entropy.

The low temperature values are based on the heat capacities (3-266°K) reported by T. H. K. Barron, A. J. Leadbetter, J. A. Morrison, Proc. Roy. Soc. (London) **A279** (1376), 62 (1964). The earlier work of K. Clausius, J. Goldman, A. Parlick, Z. Naturforsch. **4b**, 424 (1949), results in a slightly higher entropy ( $S_{298.15} = 17.35$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>) but a lower heat capacity at room temperature ( $C_p^{298.15} = 11.9$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>). The high temperature values have been obtained by reanalysis of the enthalpies (672 - 1279°K) of R. Dawson, E. B. Brackett, T. E. Brackett, J. Phys. Chem. **67**, 1669 (1963), using the new value for  $C_p^{298.15}$ . The resulting tables agree within  $\pm 0.1$  kcal. with the enthalpies (812 - 1058°K) of W. A. Roth, W. Bertram, Z. Elektrochem. **35**, 38 (1929). The enthalpies (540 - 1037°K) of A. Magnus, Physik. Zeitschr. **14**, 5 (1913), agree well at the lower temperatures but are about 0.3 kcal. smaller near the melting point.

Melting Data.

The melting temperature was taken from Dawson, Brackett and Brackett, loc. cit., and the heat of melting was obtained by reanalysis of their crystal and liquid enthalpies. Values of  $T_m = 1073^\circ \text{K.}$  and  $\Delta H_m^o = 6.69 \pm 0.06$  kcal. mole<sup>-1</sup> were reported by A. S. Dworkin, M. A. Bredig, J. Phys. Chem. **64**, 269 (1960).

Heat of Sublimation.

The vapor in equilibrium with NaCl contains both monomeric and polymeric forms (for details see the tables for NaCl gases).

$\Delta H_f^o = 6.73 \pm 0.04$  kcal. mole<sup>-1</sup>  
 $\Delta H_m^o = 6.73 \pm 0.04$  kcal. mole<sup>-1</sup>

$S_{298}^{298.15} = [22.719]$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 $T_m = 1073.8 \pm 1.0^\circ K.$

Heat of Formation.

$\Delta H_f^o(1)$  was obtained from  $\Delta H_f^o(c)$  by addition of  $\Delta H_m^o$  and the difference between ( $H_{1073.8}^o - H_{298.15}^o$ ) for the crystal and liquid.

Heat Capacity and Entropy.

These were obtained by analysis of the enthalpies (1076 - 1279°K) of R. Dawson, E. B. Brackett, T. E. Brackett, J. Phys. Chem. 67, 1669 (1963). The heat capacity was extrapolated to a constant value of 16.0 at the higher temperatures. A glass transition was assumed at 800°K. and below this temperature  $C_p$  was taken equal to that of the crystal.

Melting Data.

The melting temperature was taken from Dawson, Brackett and Brackett, loc. cit., and the heat of melting was obtained by reanalysis of their crystal and liquid enthalpies. Values of  $T_m = 1073^\circ K.$  and  $\Delta H_m^o = 6.69 \pm 0.06$  kcal. mole<sup>-1</sup> were reported by A. S. Dworkin, M. A. Bregis, J. Phys. Chem. 64, 269 (1960).

Heat of Sublimation.

The vapor in equilibrium with NaCl contains both monomeric and polymeric forms (for details see the tables for NaCl gases).

Heat of Formation

Heat of Formation

The heat of formation is based on a heat of sublimation ΔH<sub>g</sub><sup>0</sup> 298.15 = 54.9 kcal. mole<sup>-1</sup> obtained from the more consistent sets of vapor pressure data by correction for the presence of dimer. Observed vapor pressures were converted to monomer pressures by use of dimer-monomer ratios calculated from JANAF free energy functions and ΔH<sub>f</sub><sup>0</sup> 298.15 = 48.6 kcal. for the reaction (NaCl)<sub>2</sub>(g) → 2NaCl(g). Higher polymeric species were neglected. Analyses of the resulting monomer pressures are summarized below.

Temperature Range (°K)

Heat of Sublimation ΔH<sub>g</sub><sup>0</sup> 298.15 (kcal. mole<sup>-1</sup>)

Heat of Sublimation ΔH<sub>g</sub><sup>0</sup> 298.15 (kcal. mole<sup>-1</sup>)

The molecular constants are based on molecular beam studies of the rotational spectra by Clouser and Gordy, Bull. Am. Phys. Soc. B, 328 (1963) and on microwave studies by Honig, Mandel, Stinch and Townes, Phys. Rev. 96, 629 (1954). The infrared spectra of Rice and Kempner, J. Chem. Phys. 21, 573 (1957) give a frequency in close agreement (368 cm.<sup>-1</sup>).

ΔH<sub>f</sub>° = Unknown  
 ΔH<sub>f</sub>° 298.15 = -91.48 ± 0.22 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub>° = [3.34] kcal. mole<sup>-1</sup>  
 T<sub>c</sub> = 581°K.  
 T<sub>m</sub> = 755°K.

Heat of Formation.

A. A. Gilliland and W. H. Johnson, J. Res. Natl. Bur. Std. 65A, 67 (1961) measured the heat of solution of NaClO<sub>4</sub>(c) and gave ΔH<sub>f</sub>° 298.15 = -91.48 ± 0.22 kcal. mole<sup>-1</sup> for NaClO<sub>4</sub>(c). The heat of dilution of NaClO<sub>4</sub>(c) was measured by C. E. Vandervee and J. A. Sorenson, J. Phys. Chem. 67, 285 (1963). The data led to ΔH<sub>f</sub>° 298.15 = -91.464 kcal. mole<sup>-1</sup>, which agrees very well with the data reported by A. A. Gilliland and W. H. Johnson, loc. cit. The value of ΔH<sub>f</sub>° 298.15 was reported to be -92.18 kcal. mole<sup>-1</sup> in the National Bureau of Standards Circular 500, "Selected Values of Chemical Thermodynamic Properties," 1952, based upon the data prior to 1950. A. F. Vorob'ev, et al., Proc. Acad. Sci. USSR, 135, 1439 (1960) measured the heat of decomposition of NaClO<sub>4</sub>(c) into NaCl(c) and O<sub>2</sub>(g) and gave ΔH<sub>r</sub>° 298.15 = -90.68 ± 0.3 kcal. mole<sup>-1</sup> for NaClO<sub>4</sub>(c). The value reported by A. A. Gilliland and W. H. Johnson, loc. cit. was used.

Heat Capacity and Entropy.

Heat capacities and S° 298.15 were estimated by comparison with those for NaClO<sub>3</sub>(c) and KClO<sub>4</sub>(c), respectively.

Transition Data.

T<sub>c</sub> was reported in the National Bureau of Standards, Circ. 500, loc. cit. ΔH<sub>f</sub>° was estimated from that for KClO<sub>4</sub>(c).

Temperature of Melting.

T<sub>m</sub> was obtained from Bulletin of the National Research Council, No. 118, "Data on Chemicals for Ceramic Use," June 1949.

Chlorine Monoxide (ClO)

(Ideal Gas) Mol. Wt. = 51.457

CHLORINE MONOXIDE (ClO)

June 30, 1961

D<sub>0</sub> = 63.33 ± 0.03 kcal. mole<sup>-1</sup>  
 ΔH<sub>f<sup>o</sup></sub><sup>o</sup> 298.15 = 24.19 ± 0.05 kcal. mole<sup>-1</sup>  
 ΔH<sub>f<sup>o</sup></sub><sup>o</sup> 298.15 = 54.145 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 Ground State Configuration 2Π<sub>3/2</sub>

Electronic Level and Multiplicity

$$\frac{E_i, \text{ cm.}^{-1}}{0}$$

ω<sub>e</sub> x<sub>e</sub> = 7.5 cm.<sup>-1</sup>  
 ω<sub>e</sub> = 866 ± 26 cm.<sup>-1</sup>  
 B<sub>e</sub> = 0.645(3)  
 D<sub>e</sub> = 2.(2) X 10<sup>-6</sup> cm.<sup>-1</sup>  
 r<sub>e</sub> = 1.546 Å

Heat of Formation

R. A. Durie and D. A. Ramsay, Can. J. Phys. 35, 35 (1958) and G. Herzberg and D. A. Ramsay, Disc. Faraday Soc. 9, 80 (1950) report D<sub>0</sub> = 22152 ± 10 cm.<sup>-1</sup> and D<sub>0</sub> = 22141 cm.<sup>-1</sup> respectively, and these values have been averaged.

Heat Capacity and Entropy

The spectroscopic constants are for the natural mixture of isotopes and are based on measurements by Durie and Ramsay, loc. cit., and by G. Porter, Disc. Faraday Soc. 9, 60 (1950). C<sub>p</sub> has been estimated by the method given by G. Herzberg, "Spectra of Diatomic Molecules", 2nd Edn., D. Van Nostrand Company, Inc., New York, 1950, p. 108.

Sept. 30, 1963

Point Group  $C_{2v}$   
 $\Delta F_0^0 = [-59.0]$  kcal. mole<sup>-1</sup>  
 $\Delta F_0^{298.15} = [-58.4]$  kcal. mole<sup>-1</sup>  
 Ground State Quantum Weight = [2]

## Vibrational Frequencies and Degeneracies

$\omega_e$ , cm.<sup>-1</sup>  
 [880] (1)  
 [230] (2)  
 [490] (1)

Bond Distances: O-Ti = [1.62] Å Ti-F = [2.17] Å

Bond Angles: O-Ti-Cl = [180°]  $\sigma = 1$ Rotational Constant:  $B_0 = [0.09225]$  cm.<sup>-1</sup>

## Heat of Formation.

$\Delta H_f^0$  was estimated as -58 kcal. mole<sup>-1</sup> by J. S. Gordon, AstroSystems, Inc., Caldwell Twp., N. J., private communication, January 10, 1963.  $\Delta H_f^0$  298.15 was then calculated.

## Heat Capacity and Entropy.

Molecular constants were estimated by J. S. Gordon, loc. cit. Principal moments were  $I_A = I_C = 30.34 \times 10^{-39}$  g. cm.<sup>2</sup>

Chlorine Dioxide (ClO<sub>2</sub>)

(Ideal Gas) Mol. Wt. = 67.457

C102

CHLORINE DIOXIDE (ClO<sub>2</sub>) (IDEAL GAS) MOL. WT. = 67.457

Heat of Formation

M. H. Evans, T. R. Munson, and D. D. Wagman, J. Research Natl. Bur. Standards 55, 147 (1955), have evaluated the available data and chosen the above value.

Heat Capacity and Entropy

J. S. Gordon, private communication, February, 1961, has calculated the thermodynamic functions from 298.15° to 6000°K by the method of R. E. Pennington and K. A. Kobe, J. Chem. Phys. 22, 1442 (1954), which takes vibration-rotation interaction and anharmonicity into account. Gordon's data are from J. B. Coon and E. Ortiz, J. Molec. Spectros. 1, 61 (1957). The functions below 298.15°K have been calculated for a rigidly rotating harmonic oscillator.

June 30, 1963; Dec. 31, 1963

Ground State Configuration [ $3s^2 3p^4$ ] kcal. mole<sup>-1</sup>  
 $\Delta H_f^o = [34.7]$  kcal. mole<sup>-1</sup>  
 $\Delta H_f^o = [56.8]$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 $\Delta H_f^o = [35.0]$  kcal. mole<sup>-1</sup>

Electronic Levels and Multiplicities

$$\frac{C_p}{R} = \frac{5}{2} + \frac{1}{2} \sum \frac{g_i}{g_0}$$

$$\omega_e = [4.72] \text{ cm.}^{-1} \quad \omega_e x_e = [1.09] \text{ cm.}^{-1} \quad \sigma = 1$$

$$B_e = [0.2443] \quad \alpha_e = [0.00098] \quad r_e = [2.04] \text{ \AA}$$

Heat of Formation.

The selected  $\Delta H_f^o$  298.15 was calculated by assuming that the second and third bonds in PCl<sub>3</sub>(g) are of equal strength, and that the first bond has a strength 20% greater than the other two. These assumptions were used by C. B. Henderson and R. S. Scheffee, Survey of Thermochemical Data, Atlantic Research Corporation, Alexandria, Virginia, January 1960. The selected  $\Delta H_f^o$  298.15 was calculated using these bond strengths and auxiliary data from JANAF Tables.

A  $\Delta H_f^o$  298.15, 40 kcal. mole<sup>-1</sup>, estimated by C. J. O'Brien and J. R. Perrin, The Marquardt Corporation and J. Perrine, Olin Mathieson Chemical Corp., "Estimation of the Heats of Formation of Gaseous Combustion Product Molecules," MS/CI Paper 59-4, October, 1959, when adjusted to the red V phosphorus reference state becomes [44.2] kcal. mole<sup>-1</sup>.

A. A. Sandoval, H. C. Moser, and R. W. Kiser, J. Phys. Chem. 67, 124, (1963) have calculated a  $\Delta H_f^o$  298.15 for PCl from an appearance potential. They selected the process PCl<sub>3</sub> → Cl<sup>+</sup> + e<sup>-</sup> + PCl + Cl to explain this potential rather than the process PCl<sub>3</sub> → Cl<sup>+</sup> + e<sup>-</sup> + P + Cl<sub>2</sub>. The reason for their selection was a calculated  $\Delta H_f^o$ (Cl), 10 kcal. lower than the literature value (See National Bureau of Standards "Selected Values of Chemical Thermodynamic Properties" Circular 500). Use of the JANAF  $\Delta H_f^o$  298.15 for PCl<sub>3</sub> eliminates this difference. Therefore, the process of the reported appearance potential would apparently be the second process which does not involve the neutral PCl radical.

Heat Capacity and Entropy.

The molecular constants were estimated by J. S. Gordon, AstroSystems International, Livingston, New Jersey, private communication, April 25, 1963.

$\omega_e = 303.6$  cm.<sup>-1</sup>  $\omega_e x_e = 0.88$  cm.<sup>-1</sup>  $\sigma = 1$   
 $B_e = [0.1029]$  cm.<sup>-1</sup>  $\alpha_e = [0.00048]$  cm.<sup>-1</sup>

Heat of Formation.  $\Delta H_f^{\circ} 298.15$  was calculated from the dissociation energy of PbCl(g) reported by A. G. Gaydon, "Dissociation Energies and Spectra of Diatomic Molecules," Chapman and Hall, Ltd., London, 1953.

Heat Capacity and Entropy. Ground state configuration,  $\omega_e$ , and  $\omega_e x_e$  were given by Herzberg, loc. cit.  $B_e$ ,  $\alpha_e$ , and  $\sigma$  were estimated by J. S. Gorden, Astronomers, Inc., private communication, May, 1962.

Ground State Configuration  $2^1P_1$   
 $S_{298.15}^{\circ} = 56.82$  gibbs/mol  
 $\Delta H_f^{\circ} = 45.2 \pm 1.5$  kcal/mol  
 $\Delta H_f^{\circ}{}_{298.15} = 45.7 \pm 1.5$  kcal/mol

GFW = 63.539

$\omega_e X_e = 2.27$  cm<sup>-1</sup>     $\sigma = 1$   
 $\omega_e = 533.75$  cm<sup>-1</sup>     $r_e = 2.058$  Å  
 $B_e = 0.25416$  cm<sup>-1</sup>     $\alpha_e = 0.00161$  cm<sup>-1</sup>

Heat of Formation

The adopted value is based on  $D_0^{\circ} = 90 \pm 15$  kcal/mol which is calculated from  $D_0^{\circ}/D^{\circ}(\text{LiX}) = 1.01$  and  $D^{\circ}(\text{LiX}) = 89$  kcal/mol. The latter value comes from linear Birge-Sponer extrapolation of ground state vibrational constants obtained by Verma (1) from the B-X system. The ratio  $D_0^{\circ}/D^{\circ}(\text{LiX}) = 1.01$  is calculated from an empirical relationship proposed by Hildenbrand (2):  $D_0^{\circ}/D^{\circ}(\text{LiX}) = 0.365(r_0/r_e) + 0.448$  and  $r_0 = 14.40$  (IP-EA), where IP is the ionization potential of the more electropositive element and EA is the electron affinity of the more electronegative element. A similar calculation using  $\omega_e X_e = 2.1$  cm<sup>-1</sup> obtained from the B-X system (2) would give  $D_0^{\circ} = 98$  kcal/mol. These values for  $D_0^{\circ}$  may be compared with average (per bond) heats of atomization of 101 kcal/mol for SiCl<sub>2</sub> and 98 kcal/mol for SiCl<sub>4</sub>.

Gaydon (3) selected  $D_0^{\circ} = 7612$  kcal/mol on the assumption that  $D_0^{\circ}/D^{\circ}(\text{LiX}) = 0.8$ , but Ovcharenko (4) suggested that this was too low by comparison with  $D_0^{\circ} = 117$  kcal/mol obtained from the B' state. The latter value is calculated from  $D^{\circ}(\text{LiX}) = 33$  kcal/mol and presumes that Si(1D) is the excited atomic product. The B and C states could also correlate to give values fairly consistent with  $D_0^{\circ} = 117$ . This interpretation seems unlikely, however, because it would involve a crossing of the potential curves for the B and B' states. Since the potential curves may be distorted due to the close proximity of the B and B' states, it seems preferable to obtain  $D_0^{\circ}$  from constants for the ground state.

Heat Capacity and Entropy

Electronic levels of the B and C states are taken from the B-X and C-X systems reported by Ovcharenko et al. (5, 6). The A level is that assigned by Sanii (10) from analysis of the A-X system. The D level is that derived by Herzberg (7) from data of Jevons (8), but it is assigned as  $^1\Pi$  as suggested by Verma (1). The B' level is from Verma and is confirmed by the earlier analysis of Ovcharenko (4). All vibrational and rotational constants for the ground state are those obtained by Verma (1) from the B'-X system. Values only slightly different were obtained from the B-X system by Ovcharenko (5, 6). The adopted constants are adjusted to the natural isotopic abundances of Si and Cl.

Heat of Formation

The heat of formation,  $\Delta H_f^\circ$ , of TiCl (g) is calculated from the dissociation energy,  $D_0^\circ$ , which is estimated as 105 kcal/mol. This estimate is obtained from the relation  $D(\text{TiCl}) < D_0^\circ(\text{TiCl}) < D_0^\circ(\text{TiCl}_2)$ , where D represents the average energy per bond, which is valid for the titanium fluorides. The dissociation energy of TiF(g) from which the relation is derived was estimated relative to that of  $\text{Ti}_2(\text{g})$  by Zmbov and Margrave (1).

Extrapolations of the vibrational levels reported by Shenyavskaya (2), Rao (3) and Mace and Packer (4) yield values of the dissociation energy which are very low when considered with respect to bond energy relations.

Heat Capacity and Entropy

The vibrational frequency,  $\omega_e$ , and anharmonic vibrational term,  $\omega_e x_e$ , were reported by Shenyavskaya et al. (2). The interatomic distance is estimated from Guggenheimer's relation (5).  $B_e$  is calculated from  $r_e$ . The ground state term and electronic levels are estimated from the ground state multiplet of  $\text{Ti}^+(g)$ .  $\omega_e$  is estimated from the Morse potential function.

$\omega_e = [455.4] \text{ cm}^{-1}$       $\omega_e x_e = [1.46] \text{ cm}^{-1}$       $\sigma = 1$   
 $B_e = [0.11103] \text{ cm}^{-1}$       $\alpha_e = [0.00042] \text{ cm}^{-1}$       $r_e = [2.26] \text{ \AA}$

Heat of Formation

The heat of formation,  $\Delta H_{f298}^{\circ}(\text{WCl}, g) = 132.3 \text{ kcal/mol}$ , is calculated from the bond dissociation energy,  $D_{298}^{\circ}(\text{W-Cl}) = 100 \pm 10 \text{ kcal/mol}$ . This estimated  $D_{298}^{\circ}$  is obtained from the average bond dissociation energy for  $\text{WCl}_x(g) + \text{W}(g) + x\text{Cl}(g)$  where  $x = 2, 4, 5, 6$ , using all JANAF values.

Heat Capacity and Entropy

The bond distance is estimated to be the same as that in  $\text{WCl}_2(g)$ . This distance is then used with Guggenheim's relation for polar molecules to calculate the fundamental vibrational frequency  $\omega_e$  (K. M. Guggenheim, Proc. Phys. Soc. (London) 59, 456 (1946)). The anharmonicity correction  $x_e$  is estimated roughly by assuming  $x_e = \omega_e^4(D_0^3 + 0.5 \omega_e) = 0.0032$ . The rotational constant  $B_e$  is calculated from the estimated bond distance. The value of  $\alpha_e$  is calculated from the Morse potential function. The moment of inertia is  $25.20 \times 10^{-39} \text{ g cm}^2$ . The ground state configuration, low lying electronic levels and their quantum weights are assumed to be the same as those estimated for  $\text{WF}(g)$ . See  $\text{WF}(g)$  table (March 31, 1967) for details.

Heat of Formation

Potter (1) investigated mass spectrometrically the gaseous equilibria among ZrCl<sub>4</sub>, ZrCl<sub>3</sub>, ZrCl<sub>2</sub>, ZrCl<sub>3</sub> and ZrCl<sub>4</sub>. Ion intensities were measured 2.5 eV above the ionization threshold. Using the reported equilibrium constants for the reaction ZrCl<sub>3</sub>(g) + ZrCl<sub>4</sub>(g) = 2 ZrCl<sub>2</sub>(g) in the temperature range 1978-2274°K, second and third law analyses give the heats of reaction at 298°K as -10.36 and -12.83 kcal/mol, respectively. The third law drift is 1.4 ± 2.5 eu. Based on the third law ΔH<sub>f298</sub><sup>0</sup> and ΔH<sub>f298</sub><sup>0</sup>(ZrCl<sub>3</sub>, g) = -44.5 kcal/mol (2), and ΔH<sub>f298</sub><sup>0</sup>(ZrCl<sub>3</sub>, g) = -125.3 kcal/mol (3), we obtain ΔH<sub>f298</sub><sup>0</sup>(ZrCl<sub>4</sub>, g) = 49.1 kcal/mol which is adopted in the tabulation.

Farber et al. (4) also studied mass spectrometrically the reaction Zr(c) + Cl(g) = ZrCl(g). They reported a second law heat of reaction, ΔH<sub>f298</sub><sup>0</sup> = 8.7 ± 1.4 kcal/mol. Using the equilibrium constants K = (ZrCl)/(Cl) which we calculated from their reported ion intensities of run 3 in the temperature range 1657-1895°K, we obtain ΔH<sub>f298</sub><sup>0</sup> = 20.3 kcal/mol by the third law method. The third law drift is 6.1 ± 2.4 eu. The heat of formation is derived as ΔH<sub>f298</sub><sup>0</sup>(ZrCl, g) = 49.2 kcal/mol.

Heat Capacity and Entropy

The bond distance is estimated to be the same as that in ZrCl<sub>4</sub>(g). The bond distance is then used with Guggenheimer's relation (5) for polar molecules to calculate the fundamental vibrational frequency ω<sub>e</sub>. The anharmonicity correction x<sub>e</sub> is estimated roughly by assuming x<sub>e</sub> = ω<sub>e</sub><sup>2</sup>(0.5 + 0.5 ω<sub>e</sub>) = 0.0025. The rotational constant B<sub>e</sub> is calculated from the estimated bond distance. The value of a<sub>e</sub> is calculated from the Morse potential function. The moment of inertia is 22.425 × 10<sup>-39</sup> g cm<sup>2</sup>.

The ground state configuration is taken from the ground state multiplet of Zr<sup>4+</sup> reported by Moore (6). The electronic levels and the quantum weights are estimated to be the same as those of Zr(fg).

$\omega_e x_e = 561.1 \text{ cm.}^{-1}$   
 $\omega_e = 4.0 \text{ cm.}^{-1}$   
 $B_e = 0.2408 \text{ cm.}^{-1}$   
 $r_e = 1.986 \text{ \AA}$   
 $\sigma = 2$

Heat of Formation.  
 The heat of formation ( $\Delta H_f^{\circ}$ ) for Cl<sub>2</sub>(g) is zero at all temperatures, by definition.

Heat Capacity and Entropy.

The functions adopted here were calculated by R. L. Fottler, J. Chem. Phys. 31, 1100 (1959) using a direct summation over the energy levels not including those of non-bonding states. The functions are for the naturally occurring isotopic composition.

The absorption spectrum of chlorine has been observed by A. Elliott, Proc. Roy. Soc. A 127, 638 (1930); C. F. Goodeve and B. A. Stephens, Trans. Faraday Soc. 32, 1517 (1936); H. Stammreich, R. Fornieris and Y. Tsvaras, Spectrochim. Acta, 17, 775 (1961); Y. V. Rao and P. Venkateswarlu, J. Mol. Spectr. 9, 173 (1962); and A. E. Douglas, C. K. Moller and B. P. Stoicheff, Can. J. Phys. 41, 1174 (1963). There is disagreement over the vibrational assignments. The listed ground state spectroscopic constants for the naturally occurring isotopic composition are based upon the abundances given by D. Strominger, J. M. Hollander and G. T. Seaborg, Rev. Mod. Phys. 30, 585 (1958).

The molecular structure of gaseous chlorine was determined by the sector-microphotometer method of electron diffraction by S. Shibata, J. Phys. Chem. 57, 2256 (1953). The value of  $r_e$ (Cl-Cl) was found to be 1.986 Å. The other  $r_e$  values, 1.983 - 1.989 Å, were reported by G. Herzberg, "Spectra of Diatomic Molecules", D. Van Nostrand Co., Inc., 1950; M. G. Richards and R. F. Barrow, Proc. Chem. Soc., 297 (1962), and L. S. Bartell and K. Kuchitsu, presented at the International Conference on Magnetism and Crystallography, 1961, quoted by S. Shibata, loc. cit.

Heat of Formation

Datz (1) studied the molecular association equilibrium in cesium chloride vapors by measuring the temperature dependence of the molecular weight of gaseous CsCl. The molecular weights were determined by measurement of the absolute pressure exerted by a known weight of completely vaporized salt contained in an isothermal fused silica bulb of known volume. The pressure sensing element was a fused silica manometer containing Au(t). Based on the reported results, we derive the equilibrium constants for the reaction Cs<sub>2</sub>Cl<sub>2</sub>(g) = 2CsCl(g) in the temperature range 1224 - 1418°K. The enthalpy change of this reaction is evaluated by the second and third law method as 39.3 ± 1.1 and 42.9 ± 0.6 kcal/mol, respectively. The drift in the third law value is equivalent to an entropy error of 2.7 ± 0.8 eu. Using the third law ΔH<sup>o</sup> and ΔH<sub>f</sub><sup>o</sup> of CsCl, g = -57.4 kcal/mol, we obtain ΔH<sub>f</sub><sup>o</sup> = -157.7 ± 2.5 kcal/mol for Cs<sub>2</sub>Cl<sub>2</sub>(g), which is adopted.

Schrier (2) determined the vapor pressures of molten cesium chloride at temperatures between 1165 and 1387°K by the boiling point or manometric method. The vapor analysis was performed using the transpiration method. An inert gas, V<sub>2</sub>, was passed over the CsCl sample at a given temperature. The salt vapor entrained by the carrier gas was collected, weighed and analyzed. The data obtained were combined with the boiling point measurements to yield the average molecular weight of the vapor. Association into dimer was postulated. The mole fraction in the vapor and the partial pressure of CsCl(g) and Cs<sub>2</sub>Cl<sub>2</sub>(g) were calculated. The equilibrium constants, 1209 - 1350°K, for dissociation of the Cs<sub>2</sub>Cl<sub>2</sub> dimer were derived. Using the reported equilibrium constants, we evaluate the enthalpy change (ΔH<sub>f</sub><sup>o</sup>) of the reaction Cs<sub>2</sub>Cl<sub>2</sub>(g) = 2CsCl(g) to be 34.1 ± 2.9 and 43.2 ± 0.9 kcal/mol by the second and third law methods. Based on the third law ΔH<sub>f</sub><sup>o</sup> value and ΔH<sub>f</sub><sup>o</sup> of CsCl, g = -57.4 kcal/mol, we obtain ΔH<sub>f</sub><sup>o</sup> = -156.0 kcal/mol for Cs<sub>2</sub>Cl<sub>2</sub>(g), which is in agreement with the adopted value.

Miller and Kusch (3) made an analysis of the velocity distribution of the CsCl molecules which escape through an ideal aperture from an isothermal enclosure. They found that there was no definite evidence that any species other than diatomic molecules were present in the beams in measurable amounts, in other words, the dimerization must be small, e.g. <1.5 per cent. However, according to our calculation the concentration of dimer is 15 - 34 per cent in the temperature range 600 - 900°K, and 33 - 20 per cent at the temperatures 1000 - 1600°K.

Heat Capacity and Entropy

The molecular structure is assumed to be planar, having D<sub>2h</sub> symmetry. Based on the bond distances of Cs-Cs and Cl-Cl estimated by Berkowitz (4), the Cs-Cl bond distance and Cl-Cs-Cl bond angle are calculated. The vibrational frequencies were calculated by Berkowitz (5), on the basis of the potential function for an ionic model. The three principal moments of inertia are: I<sub>A</sub> = 2.105 × 10<sup>-37</sup>, I<sub>B</sub> = 6.272 × 10<sup>-37</sup>, and I<sub>C</sub> = 2.732 × 10<sup>-37</sup> g cm<sup>2</sup>.

 $T_d = [766]^{\circ}\text{K.}$

**Heat of Formation.**  
 S. A. Shchukarev and M. A. Oranskys, Zhur. Obshchei Khim. 24, 1928 (1954) have reported equilibrium constants for the dissociation  $\text{CuCl}_2(c) \rightarrow \text{CuCl}(c/l) + 0.5 \text{Cl}_2(g)$ , which are in general agreement with earlier reports by P. Ephraim, Ber. 50, 1089 (1917) and D. I. Tarasenkov, A. I. Origorovich and A. V. Boroslovskys, Collected Works of the Central State Institute for Non-Ferrous Metallurgy, Part 1, 1, 69 (1929). These data were subjected to third law analysis which revealed a significant trend of 13 ± 0.5 cal. deg.<sup>-1</sup> mole, indicating that equilibrium conditions were not reached. However an average value of  $\Delta H_{298} = 16.5 \pm 1.9$  kcal. mole<sup>-1</sup> yields a heat of formation of  $\text{CuCl}_2(c) = -49.5 \pm 2.5$  kcal. mole<sup>-1</sup> which is in good agreement with the adopted value taken from Natl. Bureau Std. Circular 500, Washington, 1952.

**Heat Capacity and Entropy.**

The low temperature heat capacity has been measured from 11-300°K. by J. W. Stout and R. C. Chisholm, J. Chem. Phys. 36, 979 (1962). The integration of this data from  $S_{10} = 0.111$  cal. deg.<sup>-1</sup> mole<sup>-1</sup> gave  $S_{298} = 25.833$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>. The heat capacity above 298° was obtained by smooth extrapolation of the above data, since the heat capacities of A. N. Kresovnikov and O. A. Karetnikov, Journ. Oen. Chem. (USSR) 5, 955 (1956) were not compatible with the low temperature data.

**Decomposition Data.**

The temperature of decomposition was estimated from the table for  $\text{CuCl}_2(c)$ ,  $\text{CuCl}(l)$  and  $\text{Cl}_2(g)$  so that the pressure of  $\text{Cl}_2$  is 1 atm.

Bond Distances: P-Cl = 1.99 ± 0.04 Å P-F = 1.50 ± 0.03 Å P-O = 1.54 ± 0.03 Å  
Bond Angle: Cl-P-Cl = 103° σ = 1

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 4.70732540 X 10<sup>-113</sup> g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation.

The ΔH<sub>f</sub>° 298.15 of POCl<sub>2</sub>F was estimated to be -179 kcal. mole<sup>-1</sup> from the ΔH<sub>f</sub>° 298.15 of POCl<sub>3</sub> by assuming bond energies of 120 kcal. for D(P-F) and 80 kcal. for D(P-Cl). The D(P-F) and D(P-Cl) values were taken from Moore, J. Chem. Soc. 422 (1956) Part II.

Essentially the same ΔH<sub>f</sub>° 298.15 may be obtained by assuming a ΔH<sub>f</sub>° = 0 for the following reaction:

Heat Capacity and Entropy.

The molecular constants were determined by L. O. Brocway and J. Y. Beach, J. Am. Chem. Soc. 60, 1836 (1938) and by Q. Williams, J. Sheridan, and M. Gordy, J. Chem. Phys., 20, 164 (1952). Brocway and Beach used electron diffraction. Q. Williams et al. measured microwave spectra. Brocway and Beach assumed that the P-P-F and P-P-Cl angles were equal in PO<sub>2</sub>Cl and POCl<sub>2</sub>F. An analysis of their data by Q. Williams et al. indicates that the angles in PO<sub>2</sub>Cl, POCl<sub>2</sub>F, POCl<sub>2</sub>, POCl<sub>3</sub>, and PO<sub>2</sub>F<sub>2</sub> should be 103° rather than the reported 106° ± 3°. The principal moments of inertia calculated from these parameters were I<sub>A</sub> = 2.69184 X 10<sup>-38</sup>, I<sub>B</sub> = 3.79516 X 10<sup>-38</sup>, and I<sub>C</sub> = 4.60780 X 10<sup>-38</sup>.

The Raman spectra and vibrational frequencies for POCl<sub>2</sub>F were reported by M. L. Delwaule and P. Francois, Compt. Rend. 222, 550 (1946). These frequency assignments are summarized in J. Chim. Phys. 4E, 87 (1949) by M. L. Delwaule and P. Francois.

The enthalpy change,  $\Delta H_f^{298.15}$  = -4.05 ± 0.05 kcal. mole<sup>-1</sup>, for the reaction  $Fe(\infty) + \frac{1}{2}(HCl_{12.731} H_2O) (l) = FeCl_2(c) + H_2(g) + 25.462 H_2O (l)$  was reported by M. F. Koehler and J. P. Coughlin, *J. Phys. Chem.* **53**, 605 (1959). The value of  $\Delta H_f^{298.15}(c)$  was then derived. The enthalpy change,  $\Delta H_f^{298.15} = -19.5 \pm 0.2$  kcal. mole<sup>-1</sup>, for the reaction  $FeCl_2(c) = Fe^{++}(aq.) + 2 Cl^{-}(aq.)$  was determined by J. C. M. Li and N. W. Gregory, *J. Am. Chem. Soc.* **74**, 4670 (1952), yielding  $\Delta H_f^{298.15} = -81.4 \pm 0.2$  kcal. mole<sup>-1</sup> which is in agreement with the adopted value reported by M. F. Koehler and J. P. Coughlin. The equilibrium constants for the reaction  $FeCl_2(c) + H_2(g) = Fe(c) + 2HCl(g)$  were determined by M. Kangro and E. Petersen, *Z. Anorg. Chem.* **261**, 157 (1950). By use of the second and third law methods the enthalpy change ( $\Delta H_f^{298.15}$ ) of this reaction was evaluated as  $37.81 \pm 0.68$  and  $38.24$  kcal. mole<sup>-1</sup>, respectively. Based on the third law value for  $\Delta H_f^{298.15}$ , the value of  $\Delta H_f^{298.15}(FeCl_2, c)$  was derived to be  $-82.37$  kcal. mole<sup>-1</sup> which is in reasonable agreement with the adopted value.

Heat Capacity and Entropy.

The low temperature (53.2-295.0°K.) heat capacities were determined by K. K. Kelley and O. E. Moore, *J. Am. Chem. Soc.* **65**, 1264 (1943). The high temperature (670.5-941.0°K.) heat capacities were measured by O. E. Moore, *J. Am. Chem. Soc.* **65**, 1700 (1943). The two sets of  $C_p$  data were plotted and joined smoothly at 298°K. The  $C_p$  values above 941.0°K. were obtained by graphical extrapolation. The  $C_p$  values, 60-500°K., were also reported by F. L. Oetting and N. W. Gregory, *J. Phys. Chem.* **65**, 139 (1961) which are in good agreement with those determined by O. E. Moore, loc. cit.  $S_{298.15}^{298.15}$  was derived from the smoothed  $C_p$  values, using  $S_{53.2}^{298.15} = 4.930$  e.u. The  $S_{298.15}^{298.15}$  value was determined by E. F. Westrum, Jr. quoted by L. E. Wilson and N. W. Gregory in *J. Phys. Chem.* **62**, 437 (1958). The entropy at 298° is assumed to include the uncoupling energy of  $Fe^{++}$  which is calculated to be 3.2 e.u. which corresponds to R in 5.

Melting Data.

$T_m$  and  $\Delta H_m^o$  were taken from O. E. Moore, loc. cit.

Heat of Sublimation.

The difference between  $\Delta H_f^{298.15}$  for  $FeCl_2(g)$  and  $FeCl_2(c)$  is  $\Delta H_g^{298.15}$ . The former was obtained by the second and third law analyses on the equilibrium pressure data as described in  $FeCl_2(g)$  table.

$\Delta H_f^{298.15} = 33.432 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $T_m = 950^\circ\text{K.}$   
 $T_b = 1347^\circ\text{K.}$   
 $\Delta H_f^{298.15} = -74.411 \pm 0.13 \text{ kcal. mole}^{-1}$   
 $\Delta H_m^{298.15} = 10.28 \pm 0.05 \text{ kcal. mole}^{-1}$   
 $\Delta H_v^{298.15} = 29.83 \text{ kcal. mole}^{-1}$

Heat of Formation.

The value of  $\Delta H_f^{298.15}(\text{FeCl}_2, l)$  was obtained from  $\Delta H_f^{298.15}(\text{FeCl}_2, c)$  by adding  $\Delta H_m^{298.15}$  and the difference between  $H_m^{298.15}$  and  $H_l^{298.15}$  for crystal and liquid.

Heat Capacity and Entropy.

The heat capacity (950-1100°K.) for FeCl<sub>2</sub>(l) was reported as 24.42 cal. deg.<sup>-1</sup> mole<sup>-1</sup> by G. E. Moore, J. Am. Chem. Soc. 65, 1700 (1943). A constant C<sub>p</sub> was assumed for all the other temperatures. The entropy was obtained in a manner analogous to that of the heat of formation.

Melting Data.

T<sub>m</sub> and ΔH<sub>m</sub><sup>298</sup> were taken from G. M. Moore, loc. cit.

Vaporization Data.

The boiling point (T<sub>b</sub>) is determined as the temperature at which the free energy change (ΔF<sub>v</sub><sup>298</sup>) for the reaction FeCl<sub>2</sub>(l) = FeCl<sub>2</sub>(g) approaches zero. The corresponding enthalpy change (ΔH<sub>v</sub><sup>298</sup>) at T<sub>b</sub> is the heat of vaporization (ΔH<sub>v</sub><sup>298</sup>).

Point Group [D<sub>oh</sub>h]  
S<sub>298.15</sub> = [66.71] cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
ΔH<sub>f</sub><sup>0</sup> = -35.83 ± 2.0 kcal. mole<sup>-1</sup>  
ΔH<sub>f</sub><sup>0</sup> 298.15 = -55.50 ± 2.0 kcal. mole<sup>-1</sup>

Electronic Levels and Quantum Weight

Bond Distance Fe-Cl = [2.09] Å  
Bond Angle Cl-Fe-Cl = [180]°  
Rotational Constant B<sub>0</sub> = [0.05442] cm.<sup>-1</sup>

Heat of Formation

The equilibrium pressures for the reactions: (1) FeCl<sub>2</sub>(l) = FeCl<sub>2</sub>(g); (2) FeCl<sub>2</sub>(c) = FeCl<sub>2</sub>(g); and (3) Fe(c) + 2HCl(g) = FeCl<sub>2</sub>(g) + H<sub>2</sub>(g) were determined by several investigators. Using the reported data, the corresponding enthalpy changes (ΔH<sub>f</sub><sup>0</sup> 298.15) for these reactions were evaluated by both the second and third law methods. Hence the respective ΔH<sub>f</sub><sup>0</sup> 298.15 values for FeCl<sub>2</sub>(g) were derived, based on the third law values for ΔH<sub>f</sub><sup>0</sup> 298.15. The results obtained are presented as follows.

| Investigator                        | Reaction | Temperature, °K. | Second Law Value | Third Law Value | ΔH <sub>f</sub> <sup>0</sup> 298.15, kcal. mole <sup>-1</sup> |

The value of ΔH<sub>f</sub><sup>0</sup> 298.15 for FeCl<sub>2</sub>(g) adopted is -35.5 ± 2.0 kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy

The molecular structure, bond distance and angle, and two vibrational frequencies (ν<sub>1</sub> and ν<sub>2</sub>) were obtained from L. Brewer, G. R. Somayajulu and E. Brackett, Chem. Rev. 63, 111 (1963). The electronic levels and quantum weights were obtained by comparison with the electronic levels in Fe<sup>2+</sup>(g) reported by C. E. Moore, "Atomic Energy Levels", Circular of the National Bureau of Standards 467, Vol. II, 1952, using the reasoning suggested by J. T. Hougen, G. E. Leroi and T. C. James, J. Chem. Phys. 34, 1970 (1961). The total 2S for the quantum weight was obtained from the ground multiplet of Fe<sup>2+</sup> and was split arbitrarily. The bending frequency (ν<sub>3</sub>) was derived such that the calculated free energy functions are consistent with the experimental equilibrium data. In other words, the free energy functions were adjusted by choosing a proper value for ν<sub>3</sub> in order to make the second and third law values of ΔH<sub>f</sub><sup>0</sup> for the reaction in reasonable agreement. The moment of inertia (I) is 5.1426 x 10<sup>-38</sup> g. cm.<sup>2</sup>.

 $\Delta H_m = 4.64 \pm 0.05$  kcal. mole<sup>-1</sup>

Heat of Formation. Taken from National Bureau of Standards (U.S.) Circular 500, "Selected Values of Chemical Thermodynamic Properties," (1952).

Heat Capacity and Entropy. C<sub>p</sub> was determined from the heat content data of L. E. Topol and L. D. Ransom, J. Phys. Chem. 54, 1359 (1950) and R. Ewald, Ann. d. Physik u. Chem. (4) 41, 1213 (1914). Above 550° the curve was smoothly extrapolated. The entropy was estimated by adjusting the value to give the best fit of the melting, sublimation, and vaporization data.

Melting. T<sub>m</sub> was taken from National Bureau of Standards Circular 500 (loc. cit.) ΔH<sub>m</sub> was given by L. E. Topol and L. D. Ransom (loc. cit.).

Mercury Dichloride (HgCl<sub>2</sub>)

MERCURY DICHLORIDE (HgCl<sub>2</sub>) (Liquid)

Mol. Wt. = 271.524  
 $\Delta H_f^\circ$  298.15 = -51.404 ± 1.0 kcal. mole<sup>-1</sup>  
 $S_{298.15}^\circ$  = [40.721] ± 1.5 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 $T_m$  = 550°K  
 $\Delta H_m$  = 4.64 ± 0.05 kcal. mole<sup>-1</sup>  
 $T_b$  = 577°K  
 $\Delta H_v$  = 14.079 ± 0.25 kcal. mole<sup>-1</sup>

Heat of Formation. Calculated from  $\Delta H_f^\circ(c)$ .

Heat Capacity and Entropy. The heat capacity was estimated to conform with the bromide and iodide, the value given by L. E. Topol and L. D. Ransom, J. Phys. Chem. 64, 1339 (1960) was discounted. A glass type transition was assumed at 367°K below which the heat capacity was equal to that of the crystal. The entropy was obtained from  $S^\circ(c)$ , the entropy of fusion and the estimated heat capacity.

Fusion and Vaporization.  $T_m$  and  $T_b$  were taken from National Bureau of Standards (U.S.) Circular 500 (1952).  $\Delta H_m$  was given by L. E. Topol and L. D. Ransom, J. Phys. Chem. 64, 1339 (1960) and  $\Delta H_v$  was obtained from the data of E. B. R. Frideaux, J. Chem. Soc. (London) 37, 2033 (1910) and F. M. G. Johnson, J. Amer. Chem. Soc. 33, 777 (1911).

Heat of Formation. The heat of formation of the crystal as given in National Bureau of Standards (U.S.) Circular 500, "Selected Values of Chemical Thermodynamic Properties," 1952 was combined with the 3rd law heat of sublimation at 298°K from the data of K. Naka and Z. Shibata, J. Fac. Sci. Hokkaido Imp. Univ. Ser. III, 2, 193 (1935); R. Ruf and W. D. Treadwell, Helv. Chim. Acta 37, 1941 (1954) and P. N. G. Johnson, J. Amer. Chem. Soc. 33, 777 (1911).

Heat Capacity and Entropy. The vibrational constants were given by W. Klemperer and L. Lindeman, J. Chem. Phys. 25, 397 (1956). The bond length is a weighted average of the values given by H. Braune and S. Knoke Naturwiss. 21, 349 (1933); A. H. Gregg, G. C. Hampson, G. I. Jenkins, P. L. F. Jones and L. E. Sutton Trans. Farad. Soc. 33, 852, 1937; L. R. Maxwell and V. M. Moulay Phys. Rev. 57, 21 (1946) and P. A. Akhtar, V. P. Spiridonov and A. N. Knochentkov, Zhur. Fiz. Khim. 33, 20 (1959).

Mercury Monochloride, Dimeric (Hg<sub>2</sub>Cl<sub>2</sub>)

(Crystal) Mol. Wt. = 472.134 **INTERIM TABLE**

MERCURY MONOCHLORIDE, DIMERIC (Hg<sub>2</sub>Cl<sub>2</sub>) (CRYSTAL) MOL. WT. = 472.134

$\Delta H_f^\circ 298.15 = -63.319 \pm 0.05$  kcal mole<sup>-1</sup>  $S^\circ_{298.15} = 46.017$  cal deg<sup>-1</sup> mole<sup>-1</sup>

$T_{\text{sub.}} = 655^\circ\text{K}$  (decomp.)

Heat of Formation

Based on the average free energy of formation, -50.315 kcal mole<sup>-1</sup>, as measured by R. H. Gerke, J. Am. Chem. Soc. 44, 1684 (1922) and G. J. Hills and D. J. G. Ives, J. Chem. Soc. (London) 318, (1951), and the entropy of formation.

Heat Capacity

The data of F. Pollitzer, Zeits. f. Electrochemie 19, 513 (1913), from 22-199°K was treated by K. K. Kelley, U. S. Bureau of Mines Bulletin 592 (1960). The heat capacities listed by Kelley were raised by 0.05 to match the entropy data of Gerke (loc. cit.). Data above room temperature were obtained by smooth extrapolation.

Entropy

A mean value of the entropy of formation of -46.614 e.u. was adopted from the cell measurements of R. H. Gerke (loc. cit.).

Sublimation

The vapor pressure over mercurous chloride reaches 1 atmosphere at 655°K according to A. Smith and A. W. C. Menzies, J. Am. Chem. Soc. 32, 1541 (1910). At this point the vapor is dissociated into Hg(g) and HgCl<sub>2</sub>(g).

 $\sigma = 4$

Heat of Formation

The heat of formation is calculated from that of KCl(g) using  $\Delta H_f^\circ = 45.0 \text{ kcal./mole}$  for  $\text{K}_2\text{Cl}_2(\text{g}) - 2\text{KCl}(\text{g})$  as selected from data analyses summarized below. The three experimental techniques include PVT measurements (source 1), combination of total vapor pressure and transpiration data (sources 2,3,4), and mass spectrometric studies of the variation of ion intensities with temperature (source 5). The results are reasonably consistent, considering the uncertainties inherent in the problem.

The resulting tables were tested by comparison with other data. Calculated total vapor pressures are in satisfactory agreement with the observed values over the range 820-1500°K.; however, near the boiling point they are lower by 6-18 percent (see KCl(g)). Knudsen effusion data and transpiration data over KCl(c) have been reviewed by A. C. P. Bueh and R. F. Barrer, *Trans. Faraday Soc.*, 54, 671 (1958). These data suggest negligible dimer formation when combined with the total vapor pressures of V. Dietz, *J. Chem. Phys.*, 4, 575 (1936). Calculated dimer formation (22 mole percent at 900°K.) agrees with the latter combination but calculated total pressures agree with those of Pugh & Barrer. Velocity distribution studies of R. C. Miller and P. Kusch, *J. Chem. Phys.*, 27, 981 (1957); 25, 860 (1956) suggest about 10 mole percent of dimer at 900°K. Thus, while minor inconsistencies do exist, it is not apparent that they exceed the combined experimental errors.

Heat Capacity and Entropy

The structure and vibrational frequencies are those calculated from an ionic model by J. Benkowitz, *J. Chem. Phys.*, 32, 1519 (1960); 23, 1366 (1958). The sixth fundamental frequency was arbitrarily lowered from 206 to 100 cm.<sup>-1</sup> since the resulting entropy increase (1.4 eu at 1300°K.) improved the overall agreement with the equilibrium data. Based on electron diffraction studies of the monomer-dimer vapor, P. A. Aklehin and N. O. Rambidi, *Zhur. Neorg. Khim.*, 4, 718 (1959) have derived the bond distances and angle to be 2.81 Å and 98°. Interpretation of the diffraction data, however, is complicated by the presence of only about 30 mole percent of dimer at the temperature of measurement. Adoption of this dimer structure would reduce the entropy by 0.23 eu. Principal moments of inertia for the Benkowitz structure are  $I_A = 45.31 \times 10^{-39}$ ,  $I_B = 60.13 \times 10^{-39}$ , and  $I_C = 105.45 \times 10^{-39}$  g. cm.<sup>2</sup>

Bond Lengths and Angles  
 Li-Cl distance = 2.23 Å  
 Li-Li distance = 2.62 Å  
 Cl-Li-Cl angle = 108 ± 4°       $\nu = 4$

Moment of Inertia I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 6418 X 10<sup>-11</sup> g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation. A heat of sublimation at 298° of 52.1 kcal. mole<sup>-1</sup> was chosen to fit the vapor pressure data and relative concentrations of monomer, dimer and trimer as described in the table for LiCl(g). This value is in reasonable agreement with the value of 53.5 kcal. mole<sup>-1</sup> from a 3rd law analysis of the vapor pressure data of An. N. Nesmeyanov and L. A. Sazonov, Zhur. Neorg. Khim. 4, 231 (1960) and the relative concentrations of monomer, dimer, and trimer from the work of R. C. Miller and P. Kusch, J. Chem. Phys. 25, 860 (1956). Also a value of 54.1 kcal. mole<sup>-1</sup> was found by T. A. Milne and H. M. Klein, J. Chem. Phys. 33, 1628 (1960), from mass spectrometer studies.

Heat Capacity and Entropy. W. Klemperer and W. G. Norris, J. Chem. Phys. 34, 1071 (1961), observed two bands in the infra-red spectrum and made tentative assignments. The remaining four frequencies were calculated by J. Berkowitz, J. Chem. Phys. 32, 1519 (1960), from a reasonable model. The bond lengths and angles were determined from the electron diffraction experiments of S. H. Bauer, T. Ino and R. F. Porter, J. Chem. Phys. 33, 685 (1960).

ΔH<sub>f</sub><sup>o</sup> 0 = -153.25 ± 0.11 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> 298.15 = -153.35 ± 0.11 kcal. mole<sup>-1</sup>  
 ΔH<sub>m</sub><sup>o</sup> = 10.30 ± 0.05 kcal. mole<sup>-1</sup>  
 ΔH<sub>g</sub><sup>o</sup> 298.15 = 57.5 ± 1.5 kcal. mole<sup>-1</sup>

S<sup>o</sup> 298.15 = 21.422 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 T<sub>m</sub> = 987°K.

Heat of Formation.

The adopted ΔH<sub>f</sub><sup>o</sup> 298.15 = -153.35 ± 0.11 kcal. mole<sup>-1</sup> is from heat of solution measurements reported by C. H. Shomate and E. H. Huffman, J. Am. Chem. Soc. 55, 1625 (1943). Shomate and Huffman's heat of solution of Mg in 1 M HCl (ΔH = -111.322 ± 0.041 kcal. mole<sup>-1</sup>) has been substantiated for calibration purposes by S. R. Dunn and B. B. Cunningham, J. Am. Chem. Soc., 79, 1553 (1957) (ΔH = -111.3 kcal. mole<sup>-1</sup>) and by E. F. Westrum Jr. and L. Eyring, J. Am. Chem. Soc., 74, 2045 (1952) (ΔH = -111.27 kcal. mole<sup>-1</sup>). Auxiliary heat of dilution and heat of formation data for HCl were taken from V. B. Parkar, "Thermal Properties of Aqueous Uni-univalent Electrolytes", NSRDS-NBS 2, Nat'l. Bur. Stds., April 1965 and from D. D. Wagman et al., N.B.S. Technical Note 270-1, Oct. 1965.

Heat Capacity and Entropy.

High temperature heat content data by G. E. Moore, J. Am. Chem. Soc. 55, 1700 (1943) were joined by Shomate correlation with low temperature heat capacity data reported by K. K. Kelley and O. E. Moore, J. Am. Chem. Soc. 55, 1264 (1943). C<sub>p</sub>(c) above T<sub>m</sub> is a linear extrapolation from 700°K. S<sub>298.15</sub> is derived from the low temperature data and is based on S<sub>53.6</sub><sup>o</sup> = 2.006 cal. deg.<sup>-1</sup> mole<sup>-1</sup>.

Melting Data.

ΔH<sub>m</sub><sup>o</sup> = 10.30 ± 0.05 kcal. mole<sup>-1</sup> is taken from heat content measurements of Moore loc. cit. T<sub>m</sub> = 987°K. is from National Bureau of Standards Circular 500, 1952.

Sublimation Data.

The value of ΔH<sub>g</sub><sup>o</sup> 298.15 was derived by 2nd and 3rd law analyses of vapor pressure data. See the MgCl<sub>2</sub>(g) table for details.

Magnesium Dichloride (MgCl<sub>2</sub>)

(Liquid) Mol. Wt. = 95.218

MAGNESIUM DICHLORIDE (MgCl<sub>2</sub>)

(LIQUID)

MOL. WT. = 95.218

S<sub>298.15</sub> = 30.949 cal. deg.<sup>-1</sup> mole<sup>-1</sup>

ΔH<sub>f</sub><sup>o</sup> 298.15 = -143.779 kcal. mole<sup>-1</sup>

T<sub>m</sub> = 987°K.

ΔH<sub>m</sub><sup>o</sup> = 10.30 ± 0.05 kcal. mole<sup>-1</sup>

T<sub>b</sub> = [1710]°K.

ΔH<sub>v</sub><sup>o</sup> = [37.34] kcal. mole<sup>-1</sup>

Heat of Formation.

ΔH<sub>f</sub><sup>o</sup> 298.15(l) was calculated from ΔH<sub>f</sub><sup>o</sup> 298.15(c) by adding ΔH<sub>m</sub><sup>o</sup> and the difference between H<sub>m</sub><sup>o</sup>-H<sub>298</sub><sup>o</sup> for crystal and liquid.

Heat Capacity and Entropy.

A constant C<sub>p</sub>(l) = 22.0 cal. deg.<sup>-1</sup> mole<sup>-1</sup> over the temperature range 1000-1428°K. is from the high temperature heat content data of G. E. Moore, J. Am. Chem. Soc. 65, 1700 (1943). This constant value was assumed to hold from an assumed glass transition of 660°K. to 3000°K. C<sub>p</sub>(l) below 660°K. is taken to be that of the crystal. The entropy was obtained in a manner analogous to the heat of formation.

Melting Data.

See MgCl<sub>2</sub>(c) table for details.

Vaporization Data.

T<sub>b</sub> is calculated as the temperature at which the free energy change of the reaction MgCl<sub>2</sub>(l) = MgCl<sub>2</sub>(g) approaches zero. The difference between ΔH<sub>f</sub><sup>o</sup> for MgCl<sub>2</sub>(l) and MgCl<sub>2</sub>(g) at T<sub>b</sub> is ΔH<sub>v</sub><sup>o</sup>.

$\Delta H_f^{\circ} = -93.82 \pm 0.5 \text{ kcal/mol}$

$\Delta H_f^{\circ} = -93.80 \pm 0.5 \text{ kcal/mol}$

Point Group D<sub>2h</sub>

$S_{298.15}^{\circ} = 66.184 \pm 0.6 \text{ gibbs/mol}$

Ground State Quantum Weight = 1

Vibrational Frequencies and Degeneracies

|                            |  |
|----------------------------|--|

| 590 (1)                    |  |
| 88 (2)                     |  |
| [273] (1)                  |  |

$c = 2$

Bond Distance: Mg-Cl = 2.10 Å

Bond Angle: Cl-Mg-Cl = 180°

Rotational Constant: B<sub>0</sub> = 0.05003 cm<sup>-1</sup>

Heat of Formation

Analysis of vapor pressure data on MgCl<sub>2</sub> is clouded by conflicting evidence for the amount of dimer in the vapor. Berkowitz and Marquart (1) by mass spectrometer studies found about 21 dimer at 820°K and derived  $\Delta H_D = -39.2 \text{ kcal/mol}$  and  $\Delta S_D = -29.9 \text{ gibbs/mol}$ . Schriber and Clark (2) from gas transpiration data calculated about 30% dimer in the saturated vapor at 1100°K, with  $\Delta H_D = -32.0 \text{ kcal/mol}$  and  $\Delta S_D = -18.8 \text{ gibbs/mol}$ . Thermodynamic functions for the gaseous monomer adopted here are clearly not compatible with large amounts of dimer and it is assumed for the present that the mass spectrometer results are correct.

Several vapor pressure studies have been published and third law analyses are given below. Berkowitz and Marquart (1) gave a single point while the remaining publications gave only equations but not individual points. Total pressures calculated from the equations were corrected for dimer.

| Source                     | Method                                | Temperature Range (°K) | $\Delta H_f^{\circ}$ (kcal/mol) |
|----------------------------|---------------------------------------|------------------------|---------------------------------|
| Berkowitz and Marquart (1) | Mass spectrometer                     | 920                    | 66.10                           |
| Schriber and Clark (2)     | Boiling Point                         | 1208-1413              | 59.55-59.68                     |
| Hildenbrand et al. (3)     | Torsion-effusion                      | 802-985                | 59.55-59.19                     |
| Hildenbrand et al. (4)     | Torsion-effusion                      | 800-970                | 59.53-59.38                     |
| Fischer et al. (5)         | "Hall" method (total vapor pressures) | 1138-1435              | 59.30-59.56                     |

The selected value for  $\Delta H_f^{\circ}$  is 59.55 kcal/mol which is combined with  $\Delta H_f^{\circ}$  of the crystal to give  $\Delta H_f^{\circ}$  (s) = -83.80 kcal/mol.

Heat Capacity and Entropy

White, Mann, and co-workers (6) by matrix infrared spectroscopy determined the molecule to be linear with the asymmetric stretching frequency at 590 cm<sup>-1</sup> and the doubly degenerate bending frequency at 88 cm<sup>-1</sup>. The symmetric stretching frequency was estimated as 273 cm<sup>-1</sup>. The asymmetric stretching was observed by Buchler and Klemperer (7) at 697 cm<sup>-1</sup> and by Randall et al. (8) at 588 cm<sup>-1</sup>, both by infrared spectroscopy of the vapor at high temperature. Electric deflection experiments by Klemperer and co-workers as summarized by Hayes (9) and the electron diffraction data of Akishin and Spiridonov (10) agree with the linear structure within their error limits of about 20°. The Mg-Cl bond length was determined as 2.18 Å by Akishin and Spiridonov (10).

Bond Distance: Mo-O = 1.75 ± 0.10 Å Mo-Cl = 2.28 ± 0.03 Å

Bond Angle: O-Mo-O = 109.5° Cl-Mo-Cl = 113°

O-Mo-O plane perpendicular to Cl-Mo-Cl plane

Product of Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 1.0986 × 10<sup>-112</sup> g<sup>3</sup> cm<sup>6</sup>

Heat of Formation

Graham and Hepler (1) determined calorimetrically ΔH<sub>f</sub><sup>0</sup> = -85.3 ± 0.5 kcal/mol for the reaction:

MoO<sub>2</sub>Cl<sub>2</sub>(c) + 4 NaOH(∞ H<sub>2</sub>O) + Na<sub>2</sub>MoO<sub>4</sub>(∞ H<sub>2</sub>O) + 2 NaCl(∞ H<sub>2</sub>O) + 2 H<sub>2</sub>O(l)

Combining this result with the following heat of formation data: ΔH<sub>f</sub><sup>0</sup>(NaOH, ∞ H<sub>2</sub>O) = -58.34 ± 0.4 kcal/mol (2); ΔH<sub>f</sub><sup>0</sup>(NaCl, ∞ H<sub>2</sub>O) = -97.33 ± 0.09 kcal/mol (3); ΔH<sub>f</sub><sup>0</sup>(NaOH, ∞ H<sub>2</sub>O) = -122.46 ± 0.1 kcal/mol (5); ΔH<sub>f</sub><sup>0</sup>(H<sub>2</sub>O, l) = -68.315 kcal/mol (6); we derive ΔH<sub>f</sub><sup>0</sup>(MoO<sub>2</sub>Cl<sub>2</sub>, c) = -169.6 ± 1.0 kcal/mol.

Shchukarev et al. (7) measured the heats of solution of MoO<sub>3</sub>(c), MoO<sub>2</sub>Cl<sub>2</sub>(c) and NaCl(c) in NaOH(aq) and derived ΔH<sub>r</sub> = -45.56 ± 0.5 kcal/mol for the reaction MoO<sub>2</sub>Cl<sub>2</sub>(c) + 2NaOH-77 H<sub>2</sub>O + MoO<sub>3</sub>(c) + 2NaCl(c) + H<sub>2</sub>O(l). Using JANAF auxiliary data (8) we obtain ΔH<sub>f</sub><sup>0</sup>(MoO<sub>2</sub>Cl<sub>2</sub>, c) = -172.86 ± 1.0 kcal/mol.

The two investigations differ only in the heat of solution of MoO<sub>2</sub>Cl<sub>2</sub>(c), both samples were better than 99.9% pure, and multiple determinations on two different samples were employed in each case. We adopt an average of the two values, -171.2 ± 1.7 kcal/mol for ΔH<sub>f</sub><sup>0</sup>(MoO<sub>2</sub>Cl<sub>2</sub>, c). Shchukarev et al. (10) reported an equation for the vapor pressure over the solid from which we have calculated a 2nd law ΔH<sub>f</sub><sup>0</sup> = 19.9 kcal/mol with an estimated uncertainty of ± 2 kcal/mol, a ΔC<sub>p</sub> correction of -4.1 gibbs/mol was used (11). Thus, our adopted value is ΔH<sub>f</sub><sup>0</sup>(MoO<sub>2</sub>Cl<sub>2</sub>, g) = -151.3 ± 3.5 kcal/mol.

-4.1 gibbs/mol was used (11). Thus, our adopted value is ΔH<sub>f</sub><sup>0</sup>(MoO<sub>2</sub>Cl<sub>2</sub>, g) = -151.3 ± 3.5 kcal/mol. Shchukarev et al. (8) report equilibrium constants for the reaction MoO<sub>3</sub>(c) + 0.5 O<sub>2</sub>(g) + Cl<sub>2</sub>(g) = MoO<sub>2</sub>Cl<sub>2</sub>(c) + H<sub>2</sub>O(g). Shchukarev et al. (10) and Hultgren and Brewer (12) reported equilibrium data for the reaction MoO<sub>3</sub>(c) + 2HCl(g) = MoO<sub>2</sub>Cl<sub>2</sub>(g) + H<sub>2</sub>O(g).

Second and third law analyses of these equilibrium data give the following results:

| Investigator             | No. of Points |         | Drift, gibbs/mol | kcal/mol   |
|--------------------------|---------------|---------|------------------|------------|
|                          | 2nd Law       | 3rd Law |                  |            |
| Shchukarev et al. (8)    | 7             | -15.6   | -30.1 ± 2.0      | -15.0      |
| Shchukarev et al. (10)   | Equation      | 12.1    | 13.8 ± 1.0       | 2.95       |
| Hultgren and Brewer (12) | Set I         | 5       | 27.2             | 15.2 ± 1.7 |
|                          | Set II        | 5       | 26.5             | 15.4 ± 3.2 |

\*Third law values

These equilibrium data are in agreement with the adopted heat of formation but are suspect because of the significant drifts and because the range of validity of the equation (10) is estimated.

Heat Capacity and Entropy

The molecular structural data are from the compilation of Sutton (13). Infrared data (14, 15, 16) for vapor phase MoO<sub>2</sub>Cl<sub>2</sub> have indicated that the molecule possesses a distorted tetrahedral structure by reason of the similarity of its spectra to that of CrO<sub>2</sub>Cl<sub>2</sub>. Individual moments of inertia are I<sub>A</sub> = 53.397 × 10<sup>-39</sup>, I<sub>B</sub> = 63.898 × 10<sup>-39</sup>, and I<sub>C</sub> = 32.200 × 10<sup>-39</sup> g cm<sup>2</sup>.

The vibrational frequencies 972, 996, 433, and 437 have been observed in the infrared vapor phase spectra of MoO<sub>2</sub>Cl<sub>2</sub> by Baracough and Stals (14). These frequencies were assigned to the symmetric and asymmetric Mo-O and Mo-Cl stretches, respectively. Similar infrared data for these four frequencies have been reported by Iorns and Stafford (15) and Ward and Stafford (16). The rest of the frequencies are from the infrared and Raman studies of crystalline MoO<sub>2</sub>Cl<sub>2</sub> by Adams and Churchill (17). Assignments are made by comparison with data reported for CrO<sub>2</sub>Cl<sub>2</sub>(s) by Miller et al. (18).

Bond Distance: Cl-Na = [2.624] Å  
 Bond Angle: Cl-Na-Cl = [108.4°]  
 Product of the Moments of Inertia:  $I_A I_B I_C = [6.649 \times 10^{-113}] \text{ g.}^3 \text{ cm.}^6$

Heat of Formation

An analysis is given below of the more extensive measurements relating to the dimer dissociation, (NaCl)<sub>2</sub>(g) → 2NaCl(g). The mass spectrometric studies suggest that higher polymeric species may be neglected. Velocity distribution analyses are consistent with this procedure. When reduced to 298.15°K, the observed heats of dissociation of the dimer show a range of more than 7 kcal., reflecting the considerable uncertainty involved in such measurements. A value of  $\Delta H_f^0 = 48.6 \text{ kcal. mole}^{-1}$  was selected for the dissociation; combining this with  $\Delta H_f^0 = 54.9 \text{ kcal. mole}^{-1}$  for sublimation to the monomer leads to  $\Delta H_f^0 = 61.2 \text{ kcal. mole}^{-1}$  for sublimation to the dimer.

The structure and vibrational frequencies are those calculated from an ionic model by J. Berkowitz, J. Chem. Phys. **32**, 1519 (1960), **29**, 1366 (1956). Electron diffraction studies by Akishin and Rumbid, Z. Physik. Chem. (Leipzig) **233**, 111 (1960) gave a similar bond angle (108°) and a slightly shorter bond distance (2.50 Å); however, interpretation of the diffraction pattern was complicated by uncertainty in the monomer-dimer ratio for the vapor. Principal moments of inertia for the Berkowitz structure are  $I_A = 18.01 \times 10^{-39}$ ,  $I_B = 53.31 \times 10^{-39}$  and  $I_C = 71.32 \times 10^{-39} \text{ g. cm.}^2$ .

Heat of Formation.

V. A. Kustodins, K. P. Mishchenko and I. E. Flis, Zh. Prikl. Khim. 35, 1374 (1962) (Source 1) derived the heat of formation of Cl<sub>2</sub>O dissolved in CCl<sub>4</sub> from solution calorimetry at 278, 293, 298 and 309°K. The heat of formation in CCl<sub>4</sub> was interpolated to 285°K. D. M. Yost and R. C. Felt, J. Am. Chem. Soc. 56, 68 (1934) (Source 2) measured the partial vapor pressures of Cl<sub>2</sub>O above its CCl<sub>4</sub> solution at 273 and 298°K which yield the heat of solution -6.59 kcal. mole<sup>-1</sup> at 285°K. The  $\Delta H_f^0 = 21.0 \text{ kcal. mole}^{-1}$  was calculated from these two values. J. I. Wallace and C. F. Goodeve, Trans. Faraday Soc. 27, 648 (1931) (Source 3) obtained the heat of explosion of Cl<sub>2</sub>O(g); their data gave  $\Delta H_f^0 = 21.4 \text{ kcal. mole}^{-1}$  which is in very good agreement with the above. Also F. Günther and K. Wekua, Z. Physik Chem. 154, 193 (1931) (Source 4) measured the heat of explosion; their data give  $\Delta H_f^0 = 298.15 \text{ Cl}_2\text{O}(g) = 24.7 \text{ kcal. mole}^{-1}$ .

Heat Capacity and Entropy.

The vibrational frequencies were obtained from M. M. Rochkind and G. C. Pimentel, J. Chem. Phys. 42, 1361 (1965). The infrared spectrum of Cl<sub>2</sub>O(g) has been investigated previously beginning with the work of C. R. Bailey and A. B. Casate, Proc. Roy. Soc. (London) A142, 182 (1933). K. Hedberg, J. Chem. Phys. 19, 509 (1951) proposed stretching frequencies at 686 cm.<sup>-1</sup> (ν<sub>1</sub>) and 989 cm.<sup>-1</sup> (ν<sub>2</sub>) but left the bending frequency unknown. Previous evidence concerning the bending mode (ν<sub>3</sub>) was shown by Hedberg (loc. cit.) to be spurious. Rochkind and Pimentel (loc. cit.) present infrared studies of Cl<sub>2</sub>O gas and condensed phases which reveal the bending frequency and require reassignment of the stretching fundamentals. The bond distance and bond angle were obtained from J. D. Dunitz and K. Hedberg, J. Am. Chem. Soc. 72, 3108 (1950).

The three principal moments of inertia are: I<sub>A</sub> = 2.022 × 10<sup>-39</sup>, I<sub>B</sub> = 2.30808 × 10<sup>-39</sup>, and I<sub>C</sub> = 2.51028 × 10<sup>-38</sup> g. cm.<sup>2</sup>

TUNGSTEN DIOXYDICHLORIDE (WO<sub>2</sub>Cl<sub>2</sub>)

(CRYSTAL)

OPW = 286.7548

ΔHf° = Unknown

ΔHf°<sub>298.15</sub> = -166.5 ± 1.4 kcal/mol

S°<sub>298.15</sub> = [48.0] gibbs/mol

Td = 642°K

Heat of Formation.

S. A. Shchukarev, I. V. Vesil'kova and G. I. Novikov<sup>1</sup> measured calorimetrically the heats of reaction (1) and (2) at 298°K as -67.3 ± 0.2 and -13.6 ± 0.11 kcal/mol, respectively. The reactions are given as follows:

Based on these data and the heats of dilution for NaOH(aq)<sup>2</sup>, NaCl(aq)<sup>2</sup> and Na<sub>2</sub>WO<sub>4</sub>(aq)<sup>3</sup>, we obtain ΔHf°<sub>298</sub> = -53.77 ± 1.0 kcal/mol for WO<sub>2</sub>Cl<sub>2</sub>(c) + 2 OH<sup>-</sup>(∞H<sub>2</sub>O) → H<sub>2</sub>WO<sub>4</sub>(c) + 2 Cl<sup>-</sup>(∞H<sub>2</sub>O). This leads to ΔHf°<sub>298</sub>(WO<sub>2</sub>Cl<sub>2</sub>, c) = -166.5 kcal/mol using ΔHf°<sub>298</sub>(H<sub>2</sub>WO<sub>4</sub>, c) = -270.5 ± 0.4 kcal/mol<sup>5</sup>.

Heat Capacity and Entropy.

CP<sub>300</sub> = 25.0 gibbs/mol is estimated using Kopp's rule. Heat capacities at higher temperatures are estimated from those of WO<sub>2</sub>(c), WO<sub>3</sub>(c), WCl<sub>6</sub>(c). The entropy, S°<sub>298</sub> = 48.0 eu, is calculated from ΔS°<sub>298.6</sub> = 32.27 ± 1.3 eu for WO<sub>2</sub>Cl<sub>2</sub>(c) → WO<sub>2</sub>Cl<sub>2</sub>(g). The value of ΔS°<sub>298.6</sub> is obtained from the second law analysis of the vapor pressure data given by S. A. Shchukarev and A. V. Suvorov<sup>4</sup>.

Temperature of Decomposition.

Shchukarev and Suvorov<sup>4</sup> found that WO<sub>2</sub>Cl<sub>2</sub>(c) does not melt but decomposes. The saturated vapor over WO<sub>2</sub>Cl<sub>2</sub>(c) consists mainly of WCl<sub>4</sub>(g) which will disproportionate to form WO<sub>2</sub>Cl<sub>2</sub>(g) and WCl<sub>6</sub>(g). The estimated Td is derived by interpolation to one atmosphere in the total pressures of WCl<sub>4</sub>(g), WO<sub>2</sub>Cl<sub>2</sub>(g) reported by Shchukarev and Suvorov<sup>4</sup>.

Heat of Formation.

The adopted heat of formation, ΔH<sub>f298</sub><sup>o</sup>(WO<sub>2</sub>Cl<sub>2</sub>,g) = -160.5 kcal/mol, is obtained from ΔH<sub>f298</sub><sup>o</sup> = 26.0 kcal/mol for WO<sub>2</sub>Cl<sub>2</sub>(c) → WO<sub>2</sub>Cl<sub>2</sub>(g). The latter is calculated by the third law method from the partial pressures of WO<sub>2</sub>Cl<sub>2</sub>(g) given by S. A. Shekharov and A. V. Suvorov<sup>6</sup>. Second law analysis gives ΔH<sub>f298,6</sub><sup>o</sup> = 24.1 ± 0.8 kcal/mol (ΔH<sub>f298</sub><sup>o</sup> = 26.0 kcal/mol). These reported partial vapor pressures of WO<sub>2</sub>Cl<sub>2</sub>(g) were derived by the optical tensimetric method from total pressures over WO<sub>2</sub>Cl<sub>2</sub>(c) considering the species WCl<sub>4</sub>(g), WO<sub>2</sub>Cl<sub>2</sub>(g) and WCl<sub>6</sub>(g). Since the decomposition of WO<sub>2</sub>Cl<sub>2</sub>(c) was very complicated, we tentatively assign 6 kcal/mol uncertainty to the adopted heat of formation.

Shekharov and Suvorov<sup>6</sup> have also derived a log Kp equation for the disproportionation process, 2 WCl<sub>4</sub>(g) = WO<sub>2</sub>Cl<sub>2</sub>(g) + WCl<sub>6</sub>(g). Third law analysis gives ΔH<sub>f298</sub><sup>o</sup> = 10.3 kcal/mol for the above process. This leads to ΔH<sub>f298</sub><sup>o</sup>(WO<sub>2</sub>Cl<sub>2</sub>,g) = -145.7 ± 16 kcal/mol. The second law ΔH<sub>f298</sub><sup>o</sup> is 11.0 kcal/mol (ΔH<sub>f298</sub><sup>o</sup> = 10.1 kcal/mol). The drift in the third law analysis is 0.3 eu.

Heat Capacity and Entropy.

The molecular configuration is assumed to be a distorted tetrahedron of C<sub>2v</sub> symmetry, similar to that of MoO<sub>2</sub>Cl<sub>2</sub>(g)<sup>1</sup>, and CrO<sub>2</sub>Cl<sub>2</sub>(g)<sup>2</sup>. The bond distances W-O and W-Cl are estimated to be the same as those in WO<sub>3</sub>(g) and WCl<sub>6</sub>(g), respectively. The bond angles are assumed to be the same as those in MoO<sub>2</sub>Cl<sub>2</sub>(g)<sup>1</sup>. The three principal moments of inertia are I<sub>A</sub> = 6.419 x 10<sup>-38</sup>, I<sub>B</sub> = 5.342 x 10<sup>-38</sup> and I<sub>C</sub> = 3.397 x 10<sup>-38</sup> g cm<sup>2</sup>.

The vibrational frequencies, 984 cm<sup>-1</sup> and 972 cm<sup>-1</sup>, were observed in the infrared spectra by C. O. Barreclough and J. Stala<sup>3</sup>. They tentatively assigned these two as the asymmetric and asymmetric W-O stretching frequencies. The rest of the frequencies are estimated by comparison with those observed in the infrared end Raman spectra for CrO<sub>2</sub>Cl<sub>2</sub>(g)<sup>4,5</sup>. They are not listed in point group order.

Lead Dichloride (PbCl<sub>2</sub>) (Crystal)

Mol. Wt. = 278.12  
 ΔH<sub>f</sub>° 298.15 = -86.20 ± 0.07 kcal. mole<sup>-1</sup>  
 S° 298.15 = 32.5 ± 0.5 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 ΔH<sub>f</sub>° 298.15 = 45.59 ± 0.70 kcal. mole<sup>-1</sup>  
 T<sub>m</sub> = 769°K  
 ΔH<sub>m</sub>° = 5.70 kcal. mole<sup>-1</sup>

Heat of Formation. Recalculated from the data reported by E. J. Salstrom, J. Am. Chem. Soc. 55, 2426 (1933) and A. Wachter, J. Am. Chem. Soc. 54, 2271 (1932).

Heat Capacity, Entropy and Melting Data. C<sub>p</sub> (15.8° to 205.5°K.) reported by W. Nemst, Ann. Physik, 35, 395 (1911) and adjusted so that S° 298.15 is equal to the value reported by K. K. Kelley and E. G. King, U. S. Bur. Mines Bull. 592 (1961). C<sub>p</sub> above 298.15°K. obtained from K. K. Kelley, U. S. Bur. Mines Bull. 584 (1960) and joined smoothly to the low temperature heat capacity curve by graphical extrapolation. T<sub>m</sub> and ΔH<sub>m</sub> obtained from M. Blanc and O. Petit, Compt. rend. 249, 1305 (1959).

Heat of Sublimation. Calculated from vapor pressure data of E. D. Eastman and L. H. Duschak, U. S. Bur. Mines Tech. Paper 225 (1919), C. G. Kaiser, U. S. Bur. Mines Tech. Paper 360, 28 (1925), H. V. Wartenberg and O. Bogase, Z. Elektrochem. 29, 384 (1922), and M. Jahn-Held and K. Jellinek, Z. Elektrochem. 13, 191 (1937), which are in good agreement. Vapor pressure was also measured by F. Volmer, Physik. Z. 30, 580 (1929), J. L. Barton and H. Bloom, J. Phys. Chem. 60, 1413 (1956), B. Greiner and K. Jellinek, Z. Physik. Chem. 165, 97 (1933), and K. Mwa, M. Sato and M. Yoshiyama, J. Faculty Sci. Hokkaido Imp. Univ. Ser. III, 2, 17 (1940).

March 31, 1962

Lead Dichloride (PbCl<sub>2</sub>) (Liquid)

Mol. Wt. = 278.12

ΔH<sub>f</sub><sup>o</sup> 298.15 = [-81.49] kcal. mole<sup>-1</sup>

S<sub>298.15</sub><sup>o</sup> = [38.336] cal. deg.<sup>-1</sup> mole<sup>-1</sup>

T<sub>m</sub> = 768°K

ΔH<sub>m</sub><sup>o</sup> = 5.70 kcal. mole<sup>-1</sup>

T<sub>b</sub> = 1226°K

ΔH<sub>v</sub><sup>o</sup> = 26.61 ± 0.70 kcal. mole<sup>-1</sup>

Heat of Formation. Calculated from that of the crystal.

Heat Capacity, Entropy and Melting Data. C<sub>p</sub> reported by M. Bizouard and F. Peuty, Compt. rend. 252, 511 (1961). T<sub>m</sub> and ΔH<sub>m</sub><sup>o</sup> obtained from M. Blanc and G. Petit, Compt. rend. 248, 1305 (1959).

A glass transition temperature of 520°K. is assumed.

Vaporization Phenomena. T<sub>b</sub> and ΔH<sub>v</sub><sup>o</sup> calculated from ΔH<sub>f</sub><sup>o</sup> 298.15 and functions for condensed and gaseous states.

Lead Dichloride (PbCl<sub>2</sub>)

(Ideal Gas) Mol. Wt. = 278.12

 [ 70] (1)  
 [300] (1)

Pb-Cl distance = 2.46 ± 0.02 Å ClPbCl angle = 95°  $\sigma = 2$   
 $I_A = 24.223 \times 10^{-39}$  g. cm.<sup>2</sup>  $I_B = 38.741 \times 10^{-39}$  g. cm.<sup>2</sup>  
 $I_C = I_A + I_B = 62.970 \times 10^{-39}$  g. cm.<sup>2</sup>

Heat of Formation, calculated from  $\Delta H_f^o$  298.15 for PbCl<sub>2</sub>(c) and  $\Delta H_f^o$  298.15.

Heat Capacity and Entropy. Molecular dimensions obtained from L. E. Sutton (ed.), "Tables of Interatomic Distances and Configurations in Molecules and Ions," The Chemical Society, London, 1958. Vibrational frequencies estimated by comparison with the vibrational frequencies for the mercury dihalides.

Cl<sub>2</sub>Pb

$\Delta H_f^\circ = -39.34 \pm 1 \text{ kcal/mol}$   
 $\Delta H_f^\circ = -39.3 \pm 1.0 \text{ kcal/mol}$

$S_{298.15}^\circ = 67.36 \pm 0.5 \text{ gibbs/mol}$

GFW = 98.992

Bond Distance: Si-Cl = [2.04] Å

Bond Angle: Cl-Si-Cl = [106°]

Product of the Moments of Inertia:  $I_A I_B I_C = [5.709 \times 10^{-114}] \text{ g}^3 \text{ cm}^6$

$\sigma = 2$

Heat of Formation

The adopted value is derived from  $\Delta H_f^\circ = 78.5 \pm 2 \text{ kcal/mol}$  at 298.15 K for the reaction  $\text{Si(c)} + \text{SiCl}_4(\text{g}) \rightarrow 2 \text{SiCl}_2(\text{g})$ . JANAF analyses of equilibrium data for this reaction are summarized below. Three sets of data ( $\bar{A}$ ,  $\bar{B}$ ) yield average values of  $\Delta H_f^\circ$  (3rd law) which agree within 0.5 kcal/mol and values of  $\Delta S_f^\circ$  (2nd law) which are in reasonable agreement with the JANAF functions. Two of the equilibrium studies used flow techniques while the third used a static technique. A median value of  $\Delta H_f^\circ$  is adopted. Its uncertainty is estimated by assuming that the JANAF entropy for  $\text{SiCl}_2(\text{g})$  may be too low by 0.7 gibbs/mol at 1400 K. The adopted value corresponds to  $\Delta H_f^\circ$  atom = 203.0 kcal/mol and an average bond energy of 101.5 kcal/mol.

Two other flow studies ( $\bar{A}$ ,  $\bar{B}$ ) yield large entropy errors, suggesting that there are temperature-dependent errors in Kp. The reported equilibrium constants are reasonable at the lower temperatures but deviate progressively at the higher temperatures. In contrast, the static study of Ishino ( $\bar{A}$ ) gave Kp values which differ by a factor of five from the adopted ones. These data yield a consistent entropy but  $\Delta H_f^\circ$  (3rd law) is lower by 5 kcal/mol.

$\Delta \delta = \Delta S_f^\circ$  (2nd law) -  $\Delta S_f^\circ$  (JANAF functions); where equations are used as input, the uncertainties are those given by the original authors.

Heat Capacity and Entropy

The point group is assumed to be the same as that of  $\text{CF}_2$  and  $\text{SiF}_2$ . The Si-Cl bond length and Cl-Si-Cl bond angle are estimated to be intermediate between those in  $\text{HSiCl}$  and  $\text{H}_2\text{SiCl}_2$ . Comparisons with  $\text{CF}_2$ ,  $\text{SiF}_2$ ,  $\text{H}_2\text{O}$  and  $\text{H}_2\text{SiF}_2$  confirm that the estimated angle is reasonable. Further confirmation of the structure comes from analysis of isotopic splittings in the infrared spectra of matrix-isolated  $\text{SiCl}_2$ . Milligan and Jacox (7) deduced angles of 90 to 170° from alternative assignments for the two stretching vibrations. Observations on argon matrices gave 502 and 513  $\text{cm}^{-1}$  for these vibrations, but it was not possible to decide which is the symmetric mode. Principal moments of inertia are  $I_A = 31.25 \times 10^{-38}$ ,  $I_B = 5.035 \times 10^{-38}$ , and  $I_C = 36.29 \times 10^{-39} \text{ g cm}^2$ .

Milligan and Jacox (7) also observed an unstructured absorption in the ultraviolet spectrum. This is the region in which gas-phase emission studies (8) showed features tentatively ascribed to  $\text{SiCl}_2$ . Vibrational spacings of about 250 and 940  $\text{cm}^{-1}$  were associated (8) with the ground state; however, this analysis should be reviewed in the light of the matrix spectra. Meanwhile, we estimate that the bending mode should be similar to that in  $\text{H}_2\text{SiCl}_2$ , probably 190 ± 40  $\text{cm}^{-1}$ .

The ground state is assumed to be  $^1A_1$ , as suggested by Hückel-molecular-orbital calculations (9). Singlet excited states (8, 10) are included near 28000 and 30000  $\text{cm}^{-1}$ , but the values are placed in brackets to emphasize the uncertainty in the analysis. Also tentatively adopted is the suggestion by Hastie et al. (10) that the continuous spectrum near 23000  $\text{cm}^{-1}$  is due to a triplet excited state.

Heat of Formation

The heat of formation of TiCl<sub>2</sub>(c) has been measured calorimetrically. The chosen value of  $\Delta H_f^\circ$  is the average of two such determinations. Values of  $\Delta H_f^\circ$  are also calculated from the heats of reaction for the processes (A) 2TiCl<sub>3</sub>(c) = TiCl<sub>2</sub>(c) + TiCl<sub>4</sub>(g), (B) 3TiCl<sub>3</sub>(c) = 2TiCl<sub>2</sub>(c) + Ti(c), and (C) 2TiCl<sub>2</sub>(c) = TiCl<sub>4</sub>(g) + Ti(c). These heats of reaction are combined with auxiliary JANAF values for the heats of formation of TiCl<sub>3</sub>(c), TiCl<sub>4</sub>(g), TiCl<sub>3</sub>(c) and Ti(c). The following table summarizes the data used to calculate  $\Delta H_f^\circ$ .

Heat Capacity and Entropy

The heat capacity of TiCl<sub>2</sub>(c) has been measured by Kim and Stout (8) over the range 6° to 300°K. They calculated the adopted value of  $S_{298}^\circ$  from their measurements based on  $S_{298}^\circ = 0.017$  eu. The heat capacity above 300°K is estimated by graphical extrapolation. The large uncertainty on  $S_{298}^\circ$  is due to the possibility of sizeable electronic contributions to the heat capacity below 6°K which would account for the rather low value of  $S_{298}^\circ$  reported by Kim and Stout (8).

Heat of Sublimation

The heat of sublimation is calculated from the heats of formation of TiCl<sub>2</sub>(c) and TiCl<sub>2</sub>(g). The temperature of sublimation is taken as the point at which  $\Delta G^\circ = 0$  for the process TiCl<sub>2</sub>(c) = TiCl<sub>2</sub>(g). These values are hypothetical since TiCl<sub>2</sub> would be decomposed to TiCl<sub>3</sub>(g) and TiCl<sub>4</sub>(g) below this temperature.

Bond Distance: Ti-Cl = [2.31] Å  
 Bond Angle: Cl-Ti-Cl = [100°]  
 Rotational Constant:  $B_0 = [0.0449]$  cm<sup>-1</sup>

Heat of Formation

Gross and Levi (1) have measured the equilibrium  $2\text{TiCl}_3(g) + \text{Ti}(c) \rightarrow 3\text{TiCl}_2(g)$  at 1723°K and obtain  $\Delta G_f^\circ(1723) = 21.7$  kcal/mol from four measurements. This yields  $\Delta H_f^\circ(298)(\text{TiCl}_2, g) = -56.7 \pm 3$  kcal/mol. They discuss the measurements of Farber and Bernal (2), on the vapor pressure of TiCl<sub>2</sub>(c), and show that the results are probably in error due to disproportionation of TiCl<sub>3</sub>(g) on condensation. In the work of Skinner and Rushwain (3) on the reaction  $2\text{HCl}(g) + \text{Ti}(c) = 2\text{H}(g) + \text{TiCl}_2(g)$ , Gross and Levi indicate that the basic assumption, of conversion to TiCl<sub>2</sub> only, is erroneous. In the third law analysis of both these data sets significant drifts are obtained which tends to confirm the above arguments.

Heat Capacity and Entropy

The interatomic distances are estimated from those of TiCl<sub>2</sub>(c) reported by Benzinger and Rundle (4). The vibrational frequencies are estimated from a valence force field model. The electronic levels are assumed to correspond to the inverted states of NiCl<sub>2</sub>(g) (5). This linear configuration is adopted, since experimental evidence indicates that other transition metal dihalides are linear (6, 7, 8, 9).

TUNGSTEN DICHLORIDE (WCl<sub>2</sub>)

(CRYSTAL)

GF<sub>W</sub> = 254.756

C<sub>1</sub>W<sub>2</sub>

ΔHf° = Unknown

ΔHf°<sub>298.15</sub> = -61.5 ± 3 kcal/mol

S°<sub>298.15</sub> = [31.2] gibbs/mol

Td = 862°K

Heat of Formation.

The heat of formation, ΔHf°<sub>298</sub> (WCl<sub>2</sub>, c) = -61.5 ± 3 kcal/mol, is derived from the heat of combustion, ΔHc° = -140 ± 3 kcal/mol for WCl<sub>2</sub>(c) + 3/2 O<sub>2</sub>(g) → WO<sub>3</sub>(c) + Cl<sub>2</sub>(g), reported by S. A. Shchukarev, G. I. Novikov, I. V. Vasil'kovs, A. V. Suvorov, N. V. Andreeva, B. N. Sharupin, and A. K. Baev, Zhur. Neorg. Khim. 5, 1650 (1960). The value of ΔHc° was determined calorimetrically, but no further information about the combustion process was given in the paper.

Heat Capacity and Entropy.

CP°<sub>298</sub> = 6.2 gibbs/g-atom and CP°<sub>900</sub> = 7.25 gibbs/g-atom are estimated using the method described by O. Kubaschewski and E. L. Evans, Metallurgical Thermochemistry, Pergamon Press, New York, 1958. Between 298° and 900°, which is near the decomposition temperature, the heat capacity is obtained by linear interpolation.

The entropy, S°<sub>298</sub> = 31.2 eu, is estimated by the method of W. M. Latimer, "Oxidation Potentials," 2nd Ed., Prentice-Hall, Inc., New York, 1952. S. A. Shchukarev et al., loc. cit., have estimated ΔSf° = -30 eu for W(c) + Cl<sub>2</sub>(g) = WCl<sub>2</sub>(c) which leads to S°<sub>298</sub> (WCl<sub>2</sub>, c) = 31.1 eu, using JANAF auxiliary data.

Temperature of Decomposition.

The decomposition temperature is obtained by extrapolation to one atmosphere total pressure of a log P versus 1/T fit of the decomposition pressure data reported by S. A. Shchukarev, G. I. Novikov, and N. V. Andreeva, Vestnik Leningrad. Univ. 14, No. 10, Ser. Fiz. i Khim., No. 2, 78 (1959). Decomposition pressure data for Cl:W ratios less than two suggest that the decomposition reaction is not simple.

| [60]                          | (2)        |
| [423]                         | (1)        |

Bond Distance: W-Cl = [2.26] Å

Bond Angle: Cl-W-Cl = [180]°

Rotational Constant: B<sub>0</sub> = [0.04655] cm<sup>-1</sup> $\sigma = [2]$ 

## Heat of Formation.

The value of  $\Delta H^o_{298}(\text{WCl}_2, g)$  = -3 ± 25 kcal/mol is calculated from the heat of formation of the crystal plus the heat of sublimation,  $\Delta H^o_{298} = 58.5 \pm 25$  kcal/mol. The latter is estimated from the heats of sublimation of TiCl<sub>2</sub>, CrCl<sub>2</sub>, MnCl<sub>2</sub>, FeCl<sub>2</sub>, CoCl<sub>2</sub>, NiCl<sub>2</sub> given by L. Brewer, G. R. Somayajulu and E. Brackett, Chem. Rev. 63, 111 (1963).

The uncertainty covers the difference between the heats of sublimation among the above compounds and also the possible error in transference from the first row transition metal dichlorides to tungsten dichloride.

S. A. Shchukarev, G. I. Novikov, I. V. Vasil'kova, A. V. Suvorov, N. V. Andreeva, B. N. Sharupin, and A. K. Beev, Zh. Neorg. Khim. 5, 1650 (1960), have also estimated the heat of sublimation as 102 kcal/mol.

## Heat Capacity and Entropy.

The molecular configuration of WCl<sub>2</sub>(g) is assumed to be linear. The bond distance is estimated to be the same as that in WCl<sub>6</sub>(g). The ground state configuration ( $\Sigma^+$ ), the low lying electronic levels and their quantum weights are assumed to be the same as those for CrCl<sub>2</sub>(g), observed by C. W. DeKock and D. M. Gruen, J. Chem. Phys. 44, 4387 (1966).

The vibrational frequencies are calculated from a valence force field model. The stretching force constant, K<sub>1</sub>, is estimated to be the same as that of HgCl<sub>2</sub>(g), 2.7 millidynes/Å. The bending force constant is assumed to be one hundredth of the stretching force constant. The moment of inertia is I = 6.013 × 10<sup>-36</sup> g cm<sup>2</sup>.

Zirconium Dichloride (ZrCl<sub>2</sub>)  
(Crystal) GFV = 162.126

$\Delta H F_0^\circ = \text{Unknown}$   
 $\Delta H F_{298.15}^\circ = [-103.0 \pm 10] \text{ kcal/mol}$   
 $\Delta H_m^\circ = [6.4 \pm 3] \text{ kcal/mol}$   
 $\Delta H S_{298.15}^\circ = [58.5 \pm 10] \text{ kcal/mol}$

$S_{298.15}^\circ = [26.3 \pm 3] \text{ gibbs/mol}$   
 $T_m = [1000]^\circ \text{K}$

Heat of Formation

The value of  $\Delta H F_{298}^\circ(\text{ZrCl}_2, c) = -103.0 \text{ kcal/mol}$  is calculated from the estimated  $\Delta H S_{298}^\circ = 58.5 \text{ kcal/mol}$  for  $\text{ZrCl}_2(c) + \text{ZrCl}_2(g)$ , using  $\Delta H F_{298}^\circ(\text{ZrCl}_2, g) = -44.5 \text{ kcal/mol}$  (1). The estimated  $\Delta H S_{298}^\circ$  is obtained as an average of the heats of sublimation at 298°K for  $\text{TiCl}_2$ ,  $\text{VCl}_2$ ,  $\text{CrCl}_2$ ,  $\text{FeCl}_2$ ,  $\text{NiCl}_2$ ,  $\text{CoCl}_2$ ,  $\text{MnCl}_2$ , given by L. Brewer, G. R. Somayajulu and E. Brackett (2).

Heat Capacity and Entropy

The heat capacities of  $\text{ZrCl}_2(c)$  are estimated based on the assumption that  $\text{Cp}(\text{ZrCl}_2, c) = 1/2[\text{Cp}(\text{ZrCl}_2, c) + \text{Cp}(\text{Zr}, c)]$ . The entropy,  $S_{298}^\circ$ , is also estimated in a manner similar to that of the heat capacity.

Melting Data

The melting point was estimated to be 1000°K by L. Brewer (3) and the heat of melting was also estimated by A. Glassner (4).

ZIRCONIUM DICHLORIDE (ZrCl<sub>2</sub>) (LIQUID) GFV = 162.126

$\Delta H_f^{\circ} = 299.15 = [29.278] \text{ gibbs/mol}$

$\Delta H_m^{\circ} = 299.15 = [-98.372] \text{ kcal/mol}$

$\Delta H_v^{\circ} = [16.4 \pm 3] \text{ kcal/mol}$

$T_m = [1000] \text{ }^{\circ}\text{K}$

$T_b = [1565.3] \text{ }^{\circ}\text{K}$

Heat of Formation

The  $\Delta H_f^{\circ}(\text{ZrCl}_2, \ell)$  is calculated from  $\Delta H_f^{\circ}(\text{ZrCl}_2, c)$  by adding  $\Delta H_m^{\circ}$  and the difference between  $H_{1000} - H_{298}^{\circ}$  for crystal and liquid.

Heat Capacity and Entropy

The heat capacities are assumed to be constant at 7.25 gibbs/g-atom. The entropy is calculated in a manner analogous to that of the heat of formation.

Melting Data

The melting point was estimated to be 1000°K by L. Brewer (1), and the heat of melting was also estimated by A. Glassner (2).

Vaporization Data

$T_b$  is the temperature at which the Gibbs energy change approaches zero for the process  $\text{ZrCl}_2(\ell) \rightarrow \text{ZrCl}_2(g)$ . The difference between  $\Delta H_f^{\circ}$  for  $\text{ZrCl}_2(\ell)$  and  $\text{ZrCl}_2(g)$  at  $T_b$  is  $\Delta H_v^{\circ}$ .

Bond Distance: Zr-Cl = [2.3] Å  
 Bond Angle: Cl-Zr-Cl = [180]°  
 Rotational Constant: B<sub>0</sub> = [0.04494] cm<sup>-1</sup>  
 g = [2]

Heat of Formation  
 Potter (1) investigated mass spectrometrically the gaseous equilibria among ZrCl<sub>2</sub>, ZrCl<sub>3</sub>, ZrCl<sub>4</sub>, and ZrCl<sub>5</sub>. Ion intensities were measured 2.5 eV above the ionization threshold. Using the reported equilibrium constants for the reaction ZrCl<sub>4</sub>(g) + ZrCl<sub>2</sub>(g) + ZrCl<sub>3</sub>(g) in the temperature range 1873-2110°K, second and third law analyses give the heat of reaction at 298°K as -15.6 and +1.7 kcal/mol, respectively. The third law drift is 8.9 ± 3.7 eu. Based on the third law heat of reaction and ΔHf°<sub>298</sub>(ZrCl<sub>4</sub>, g) = -207.77 kcal/mol (2) and ΔHf°<sub>298</sub>(ZrCl<sub>3</sub>, g) = -125.3 kcal/mol (3), we obtain ΔHf°<sub>298</sub>(ZrCl<sub>2</sub>, g) = -44.5 kcal/mol which is adopted in the tabulation.

Ferber et al. (4) also studied mass spectrometrically the reaction (a) Zr(c) + ZrCl<sub>4</sub>(g) + 2ZrCl<sub>3</sub>(g) and the reaction (b) ZrCl<sub>4</sub>(g) + 2ZrCl<sub>2</sub>(g). They reported second law heats of reaction as ΔHf°<sub>298</sub> = 28.6 ± 1.6 kcal/mol for reaction (a); and -141.1 ± 2.2 kcal/mol for reaction (b). Third law analysis of the equilibrium constants which were calculated from their ion intensities of run 3 (the only available values) gives ΔHf°<sub>298</sub>(ZrCl<sub>2</sub>, g) = -43.4 kcal/mol. See JANAF ZrCl<sub>3</sub>(g) table (3) for details.

Heat Capacity and Entropy  
 The molecular configuration is assumed to be linear, since experimental evidence indicates that other transition metal dichlorides are linear (5, 6, 7, 8, 9, 10) even though some fluorides are bent (11). The bond distance is assumed to be the same as that of ZrCl<sub>4</sub>(g). The electronic levels and quantum weights are estimated to be the same as those of TiCl<sub>2</sub>(g) (12).

The vibrational frequencies are calculated from a valence force field model. The stretching force constant is estimated to be 2.5 millidynes/Å and the bending force constant 0.05 millidynes/Å. The moment of inertia is 52.2817 × 10<sup>-39</sup> g cm<sup>2</sup>.

Heat of Formation.

The heat of sublimation was determined by second and third law analysis of the following vapor pressure data. D. W. Magee, Doctoral Thesis, Ohio State University (1955), measured both vapor pressures by torsion effusion and vapor density in the range 533-644°K. and found only trimer present. The 2nd and 3rd law analyses gave  $\Delta H_f^o(298) = 37.37 \pm 0.04$  and  $37.24 \pm 0.02 \text{ kcal. mole}^{-1}$  with a drift of  $-0.25 \pm 0.07 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$ . R. A. J. Shelton, Trans. Faraday Soc. 57, 2113 (1961) using Knudsen effusion in the range 547-657°K. obtained  $\Delta H_f^o(298) = 40.35 \pm 1.4$  and  $37.42 \pm 0.4 \text{ kcal. mole}^{-1}$  with a drift of  $-4.9 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$ . P. I. Fedorov and M. N. Shakhov, Izv. Vysshikh Uchebn. Zavedenii, Khim. 1 Khim. Tekhnol. 4, 550 (1961), using transport methods obtained vapor pressures over the liquid from 751-1057°K. Using 2nd and 3rd law analysis these gave  $\Delta H_f^o(298) = 38.6 \pm 1.0$  and  $39.27 \pm 0.5 \text{ kcal. mole}^{-1}$ .

L. Brewer and N. L. Lofgren, J. Am. Chem. Soc. 72, 3038 (1950) obtained equilibrium constants for the reaction  $3\text{Cu}(c) + 3\text{HCl}(g) \rightarrow \text{Cu}_3\text{Cl}_3(g) + 1.5 \text{H}_2(g)$ . Second and third law analysis of these constants gave  $\Delta H_f^o(298) = 3.9 \pm 0.6$  and  $4.39 \pm 0.3 \text{ kcal. mole}^{-1}$  which leads to  $\Delta H_f^o(298) = -61.8 \pm 0.5 \text{ kcal. mole}^{-1}$ . This was the value adopted since it is dependent only on HCl(g) and does not involve three times the uncertainty of CuCl(c) as do the sublimation experiments, which yield values in good agreement but of larger uncertainty.

Heat Capacity and Entropy.

The structure of the trimer has been investigated by C-H. Wong and V. Schomaker, J. Phys. Chem. 61, 358 (1957). They conclude that the molecule is planar with D<sub>3h</sub> symmetry and a Cu-Cl bond length of 2.16 Å. They also state that a very large amplitude of the asymmetric in-plane bending appears plausible from the diffraction pattern. The infra-red spectrum has been investigated by W. Klamper, S. A. Rice and R. S. Berry, J. Am. Chem. Soc. 79, 1010 (1957). They observed one strong absorption with a maximum at 350 cm<sup>-1</sup> they attribute this to bond stretching motion of type E'. They also suggest that the broad absorption may involve another mode of approximately equal frequency.

In order to estimate the remaining frequencies we assumed that the other infra-red active E' mode would be close to the observed 350 cm<sup>-1</sup> and this was estimated as 300 cm<sup>-1</sup>. The in-plane bending is the third E' mode and since this has a very large amplitude it was estimated as 60 cm<sup>-1</sup>. By analogy with other D<sub>3h</sub> rings the A<sub>2</sub>' mode was assumed to be in the same region as the E' stretches and was taken to be 250 cm<sup>-1</sup>. The 2A<sub>1</sub>' stretches were estimated as 100 and 150 cm<sup>-1</sup>, while the out of plane A<sub>2</sub>' was taken as 200 cm<sup>-1</sup> and the E'' as 80 cm<sup>-1</sup>. These values gave calculated entropies in excellent agreement with the equilibrium data and thus support the estimates.

The individual moments of inertia were I<sub>A</sub>=I<sub>B</sub> = 100.472 X 10<sup>-39</sup> g. cm.<sup>2</sup>, I<sub>C</sub> = 200.944 X 10<sup>-39</sup> g. cm.<sup>2</sup>

The enthalpy change,  $\Delta H_f^\circ$ , 298.15 = -24.49 ± 0.07 kcal. mole<sup>-1</sup>, for the reaction  $\text{Fe}(\text{OH})_2 + 3(\text{HCl} \cdot 12.731 \text{H}_2\text{O})(\text{l}) + \frac{1}{2}(\text{H}_2\text{O}_2 \cdot 12.560 \text{H}_2\text{O})(\text{l}) = \text{FeCl}_3(\text{c}) + \text{H}_2(\text{g}) + 45.483 \text{H}_2\text{O}(\text{l})$  was determined by M. P. Koehler and J. P. Coughlin, J. Phys. Chem. **63**, 605 (1959). This leads to  $\Delta H_f^\circ$  298.15 = -95.48 ± 0.20 kcal. mole<sup>-1</sup> for  $\text{FeCl}_3(\text{c})$ , using  $\Delta H_f^\circ$  298.15 = -39.9 ± 0.05 and -45.68 ± 0.01 kcal. mole<sup>-1</sup> for hydrochloric acid and hydrogen peroxide solution, respectively, obtained from F. D. Rossini, D. D. Wagman, W. H. Evans, S. Levine and I. Jaffe, National Bureau of Standards Circular 500, 1952. From  $\Delta H_f^\circ$  298.15 = -38.0 ± 0.2 kcal. mole<sup>-1</sup> for the reaction  $\text{FeCl}_3(\text{c}) = \text{Fe}^{3+}(\text{aq.})$  reported by J. C. M. Li and N. W. Gregory, J. Am. Chem. Soc. **74**, 4670 (1952), the value of  $\Delta H_f^\circ$  298.15 ( $\text{FeCl}_3, \text{c}$ ) was calculated as -93.26 ± 0.2 kcal. mole<sup>-1</sup>. The former  $\Delta H_f^\circ$  298.15 value is adopted.

The equilibrium pressures of the reaction  $2 \text{FeCl}_2(\text{c}) + \text{Cl}_2(\text{g}) = 2 \text{FeCl}_3(\text{c})$ , in the temperature range of 435.7-482.2°K., were measured by H. Schäfer and E. Oehler, Z. anorg. allgem. Chem. **271**, 206 (1953). Using the reported partial pressures for  $\text{Cl}_2(\text{g})$ , the enthalpy change ( $\Delta H_f^\circ$  298.15) of the reaction was evaluated as -27.43 ± 0.44 and -27.21 kcal. mole<sup>-1</sup> by the second and third law methods, respectively. Based on the third law value for  $\Delta H_f^\circ$  298.15, the value of  $\Delta H_f^\circ$  298.15 ( $\text{FeCl}_3, \text{c}$ ) was derived to be -95.36 ± 0.12 kcal. mole<sup>-1</sup>, which is in good agreement with the adopted value.

#### Heat Capacity and Entropy.

The low temperature (51-298.15°K.) heat capacities and high temperature (339.6-560.9°K.) heat content of  $\text{FeCl}_3(\text{c})$  were determined by S. S. Todd and J. P. Coughlin, J. Am. Chem. Soc. **73**, 4184 (1951). The low temperature  $C_p$  and the derived high temperature  $C_p$  were plotted. The two  $C_p$  curves were joined smoothly at 298°K. The  $C_p$  values above 560.9°K. were obtained by graphical extrapolation. The value of  $S_{298.15}^\circ$  was derived from the low temperature data reported by S. S. Todd and J. P. Coughlin, loc. cit., using  $S_{51}^\circ = 6.29 \text{ cal. deg}^{-1} \text{ mole}^{-1}$ . The value of  $S_{298.15}^\circ$  was selected to make the second and third law values of  $\Delta H_f^\circ$ , derived from the equilibrium data reported by H. Schäfer and E. Oehler, loc. cit., in good agreement. The difference in  $S_{298.15}^\circ$  between the selected value, 6.29, and the reported value, 4.50 cal. deg<sup>-1</sup> mole<sup>-1</sup>, by S. S. Todd and J. P. Coughlin, loc. cit., is assumed to be the magnetic entropy remaining at 51°K. which was unaccounted for in the report.

#### Melting Data.

$T_m$  and  $\Delta H_m^\circ$  were obtained from S. S. Todd and J. P. Coughlin, loc. cit.

#### Heat of Sublimation.

The difference between  $\Delta H_f^\circ$  298.15 for  $\text{Fe}_2\text{Cl}_6(\text{g})$  and  $2\text{FeCl}_3(\text{c})$  is the heat of sublimation at 298.15°K. The former is obtained by the second and third law analyses of related equilibrium data. See  $\text{Fe}_2\text{Cl}_6(\text{g})$  table for details.

S<sub>298,15</sub> = 47.955 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> 298.15 = -86.713 kcal. mole<sup>-1</sup>  
 ΔH<sub>m</sub><sup>o</sup> = 10.30 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> (to dimer) = 10.46 kcal. mole<sup>-1</sup>

T<sub>m</sub> = 577°K.  
 T<sub>b</sub> = 605°K.

Heat of Formation.

The value of ΔH<sub>f</sub><sup>o</sup> 298.15(FeCl<sub>3</sub>, l) was obtained from ΔH<sub>f</sub><sup>o</sup> 298.15(FeCl<sub>3</sub>, c) by adding ΔH<sub>m</sub><sup>o</sup> and the difference between H<sub>m</sub><sup>o</sup> - H<sub>298.15</sub><sup>o</sup> for crystal and liquid.

Heat Capacity and Entropy.

The heat capacity for FeCl<sub>3</sub>(l) was taken from S. S. Todd and J. P. Coughlin, J. Am. Chem. Soc. 73, 4184 (1951) and assumed as constant between 298.15° and 1500°K. The entropy (S<sub>298.15</sub>) was obtained in a manner analogous to that of the heat of formation.

Melting Data.

T<sub>m</sub> and ΔH<sub>m</sub><sup>o</sup> were reported by S. S. Todd and J. P. Coughlin, loc. cit.

Vaporization Data.

The boiling point (T<sub>b</sub>) is determined as the temperature at which the free energy change (ΔG<sub>p</sub><sup>o</sup>) of the reaction 2FeCl<sub>3</sub>(l) = Fe<sub>2</sub>Cl<sub>6</sub>(g) approaches zero. The corresponding enthalpy change at T<sub>b</sub> is the heat of vaporization (ΔH<sub>v</sub><sup>o</sup>).

IRON TRICHLORIDE (FeCl<sub>3</sub>)

MOL. WT. = 162.208

(IDEAL GAS)

Point Group [D<sub>3h</sub>]ΔH<sub>f</sub><sup>0</sup> = -80.5 ± 1.2 kcal. mole<sup>-1</sup>S<sub>298.15</sub><sup>0</sup> = [82.243] cal. deg.<sup>-1</sup> mole<sup>-1</sup>ΔH<sub>f</sub><sup>0</sup> 298.15 = -80.5 ± 1.2 kcal. mole<sup>-1</sup>

Ground State Quantum Weight = [6]

## Vibrational Frequencies and Degeneracies

| ω, cm. <sup>-1</sup> |
|----------------------|
| (350) (1)            |
| (180) (1)            |
| (130) (2)            |
| (130) (2)            |

Bond Distance: Fe-Cl = [2.17] Å

Bond Angle: Cl-Fe-Cl = [120]°

Product of the Moments of Inertia: I<sub>A</sub><sup>1</sup>I<sub>B</sub><sup>1</sup>I<sub>C</sub><sup>1</sup> = [1.43769 × 10<sup>-112</sup>] g.<sup>3</sup> cm.<sup>6</sup>

## Heat of Formation.

The equilibrium pressures for the reaction Fe<sub>2</sub>O<sub>3</sub>(g) = 2FeCl<sub>3</sub>(g) were determined by Kangro and Bornstorff<sup>1</sup> and Schiffer<sup>2</sup>, respectively. Using their vapor pressure data the corresponding values of ΔH<sub>f</sub><sup>0</sup> 298.15 for that reaction were evaluated by both the second and third law methods. Based on the third law values for ΔH<sub>f</sub><sup>0</sup> 298.15, the heat of formation (ΔH<sub>f</sub><sup>0</sup> 298.15) for FeCl<sub>3</sub>(g) were derived. The results obtained are presented as follows.

| Investigator                       | Temperature, °K. | Second Law Value | Third Law Value | ΔH <sub>f</sub> <sup>0</sup> 298.15 kcal. mole <sup>-1</sup> |
|------------------------------------|------------------|------------------|-----------------|--|
| Kangro and Bornstorff <sup>1</sup> | 760.2-1034.2     | 34.89 ± 0.44     | 35.73           | -60.34 ± 0.30  |
| Schiffer <sup>2</sup>              | 675.2-1075.2     | 34.61 ± 0.02     | 34.93           | -60.74 ± 0.20  |

<sup>1</sup> W. Kangro and H. Bornstorff, Z. anorg. allgem. Chem. **253**, 318 (1950).<sup>2</sup> H. Schiffer, Z. anorg. allgem. Chem. **259**, 53 (1949).The adopted value of ΔH<sub>f</sub><sup>0</sup> 298.15(FeCl<sub>3</sub> g) is -80.5 ± 1.2 kcal. mole<sup>-1</sup>.

## Heat Capacity and Entropy.

The molecular structure was assumed to be the same as that of AlCl<sub>3</sub>(g) due to the similarities in structure between Fe<sub>2</sub>O<sub>3</sub>(g) and Al<sub>2</sub>O<sub>3</sub>(g). The Fe-Cl bond distance was estimated by comparison with those for Fe<sub>2</sub>Cl<sub>6</sub>(g) reported by E. Z. Zaslavin, N. G. Rembidi and P. A. Akhshin, Zh. Strukt. Khim., **3**, 910 (1963) and O. Heasel and H. Viorvold, Acta Chem. Scand., **1**, 149 (1947). Both the ground state quantum weight and vibrational frequencies were estimated so that the second and third law values of ΔH<sub>f</sub><sup>0</sup> 298.15, derived from the vapor pressure data, for the reaction Fe<sub>2</sub>O<sub>3</sub>(g) = 2FeCl<sub>3</sub>(g) are in reasonable agreement. The three principal moments of inertia are: I<sub>A</sub><sup>1</sup>I<sub>B</sub><sup>1</sup>I<sub>C</sub><sup>1</sup> = 4.15794 × 10<sup>-38</sup> and I<sub>C</sub><sup>1</sup> = 8.31588 × 10<sup>-38</sup> g. cm.<sup>2</sup>

Si-H dist. = 1.48

Si-Cl dist. = 2.02

Product of Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 75.642 X 10<sup>-114</sup> g.<sup>3</sup> cm.<sup>6</sup>

all angles = [109° 28']

Heat of Formation. ΔH<sub>f</sub><sup>o</sup> 298.15 was calculated from heats of reaction reported by E. Wolf, Z. Anorg. u. Allgem. Chem. 313, 228 (1961) for the equation

Heat Capacity and Entropy. Molecular constants were found in Janz and Mikawa, Bull. Chem. Soc. Japan 34, 1495 (1961). Vibrational Frequencies can also be found in Henderson and Schaeffer, Atlantic Research Corp., Alexandria, Va., "Survey of Thermochemical Data," January, 1960.

Lithium Chloride, Trimeric ((LiCl)<sub>3</sub>) (Ideal Gas)

Mol. Wt. = 127.19  
 ΔH<sub>f</sub>° 298.15 = -240.134 + 5 kcal. mole<sup>-1</sup>  
 S° 298.15 = 80.223 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 Point Group = D<sub>3h</sub>

Vibrational Levels and Multiplicities

$$\frac{\omega_e}{[550]} \left\{ \frac{G}{G} \right\}$$

Bond distances and angles LA-Cl distance = [2.2] Å  
 Plane cyclic structure σ = 6  
 Li-Cl-L angle [120°]

Moment of Inertia I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 2.675 x 10<sup>-112</sup> g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation. The heat of sublimation at 298° was chosen so as to give the correct ratio of monomer, dimer and trimer at 870°K. The value used was 52.6 kcal. mole<sup>-1</sup>, which compares very well with the value 53.6 kcal. mole<sup>-1</sup> obtained from a third law analysis of the data of An. N. Nemeyanov and L. A. Sazonov, Zhur. Neorg. Khim. 4, 231 (1960) in conjunction with the relative concentrations of monomer, dimer, and trimer at 870°K from the work of R. C. Millar and P. Kusch, J. Chem. Phys. 25, 860 (1950).

Heat Capacity and Entropy. The postulated structure, bond lengths and frequencies were all taken from D. L. Hildenbrand, A. M. Saul P. R. Besford, S. E. Stephanon, L. Larson and A. Ueyehara, Aeronautic Month Quarterly Report on Contract NORD 17980 Report C-898 (1960).

Heat of Formation.

The ΔH<sub>f</sub>° 298.15 for POCl<sub>3</sub>(g) was derived from the ΔH<sub>f</sub>° 298.15 of POCl<sub>3</sub>(l) and the ΔH<sub>v</sub>° 298.15. The ΔH<sub>f</sub>° 298.15 of the POCl<sub>3</sub>(l) was calculated from the heat of hydrolysis observed by T. Charnley and H. A. Skinner, J. Chem. Soc., 450, (1953) for the reaction:

The auxiliary thermochemical data, on the heats of formation of water and aqueous solutions of HCl and of H<sub>3</sub>PO<sub>4</sub>, were taken from the National Bureau of Standards, "Selected Values of Chemical Thermodynamic Properties," Circular 500, and were adjusted for consistency with JANAF tables. The heat of vaporization was measured and corrected to 298.15°K by J. B. Ott and W. F. Giauque, J. Am. Chem. Soc., 82, 1308 (1960). A correction was made for the change in phosphorus reference state [white (α) → red (γ)].

Heat Capacity and Entropy.

The molecular constants are from the microwave spectral data of Q. Williams, J. Sheridan, and W. Gordy, J. Chem. Phys., 20, 164 (1952). In order to determine the structure Williams et al. (loc. cit.) assumed the P-Cl distance equal to 1.99 Å. This was the smallest value allowed (2.02 ± 0.03 Å) by the electron diffraction work of I. O. Brockway and J. Y. Beach, J. Am. Chem. Soc., 60, 1836 (1938).

Ott and Giauque (loc. cit.) have given the moments of inertia obtained from a weighted average of the isotopic species. I<sub>A</sub>, I<sub>B</sub> due to isotopic loss of asymmetry. The S<sub>298.15</sub> calculated from calorimetric data by Ott and Giauque (loc. cit.) was 77.75 cal. deg.<sup>-1</sup> mole<sup>-1</sup> and the S<sub>298.15</sub> calculated from the spectral data was 77.77 cal. deg.<sup>-1</sup> mole<sup>-1</sup>.

Cl<sub>3</sub>OP

PHOSPHORUS TRICHLORIDE (PCl<sub>3</sub>) (IDEAL GAS) GTW = 137.3328

Point Group C<sub>3v</sub> S<sub>298.15</sub> = 79.47 ± 0.10 gibbs/mol ΔH<sub>f</sub><sup>0</sup> = -64.5 ± 1.3 kcal/mol ΔH<sub>f</sub><sup>298.15</sup> = -64.8 ± 1.3 kcal/mol

Ground State Quantum Weight = 1 Bond Distance: P-Cl = 2.039 ± 0.0014 Å Bond Angle: Cl-P-Cl = 100.27 ± 0.09° Product of Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 6.0517 × 10<sup>-113</sup> g<sup>3</sup> cm<sup>6</sup> σ = 3

Heat of Formation kcal/mol for the following reaction: PCl<sub>3</sub>(g) + (X<sub>2</sub> + 3) H<sub>2</sub>O + H<sub>3</sub>PO<sub>3</sub>(aq) + 3 HCl(aq) with X<sub>2</sub> in range 4500 to 7500. Combining this result with heat of formation data for aqueous H<sub>3</sub>PO<sub>3</sub>, -229.4 kcal/mol (2, 5, 16), H<sub>2</sub>O (2), and aqueous HCl (2), we derive ΔH<sub>f</sub><sup>0</sup>(PCl<sub>3</sub>, g) = -76.7 kcal/mol. Chamley and Skinner (3) made an independent investigation of the hydrolysis of liquid phosphorus trichloride and obtained enthalpy data in very good agreement with Neale and Williams' results. Their results lead to ΔH<sub>f</sub><sup>0</sup>(PCl<sub>3</sub>, g) = -76.5 kcal/mol when combined with heat of formation data (2, 5, 16). Neale and Williams (4) also investigated the hydrolysis of liquid phosphorus trichloride in aqueous bromine solution with the formation of phosphoric acid rather than phosphorous acid which results when hydrolysis occurs in water. They reported a ΔH<sub>f</sub><sup>0</sup> = -137.9 kcal/mol for the following reaction: PCl<sub>3</sub>(g) + Br<sub>2</sub>(aq) + (X<sub>2</sub> + 4)H<sub>2</sub>O + H<sub>3</sub>PO<sub>4</sub>(aq) + 3HCl(aq) + 2 HBr(aq) with X<sub>2</sub> in range 3500 to 6300. Combining this result with the following heat of formation data: ΔH<sub>f</sub><sup>0</sup>(H<sub>3</sub>PO<sub>4</sub>, l, H<sub>2</sub>O) = -308.4 ± 0.5 kcal/mol (5) ΔH<sub>f</sub><sup>0</sup>(Br<sub>2</sub>, aq) = -0.2 kcal/mol (6) HCl(aq) and HBr(aq) (2) along with dilution data for H<sub>3</sub>PO<sub>4</sub>(aq) (2), we derive ΔH<sub>f</sub><sup>0</sup>(PCl<sub>3</sub>, g) = -77.0 kcal/mol.

The heat of formation from white phosphorus of gaseous PCl<sub>3</sub>, ΔH<sub>f</sub><sup>0</sup>(PCl<sub>3</sub>, g) = -69.0 ± 1.1 kcal/mol, is calculated from the heat of formation of the liquid, ΔH<sub>f</sub><sup>0</sup>(PCl<sub>3</sub>, l) = -76.7 ± 1.0 kcal/mol, an average value of the three results given above, and the heat of vaporization of PCl<sub>3</sub>. The heat of vaporization of the liquid, ΔH<sub>v</sub><sup>0</sup> = 7.7 ± 0.1 kcal/mol, is determined from a second law analysis of the combined vapor pressure data of Masel'zon and Saryakov (7) and Regnault (8). The smoothed vapor pressure data of Regnault as reported by Stull (9) were used. Converting to the P (red, V) standard state with a ΔH<sub>trans</sub> = 4.2 ± 0.2 kcal/mol (10), we derive ΔH<sub>f</sub><sup>0</sup>(PCl<sub>3</sub>, g) = -68.9 ± 1.3 kcal/mol.

An independent value for the heat of formation can be obtained from the work of Duss and Mykytiuk (17) on the reaction 1.5CaF<sub>2</sub> + PCl<sub>3</sub>(g) → 1.5CaCl<sub>2</sub> + PF<sub>3</sub>(g). The authors report ΔH<sub>30</sub> = -2.97 kcal. From a reexamination of their technique we believe that this heat evolution is likely to be too small, perhaps by 100%. The analytical results indicate that the reaction is 93% complete or better; thus, we can use this with JANAF entropies to calculate ΔH<sub>f</sub><sup>0</sup> ≤ -3.55 kcal. Finch et al. (18) have reported ΔH<sub>f</sub><sup>0</sup>(CaF<sub>2</sub>, c) = ΔH<sub>f</sub><sup>0</sup>(CaCl<sub>2</sub>, c) = -100.87 ± 0.02 kcal/mol; thus, we obtain ΔH<sub>f</sub><sup>0</sup>(PCl<sub>3</sub>, g) = 70.1 ± 2.0 kcal/mol from ΔH<sub>f</sub><sup>0</sup>(PF<sub>3</sub>, g) = -724.9 ± 0.9 kcal/mol. This value is not adopted because of the lack of calorimeter calibration, but it offers an attractive possibility for further study.

Heat Capacity and Entropy The molecular structure and bond length given above for PCl<sub>3</sub> are from the electron diffraction studies of Hedberg and Iwazaki (11). The adopted values are in good agreement within experimental error with the following structural data reported by Kialuk and Townes (12) from microwave studies: P-Cl = 2.043 ± 0.003 Å, the angle Cl-P-Cl = 100°6' ± 20'. The vibrational frequencies are from the recent infrared and Raman studies of Frankiss and Miller (13) and are in excellent agreement with those of Miller et al. (14) and Davis and Oetjen (15). Individual moments of inertia calculated from the electron diffraction data are: I<sub>A</sub> = I<sub>B</sub> = 32.393 × 10<sup>-39</sup> g cm<sup>2</sup>, and I<sub>C</sub> = 57.673 × 10<sup>-39</sup> g cm<sup>2</sup>.

Cl-P-Cl angle = 100.5° ± 1° I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 2.0690 X 10<sup>-112</sup> g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation. ΔH<sub>f</sub><sup>o</sup> 298 was estimated by C. B. Henderson and R. S. Scheffee, Atlantic Research Corporation, Alexandria, Virginia, "Survey of Thermochemical Data," January 1960. Henderson and Scheffee (loc. cit.) use white(α) phosphorus as a reference state. Their estimated ΔH<sub>f</sub><sup>o</sup> 298 was adjusted to the Red (V) phosphorus reference state [see white(α) phosphorus sheet.]

Heat Capacity and Entropy. J. S. Zlomek and E. A. Piotrowski, J. Chem. Phys. 34, 1087 (1961) have chosen the most probable values for the wave numbers from the infrared spectral data of G. Cilento, D. A. Ramsey, and R. N. Jones, J. Am. Chem. Soc. 71, 2753 (1949), and the Raman spectral data of A. Simon and O. Schulze, Naturwissenschaften 25, 669 (1937); V. N. Matve, Nature 138, 469 (1936); H. Gerding and R. Heerick, Rec. trav. chim. 61, 842 (1942); and M. Delvaule and F. Franciosa, Compt. Rend. 220, 817 (1945). Zlomek and Piotrowski (loc. cit.) found their normal coordinate treatments gave the listed wave numbers as fundamentals and lent support for the 247 cm<sup>-1</sup> band missing from the Raman spectral data. The structure (bond distances and angles) was determined from microwave data by Q. Williams, J. Sheridan, and W. Gordy, J. Chem. Phys. 20, 164 (1952).

Cl<sub>3</sub>PS

Silicon Trichloride (SiCl<sub>3</sub>)  
(Ideal Gas) GFW = 134.445

$\Delta H_f^0 = -85.7 \pm 10$  kcal/mol

$\Delta H_f^{298.15} = -96 \pm 10$  kcal/mol

Point Group C<sub>3v</sub>

$S^{298.15} = 76.17 \pm 1.5$  gibbs/mol

Ground State Quantum Weight = (2)

Bond Distance: Si-Cl = (2.02) Å  
Bond Angle: Cl-Si-Cl = 110.9°  
Product of the Moments of Inertia:  $I_A I_B I_C = [7.5469 \times 10^{-113}]^3$  g<sup>3</sup> cm<sup>6</sup>  
 $\sigma = 3$

Heat of Formation

The adopted value is derived from an average bond energy of  $\Delta H_{atom}^0/3 = 96 \pm 3$  kcal/mol. This value is estimated by comparison of average bond energies for  $\text{XH}_n$  where H = C or Si, X = F or Cl, and n = 2, 3 or 4. These comparisons suggest that the average bond energy for SiCl<sub>3</sub> should be bracketed by those for SiCl<sub>4</sub> and SiCl<sub>2</sub>, i.e. 94, 3 and 101.5 kcal/mol, respectively. Alternative estimates from linear plots of  $\Delta H_f^0(\text{SiCl}_n)$  versus  $\Delta H_f^0$  for SiF<sub>4</sub>, CCl<sub>4</sub> and CF<sub>4</sub> yield -96, -96, and -86 kcal/mol for  $\Delta H_f^0$  of SiCl<sub>3</sub> at 298.15°K. These agree with the adopted value of -86 ± 10 kcal/mol, which corresponds to  $\Delta H_{atom}^0 = 286 \pm 10$  kcal/mol.

Kerr et al. (1) reported relative rates for several reactions of SiCl<sub>3</sub>, but the authors state that no absolute activation energies are known for reactions of this radical. This precludes derivation of thermochemical values from the kinetic studies. Recently, however, Vurzel et al. (2) reported studies of the decomposition of SiCl<sub>4</sub> by adiabatic compression. Rate constants, as reported in Chemical Abstracts, led to an activation energy of  $88 \pm 5$  kcal/mol for SiCl<sub>4</sub> + SiCl<sub>3</sub> + Cl. This activation energy for recombination should be very close to zero, so  $\Delta H_f^0 = 88 \pm 5$  compared with the adopted result of 86 ± 10 at room temperature. Steale et al. (2) derived an average value of D(Cl<sub>3</sub>Si-H) = 93 ± 4 kcal/mol from an interpretation of electron impact studies on several molecules. Using  $\Delta H_f^0(\text{Cl}_3\text{SiH}, g) = -122.6$  kcal/mol (3), we calculate  $\Delta H_f^0(\text{SiCl}_3) = -82$  kcal/mol and estimate the uncertainty as about 10 kcal/mol.

Heat Capacity and Entropy

Jacob and Milligan (5) studied the formation of SiCl<sub>3</sub> by photolysis of HSiCl<sub>3</sub> trapped in matrices of argon, nitrogen and CO. The two stretching fundamentals were assigned from the infrared spectra. Isotopic splittings were found to be consistent with an angle of 72 ± 5° between the threefold axis and each of the Si-Cl bonds. This yields a bond angle of 110.9° which is similar to that of HSiCl<sub>3</sub>. Non-planarity of SiCl<sub>3</sub> is consistent with the electron-spin-resonance studies of Poinc (6).

We adopt the results of Jacob (5) and estimate the bond length and two bending vibrations by analogy with HSiCl<sub>3</sub>. Similar analogies are reliable for SiF<sub>3</sub> and CF<sub>3</sub>. The ground state quantum weight is taken as two, but excited electronic levels are neglected. Jacob (5) observed unstructured absorptions corresponding to excitation energies of 30000-34500 cm<sup>-1</sup> and 41000-46000 cm<sup>-1</sup>. Principal moments of inertia are  $I_A = 65.18 \times 10^{-39}$  and  $I_B = I_C = 34.03 \times 10^{-39}$  g cm<sup>2</sup>.

TITANIUM TRICHLORIDE (TiCl<sub>3</sub>)

(CRYSTAL)

GFW = 154.259

ΔHf° = -173.1 ± 1.0 kcal/mol  
 ΔHf°<sub>298.15</sub> = -172.5 ± 1.0 kcal/mol  
 ΔH° = 0 kcal/mol  
 ΔHs° = [39.71] kcal/mol

S°<sub>298.15</sub> = 31.4 ± 0.3 gibbs/mol  
 T<sub>m</sub> = 220.1°K  
 T<sub>s</sub> = [1104.1]°K

Heat of Formation

The heat of formation, ΔHf°<sub>298</sub>, of TiCl<sub>3</sub>(c) has been measured by several investigators. The results of these measurements are as follows.

Investigators

| Investigator                   | Method   | ΔHf° <sub>298</sub> kcal/mol |
|--------------------------------|--|------------------------------|
| Schaffer et al. (1954) (1)     | Calorimetric, TiCl <sub>4</sub> + Hg = TiCl <sub>3</sub> + 1/2Hg <sub>2</sub> Cl <sub>2</sub>    | -171.8, -172.4               |
| Clifton and MacLeod (1956) (2) | Solution calorimetric  | -172.4                       |
| Johnson et al. (1956) (3)      | Calorimetric, TiCl <sub>4</sub> (l) + HI(g) = TiCl <sub>3</sub> (c) + HCl(g) + 1/2I <sub>2</sub> | -172.5                       |
| Krievė et al. (1956) (4)       | Solution calorimetric  | -171.3                       |
| Krievė and Mason (1956) (5)    | Equilibrium, TiCl <sub>3</sub> (c) + HCl(g) = TiCl <sub>4</sub> (g) + 1/2H <sub>2</sub> (g)      | -172.9                       |
| Altman et al. (1956) (6)       | Equilibrium, Ti(c) + 3TiCl <sub>4</sub> (g) = 4TiCl <sub>3</sub> (c)                             | -169.4, -171.0               |
| Head (1960) (7)                | Equilibrium, 2TiCl <sub>4</sub> (2) + H <sub>2</sub> (g) = 2TiCl <sub>3</sub> (c) + 2HCl(g)      | -172.3                       |
|                                | TiCl <sub>4</sub> (l) + Hg(l) = 1/2Hg <sub>2</sub> Cl <sub>2</sub> (c) + TiCl <sub>3</sub> (c)   |                              |
|                                | TiCl <sub>4</sub> (l) + Ag(c) = AgCl(c) + TiCl <sub>3</sub> (c)                                  |                              |

The chosen value of -172.5 ± 1.0 kcal/mol is that reported by Johnson et al. (3).

Heat Capacity and Entropy

The heat capacity and entropy of TiCl<sub>3</sub>(c) has been measured over the temperature range 54° to 1000°K by King et al. (8). The value of S°<sub>298</sub> is calculated from these data based on S°<sub>31</sub> = 4.29 eu.

Transition Data

A second order transition at 220.1°K was observed by King et al. (8). The heat capacity at this temperature is in excess of 146.8 gibbs/mol. King et al. measured the value of H°<sub>240</sub> - H°<sub>200</sub> as 1.213 kcal/mol.

Heat of Sublimation

The heat of sublimation is calculated from the heats of formation of TiCl<sub>3</sub>(c) and TiCl<sub>3</sub>(g) at the sublimation temperature. The sublimation temperature is taken as the point at which ΔGr = 0 for the process TiCl<sub>3</sub>(c) = TiCl<sub>3</sub>(g).

Heat of Formation  
 The heat of formation of TiCl<sub>3</sub>(g) is calculated from the heats of reaction for the processes, (A) 3TiCl<sub>4</sub>(g) + Ti(s) = 4TiCl<sub>3</sub>(g) and (B) TiCl<sub>3</sub>(s) = TiCl<sub>3</sub>(g), combined with auxiliary JANAF heats of formation for TiCl<sub>4</sub>(g), TiCl<sub>3</sub>(s) and Ti(s). Equilibrium measurements of reaction (A) have been reported by Gross and Levi (1). Vapor pressure measurements for reaction (B) have been reported by Sanderson and MacLeod (2) and by Farber and Barnall (3). Second and third law analyses of these data yield the following results.

| Source                    | Reaction | No. Points | Range, T/K | Second Law | Third Law  | Drift, eu  | ΔH <sub>f,298</sub> * |
|---------------------------|----------|------------|------------|------------|------------|------------|-----------------------|
| Gross and Levi (1)        | A        | 3          | 1223       |            | 31.6 ± 2.0 |            | -128.5                |
| Sanderson and MacLeod (2) | B        | 9**        | 678-823    | 42.8 ± 1.1 | 42.8       | -0.1 ± 1.5 | -129.3                |
| Farber and Barnall        | B        | 8          | 636-732    | 45.3 ± 2.1 | 45.8       | 0.8 ± 3.1  | -126.2                |

\*Calculation based on third law ΔH<sub>f,298</sub>  
 \*\*One point rejected due to failure of statistical test.  
 The chosen value of ΔH<sub>f,298</sub> is -128.9 kcal/mol. This value is the average of the first two determinations.

Heat Capacity and Entropy  
 The interatomic distance is estimated from that of the solid, given as 2.46 Å by Matta et al. (4), and from comparisons of bond distances of crystal and gas phase tetrahalides of titanium. The pyramidal bond angle is estimated assuming TiCl<sub>3</sub>(g) similar to the group V trihalides. The principal moments of inertia are I<sub>A</sub> = 4.28 × 10<sup>-38</sup> g cm<sup>2</sup> and I<sub>C</sub> = 7.26 × 10<sup>-38</sup> g cm<sup>2</sup>. The vibrational frequencies are estimated from valence force field predictions and comparisons with group V trihalides. The electronic levels are estimated from the levels of Ti<sup>3+</sup> (5).

Heat of Formation

Turnbull and Watts (1) determined the equilibrium pressures for the disproportionation of ZrCl<sub>3</sub>(c) in the temperature range from 613°K to 723°K by a modified dew point technique. Third law and second law analyses of their vapor pressure-temperature equation give the same heat of reaction  $\Delta H_{298}^\circ = 30.7$  kcal/mol for  $2ZrCl_3(c) \rightarrow ZrCl_2(c) + ZrCl_4(g)$ . The adopted value,  $\Delta H_{298}^\circ(ZrCl_3, c) = -170.7$  kcal/mol, is calculated from the heat of reaction at 298°K, and  $\Delta H_{298}^\circ(ZrCl_4, g) = -207.77$  kcal/mol (2) and  $\Delta H_{298}^\circ(ZrCl_2, c) = -103$  kcal/mol (3). The assigned uncertainty,  $\pm 15$  kcal/mol is mainly due to the uncertainty in the heat of formation of ZrCl<sub>2</sub>(c), and also the dew point technique used.

Heat Capacity and Entropy

The heat capacities of ZrCl<sub>3</sub>(c) are estimated from the Cp values of ZrCl<sub>4</sub>(c) by deduction of one Cl atom Cp contributions which are calculated as  $1/4[Cp(ZrCl_4, c) - Cp(Zr, c)]$ . The  $S_{298}^\circ$  is calculated as  $34.85$  eu based on the assumption that  $S_{298}^\circ(ZrCl_3, c) = S_{298}^\circ(ZrCl_4, c) - 1/4[S_{298}^\circ(ZrCl_4, c) - S_{298}^\circ(Zr, c)]$ .

Heat of Sublimation

The heat of sublimation is calculated from the difference in the heats of formation of gas and crystal at 298°K. The sublimation temperature is taken as the point at which  $\Delta G_r = 0$  for  $ZrCl_3(c) = ZrCl_3(g)$ .
